The Gardeners' Company.—An interesting function was that at the Mansion House on the 29th ult., when the Master of the Gardeners' Company (Mr. Charles Bayer) presented the Lord Mayor with a basket of vegetables, herbs, and flowers, "in grateful remembrance of the Recorder's Warrant of 1632," which enacted that any person using the trade of gardening in any way calculated to bring it into contempt, was liable to arrest. The Master of the company was accompanied by Alderman Sir Horace Brooks Marshall, Mr. W. T. Crosweller, and Mr. E. A. Ebblewhite (Clerk to the Company), and in making the presentation, said they were at the Mansion House that day to exercise a privilege of which they were proud, namely to present to his Lordship a basket of flowers and vegetables such as were grown in their gardens in 1605, the period of the foundation of the company. He then presented the Lady Mayoress with a beautiful bouquet of orchids. The Lord Mayor, in accepting the gift, said he was especially gratified to find that the products contained in the basket were wholly the products of English soil. The basket, which was of elegant design, contained asparagus, artichokes, cucumbers, kidney beans, peas, vegetable marrows, and other vegetables; and prominent among the flowers were roses, stocks, and sweet peas. The last-named flowers were, of course, not introduced to this country until nearly a century after the Gardeners' Company was founded.

Japanese Horticulture. — In order to express British appreciation of Japanese horticulture, the President and Council of the Royal Horticultural Society decided to take advantage of the opportunity afforded by the Japan-British Exhibition and the number of Japanese interested in gardening at present in this country. They accordingly invited all the leading horticulturists to luncheon at the Holland House Show on Wednesday last, and, as our gardening friends from the Far East fully showed their appreciation of the honour done them, the gathering was large and of much interest. About seventy Japanese horticulturists and others at the present time in this country accepted invitations, among them being his Excellency Takaaki Kato, the Japanese Ambassador; Baron Oura, Minister of Agriculture and Commerce; Prince Torkergawa, Chairman of the House of Peers; Mayor Yukio Osaki, Mayor of Tokyo; Dr. Bunji Mano, Mr. Hikojiro Wada, Commissioner-General of the Japanese section of the Japan-British Exhibition; Mr. Yasunosuke Kagami, Principal of the Japanese School of Horticulture; and Mr. Hannosuke Izawa, expert gardener to the Japanese Government Commission. About thirty British horticulturists were invited to meet the Japanese guests, and, in addition to the members of council, we noticed Lord Blythe, Sir T. Elliott, Sir Daniel Morris, Lieut.-Colonel Prain, Mr. A. W. Sutton, Professor Bateson, Mr. Spencer Pickering, Mr. N. N. Sherwood, Mr. George Gordon, Dr. A. B. Rendle, and Mr. H. Somers Rivers. Sir Trevor Lawrence presided, and, after the toast of "The King" had been duly honoured, he proposed the toast of "The Emperor of Japan," and in doing so referred to the kindly feelings his Majesty had at all times shown towards this country. The President then submitted the toast of "The Japanese Guests and Japanese Horticulture," and spoke of the remarkable ability, energy, and perseverance of the Japanese people, and of the great success achieved by Japanese horticulturists. He also passed under review the many beautiful trees, shrubs, and bulbous plants that had been introduced from Japan. Dr. Mano made a suitable response in excellent English. The Japanese Ambassador, in an eloquent speech, proposed the toast of "The Royal Horticultural Society," which was acknowledged by Sir D. Morris. Sir Albert Rollit submitted the health of Sir Trevor Lawrence, which was heartily received and briefly acknowledged.

Awards for Japanese Gardens, etc.—On Thursday, June 30, the President and Council of the Royal Horticultural Society visited the Japan-British Exhibition for the purpose of inspecting the Japanese gardens and the horticultural exhibits. As the result of their visit they awarded silver cups as follows: To Mr. Keijiro Ozawa, of Tokyo, for the design of the "Garden of Peace" and the "Garden of the Floating Islands"; to Mr. Hannosuke Izawa, for the construction of these gardens; to the Tokyo Yen for the design and construction of two miniature gardens; to the Yokohama Nursery Company for a collection of dwarf trees in pots, and for a dwarf specimen of Thuia obtusa aurea, 125 years old; to Mr. S. Hayashi, Kioto, for a pair of bronze garden lamps; to Mr. Senker Agawa, Kioto, for an imitation dwarf pine used in ceremonies; to Nippon Yusen Kaisha, for a garden of artificial flowers, and to the Girls' Technical School, Tokyo, for an arrangement of artificial flowers.

New Park for Winchmore Hill.—The Southgate Urban District Council has decided to purchase from Captain Taylor a portion of the Winchmore Hill Woods Estate for the purpose of a public use. The portion to be purchased has an area of sixty acres, including a lake of about seven acres, and the sum to be paid for it is £20,000.

Colouration of Sweet Pea Tendrils, etc.—Mr. Cuthbertson submitted to the Scientific Committee of the Royal Horticultural Society at a recent meeting sweet pea growths in flower for the purpose of showing that the colouration of the tendrils and axils cannot in every case be accepted as one of the guides to purity of stock. The variety Mrs. Hugh Dickson gives both green and coloured tendrils and axils. The old variety Lady G. Hamilton behaves in a similar way. Mr. Ireland, Messrs. Dobbie's sweet pea grower, says that seed saved from a green tendril plant gives, when shown, both colours in the first generation and vice versa. It was at one time thought that the presence or absence of colour in the axils and tendrils of sweet peas might be taken as a guide to enable "rogueing" to be done at an early stage, but, although this is frequently true, it is evident that this unit character would have to be selected and bred for as with any other, before it would prove an absolutely trustworthy guide.

National Rose Society.—In our next issue we shall give a full and illustrated report of the Metropolitan exhibition of this society, held in the gardens of the Royal Botanic Society on the 8th inst. We shall also give a report of the society's provincial exhibition to be held at Salisbury on Wednesday next, the 13th inst.

Rare British Plants at Cambridge.—Among the more interesting of the British plants that have been received at the Cambridge Botanic Gardens during the past year are Eriophorum alpinum (from Switzerland) formerly native of the Moss of Restenet, Forfarshire, but long lost through drainage and now extinct in this country; Eriocaulon septangulare, one of the most interesting of British plants (from West Ireland); Catabrosa aquatica var. littoralis; Papaver hybridum, from Wells, Norfolk; Achillea Ptarmica, the wild original of a well-known garden plant; Carduus heterophyllus, a handsome species; Solanum nigrum var. luteo-virescens, from Jersey, a curious variety of Black Nightshade, with yellowish-green berries; the Pyrus scandica Bab., as also of P. latifolia; Ulex Gallii, the smaller autumn-flowering gorse, characteristic of the North and West of England and Ireland; Salix Lapponum and S. Lapponum × reticulata. The Curator, Mr. R. Irwin Lynch, M.A., found two forms of Statice occidentale at Hunstanton so much alike that their morphological characters are hardly definable; they do not appear to cross, come perfectly true from seed in cultivation, and differ in time of coming in flower, height and general appearance. Mr. Salmon, who has worked at the British species, has been unable to distinguish them.

Supplies of Early Potatoes. The marketing of the early crops of potatoes in Ayrshire and Cheshire is now in full swing, and the large supplies available are being readily disposed of in the populous centres of England and Scotland. The yields, according to the reports that have come to hand, are more satisfactory than was at one time expected, and in size and quality the tubers are above the average. It is also satisfactory to learn that the prices now being realised are such as to give a good return to the growers. The crop of early potatoes in the south-western counties of Ireland is reported to be of a satisfactory character, although disease is said to have made its appearance in some districts.

Delphiniums from Langport.—We have on our table at the present time a vase of splendidly-developed spikes of delphiniums that have been sent for our inspection from Langport, and a fine effect they produce. The varieties which Messrs. Kelway and Son have submitted to our notice comprise some of the finest they have raised, and their flowers afford a long range of shades of blue. Conspicuous among them are F. Carr, Silver Buckle, True Blue, Christine Kelway, Lady Fair, Lovely, Huish Beauty, Nymph, and Zinfandel.

GREAT FLOWER SHOW AT HOLLAND PARK.

There was a superb exhibition at Holland Park on July 5 and 6, and rarely has there been such a splendid representation of British horticultural skill. There were ten tents, all splendidly filled with the finest flowers, and fruits, and plants. Altogether under canvas there were 64,000 square feet of staging, and the groups outside occupied many thousands of feet more. Probably the Royal Horticultural Society has never before had so glorious an exhibition, and though a Temple Show takes precedence from an orchidist's point of view, in all other ways this show at Holland Park was far ahead in size and quality.

A CHARMING JAPANESE GARDEN.
Exhibited by Messrs. J. Carter and Co., at Holland Park Show.

The amount of labour such a display entails is enormous, and great credit is due to the Rev. W. Wilks, Mr. Gaskell, Mr. S. T. Wright, Mr. Reader, Mr. H. B. May, and others who worked so well and had arrangements all in excellent order. To Lady Ilchester also the thanks of horticulturists are due for permission to hold the show once more in Holland Park, Kensington.

ORCHID COMMITTEE.

Messrs. Sander and Sons, St. Albans, put up a superb group of orchids, the central feature of which was a trophy of Phalænopsis Rimestadiana, Dendrobium Phalænopsis, Cattleya Mendeli, and C. Warscewiczi. On one side of this was a fine batch of Odontoglossum Williamsianum (grande type), and on the other side were Vanda cærulea and a number of magnificent Brasso-cattleyas. A few of the more interesting and beautiful of the other subjects with which this glorious display was crowded were Miltonia Bleuana, M. St. Andre, Epidendrum prismatocarpum, Cypripedium Curtisi Sander's var., C. Godefroyæ leucochilum, Cattleya fulvescens, C. Mossiæ Wageneri, Oncidium macranthum, Odontioda St. Fuscien, and a host of hybrid odontoglossums.

Messrs. Mansell and Hatcher, Rawdon, Yorkshire, had the largest display of orchids, and once again their exhibit was magnificently and beautifully arranged. It was about fourteen yards long, and an altogether splendid effort. In the centre was an elegant group of fine forms of Cattleya Warscewiczi, with a few white odontoglossums rising above them. At one end Vanda cærulea, Miltonia vexillaria, odontoglossums, and Phalænopsis Rimestadiana were grouped together in a fine mass, and at the other end Cattleya Mendeli, and C. Warscewiczi were pleasingly arranged. Between these three fine groupings were hosts of good things, only a few of which we have space to mention. There was Odontioda Bradshawiæ in large numbers, the pretty Cochlioda Noetzliana, Oncidium Lanceanum, O. macranthum, Miltonia vexillaria Chelsiensis, Renanthera Imschootiana, Cœlogyne pandurata, Vanda cærulea, Odontoglossum ardentissimum, O. amabile, O. Rolfæ, Brassia verrucosa, and Cattleya Mendeli.

A handsome group arranged in mound form, by Mr. Collier, gardener to Sir Jeremiah Colman, Bart., was a great success, and it contained fine plants especially well set up. Cattleya Warscewiczi, white odontoglossums, Odontioda Thompsoniana, and Oncidium undulatum were boldly associated in the centre, and around these were Odontioda Bradshawiæ, Miltonia Bleuana nobilior, Lælia-cattleya Canhamiana, and L.-c. C. alba, Brassia Lawrenceanum, Cochlioda Noetzliana, Lælio-cattleya Phœbe, Cypripedium callosum Sanderæ, the quaint Eriopsis rutidobulbon, Bulbophyllum grandiflorum, and Cœlogyne Schilleriana. A fine effort from a private garden. Mr. Edward V. Low, Vale Bridge, Haywards Heath, was chiefly represented by a batch of Cypripedium callosum Sanderæ and C. Lawrenceanum Hyeanum, together with Cattleya Gaskelliana alba, C. Mossiæ alba, Reine des Belges, and Odontioda Charlesworthi

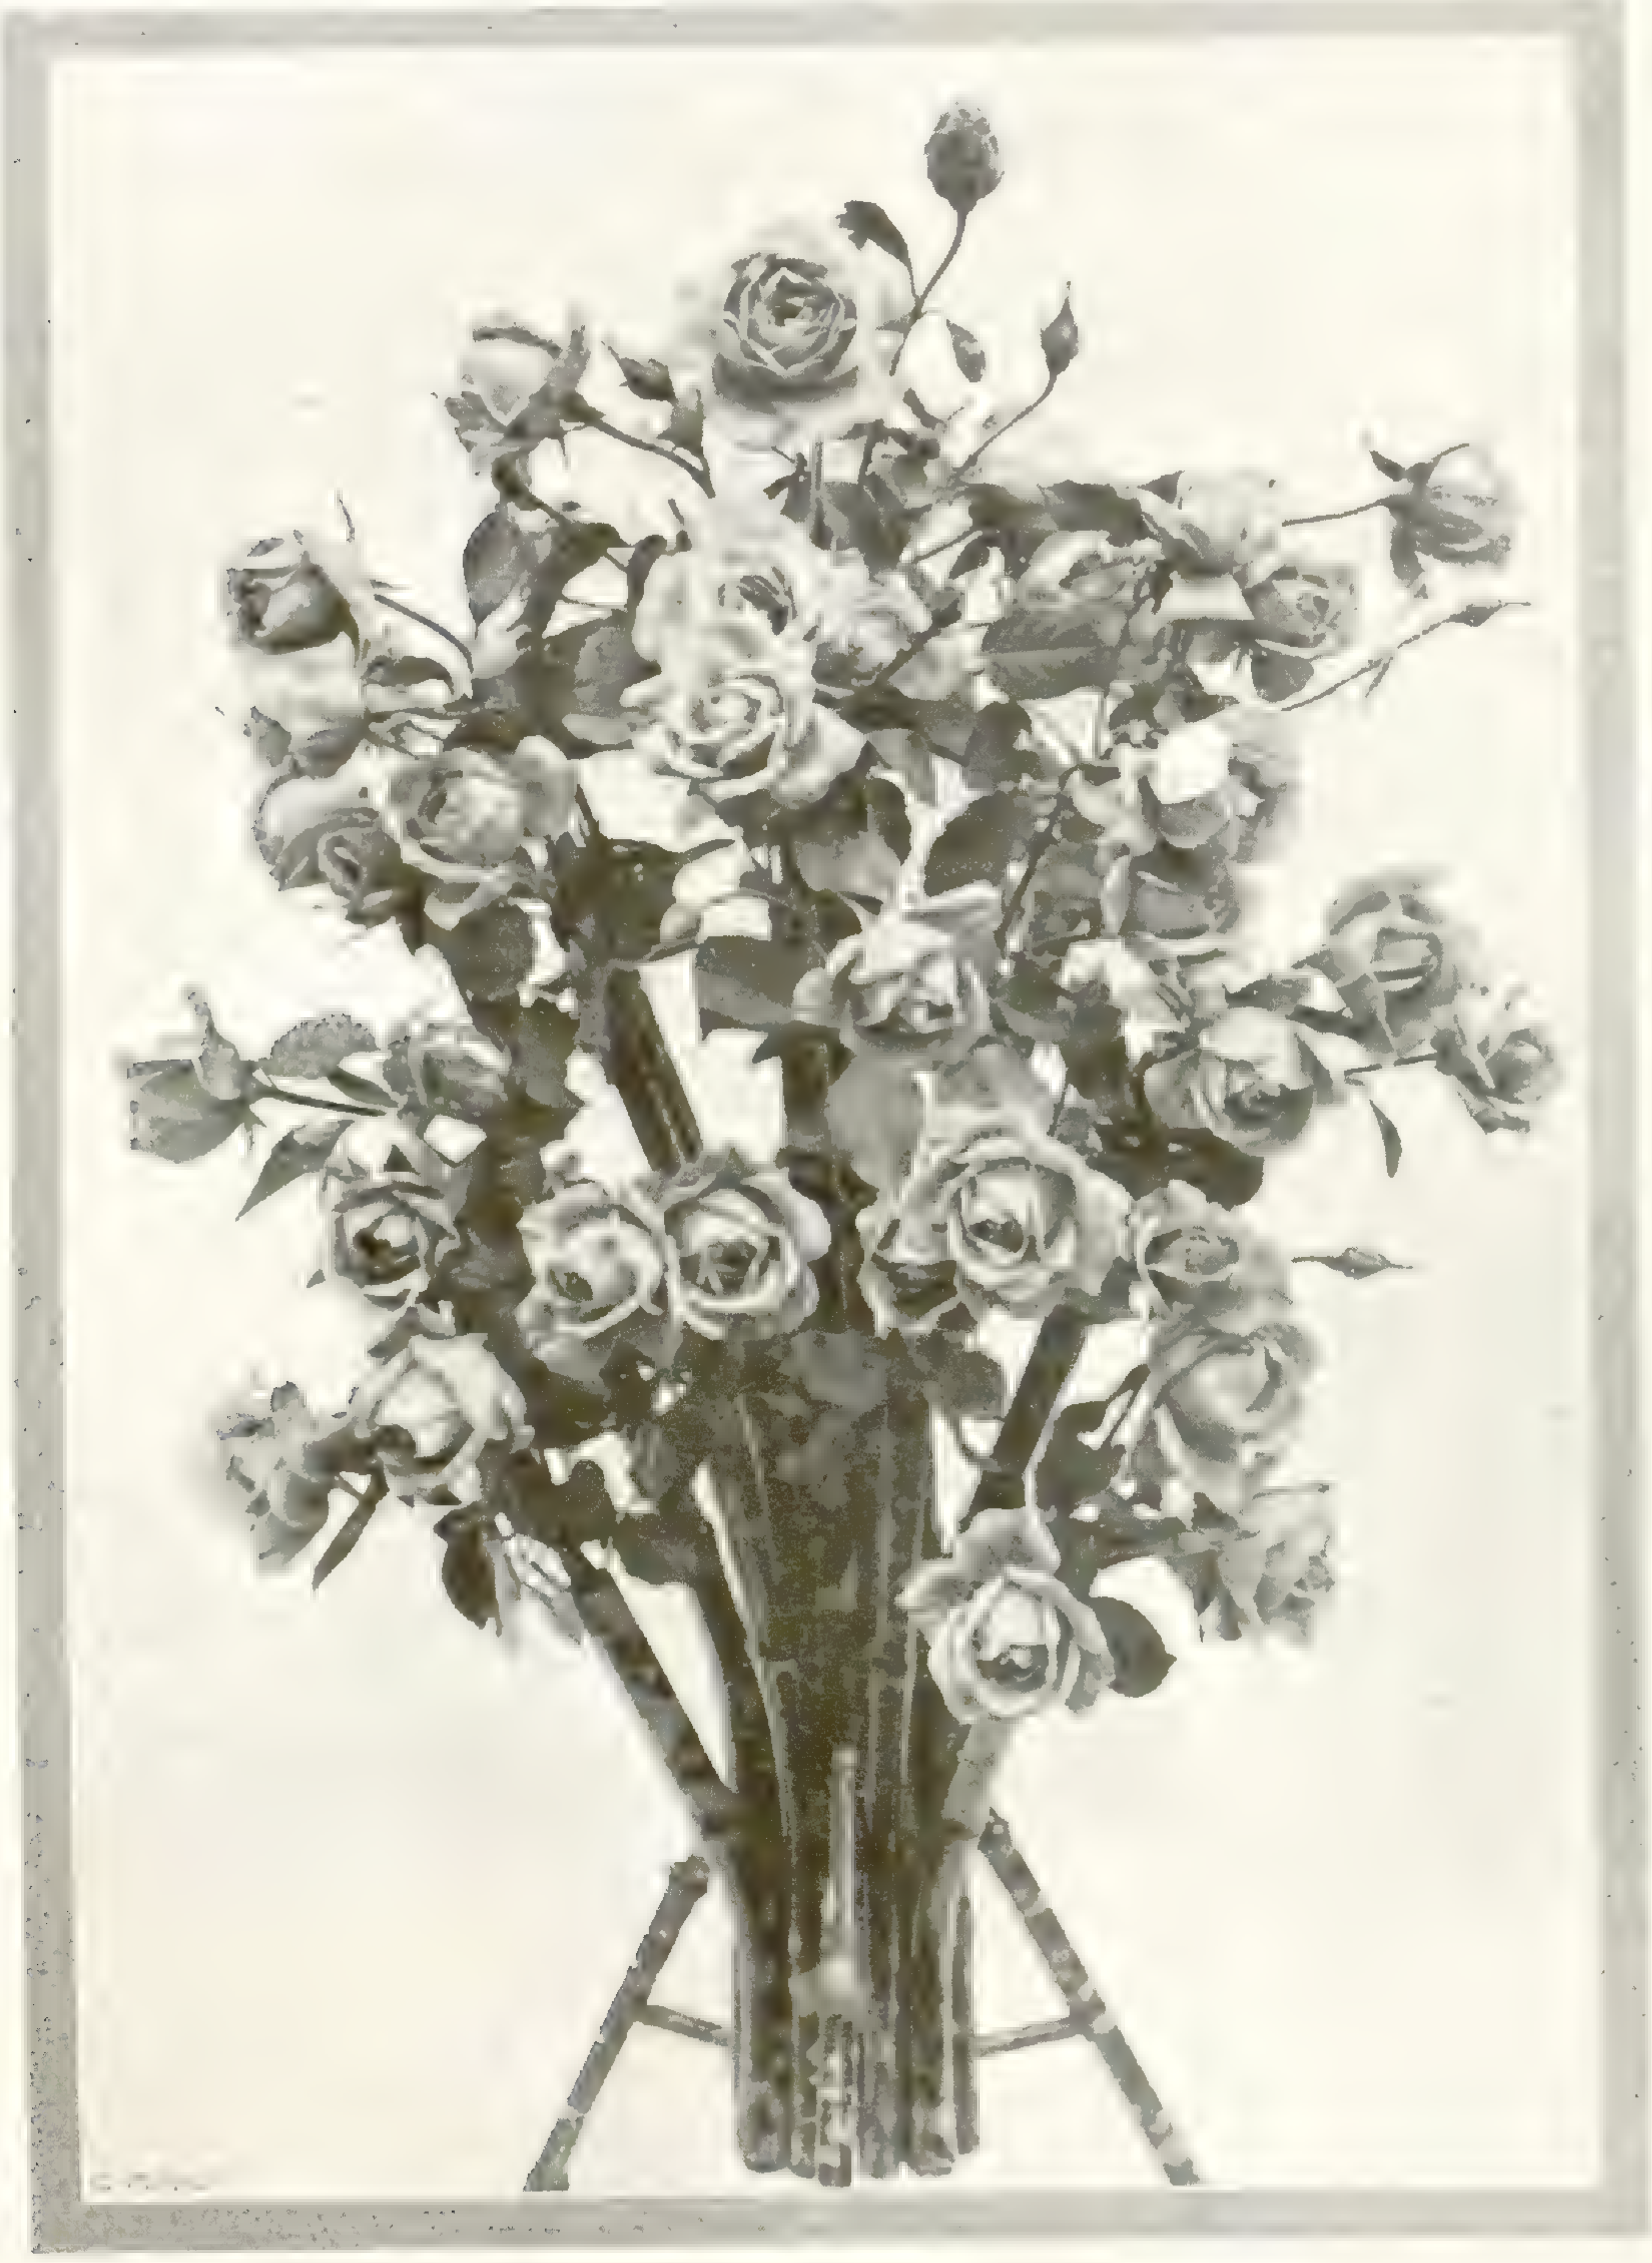
Messrs. Charlesworth and Co., Haywards Heath, were also finely represented on this occasion by a large, brilliant, and very graceful group. The central feature of this exhibit was composed of grand spikes of Phalænopsis Rimestadiana, rising from a mass of the bright little Epidendrum vitellinum majus. Dendrobium Phalænopsis was largely used at either end of the display with white phalænopsis. One of the bays was filled with Odontoglossum Wiliamsianum and magnificent plants of Cattleya Warscewiczi and C. Warneri, while in another bay were Lælio-cattleya Canhamiana and its white variety, with the brilliant L.c. C. Fire King. Other lovely things on view in this fine group were L.-c. G. S. Ball, L.-c. Ceres, Odontioda Charlesworthi magnifica, Odontoglossum Smithi, O. armainvilliersensis, Odontioda Bradshawiæ, and Oncidium Lanceanum.

Messrs. Stuart Low and Co., Bush Hill Park, Enfield, submitted a collection of orchids, but the display was lacking in finish, the pots being too much in evidence. Dendrobium nobile virginale was excellent, and so were the varieties of Cattleya Mendeli and C. Mossiæ, the White C. Mendeli Stuart Low gaining an F.C.C.; Cattleya Warscewiczi, odontoglossums in great variety, Oncidium macranthum, and Epidendrum vitellinum majus were also prominently displayed.

FLORAL COMMITTEE.

Messrs. Paul and Son, Waltham Cross, had a particularly pleasing exhibit of roses. They had covered a large space with vases and baskets of roses of special value for garden decoration; these were kept low, and over them rose weeping standards and graceful pillars of famous Wichuraiana hybrids, such as Dorothy Perkins, White Dorothy, Hiawatha, Paradise, and Lady Gay. Among the roses that made up the glorious and fragrant groundwork, Juliet, the new and famous variety, was conspicuously beautiful; Aennchen Muller, Lyon Rose, Madame Abel Chatenay, Liberty, Richmond, Madame Ravary, Melanie Soupert, Marquise de Sinety, Warrior, Betty, and Marquise de Salisbury—a grand group.

Messrs. Paul and Son, Cheshunt, had a very bright and interesting group of roses. In the foreground cut blooms were massed together, and such varieties as Lady Ashtown, Victor Hugo, Harry Kirk, Irish Glory, Betty, Lady Battersea, His Majesty, and Marquis de Sinety were finely represented. Behind these were plants of climbing roses of the Wichuraiana class, and among these were J. Billiard, Shower of Gold, Delight, Dorothy Perkins, Goldfinch, Lady Gay, and other good things. Messrs. J. Veitch and Sons, Chelsea, put up a large group of stove and greenhouse plants, and in their display every plant was a fine specimen. Palms, giant dracænas, and crotons formed the background, and in front of these were splendid caladiums, Anthurium crystallinum, Tillandsia Massangeana, Heliconia illustris rubricaulis, Alocasia Watsoni, Maranta insignis, and fine examples of Croton Warreni. Two large specimens of Datura arborea towered above everything else, and raised above the central portion of the display were finely-grown examples of Nepenthes Diadem, N. Curtisi superba, N. Mastersiana, and N. Dr. J. Macfarlane. In the front centre was a pretty group of orchids, which included Epidendrum prismatocarpum and Disa Luna. At either end the beautiful Solanum Wendlandi was associated with gorgeous cannas, and the graceful and bright Kalanchoe flammea. A rare bank of ferns, set up by Messrs. H. B. May and Sons, Edmonton, contained a grand example of Asplenium marginatum, and a batch of the lovely and elegant Nephrolepis Marshalli. Other fine things were N. Whitmani, N. exaltata superba, the graceful Polypodium Vidgeni, and the beautiful Gymnogramma flavescens var. Cordreyi.



ROSE MARQUISE DE SINETY.

A beautiful variety exhibited by Messrs. H. Merryweather and Son, Lim., Southwell, Notts, at the Holland Park Show.

Mr. C. Engelmann, Saffron Walden, had a large exhibit of carnations; Carola occupied the post of honour, and was flanked by large vases of Afterglow, Red Lawson, Robt. Craig, Mikado, Alvina, White Perfection, Beacon, and Enchantress. Mrs. Trelawny, a salmon-scarlet Malmaison carnation, was finely shown by Mr. Chas. Turner, Slough, and round this were Old Blush, Princess of Wales, and Maggie Hodgson Malmaison varieties, with Ethel, Voltaire, and other bolder varieties in the foreground. Mr. Turner also showed weeping standard roses over cut blooms of good garden varieties.

Messrs. Stuart Low and Co., Enfield, put up perpetual and Malmaison carnations in bold fashion, and presented great vases and sheaves of Irene, The Colonel, Princess of Wales, Lady Mary Hope, and other good Malmaisons; the same firm showed a fine lot of cut blooms of popular roses, including a few of the newer kinds, and made a lovely and fragrant exhibit with them. The Rowberry also figured here.

Messrs. Wm. Cutbush and Son, Highgate, N., occupied a large corner space in the big marquee, and filled it in very pleasing fashion. Carnations and roses were the great features, the former being very largely and very well shown in big groups of plants freely flowered. The background was of palms and large examples of Dracæna Lindeni. The leading carnations were President, Marmion, Rose Doré, Mikado, White Perfection, Mercia, Lady Nunburnholme, Dragon, King Arthur, The Queen, and these were arranged in graceful fashion in a setting of dwarf polyantha roses and ferns.

Messrs. R. Wallace and Co., Colchester, again provided an exhibit of outstanding merit and unique design. The first portion of their display was a water garden aglow with Iris Kæmpferi in great beauty and variety, grouped near spiræas, hardy orchids, and liliums in delightfully artistic fashion along the sides of a stream of water, the latter dotted with water lilies. It was a charming representation of a Japanese iris garden. The second portion was a modification of the display that created so great a sensation last year. There was a raised flagged walk, backed by a rough wall filled with pleasing wall plants, sedums, campanulas, dianthuses, etc., all blooming freely and looking as though they had been in position for years. The wall served to retain a broad border filled with the gayest of gay flowers, such as Lilium elegans in variety, coreopsis, irises in great variety, glowing kniphofias, and quantities of tall spikes of Eremurus Bungei and E. Warei, delphiniums, spiræas, erigerons, and other lovely things—yellow shades were well represented—the whole was, as the ladies said, "Perfectly lovely." In the centre of this latter part of the exhibit was a recess with a stone seat, with hardy ferns in the stone crevices around, and a little pool of water-lilies on either side of the seat. It was a great exhibit—in many respects the finest in the show. Messrs. Hobbies, Lim., Wisbech, made up a good show of roses, setting up weeping standards and pillars of Dorothy Perkins and kindred varieties, and the new copper-shaded Joseph Billiard. In the foreground were cut blooms of Lyon Rose, Mildred Grant, Richmond, Triumph, etc.

Messrs. R. H. Bath, Lim., Wisbech, occupied a small corner with decorative roses, which included some fine rambler varieties, also a collection in vases. In the latter were Irene Watts, Duke of York, Cecile Brunner, Madame E. Resal, Leonie Lamesh, and Madame Abel Chatenay. This firm also had groups of delphiniums, English irises, and carnations; the latter were beautifully arranged in tall bamboo stands with asparagus. From Colonel the Hight Hon. Mark Lockwood, C.V.O. (gardener, Mr. G. Cradduck), Bishop's Hall, Romford, came a splendid group of Trachelium cæruleum, most tastefully arranged with cocos palms and with Panicum variegatum, the whole forming a pleasing soft colour scheme in a tent of brilliant colouring.

Mr. C. W. Breadmore, High Street, Winchester, showed sweet peas finely, and in an excellent collection he had Mrs. Henry Bell, Marjory Linzee, King Alfonso, Constance Oliver, President, Countess Spencer, A. N. Dickson, Mistress Lumley, Freda, George Herbert, Princess Juliana, etc. Mr. W. E. Alsen, Denmead, Hants, had a small exhibit of sweet peas, in which the brilliant Sterling Stent was conspicuously good. Messrs. Thos. S. Ware, Feltham, had a glorious bank of tuberous begonias, the flowers perfect in size and form and of exquisite colouring; Lady Cromer, Hon. Mrs. Ronald Greville, and Marchioness of Bute, Mrs. W. L. Ainslee, and Mary Pope were lovely examples. Mr. A. L. Gwillim, New Eltham, contributed a fine bank of tuberous begonias, his Margaret Gwillim, yellow, standing out as a fine thing. A large, bold, and well-arranged exhibit of sweet peas was made by Messrs. S. Bide and Son, Farnham, their Sunproof King, Mrs. Henry Bell Improved, Mrs. W. T. Massey, and President standing out as distinctly good. Messrs. W. and J. Brown, Peterborough, staged hardy flowers largely, and

(Continued on page 535.)

AT HOLLAND HOUSE.

You are in a town garden, amid an atmosphere of association, and yet you might have been transported miles away from the noise and confusion of the adjacent thoroughfare. That is one of the delights a garden yields. It removes you from the environment of tumult and care, and surrounds you with soothing freshness and colour—bringing you at once into a surprisingly recreative sphere, a new world.

The charms of the wonderful exhibition will remain—memories of nymphæas, roses, carnations, begonias; the vari-hued world of herbaceous flowers; the out-of-door designs that almost justify the venial offence of covetousness for one's own enclosure; these make the dark days of the later months the more endurable by the recollection of them, and reclaim the grown-up to the dream of fairyland that possessed his younger fancy.

But why not realise it all? The area of size or of less proportions responds to the culture of any determined grower who is aided by CLAY'S FERTILIZER. This remarkable preparation is relied upon by the owner of the garden of taste, by the controller of the garden of dimensions, by the earnest worker in the more limited garden to which he gives his unremitting care and love. And everywhere it proves responsive to the confidence reposed in its properties. It is vital, it is certain. Mention it in the meeting of the local association, in the bothy, in the greenhouse and garden, and it is recognised at once as a friend—an unfailing one.

Every gardener knows that CLAY'S FERTILIZER is easily absorbed into the soil, and resolved into tissue by all plants; that it is vital fare, and indispensable for all horticultural purposes. It is procurable of seedsmen, nurserymen, or direct from Messrs. CLAY AND SON, Stratford, London, E.

CLAY'S SUCCESSFUL GARDENING is in the hands of a large proportion of the horticultural public, who find in its pages information of the highest value, since it is contributed to by the most expert authorities of the day. A copy costs but NINEPENCE, Net, from any member of the horticultural trade, or post free if ordered from the publishers, as above.

THE FLOWER GARDEN.

The Formation and Management of a Garden, and the Culture of Outdoor Flowers and Plants.

W. H. and L. Collingridge, 149 and 149, Aldersgate Street, London.

NEW SINGLE ROSE MILKY WAY.

Every year the race of hybrid roses derived from Rosa Wichuraiana increases, and though double varieties like Dorothy Perkins and Lady Gay are well able to hold their own, raisers have not forgotten the grace and beauty of single roses. Hiawatha holds a prominent position among single varieties that show in a marked degree the influence of R. Wichuraiana, and the brilliance of its blooms appeals to most lovers of roses. Jersey Beauty, a single white variety, had some popularity, but has not "caught on" like Hiawatha. There is, however, a newcomer that bids fair to fill up the gap and provide a single Wichuraiana rose with an abundance of pure white flowers. This is Milky Way, a new seedling raised by Messrs. William Paul and Son, Waltham Cross; it far surpasses R. Wichuraiana and Jersey Beauty, and bears its lovely white blossoms in large elegant panicles, the pure whiteness of the flowers being enhanced by the large central cluster of golden stamens. There is a lightness about Milky Way that is sure to obtain for it a host of lovers. As a pot plant for flowering in the conservatory or winter garden during late spring it is peculiarly beautiful, and it is really wonderful what large and lovely pillar specimens, branching and flowering in a most graceful fashion, can be produced in comparatively small pots. As a pillar plant or as a weeping standard on a tall stem Milky Way will be found most useful.

GENISTA VIRGATA.

This is one of the few shrubs from Madeira which is perfectly hardy in England, whilst it is one of the most ornamental of the larger-growing brooms. Under natural conditions it attains a height of from 12 to 15 feet, with a considerable spread. It is of upright habit, and plentifully clothed with tiny leaves, which are rather more than half an inch long. The flowers are golden, and borne with great freedom during June. It possesses the peculiarity of being equally well suited for a position exposed to full sun, and also for planting in semi-shade. in fact there are few large growing flowering shrubs which are better suited for thin woodland. Planted along the margins of a woodland path it has a charming effect, the rich golden blossoms showing up finely amongst the dark trunks in the vicinity. It is also very suitable for planting in poor sandy ground. that is if quite young plants are put in, for, like other brooms, large examples are difficult to establish even in the best of soil and under the best possible conditions. In some situations it naturalises itself readily, particularly where the seeds can fall on to loose earth which is comparatively free from grass and coarse weeds. Seeds sown in pots or boxes germinate in a fortnight, and there is no difficulty in raising a stock of plants quickly.

D.

The Lyon Rose.—No one who has a rose garden can afford to be without a few plants of this variety. The colour, shrimp-pink near the ends of the petals deepening to a rich salmon suffused with yellow near the centre of the blooms, is distinct, and highly attractive. It is a grand variety for exhibition, and, in my opinion, surpassed by few for decorative purposes. In a cut state in vases, especially in masses, the effect is charming. The blooms are well-formed and very fragrant. Generous treatment of the plants brings good crops of blossoms.—G. B.

HARDY BORDER FLOWERS OF JULY.

Wherever hardy plants are grown in quantity, the highest point in floral beauty will be reached in July, and if rock plants are specialised, the entire month will be one gay floral pageant. It is interesting and instructive to examine the character and composition of the border flowers of July, disregarding for the present those subjects constituting the alpine section.

The opening days of the month are rich with the over-flush of June. Delphiniums, irises, and herbaceous pæonies are hastening toward their setting. The "Japanese" section of iris may be accepted as the July contribution from this important genus. Iris aurea, I. gigantea, and their hybrids are also flowers of the month, all of them being partial to wet ground, so that it is the moisture-loving section that pay their floral tribute last. Liliums are typical, though not exclusively July flowers; L. umbellatum, L. Hansoni, L. croceum, L. Chalcedonicum, L. pardalinum, and L. testaceum all bloom within the month, and all are characterised by sterling merit and great freedom of flowering, while their cultural requirements are not difficult to satisfy. Lilium Chalcedonicum, Lychnis Chalcedonica, and some forms of potentilla supply scarlet flowers to replace the Oriental poppies in the colour scheme. Crimson flowers are represented by Centranthus coccineus, a fine form of an old garden flower; Monarda Didyma, when represented by the Cambridge Scarlet variety; Heuchera sanguinea splendens, and Spiræa palmata. The red flowers of Chelone obliqua are best used only with low-toned colours, and will always gain in effect if the white form is sparingly planted with the type. Pink flowers are found in Astilbe chinensis, A. Queen Alexandra, and A. New Rose, and in the pretty mallow-flowered Sidalcea Listeri.

Scarlet flowers gain in intensity when used against white, the latter predominating in quantity. Crimson may be evenly balanced with white, and gain in effect, but with dull red flowers white must be sparingly used. Flowers of a crude yellow harmonise best with orange; they sometimes yield pleasing contrasts when associated with those of a coppery or maroon shade. During July the deepest yellows are obtained in Coreopsis grandiflora, Helenium pumilum, Linaria dalmatica, verbascums, gaillardias, hemerocallis, and senecios; the three last-named yield perfect harmonies of colour within themselves, so that no difficulty need be experienced in leading up to or away from them. Copper-orange flowers attain a high degree of beauty when used with medium yellow; such

NEW SINGLE ROSE MILKY WAY.
A Wichuraiana variety, pure white with golden stamens.

flowers occur in Helenium cupreum and some forms of potentilla.

A scheme of blue is carried forward from June with Phlox canadensis Laphami and Viola cornuta purpurea, the former a fine shade of lavender, the latter a purple-violet flower. Almost the same shades are obtained in campanula, and this great genus contains the intermediate shades also. The deepest colours obtain in C. glomerata dahurica, a free-flowering subject, with violet flowers, in umbel-like heads, and two-feet stems; C. latifolia macrantha is much taller, with pendulous, purple-violet flowers; C. Van Houttii, violet-blue, and C. latifolia Boughalti, satin-lilac, have each pendulous flowers of a large size, while their beauty is also of a high order. Campanula persicifolia grandiflora gives many shades of lavender to deepest blue, and is altogether one of our most prodigal July flowers. Campanula lactiflora is a giant, when established, towering to a height of seven feet, with a panicle of small bells in proportionate breadth. Eryngiums yield shades of blue that are not found elsewhere, and the rich glistening blue of highly-tempered steel is much enhanced by the delicately cut bracteate leaves. Funkia ovata yields lilac flowers, and may be associated with Scabiosa caucasica and Galega Hartlandi, the latter the brightest and tallest of the trio. Lavender Munstead Dwarf readily finds a place in the July border, not only for the violet blue of its flowers, but also for their rich fragrance.

White flowers are abundant in July, the forms of Chrysanthemum maximum being most conspicuous; Galega officinalis alba, Clematis recta, various spiræas, and the beautiful and free-blooming lathyrus, The Pearl, are representative of the tallest section. Dwarf kinds occur in Gillenia trifoliata, gypsophilas, Salvia argentea, and the dwarf hybrid astilbes. Grey-leaved plants form an important group of border subjects, as they yield many pleasing harmonies when associated with warm purples, lemon, or greenish-yellow flowers, the grey tones are quiet and restful after high-toned colours. When viewed in this aspect, the common rue gains in importance, the leaves being a fine shade of blue-green; Salvia argentea and S. turkestanica produce large entire leaves of a woolly grey-green tone; Santolina incana is silver-grey, and Cineraria maritima is the brightest silver of all.

Thomas Smith.

Walmsgate Gardens.

Fabiana imbricata.—Never have I seen this heath-like evergreen shrub flowering so profusely as this season. Plants growing at the foot of a south wall have been one mass of pure white blossoms. It is strange that we do not see more plants of this in gardens than we do, considering how easily it is propagated from cuttings inserted in a cold frame in September, and how vigorously it grows in sandy soil at the foot of a south wall. In the open it will thrive in most seasons, but it does not flower so profusely owing to a want of that maturity which is easily attained against a wall.—E. M.

Hardy Ferns.—For a shaded border in London I know of nothing to equal some of our hardy ferns. I have tried many things, but the ferns give the most satisfaction. For this purpose, free growing rather than rare kinds should be chosen. The male and lady ferns, with their more vigorous varieties, are the best. Heavily-crested kinds should be avoided. As these ferns need an ample supply of water, and the neighbouring walls keep off much of the rain, it is a mistake to plant them on an elevated imitation of rockwork, as on the level they are far more easily kept moist.—W. T.

AMONG THE ALPINE FLOWERS.

> "All the seasons run their race
> In this quiet resting place."
> —Austin Dobson.

To the lover of alpine flowers this race of the seasons runs all too swiftly. It looks but yesterday since we welcomed with joy the first of the flowers; now 'tis past Midsummer day of the calendar, and we seem to be rushing through the year with a speed appropriate to the swiftness of the world outside the garden's bounds. Day by day fresh flowers come to greet us, and day by day some favourite bids us a pathetic farewell for the year. And so the days move swiftly and our flowers come into bloom and pass from our sight. We mourn their departure, while we yet feel that much of the enjoyment of our gardens consists in this constant change, rapid though it be. We would not like to have the snowdrop, the saxifrage, or the sun rose with us for twelve months together, and for another twelve, and so on while life lasted. No! 'tis better as it is; and so we turn to look at the latest beauty while losing no love for that which is passing away. Let us glance for a few minutes at some of these favourites of ours.

The Alpine Poppy.

Some of the larger poppies are splendid on the larger rock gardens, where properly placed, but in every one the little Alpine Poppy, Papaver alpinum, may well have its place. It is one which is easily raised from seeds, and which has all the beauty of flower and leaf of the Iceland Poppy, Papaver nudicaule, but with even more grace and gem-like beauty, because of its miniature size. To the mere scanner of the alpine flowers it makes but a faint appeal. Its daintily-carved leaves, with their indefinable charm of tender green, will be passed by without heed by the lover of gay colouring, while the exquisite little flowers of yellow, white, or orange-scarlet, will be almost despised by the gardener who is attached to the gorgeous glow of the great Oriental poppies. But the alpine lover will note keenly and enjoyably the delicate form of the foliage, the charm of the crinkling silk-like texture of the little flowers, and all their shapeliness as they open on the slopes of the rock garden. Truly dainty little plants are these. Only a few inches do they rise above the soil, and their beauty consists in their neatness, their charm of colouring, and their innate grace.

This little alpine poppy is best raised from seeds, a few of which scattered about the place where it is required to grow will give much finer plants than those raised in boxes or pots and planted out. Like other poppies, it moves with difficulty when full-grown. As for its duration of life, one can only say that it often flowers itself to death and proves an annual, while at times one has known plants survive for a year or two. A little bare space about the plants, or a pod of seeds saved and sown, will generally serve to afford to us a succession for many years of young plants of the alpine poppy, with all their grace and charm.

Codonopsis ovata.

We sadly need a new coinage of English names for plants of recent introduction, such as the codonopsis. Deplore it as we may, and regret it as we should do, we find that the average lover of flowers hates the Latin name, and prefers to call the flowers he loves by some popular one. Only those who are much with the amateur can tell how the scientific names retard and even absolutely bar the introduction of new plants into the garden. The codonopsis is worthy of a far more frequent place in the garden than it enjoys, and I am bold enough to think that it would become a greater favourite were one able to popularise its name by giving it a new one. But the absence of this should not prevent us from admiring the codonopsis, and although it is most commonly cultivated as a border flower, it is prettier on the rock-work than in the border. Planted in a nook it will hang its flowers all the one way, and will look prettier than when they are in more disordered array. It looks exquisite there with its pretty foliage, and its foot-high stems bearing such charming, bell-shaped flowers of faintest blue, all deeply veined.

To the mere passer-by its aspect is pleasing, but its real beauty is only revealed to him who will "mark, learn, and inwardly digest." Pretty is the exterior of these shapely flowers, with their blue-tinged substance and the prettily-reflexed green calyces; but turn up the flower and study its interior, and then! The palest blue of the exterior is still there, but the veins are deeper coloured; there is a narrow band of purplish-brown almost midway in the bell. Towards the base we see a yellow zone, and at the very base itself there lies a circle of black-brown. Ranged round the base are the anthers, while the white stigma projects into the bell as if it only awaited the addition of the clapper to ring out the music of the flowers. This may seem fantastic, but let those who own this codonopsis study it as I have done this morning, and they will admit that no effort of the imagination has been needed to read into the codonopsis all these beauties. It has a defect (and what flower has not?) This is the curious coffee-like odour of the flowers, an odour not perceived unless the flower is close to the nasal organ.

And this Codonopsis ovata is easily grown in ordinary soil. Himalayan though it is, it is happy in our British gardens, needing nothing beyond the ordinary care of other rock and border flowers.

Azalea rosæflora.

We should, I believe, call this exquisite little shrub by the long name of Rhododendron indicum balsaminæflorum, but I fear correctness is in this case more honoured in the breach than the observance, and the Rose-flowered Azalea will come more acceptably to the mind of the grower than the cumbrous one which is scientifically correct. Space will not admit of much detail regarding it, but it is sure to commend itself to all who try it on the rockery, especially near the base, where we can look down upon its neat dark-green leaves, and its full, double salmon-rose flowers. These last a while in bloom, but will be past in the South, generally opening in the end of May or the beginning of June, and lasting a long time in flower. In partial shade it continues longer than in full sun.

Other Flowers.

And what a wealth of flowers as yet! Saxifrages, with their endless variety, are not over yet, and we have sheets and spires of various kinds. Sun roses are all aglow in the warm sunlight. Some of the cytisuses or brooms, and genistas are past and gone, but others are in flower or are yet to come. One of the prettiest now is the Arrow Gorse (Genista sagittalis), a sheet of trailing yellow. There are erinuses, thrifts, campanulas, geraniums, and erodiums, violas of many hues, rose species, cerastiums, and a host of other things, more or less beautiful, but all combining to give true delight to him who loves his flowers. S. Arnott.

SWEET PEAS AND MENDELISM.

(Concluded from page 509.)

When a plant is impure as to two characteristics (such a plant would be produced by crossing parents differing in two respects), the case is somewhat more complicated. Let us consider a plant impure as to both tallness and dwarfness and creamness and whiteness of flower. Tall and dwarf gametes are, of course, produced in equal numbers, and we find that half the tall gametes bear the factor for creamness and half the factor for whiteness. The dwarf gametes are also produced cream and white in equal numbers. In the progeny, then, we have one-quarter of the plants pure for tallness, but of these only one-quarter are pure for whiteness, one-quarter are pure for creamness, and one-half are impure as to whiteness and creamness. In every 16 plants produced in the F2 generation we therefore find one pure white dwarf, one pure white tall, one pure cream dwarf, and one pure cream tall plant. The remaining 12 plants are all impure, either as to height or colour, or both. Further, of the 16 plants, 12 are tall, and of these 12, three-quarters, i.e., nine, are white, whiteness being dominant. These nine tall white plants include the one pure plant, but it is necessary to grow the seeds from each separately in order to find out which it is. The eight impure plants will prove their impurity by producing cream or dwarf progeny, and half of them will produce both creams and dwarfs.

In a simiar manner we could trace the behaviour of plants impure in three or more respects, but this is hardly necessary here. It must be pointed out, however, that in an impure plant, the more its dual natures differ, in a much greater proportion will the ratio of impure to pure plants in its progeny increase.

We can now see why, in crosses between different varieties of sweet peas, plants showing recessive characteristics are produced in smaller numbers than are these showing dominant characteristics, but are much easier to fix. We also see why cream and white varieties are less sportive than are coloured varieties, and why maroons and lavenders are so difficult, oftentimes, to fix.

When we remember that a raiser sometimes sows separately the seeds obtained from sixty or seventy plants, and then finds that only one strain, perhaps, comes true, and that the others are all valueless, we can understand why some novelties are so expensive. One very successful raiser, Miss Hemus, tells me that she has sometimes grown over one hundred separate plant cultures of the same variety, and not infrequently had to throw them all away. It is only by practical breeding that one can realise how great, and oftentimes unexpected, are the difficulties and complexities, and how frequent are the disappointments, caused by numerous allelomorphisms. We can all understand, however, that at least to some growers, there is a great temptation to dispose of impure stocks. That such a temptation is sometimes yielded to is abundantly evidenced by the presence of so many unfixed stocks of sweet peas on the market—due to no other cause.

That impure stocks are annually rogued (i.e., the plants differing from the desired type are not allowed to seed) is quite true, but, although roguing, in a decade, may improve an unfixed stock, it is practically valueless as regards fixing it, for it allows the seeds of impure as well as pure plants to be saved together, and the former will always spoil the crop in the following year.

Some varieties, such as Audrey Crier and Olive Ruffell, appear to be unfixable, and it is possible that they are impure varieties having no corresponding pure form. Mr. Bateson describes the case of a cross between the two white varieties, Emily Henderson and Sadie Burpee, yielding in the F2 generation over 30 per cent. of plants of a purple bi-colour, which were by their very nature impossible to fix from this cross. That two white plants should give a coloured progeny is due to the fact that each of the plants bore one of two factors which, when alone, did not show their presence, but which when both present in the same plant, gave the colour to the flowers. The same cause may lead to a cross between a cream and a white variety giving a coloured result.

It will be noticed that Mendelism disproves the old theories that fixity is merely a matter of time, and that a variety must be expected to sport during the first few years of its existence. Pure plants will always be produced in the F2 generation, and such plants will necessarily continue pure. The only way in which fixity could be said to be a matter of time is that the grower, among the F2 generation, might not be fortunate enough to hit upon a pure plant, owing to his not growing enough plants. In such a case, he might very likely be more fortunate in the next year. As soon as one pure plant has been obtained, it is merely a question of increasing it.

Possibly the statement that a pure strain remains pure, i.e., that a stock that comes true in one year will remain fixed in succeeding years, will not be accepted by all. Some claim that, especially in the case of varieties of the Spencer type, insects or other agencies lead to cross-fertilisation. This certainly may occur sometimes, but our chief scientists and practical growers unite in the belief that, neither in California or at home, is accidental cross-fertilisation common enough to be worth considering. Another occurrence too rare to be regarded in this respect is mutation.

Insect agency and the liability of fixed stocks to split up are, of course, frequently urged by some seedsmen as reasons for the impurity of stocks that they had previously known to be untrue, but there are, without doubt, some who honestly believe in these as causes of unfixity, and there are two facts that lend a little credence to their opinion. As is well known, many varieties are only "nearly" fixed, and annually give a small percentage of rogues, due probably to the meeting of complementary factors, which, when present alone, do not show their existence. It is obvious that in a large number of packets some will contain more than their fair share of rogues, while others will be without them. It is merely a matter of chance. It has been shown also that in impure strains, seed saved from individual plants, and more especially from individual pods, sometimes give results departing from the numerical expectation. In such cases, however, when seeds are saved from a number of plants and mixed together, the aberrations are equalised.

Beyond these two facts, which cannot account for much in the way of unfixity, there is no doubt that any grower who finds his plants not coming true is perfectly justified in assuming that they are from seeds saved from impure stocks. That fixed stocks continue fixed is perfectly recognised by our largest and most expert growers, and they have no hesitation in guaranteeing certain of their stocks to come true, nor are their guarantees belied. In the case of unfixed stocks, also, our most expert growers can tell very accurately, from their knowledge as to in what respects their strains are unfixed, not only what the rogues will be, but in what proportion each will be produced.

It would be an easy and pleasant task to enlarge this article, but those who wish to study Mendelism further should read Mr. Bateson's recent book, "Mendel's Principles of Heredity." This contains many pages dealing with sweet peas, and, in addition, some excellent coloured plates.

G. F. Drayson.

FOXGLOVES.

Bring orchis, bring the foxglove spire,
The little speedwell's darling blue,
Deep tulips dashed with fiery dew,
Laburnums, dropping wells of fire.
—Tennyson (In Memoriam).

Both the English and the Latin names of this, one of the stateliest of our British wild flowers, have a similar, if not the same, meaning, for the former is undoubtedly a corruption of folk's glove, and the latter (digitalis) is derived from digitus, a finger, or, according to some, digitale, the finger of a glove. It has the specific name purpurea because of the colour of the wild form usually found, but a white variety, known as D. p. alba, is occasionally found also, and it is from these doubtless that the various shades of cream, red, purple, and rose have been obtained. The yellow foxglove met with in gardens is a different species, D. ambigua (syn. grandiflora), and usually requires cultivation, instead of being treated as a wilding like the varieties of D. purpurea.

It is in the matter of selection of varieties that the foxglove needs some attention rather than in the rearing of the plants. Once a stock has been obtained they may be safely left to seed themselves in shrubbery and woodland, though they will repay the thinning out of the seedlings by the handsome spikes of blossom obtained from well-grown plants, sometimes half a dozen or more to the plant. Not that they are unworthy of a place in the hardy flower border, though, perhaps, it is not good economy of garden space to give them good positions when they will grow in very dry places, and do fairly well. The effect, however, of one or two large clumps of the best varieties at the back of a border amongst other tall plants, say, in front of the shrubs, if the background is a shrubbery, is so fine that the border would have to be of very high excellence indeed if we could grudge the space for them.

Beautiful though the wild variety may be in its native habitat, we can do better in our gardens and shrubberies by obtaining a good strain of the large-flowered varieties, sometimes called D. p. gloxiniæflora, the throat markings on the large flowers giving them a resemblance to gloxinias. Afterwards, by letting only the best varieties seed themselves, a good selection can be kept, but to do this means cutting back the spikes of those we do not wish to seed before they have finished flowering, as the seed pods from the blossoms lower down the stalk are ready to burst long before the top of the spike has finished flowering. This, however, serves a double purpose, as the side shoots come so much finer than they otherwise would do. It is in fact not a bad plan to cut down all the flower spikes when they begin to get shabby for the sake of the successional flowering shoots. If left to themselves a very few years is sufficient to ensure a majority of plants resembling the wild form.

Alger Petts.

JAPANESE GARDENING.

The recent visit of the President and Council of the Royal Horticultural Society to the Japan-British Exhibition, and the awards of silver cups they have made to the makers of the two Japanese gardens, and the Japanese exhibitors of various horticultural products, have created some additional interest in Japanese gardening. The present time is therefore opportune for making a more detailed reference to the two gardens that so admirably represent Japanese taste and skill in garden design and construction, and contribute so largely to the manifold attractions at the White City. Lest there be any misapprehension upon the point we would mention that we have not been waiting for something to occur that would arouse additional interest in these gardens before giving a short description of them. What we have waited for has been a sufficient development of the growth of the trees, shrubs, and plants to enable us to have photographs taken that would give our readers an adequate idea of their distinctive character and great beauty, and do justice to the achievement of those by whom they have been designed and constructed. We have now the pleasure of giving two illustrations, one of each garden, which portray aspects of great beauty, and in the course of the season we hope to illustrate other features. Both gardens have been designed by Mr. Keijiro Ozawa, of Tokyo, who may be heartily congratulated on the taste he has evinced, and they have both been constructed by Mr. Hannosuke Izawa, also of Tokyo, who, in carrying out the designs, has given ample proof of skill of a high order.

The two gardens differ considerably in style, and also in the appeal they make to the artistic perceptions, and, if one is regarded as possessing a greater charm than the other, the additional beauty is due more to environment than to a superiority of design. There are, as we have already stated, two distinct gardens, one known as "The Garden of Peace," and the other as "The Garden of Floating Islands." The first-mentioned of these is on the southern side of the Court of Honour, and is enclosed on the north side by the walls of stately buildings and tall, finely-branched elms, and on the south side and at the western end are skilfully devised scenic mountains, which, for the most part, have their sides or tops clothed with round-headed pines and other trees indigenous to Japan. These, with the walls of the buildings and the elms, completely shut out the garden from the outer world; and thus the visitor is able to enjoy its manifold charms without being constantly reminded of the strenuous endeavour and rush, with the attendant anxieties, of everyday life. The title that has been given this garden, although most appropriate, is evidently liable to be misunderstood. "This," said a lady to her companion, when passing us while we were looking round, "is not a cemetery as I thought it was." "A cemetery!" replied the companion, "what gave you that idea?" The answer was quickly forthcoming. "It is called 'The Garden of Peace,' and where do we find peace except it be in a cemetery?" So much for the difference in the views held with regard to this point. But it may be that the lady had not had the opportunity that we, in common with our readers, have had of fully realising the refreshment of mind and body that is to be obtained by those who love flowers from a pleasantly-situated and well-kept garden.

Along the south side and at the foot of the scenic mountains, low hills of varying height raise their heads, and, running the whole length of the garden, is a walk some five or six feet in width, flanked on the southern or mountainous side by small groups of birch and other elegant trees, and on the north side there are two broad walks which are separated by the line of elm trees, and a breadth of lawn with various trees and shrubs arranged thereon. The greater area of the walks on the north side is due to the fact that, owing to the proximity of some of the more important buildings, practically all the visitors pass along that side, whereas those only who make the circuit of the garden take the south walk.

The area between the north and south walks is, for the most part, occupied by a long winding lake, varying from about twenty to forty feet in width, and, as a matter of course, is more or less irregular

JAPANESE GARDENING.

The Waterfall in the Garden of Peace at the Japan-British Exhibition.

in outline, and embellished with islets, tea-houses, lanterns, and the various forms of arborescent and other vegetation that find favour in Japanese gardens. The margin is formed with blocks of a crystalline rock of moderate size, and it is a point of some practical importance to mention that the rock is carried down below the water level and the blocks set in a bed of cement. Consequently, no soil is exposed at the sides above the water level, and the difficulty that is frequently experienced in keeping the lake watertight when puddled clay is used is wholly avoided. As pointed out in these pages by contributors experienced in the making of lakes and ponds, when the sides are formed with clay they are liable to crack during dry weather, and when this happens, much loss of water results. The rock, as might be expected, is naturally arranged; here it forms a belt just sufficient to keep the banks in place, yonder it rises and forms low mounds, and now and again may be seen comparatively large blocks cropping up among the shrubs that form so admirable a setting to the glistening water.

About midway the lake narrows, and a small islet has been formed, and this is connected with the mainland on either side by stepping-stones that are of large size and well above the water. Conspicuous on this islet among a few shrubs is a specimen of a cypress that is one of the finest examples of the dwarfing process that finds favour with Japanese cultivators. The tree, which is between six and seven feet in height, has been less severely restricted in growth than many of the dwarfed trees that have come under our notice, but the characteristic form has been fully maintained. The lake has been described as being surrounded by a border planted with trees and shrubs; and to those who take a superficial glance at the water and its surroundings, the area planted may appear to be a continuous border. But this is not the case, and neither Japanese nor British planters experienced in such work would make the mistake of surrounding an ornamental sheet of water with a continuous border. The trees and shrubs occupy a series of spaces that vary much in shape and size, and are separated by turf that extends to the waterside. A short distance westward the lake is again crossed, and this time by a substantial wooden bridge of characteristic design, and not far distant therefrom is a tea-house of handsome elevation, both contributing their full share to the general effect.

At the more prominent points on the margin of the lake are well-developed specimens of such coniferous trees as Sciadopitys verticillata, Retinospora obtusa aurea, and green cypresses in variety. The first-named, which is one of the most distinct of the coniferous trees introduced from Japan, is represented in surprising numbers. The procumbent form of what is commonly known as the Chinese juniper (Juniperus chinensis), is freely used for trailing over the rocks on the margin of the water and elsewhere, with good effect. The presence of this juniper in a garden representative of Japanese ideas is fully justified, for the specific form grows naturally, not in China, as its name suggests, but on the mountains of Central Japan, and it has been cultivated by the Japanese for several centuries. Prominent among the shrubs that fringe the lake are such well-known subjects as mollis and other azaleas, the holly-leaved osmanthus, green and variegated aucubas, and rhododendrons. A touch of colour is given here and there by the more brightly-coloured forms of the Japanese maples, and the charms of the garden are further enhanced by various weeping trees, which, it need hardly be said, are planted in positions specially suited to the display of their graceful outlines. At the western end of the lake is the rushing waterfall, which adds immensely to the charm of the scene, as will be seen from the illustration given herewith. Immediately beyond the waterfall is a pergola, over which the beautiful Wistaria multijuga is trained and making good growth.

The second of the two gardens is situated some distance from "The Garden of Peace," and occupies a prominent position in the western part of the exhibition grounds. The prominence of the site of "The Garden of the Floating Islands" is a disadvantage, for the environment is not what could be described as restful, and buildings of various kinds meet the eye when making a survey. The design of this garden comprises a broad lake with irregular margin, and having an island that is large in size and of bold character. The margin of the lake, as in the case of the garden previously described, is formed with rock embedded in cement, and is fringed with trees and shrubs such as have been already mentioned. Beyond this fringe are broad walks and breadths of turf on which cypresses and other coniferous trees are in association with deciduous trees and evergreen shrubs tastefully disposed. At intervals among the trees and shrubs are placed tea-houses, that serve the purpose of adding to the attractions of the garden and afford rest and shelter to visitors. The island, with its rocky promontory, is reached by means of a stone bridge of a design that is essentially Japanese, and on the island are bold masses of rock and grassy slopes. Arranged on the grass are specimens of Sciadopitys verticillata, weeping trees, and other choice subjects, and planted freely among the rocks is the dwarf-growing azalea, bearing salmon-red flowers, that is so freely used in both gardens. On the south side one of the Japanese maples, with crimson leafage, has been freely planted, and remarkably bright is the effect produced. There are also on this island tea and summer-houses and stone lanterns of varied designs, these and other accessories adding materially, as so admirably shown in the accompanying illustration, to the interest and attractiveness of the garden.

The illustrations herewith are from photographs by Mr. A. E. Walsham, 60, Doughty Street, W.C. G.

Turnips will require a good deal of attention at this time of year; sow in well-prepared ground in drills at a foot apart, thoroughly soaking the drills before sowing the seeds. Spray the seedlings regularly with soot water before the turnip flea becomes troublesome, and alternate this with weak sulphur water. Red Globe is an excellent variety to sow now, especially on ground which has been cropped with early potatoes.—G. Ellwood.

Lantanas.—The merits of lantanas as continuous flowering subjects, or for bedding, are, I think, not sufficiently recognised. There are many pretty varieties in cultivation, while seed from a good strain will give a considerable diversity in colour, as well as in habit. So prolific are they that in some parts of the tropics lantanas are very troublesome weeds. The most popular is Lantana salviæfolia, known generally in the parks, where it is often bedded out, as Lantana delicatissima. This has purplish-lilac flowers, at least in the open ground, but under glass it is somewhat paler. Of other varieties Incendie and Ne Plus Ultra may be mentioned as rich red or scarlet kinds, while two particularly dwarf forms suitable for edging are Drap d'Or, yellow; and Chelsea Gem, bright crimson.—W. T.

SOME GOOD TOMATOES.

The popularity of the tomato was never higher than at present; indeed, the consumption of these fruits extends every year. The reason for such a popularity is in itself somewhat singular, because, not so very many years ago, tomatoes were looked upon as of ornamental rather than utilitarian worth, and further, they were offensive to the palate of many people. It used to be commonly said it needed an acquired taste to enjoy tomatoes. Yet now, after a few years of persistent effort on the part of growers and retailers, tomatoes hold a high position in the fruit markets. From a trade and labour aspect this cannot be other than satisfactory, because a great community is dependent for a portion of the year on the growth and sale of tomatoes.

Though personally concerned in the growth and distribution of a goodly quantity each year, I have not as yet acquired a sufficiently critical palate to distinguish between varieties in the matter of flavour, so that no qualifying opinion is attempted on this point. That there is a difference in flavour everyone will readily admit, but, so far as my observations extend, this difference has not much importance or value in the market. To the man in the street quantities and external appearance appeal more strongly than flavour.

Long since it was conjectured that the limit was reached in stocks and varieties, yet there is still a keenness centred in a new name, especially when expert opinions are widely published in the gardening press. There is, however, much less desire among growers to cultivate stocks for the sake of name and numbers, and this is further emphasised when catalogues are reviewed. There is a distinct limitation in some of the leading seedsmen's lists, and instead of long lists of names they devote more space to expert opinion on sterling novelties, often representing their own special stocks; a course calculated to do the most good.

There is a great difference between the tomato of the past compared with the present. Many of the old-time tomatoes were productive of seeds; to-day the opposite is the prevailing rule. One grower who made careful calculations found that from ½ cwt. of fruit he could only get 7 ozs. of marketable seed, a clear indication of the fleshy nature of the modern tomato and corresponding gain to the purchasing community.

The craze for heavy fruits has gone; the pride of former days was a 3 lb. sample, and Sutton's Perfection was the champion weight carrier. I have reviewed crops on open walls attaining almost this weight in individual samples, but cannot quite clearly remember what the ultimate purpose of these monsters was. It is more than likely they found a place in the hog-tub or the waste heap. Many names which in their time gained fame and patronage have gone the way of all things, and their memory is almost obliterated; but, thanks to enterprise, new stocks arise accommodated to the passing taste. A tomato that has been much criticised and yet has gained a remarkable position in public favour is Carter's Sunrise, a fruit below medium size, but very solid and brightly coloured. It fruits freely, and is by no means exuberant in leaf growth. No doubt, its popularity has given it a place in the evolution of later stocks, but Sunrise is not destined to extinction yet. Balch's Fill-basket, of Scottish origin, has had a large following this year, and with us has a great resemblance to Sunrise in leaf and fruit characters. Many of the fruits, however, we find do not colour readily at the stalk. A splendid variety in every respect is Webbs' Emperor, a full or above medium-sized fruit, of deep colour, good constitution, and a heavy cropper. Dickson's Moneymaker has been on the market long enough to establish a good reputation, both for home use and exhibition purposes. Veitch's Invicta is a prodigious cropper, and equally distinct and useful is Veitch's Dwarf Red, bearing oval-shaped fruits of medium size, and well coloured. It is not so heavy cropping as the others named, but it has leaf characteristics distinct from them all. Sutton's Best of All has for some time been regarded as an ideal tomato. A1, which gives a deeper, oval-shaped fruit, is also popular.

There are many, both among trade and private growers, who from year to year make selections and crosses of their own, and grow them exclusively for their own purposes and demands, and among these we frequently find as good or better stocks than those represented by catalogue names. Many of these remain localised. Quite recently a particularly good house of plants, numbering several hundreds, and representing a strictly local cross, was inspected; the crop was such that many growers would clamour for it could it but be seen. To the owner it is simply known as Long Tom—a short name for a lofty plant.

W. Strugnell.

BORDERS UNDER STAGES.

In many conservatories and greenhouses the only available space for borders for climbing plants is under the stage. Furthermore, in not a few instances these borders are not properly constructed, but are entirely composed of the ordinary fibreless garden loam. In such circumstances justice is not done to the plants; they cannot be expected to prove highly satisfactory. There is a vast difference between such specimens and those well provided with a substantial rooting medium, top-dressed in due course, and generally well cared for. I have had a rather extensive experience of climbing plants growing in borders under stages, and have taken particular notice of plants so grown in many gardens in different parts of the country.

In one garden I had charge of for ten years I found climbing plants growing under stages nearly 200 feet in length. Some of the specimens were in fairly good condition, others were not strong, and, in fact, would soon have become worthless, and an eyesore. The constant drip from the watering of plants on the stages above had worn away the soil, souring the remainder, and laying bare many roots. The plants treated as climbers were jasminums, plumbagos, heliotropes, bougainvilleas, roses, and swainsonias. I at once removed as much sour surface soil as possible without unduly interfering with the roots of the plants, and in its place put fibrous loam and a quantity of old mortar rubble. Organic manures were not used, but stimulants were given later in the year, the top dressings being put on in spring.

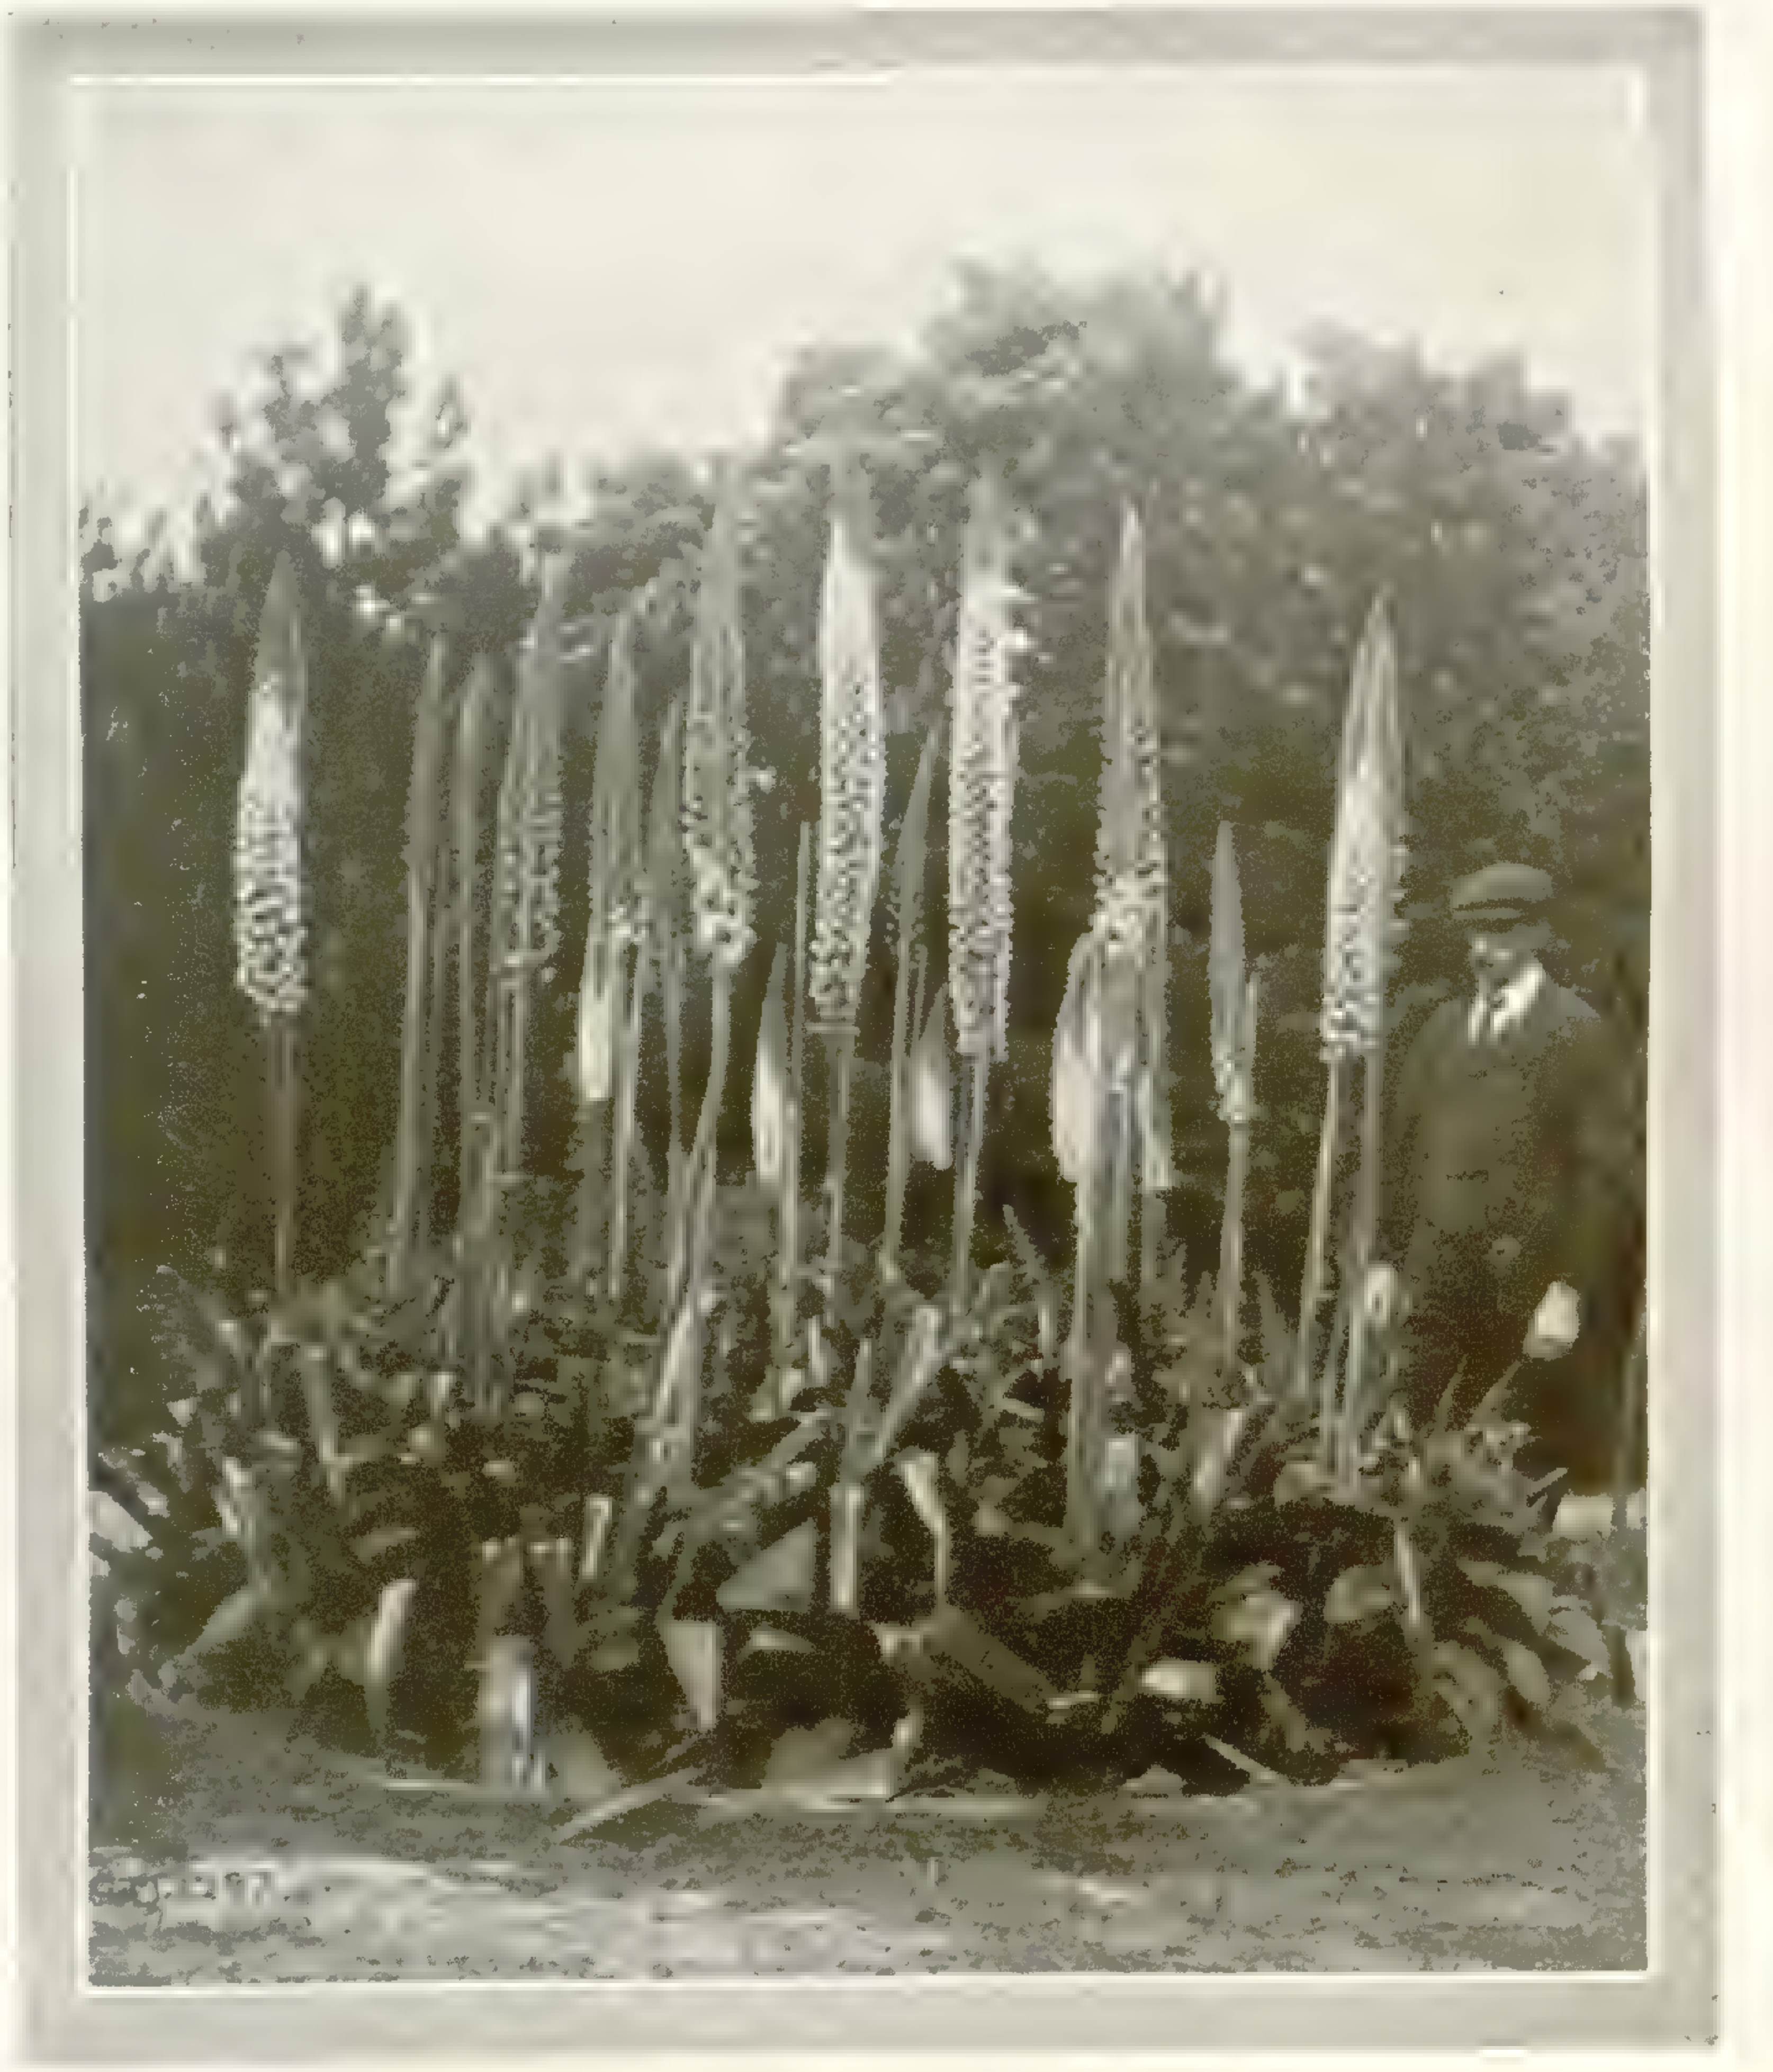
Very often surface mulches were applied in summer, and all the plants soon made healthy growth, and flowered freely.

G. B.

The Swamp Honeysuckle (Azalea viscosa).—When practically all the azaleas are over this is still in bloom, a feature which at once attracts attention. The flowers are somewhat honeysuckle-like in shape, hence the specific name, while their fragrance may be compared to that of this popular climber. In colour the flowers are white, or pinkish.—W. T.

EREMURI AT EASTBOURNE.

That eremuri do well at Eastbourne will be at once evident from an inspection of the accompanying illustration, which represents a fine bed of these stately flowers in the gardens of Mrs. Davies Gilbert, Manor House, Eastbourne. Mr. Chatfield, the gardener, informs us that the soil is very chalky, and so the site for the bed was excavated to a depth of three feet and a diameter of nine feet, and the space filled up with a mixture of top spit loam from the downs, leaf-mould, road grit, and rotten manure, using two barrow loads of each of the three latter ingredients to each cartload of loam. The compost was well mixed, and placed in position about a month before the eremurus bulbs were planted in the autumn of 1908. The bulbs were planted with their crowns about four or five inches below the soil level.



A FINE BED OF EREMURI AT MANOR HOUSE, EASTBOURNE.

Early every winter Mr. Chatfield gives the bed a good top dressing of loam, leaf-mould, and manure, and covers all over with long manure as a protection against frost. To guard against the depredations of slugs a novel method is adopted; round the bed is placed a trough, three inches deep, and this is kept filled with water. As the trough is sunk to the level of the surrounding grass, it is not unsightly. The bed is sheltered from strong winds by surrounding trees, but is open to the sunshine, and sunshine is necessary to ripen up the leaves and bulbs in the summer and autumn, and ensure fine spikes the following season. About a score or two dozen spikes are produced annually, and these range up to 9½ feet high. It it hardly necessary to say that such finely-developed specimens produce a striking effect.

The two specimens in the centre are E. Elwesi albus; the tall examples by which these are surrounded are E. Elwesi, and the shorter plants are E. himalaicus.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

ODONTOGLOSSUM GRANDE.—Although one of the oldest, and certainly one of the most desirable, of our autumn-flowering orchids, this is not so extensively cultivated as its merits deserve; in fact, prominent orchid collections are very few and far between where this and its allied species, O. Insleayi, are grown to any extent. But these species are more often found satisfactorily cultivated in an ordinary plant stove, in a garden where orchids are not cultivated to any extent. I am afraid it is another beautiful orchid that is being sacrificed on the altar of fashion. There is always one redeeming feature in this, however, and it is that as importations of these species are annually arriving in this country, and, not being included in the ruling fashion, amateurs with limited means reap the benefit by being enabled to purchase plants for the modest outlay of a few shillings. Although not requiring the conditions usually considered suitable for the ordinary stove or East Indian house, O. grande requires at all times a temperature about five degrees higher than that of the ordinary odontoglossum house. The intermediate house suits the species well, but to induce plants to flower satisfactorily it is desirable that only sufficient shade be used to prevent the foliage from being scorched at the present season of the year. They are in active growth, therefore ample light and abundance of root moisture are necessary, and a humid condition should be maintained. The flower scapes make their appearance with the young growth, just at the period when the new pseudo-bulb is being formed, and they develop and flower before the pseudo-bulb completes its growth, so that liberal treatment should be afforded until the pseudo-bulb is completed.

POTTING.—Where they can be grown in shallow pans or baskets suspended near the roof glass there is little difficulty found in successfully flowering the plants. Any repotting necessary is best attended to when the new roots make their appearance, or are in full growth; this is usually found to be immediately after the plants have flowered. No great depth of potting compost is necessary, but there must be ample drainage. The compost selected should be of a lasting nature, for, like most of the fleshy-leaved orchids, the plants take a prolonged rest; and even when exposed to the full rays of the sun during the winter and early spring months, it is surprising the small amount of root moisture they need to keep the leaves and pseudo-bulbs plump. During the growing season the young growths and flower spikes are liable to become infested with green-fly and thrips, but if the plants are sprayed with some safe insecticide at regular intervals there is little difficulty in keeping these pests in check.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

ROSES IN POTS.—Plants intended for early forcing should now be placed out of doors in a position fully exposed to the sun, where they will ripen their shoots. As soon as they have ceased to make growth water should be very sparingly applied. About the middle of September they may be pruned, removed from their pots, have a portion of the old soil removed, and be repotted in good rich loam, to which, if very heavy, some lime rubble and crushed bones should be added. After repotting place the plants in an unheated frame, giving them a good watering at once, and keeping them rather dry afterwards until removed indoors.

HYDRANGEAS.—Young plants of Hydrangea hortensis that produce single heads of flower are the most useful for forcing. A stock of cuttings should now be inserted, and for this purpose short-jointed strong shoots which have not flowered should be selected; if these are fairly matured they will root readily in a cool frame, but if they are soft they should be placed on a mild hotbed. Larger plants capable of producing five and six heads of flowers may be obtained by growing these small plants on after they have flowered, and encouraging them to grow freely. When growth is completed give the plants all the air possible, so as to thoroughly mature their shoots.

LILIUMS. — As the earlier flowering batches of these plants come into bloom they should be placed in a cool house, where they will keep in flower longer than in a close warm atmosphere. Any top dressings necessary for the later batches should now be applied, and a stake put to each as required. A selection of the very latest plants should be made, and placed out of doors in a cool corner, and sheltered from strong winds. These will furnish flowers late in autumn.

HARD-WOODED PLANTS, such as epacris, libonias, camellias, acacias, etc., in pots and tubs should all be placed out of doors at this season of the year. Their foliage can then be kept clean easily, and the plants will be healthier and hardier when the time comes round for housing them.

SCHIZANTHUS.—Young seedlings should be potted off singly to succeed earlier batches; use rather sandy soil, and place them in a cool frame near the glass; shade from bright sunshine. A further sowing should be made now for late flowering.

MALMAISON CARNATIONS. — Plants that flowered some time ago and have stood out of doors to harden their growth will now be ready for layering. A selection of the best balanced plants, and with from seven to nine growths on each, should be made for potting into larger pots to flower early in the year. Layering should be done in low frames, and at intervals, so as not to have all the layers ready for potting at once. When a frame has been filled a good watering will be necessary to settle the soil around each layer, afterwards closing the frames for a few days, shading from very bright sunshine, and damping overhead morning and evening. In the course of a few weeks roots will be formed, and then plenty of air should be given.

CLIMBING PLANTS in greenhouse or conservatory will now be growing freely, and their growth must be regulated at intervals. Early-flowering kinds will require a severe pruning. The old heliotrope makes a fine pillar plant, and will stand pruning at any time. Habrothamnuses should be pruned hard back after flowering.—W. Staward, Belford Hall Gardens.

THE FLOWER GARDEN.

TUBS AND VASES in the vicinity of the flower garden or shrubbery should be kept, if possible, full of flowers, and scrupulously neat and tidy. Blooms past their best should be promptly removed, not only for appearance sake, but that a continuance of bloom may be assured. It is a point worth noting that in the making up of tubs and vases annually only good sturdy plants that have been thoroughly hardened should be used, and new soil is essential, and in such the plants grow away quickly and soon furnish the places allotted to them. In connection with this class of flower gardening, and, in fact, with pot plants in general, that are used for grouping purposes in the flower garden, as the pots or vases become filled with roots some stimulant must be given to keep the growth healthy. Liquid cow manure, to which a little soot has been added, will afford a staying power suited to the class of plants usually employed, with a minimum of danger in its application as compared with artificial manures.

VIOLAS that are being held in reserve for propagating purposes should be kept thoroughly moist at the roots to assist the plants in throwing up cuttings for striking at an early date; in fact, preparations might now be made for these, and the frames or beds prepared at any time. If possible, it is well to give these the benefit of a frame, however rough, as the cuttings can be easily shaded, if, as often happens, the weather should be hot and bright for any length of time while propagation is in progress. A light, rich compost should be used, and after having been made firm a layer of clean silver sand should be spread over the surface so that when the cuttings are dibbled in a portion of sand will be in contact with the base of each cutting, and so hasten the formation of roots. A thorough watering should be given immediately the cuttings have been inserted, keeping the frame close until signs of growth are visible; during hot weather a spraying overhead will greatly aid in keeping the cuttings fresh, but this must not be overdone, or damping will follow. The varieties now in commerce are so numerous that it is exceedingly difficult to recommend any particular one or more, although experience teaches us that some succeed in certain localities better than others. The selection should, in consequence, be left to each person's individual taste and opinion, but it is scarcely advisable to grow a great number of varieties unless these are required for exhibition purposes, as a much better effect can be obtained by growing a reliable variety of each colour required, and a consequent less risk in mixing.

POLYANTHUSES, OXLIPS, and similar plants raised from seed during the spring should receive unremitting attention. Many of these may yet be pricked off, and be in time for making good plants for autumn planting, but most of them are now making good headway; if growing in boxes ample waterings should be given, for on no account must they become dry at the roots, or premature flowering will ensue, and a correspondingly weakened crown for spring flowering result.—W. Hedley Warren, Aston Clinton Gardens.

HARDY FRUITS.

STRAWBERRIES. — Exceptionally fine crops of strawberries are general in this locality, but owing to the heavy showers of rain we have had during the past few days scores of berries have rotted before ripening; all such should be removed as the work of gathering proceeds, or otherwise this trouble will continue, the decayed berries being in close contact with the sound ones. Preparations should now be made for putting layers into three-inch pots to provide good strong plants for making new plantations early next autumn. The pots should be filled with a compost of two-thirds good heavy loam and one-third well decayed manure; when the runners have developed two plants the points should be cut off, and as soon as the plants are large enough they should be pegged down to the soil in the centre of the pots, using small birch or hazel pegs for this purpose. The method which we adopt here is to put out a sufficient number of plants solely for the purpose of supplying layers, both for forcing and new plantations; this is found to be advantageous, as the work is facilitated, the fruiting plants not being interfered with. Some plants of the late varieties here have had a slight attack of red spider, and to combat this pest it has been necessary to dust the leaves while damp with flowers of sulphur, and frequently syringe them with clean water applied forcibly with the garden engine. Applications of weak liquid manure will be found beneficial to late-fruiting varieties, taking care when applying it not to wet the fruits; at the same time see that there is plenty of straw underneath the berries, so that when ripe they will be in a good clean condition for dessert or market purposes. All runners that develop on plants that are to be kept for fruiting next year should be nipped off as soon as they make their appearance; this will materially strengthen the crowns, and also be a great saving of labour when plantations have to be cleaned after the fruit is gathered.

APPLES AND PEARS.—The thinning of these fruits can be proceeded with as soon as it can be ascertained beyond doubt that they are swelling freely. Unfortunately the work will not prove an arduous task in this locality this season, many varieties of pears growing in the open quarters in the gardens here are almost an absolute failure, owing to the severe frosts and cold winds which we experienced on three consecutive nights early in May, when the trees were in full bloom. Some varieties, both in the open quarters and upon walls, have set heavy crops, and thinning will have to be resorted to to obtain good fruits for table use; varieties of apples such as Lord Grosvenor, Lord Suffield, Keswick Codlin, Cox's Orange Pippin, and many others have set heavy crops, and severe thinning will be required. Trees that are carrying heavy crops of fruit against warm walls should be given copious supplies of clean water, and occasionally liquid manure to assist the swelling fruit, also trees growing in the open quarters carrying heavy crops of fruit should receive the same amount of attention in this respect.

AMERICAN BLIGHT.—I have observed in many places that this has already become a great source of trouble, especially amongst the orchard trees, and immediate steps should be taken to eradicate this pest. It is not so difficult to combat when found upon trees that are grown in the fruit garden proper, but when it attacks large orchard trees the difficulty is a serious one. We have found here that by spraying the trees in the winter months with caustic alkali solution no difficulty is experienced in eradicating this pest entirely. Where trees are affected with American blight the following solution can be used at this season of the year: Put four ounces of soft soap in one gallon of water, place on the fire, and allow it to boil, then add, while still boiling, half a pint of petroleum, and stir well for a few minutes; this should be allowed to cool, and then be applied to the affected parts with a stiff paint brush.—Henry R. Farmer, Cardiff Castle Gardens.

GRAPES AND HOW TO GROW THEM.—An illustrated guide to propagation, culture, and management in vineries, greenhouses, and in the open air. By J. Landell, F.R.H.S. Price 1s. net, by post 1s. 2d.; cloth, 1s. 6d., by post 1s. 8d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London

GREAT FLOWER SHOW AT HOLLAND PARK.

(Concluded from page 526.)

had good batches of gaillardias—giant flowers—Lilium Szovitazinum, Eremurus Bungei, etc.

The carnations shown by Mr. Charles Blick, Hayes, were greatly admired, especially the fancy and yellow ground varieties Melita, Dancocks, Pascal, Bonnie Bess, Hidalgo, Bohemia, and Linkman. Messrs. Barr and Sons, Covent Garden, were extensive exhibitors, and their array of hardy flowers contained many good things, notably Spiræa Peach Blossom, great spikes of Lilium giganteum, English irises, and delphiniums, Lilium elegans in variety, L. monadelphum, a fine set of varieties of Gladiolus Colvillei, and Salvia virgata nemorosa.

Superb tuberous begonias were set up in a fine bank by Messrs. Blackmore and Langdon, who have grand varieties in Lady Greenall, King Alfonso, Rose Queen, Mdme. Tetrazzini, Duchess of Cornwall, Mrs. J. Whalley, Mrs. W. L. Ainslie, the White Lady Dorrington, Mdme. Melba, and a delightful range of colouring in exquisitely frilled and fringed single varieties. The same firm had some excellent delphiniums. Messrs. J. Peed and Son, Norwood, contributed a fine strain of netted and shaded gloxinias.

Mr. A. E. Usher, gardener to Sir Randolf L. Baker, Bart., M.P., Ranston, Blandford, had a lovely exhibit of sweet peas, and showed splendid bunches of fine flowers of Lavender George Herbert, Earl Spencer, Doris Usher, Apple Blossom Spencer, Mrs. A. Ireland, George Stark, John Ingman, Clara Curtis, and The Marquis. Messrs. G. Bunyard and Co., Maidstone, displayed roses and hardy flowers advantageously, and were especially strong with English irises, pink spiræas, and a grand lot of delphiniums, including Rev. Lascelles, Media, Lady Conway, and Vitellus. Messrs. W. Cutbush and Son, Highgate, showed hardy flowers finely, and had a lovely lot of water lilies and moisture-loving plants. Messrs. G. and A. Clark, Dover, contributed some good sweet peas, a batch of the bright Gilia coronopifolia and a lovely display of hardy flowers and water lilies. Messrs. B. R. Cant and Sons, Colchester, had a very bright lot of cut roses, and showed their new white H.T. Lady de Bathe in good form among a lot of fine flowers of Mrs. Roosevelt, Captain Hayward, Lyon Rose, etc.

The carnations from Mr. H. Burnett, Guernsey, were greatly admired, and included lovely sets of Mrs. H. Burnett, Enchantress, Marmion, Fortuna, Aurora, and Mikado. Messrs. H. B. May and Sons, Edmonton, exhibited hardy ferns in great variety in one of the tents, and demonstrated the beauty of the finer forms of these useful and graceful plants. Messrs. J. Veitch and Sons had a miscellaneous display in the second largest tent, and here they grouped strepocarpuses in lovely form and great variety.

Mr. Maurice Prichard, Christchurch, had an iris garden, Iris Kæmpferi being well displayed around a pool of water-lilies. Moisture-loving spiræas, delphiniums in variety, irises of sorts, Hemerocallis aurantiaca, Isatis glauca, and other good things were included. Mr. H. Hemsley, Crawley, had a small rock garden, some shrubs and hardy ferns; and the Misses Hopkins, Shepperton, showed hardy flowers in rock garden fashion. Malmaison carnations—large, well-flowered plants—were contributed by Mr. G. Johnson, gardener to the Right Hon. Lord Burnham, Hall Barn, Beaconsfield, Bucks. Mr. Mallett, Cheddar, had fine batches of Lilium candidum, Campanula pulsilla, Dianthus granitens, alstromerias, erigerons, etc. Mr. James Douglas, Great Bookham, had a few fine carnations, notably Sam Weller, Nell Gwynne, Eros, Deloraine, and Elizabeth Shiffner, and some good seedling pinks. Mr. H. Pulham, Elsingham, contributed a collection of choice alpines arranged in a small rock garden.

Mr. G. Lange, Hampton, put up carnations in fine style, and had huge bunches of Mrs. Burnett, Mikado, Nelson Fisher, Autocrat, White Perfection, and Fair Maid. Messrs. E. W. King and Co., Coggeshall, had a fine lot of sweet peas, their Anglian Pink, Anglian Orange, The Marquis, Mrs. W. King, Constance Oliver, and Countess Spencer being very fine. Mr. W. J. Unwin, Histon, Cambs, had a very bright lot of sweet peas, that included Gladys Burt, Mrs. A. Ireland, Frank Dolby, Mrs. R. Hallam, Clara Curtis, Edna Unwin, Helen Lewis, and the showy Mrs. W. J. Unwin. Messrs. William Bull and Sons, Chelsea, sent pelargoniums, and Messrs. Paul and Son, Cheshunt, put up popular hardy flowers in quantity.

Mr. Prince, Oxford, had some lovely roses, and, as usual, showed tea and hybrid tea varieties in excellent condition and of very clear colouring. The sweet peas shown by Messrs. Kelway and Son, Langport, were very fresh and bright, and the firm had a large and gloriously beautiful exhibit of massive branching spikes of superb varieties of delphiniums, showing a great variety of blue and purple colouring. Messrs. H. Merryweather and Sons, Loughborough, showed roses in variety and of high quality. Messrs. W. Artindale and Son, Sheffield, showed violas in their usual fine style, putting up beautiful flowers in pretty fashion.

Mr. P. Le Cornu, Jersey, staged a few vases of his new hybrid tea, Mrs. P. le Cornu, a sweetly-scented and effectively-coloured variety. Hardy flowers from Messrs. B. Ladhams, Lim., Southampton, made a goodly display. Noteworthy were the pinks, which included Princess Christian, The King, Elsie, and Nellie, campanulas, scabiosus, and potentillas were the chief features of the exhibit. Sweet peas from Messrs. G. Stark and Son, Great Ryburgh, were really fine. The groups of colours included Maggie Stark, Clara Curtis, Tennant Spencer, Florence Wright, George Stark Improved, Mrs. C. W. Breadmore, Maroon Spencer, Nell Gwynne, and Mrs. Duncan, the whole being tastefully arranged with appropriate foliage.

From Messrs. Carter Page and Co., London Wall, came a pretty collection of zonal pelargoniums, violas, and cactus dahlias. The Guildford Hardy Plant Nursery had a display of hardy flowers arranged in a light fashion. The irises were a feature, as were also the delphiniums. Sedums in variety were flowering beautifully, while lupins, especially the roseus variety, were to be seen, with many other attractive flowers.

Miss Hemus, Upton-on-Severn, had a splendid display of sweet peas, arranged in vases, with a groundwork of suitable greenery. The peas themselves were of first-class quality, the most conspicuous being Crimson Paradise, Purple Paradise, Prince of Orange, Shawondasee, Paradise Apple Blossom, Charles Hemus, Elsie Herbert, and Paradise Peach Blossom. Violas from Messrs. Seagrave and Co., Sheffield, were an attractive feature. The flowers were arranged in shields, and gave a good idea of the general effect of the plant; while the front was occupied with the blooms in pans of water and sand, without any semblance of greenery, which detracted from their value. Sweet peas from Messrs. John K. King and Sons, Coggeshall, Essex, were really good, arranged in glass vases, and with appropriate setting. The flowers were beautifully bright in colour, and nicely arranged, the whole exhibit denoting good culture.

A pretty exhibit of ferns came from Mr. H. N. Ellison, West Bromwich, who had specimens chiefly of a decorative character, with several of the fancy-shaped davallias as a foreground. The same firm also exhibited cacti and variegated dracænas. Messrs. Bastock and Son, Moseley, Birmingham, presented a small though fine display of violas, the chief varieties being Moseley Perfection, Mary Burnie, Moseley Gem, Lady Knox, A. J. Bastock, and Purple Venus, though there were many others equally good in their various classes.

Mr. F. Lilley, Guernsey, had a splendid exhibit of early-flowering gladioli, which were effectively displayed in tall bamboo stands. The best varieties were General Scott, Queen Alexandra, Blushing Bride, Ardens, and Peach Blossom.

Messrs. Gunn and Sons, Oulton, Birmingham, had an exhibit of Viola cornuta purpurea, arranged in baskets, with the older forms of the type. A small group of carnations came from Mr. H. Lakeman, Thornton Heath, which included some good Malmaisons and border varieties.

Mr. Harry Dixon, Wandsworth Common, had a small but nice table of English irises. From Mr. A. F. Dutton, Iver, Bucks, came a glorious bank of carnations in vases, but, owing to an accident to the tent which necessitated a double covering of canvas, it placed Mr. Dutton in an unsatisfactory position as regards light.

From Mr. V. Phillips, Crofton Court, Orpington, gardener, Mr. T. Hobbs, came an

NEW STRAWBERRY LAXTON'S UTILITY.

A distinct variety, remarkable for its productiveness, and the rich colour and high flavour of its fruits; raised by Messrs. Laxton Brothers, Bedford, by whom it was exhibited at the Holland House Show.

exhibit of single petunias in five-inch pots, which were well grown and denoted a good strain. Mr. R. C. Notcutt, Woodbridge, sent a large and miscellaneous display of hardy flowers. The roses were the chief feature, containing as they did all the up-to-date varieties, with masses of lilies, delphiniums, gladioli, papavers, and alstromerias. Messrs. G. Gibson and Co., Leeming Bar, had a capital exhibit of hardy flowers, in which were noted the new hybrid verbascums, irises, pæonies, gaillardias, and roses. Messrs. Bees, Lim., Liverpool, staged some really interesting new primulas, which included P. Littoniana, a charming form, P. Bulleyana, and P. Beesiana. The whole attracted much attention. Messrs. Whitelegg and Page, The Nurseries, Chislehurst, had a large display of sweet peas, violas, and hardy plants. The latter had as a prominent feature Geum Mrs. J. Bradshaw, a very fine addition to the class. Messrs. T. S. Ware and Co., Lim., Feltham, presented a glorious display of hardy flowers. The delphiniums, phloxes, campanulas, irises, and a variety of other subjects all helped to make a fine exhibit, which was staged in a most tasteful manner. Messrs. Dobbie and Co., Edinburgh, had a beautiful exhibit of sweet peas arranged in tall columns, with vases as a groundwork. A few of the most conspicuous were Elsie Herbert, John Ingman, Senator Spencer, Yankee, Asta Ohn, Ivanhoe, Isabel Malcolm, and Earl Spencer.

Mr. Amos Perry, Hardy Plant Farm, Enfield, N., occupied an entire tent with delphiniums, which created quite an impression. The flowers were arranged in masses of colour, with winding paths between. The chief varieties were Amos Perry, Lizzie, Duke of Connaught, Carmen, Persimmon, and a charming collection of seedlings. The arrangement throughout was simply magnificent, and a more glorious exhibit of this flower has never been seen. The gold medal awarded was thoroughly deserved. From Mr. W. H. Page, Tangley Nurseries, Hampton, came a large exhibit of roses in pots, which were particularly well flowered, the centre being occupied with vases of carnations, while a few standard Dorothy Perkins were well finished with a groundwork of Lilium longiflorum.

Messrs. W. J. Godfrey and Sons, Exmouth, had a fine exhibit of decorative pelargoniums, some well-coloured amaranthus, campanulas, and violas, also a collection of sweet peas. Messrs. Alex. Dickson and Sons, Lim., Newtownards, sent a splendid exhibit of their new roses, which were arranged in bamboo stands. The most attractive were Mrs. Leonard Petrie, Theresa, Carine, Dorothy Page Roberts, Mrs. David Jardine, Countess of Ilchester, Mrs. Foley Hobbs, John Cuff, and Duchess of Wellington. The exhibit attracted much attention.

Hardy flowers from Mr. A. J. Harwood, St. Peter's Nursery, Colchester, were nicely arranged. The chief features were the Iris Kæmpferi, delphiniums, gaillardias, and spiræas. Mr. H. H. Crane, Highgate, presented a nice exhibit of violas, arranged in saucers and vases, the miniature type being especially admired. Messrs. F. Cant and Co., Colchester, had a fine exhibit of roses, which were considerably handicapped by the light. Nevertheless, the roses were simply charming, a few of the most conspicuous being Lyon, Countess of Gosford, Marquis de Sinety, Joseph Lowe, William Shean, and Mrs. Theodore Roosevelt. Messrs. Gunn and Sons, Oulton, exhibited some splendid phloxes in baskets and bamboo stands, creating quite a new feature at this show. Messrs. R. Sydenham, Lim., Birmingham, sent a fine collection of sweet peas, in which were noted Sunproof Crimson, Syeira Lee, Prince of Orange, Arthur Hipper, and Windlel. A goodly display of carnations arranged in bamboo stands, came from Mr. E. J. Johnston, gardener to Mr. A. T. Paskett, Burrs Wood, Groombridge, Kent. The best examples were White Perfection, Beacon, Fair Maid, Mikado, and Victory, the whole being well arranged with asparagus and ferns. The same exhibitor also staged a splendid bank of sweet peas, which were well grown and nicely staged.

Messrs. Sutton and Sons, Reading, occupied one side of a tent with an exhibit of sweet peas, which were staged in magnificent style, and which included about 150 varieties. The centre of the pathway was arched, and covered with smilax and pillars of sweet peas in colour combinations; while the opposite side of the tent was filled with about 60 varieties of culinary peas, all being in magnificent form The Hon. Vicary Gibbs, Elstree, Herts (gardener, Mr. E. Beckett), had an attractive table of sweet-scented pelargoniums. Most of the plants were of decorative size and well flowered. A most interesting exhibit.

From Messrs. R. and G. Cuthbert, Southgate, came a fine exhibit of greenhouse and decorative plants. The groups of liliums, roses, hydrangeas, lightly arranged with Humea elegans, while the whole was edged with dwarf white marguerites and clusters of verbenas.

Messrs. Sander and Sons, St. Albans, had a splendid display of their new marguerite, Mrs. F. Sander, which created so much interest at the Temple Show.

A glorious group of carnations came from Mr. C. F. Raphael, Porters Park, Shenley (gardener, Mr. A. Grubb). The plants were splendidly grown, and the group greatly admired. The massing of the colours was most effective.

From Messrs. J. Cheal and Sons, Crawley, came a beautiful exhibit of natural rockwork, on which were displayed a goodly variety of suitable plants.

A fine exhibit of roses from the King's Acre Nurseries, Lim., Hereford, arrested attention, the decorative varieties being very fine. From Messrs. J. Peed and Son, West Norwood, came a large exhibit of carnations and caladiums, the latter being especially good.

From Messrs. G. Jackman and Son, Woking, came some splendid specimens of clematises, all beautifully flowered; also a fine display of decorative roses and hardy flowers. Messrs. W. Artindale and Sons, Sheffield, contributed a large display of hardy flowers arranged most naturally, the whole producing a fine effect.

From Mr. A. Young, Scotch Hardy Plant Farm, Elgin, came an effective display of hardy flowers, which were nicely arranged.

FRUIT COMMITTEE.

Messrs. T. Rivers and Son, Sawbridgeworth, put up one of their superb displays of fruit trees in pots. Every tree carried a big crop of fruits, and the peaches, nectarines, and plums were very fine and tempting. The new Thomas Rivers peach was excellent, and such varieties as Albatross, Nectarine, and Sea Eagle were fine. Cherries were grand, and the picked fruits of Early Rivers, Emperor Francis, Reine Hortense, and Bigarreau Noir de Schmidt were as big as many plums. Foster's Seedling and Goadiska grapes were also well represented, and assisted to complete this display of orchard house cultivation.

Mr. G. Camp, gardener to S. Heilbut, Esq., The Lodge, Holyport, Maidenhead, brought up about a dozen wonderfully fine specimens of cherry trees in pots, and every one carried a magnificent crop of splendid fruits; Bigarreau Noir de Schmidt, Bohemian Black Bigarreau, Montreux de Mezel, and Emperor Francis, were the varieties staged, and they commanded the admiration of everyone.

Mr. William Poupart, Fernleigh Orchards, Twickenham, had a capital display of bottled fruits, which were remarkable alike for their perfect colour and excellent condition; not a fruit appeared to be broken.

From the Duke of Portland, K.G., Welbeck Abbey, Worksop (gardener, Mr. J. Gibson), came a splendid collection of fruit most artistically arranged with foliage and coloured greenery. Melons and grapes formed the background, while splendid dishes of peaches and nectarines attracted much attention. The grapes included Muscat of Alexandria, Alnwick Seedling, and Black Hamburgh, with splendid examples of Early Rivers nectarines, Dymond peaches, cherries, figs, and strawberries, to say nothing of the melons and cherries; the whole excited the greatest amount of attention from the visitors.

From Lord Llangattock (gardener, Mr. T. Coomber), Monmouth, came a collection of pineapples and strawberries. The former were represented by twenty-five examples of The Queen, while the most conspicuous of the strawberries were Bedford Champion, Givon's Late Prolific, The Cropper, Trafalgar, Waterloo, and Reward.

Mr. Leopold de Rothschild, Gunnersbury House, Acton (gardener, Mr. James Hudson), presented a handsome display of fruit arranged in boxes. Cherries formed the chief part of the exhibit, and included fine examples of Early Rivers, Bigarreau Napoleon, Black Circassian, Emperor Francis, and Bigarreau de Schreken, while plums, peaches, and nectarines were staged in splendid form.

A nice collection of fruit came from Mr. E. S. Hanbury, Poles, Ware (gardener, Mr. T. W. Church). The peaches and nectarines call for special comment, being good in size and colour, the greenery employed being most appropriate.

The Misses Le Lacheur and Sherris, Henfield, Sussex, displayed some well-grown and coloured melons, which gave evidence of promise.

From the King's Acre Nurseries, Lim., Hereford, came a splendid collection of cordon gooseberries, plums, cherries, grapes, peaches, and strawberries in pots. A beautifully-arranged collection of vegetables came from Mr. A. Grubb, in which the potatoes, cucumbers, cauliflowers, and salads were exceptionally good.

A collection of fruit from the Marquis of Salisbury, Hatfield House (gardener, Mr. H. Prime , excited much admiration, especially the strawberries, which were unusually large and well-finished. The peaches and nectarines were also good.

A magnificent display of vegetables from the Hon. Vicary Gibbs (gardener, Mr. E. Beckett) attracted much attention. The arrangement was a great surprise to the general public. The masses of peas, marrows, celery, turnips, cabbages, carrots, and beet, arranged as a background, were simply superb; while the beans, potatoes, tomatoes, and mushrooms arranged in front created a great impression.

Messrs. Laxton Brothers, Bedford, had a splendid display of strawberries in baskets. The chief varieties were The Laxton, their new Utility, herewith illustrated, Rival, Connoisseur, Profit, and Count. The whole were in splendid condition, and attracted much attention.

OUTDOOR EXHIBITS.

Messrs. W. Fromow and Son, Chiswick, W., had a big and artistic display of Japanese maples and hydrangeas. Mr. James Hudson, gardener to Leopold de Rothschild, Esq., Gunnersbury House, displayed a fine collection of terrace plants grown in tubs. There were huge myrtles, pomegranates, lemon-scented verbenas, great fan-shaped scented-leaved pelargoniums, 10ft. or 12ft. across, and big pyramids of other pelargoniums. Messrs. Paul and Son, Cheshunt, had a few choice shrubs, including the variegated Catalpa speciosa pulverulenta and the newer philadelphuses.

Messrs. James Carter and Co., High Holborn, had a Japanese garden charmingly arranged with a pool of water-lilies spanned by a stone bridge. There was a miniature waterfall, a hydrangea bank, and groups of waterside irises, and the inevitable stone lanterns. In a small tent the firm had dwarfed trees in great variety, rambling roses, and a brilliant exhibit of gloxinias, sweet peas, tuberous begonias, Queen May petunias, and well-grown streptocarpuses. Messrs. J. Waterer and Sons, Bagshot, showed choice evergreen and deciduous shrubs in variety, hollies being a feature. Messrs. J. Cheal and Son, Crawley, had a delightful old English garden, with pergolas, verandahs, garden arbours and seats, flagged paths, rose-clad trellises, and borders of hardy flowers. There were also clipped trees of many sorts and shapes. Messrs. James Veitch and Sons had an outside display of hydrangeas, Lilium speciosum in variety, clematises, cytisuses, variegated ivies, and other choice shrubs.

Messrs. W. Cutbush and Sons' "cut bushes" were again a feature, and there was a great assortment of chairs, tables, dogs, spirals, pyramids, and weather-vanes in box and yew. Phloxes were again superbly shown by Messrs. Forbes, Hawick, who had Mrs. Oliver, Mount Sully, Aurora, Marchioness of Linlithgow, Pierre Bayle, Mrs. Daring, and Alex Michel in good form. With these there were excellent spikes of pentstemons and delphiniums. Mr. Clarence Elliott, Stevenage, put up a rock garden, and filled it with alpines in great variety.

HORTICULTURAL SUNDRIES.

It would have been difficult to mention anything deserving the name of "garden requisite" that was not represented on the stands occupied by Messrs. W. Wood and Sons, Lim., Wood Green, N. From samples of soils and labels to the latest patents in the way of labour-saving appliances, and from ordinary bone-meal to specially compounded fertilisers for certain crops, the exhibit was thoroughly representative of the manifold necessities and aids to successful gardening. The firm also had an exhibit of very artistic garden furniture, sunblinds, and portable shelters. Messrs. Wakeley Bros., Lim., Bankside, S.E., had samples of their well-known hop manure, which, according to testimonials displayed, has found great favour with leading gardeners and exhibitors as a food for fruits, vegetables, and flowers.

Messrs. Reddaways, Lim., 212, Shaftesbury Avenue, exhibited both plain and armoured hose of first-rate quality, with a large variety of jets, couplings, reels, etc. The Reddaway Fire Extinguishers, some of which are adaptable for spraying purposes, were also shown. Messrs. Saunders and Biss, Exeter, exhibited a very interesting model demonstrating their zinc bar dry glazing, as adapted for conservatories and greenhouses, and also for verandahs, skylights, and corridors. The special advantages consist in dispensing with the necessity for either paint or putty, and the prevention of drip from condensation. The Alpha Extinguisher, Lim., put up a whole range of their excellent spraying machines, with a variety of nozzles and other attachments, by the aid of which the operator can spray anything from the frailest flower to the tallest tree.

Messrs. W. Herbert and Co., Hop Exchange, S.E., showed all kinds of garden sundries. Messrs. Corry and Co., Lim., put up Lethorion vapour cones, Niquas insecticide, and a number of chemical preparations for various uses. Messrs. Pearce and Co., Holloway Road, N., had a smart little span-roofed greenhouse eminently suitable for an amateur. A series of photographs of larger houses were displayed, as evidence of good work done by the firm. The Temple heating apparatus and other stoves were exhibited by Messrs. Fenlon and Son, Tudor Street, E.C. A dwarf boiler was shown specially designed for heating frames as used in French gardening, and Fenlon's Ephaness heater was also on view. Teak wood seats came from Messrs. B. Maggs and Co., Bristol. Messrs. Wm. Duncan Tucker and Sons, Lim., Tottenham, showed models of greenhouses and frames. Hammocks and garden tents came from Messrs. C. and W. Buswell, Victoria Works, Torquay. The hammocks were built on a folding steel frame, and a green unshrinkable awning afforded effective shelter from sun.

Messrs. Jeyes, Lim., exhibited their Cyllin soft soap, and a spraying machine called Jeyes' Horticultural Sprayer, which is fitted with screens and nozzles that defy corrosion or stopping of the jet. Mr. Fred G. Wood, Walworth Road, S.E., had table vases and various aids to floral decoration, as well as labels, stakes, and other requisites. Garden tubs, both varnished and painted, were shown by Mr. T. J. Elwin, 22, Weaver Street, London, E. The popular water cans known as Hawes' Patent were shown by the patentee in sizes from about half a pint to three gallons. The B. K. Porcelain Tallies, which have already been described in our pages as of great merit, were shown by Tallies, Lim., St. Paul's, Bristol. The Doulton garden vases and ornaments exhibited by the Royal Doulton Potteries, Lim., Lambeth, included some very artistic designs. The Patent Safety Ladder Company, Peterborough, showed extension ladders which, being adjustable to any height, are excellent for fruit gathering and other garden work. The Rural Table decorations were shown, tastefully decorated with sweet peas, by Mr. J. Williams, 4, Oxford Road, Ealing.

Messrs. W. Walters and Co., Croydon, showed rose pillars, arches, and trellis. The new cult frame heater and various styles of stoves for greenhouses, came from Messrs. C. Toope and Son, High Street, Stepney. Messrs. De Luzy Freres, Camberwell, brought knapsack sprayers, sulphur distributors, and powder bellows. A large number of garden syringes and small sprayers came from Messrs. Benton and Stone, "Enots," Birmingham. A good syringe was one fitted with a rose that can be made to give either a coarse or fine spray or jet by simply turning the syringe in the hand. The pneumatic principle is adopted in almost all the firm's sprayers. Pots, bowls, and all manner of sundries were exhibited by Messrs. D. Dowell and Son, Ravenscroft Avenue, Hammersmith. Messrs. Pradal and Co., 18, Windmill Street, London, W., showed tree tubs with movable sides, facilitating attention to drainage or transference of the tree without damage to the roots.

Visitors were much interested in the display of coloured illustrations and photographic reproductions of flowers and plants arranged on the GARDENERS' MAGAZINE stand, where a series of books on botanical and horticultural subjects were also open for inspection. Rustic garden furniture was shown by Mr. G. W. Riley, Herne Hill. Butler's Patent Garden Frame, with glazed sides as well as roof, was shown by Messrs. C. Butler and Co., Peterborough. Samples of fibrous loam were exhibited by Mr. M. Johnston, New Park, Cranleigh, Guildford. Flower baskets and useful receptacles for garden products were brought by the Meath Home of Comfort for Epileptic Women and Girls, Godalming.

Tubs for shrubs in fine polished oak were shown, their designed manufacture being sufficiently artistic to render them admissible to conservatory, verandah, or even the rooms of the dwelling.

OFFICIAL LIST OF AWARDS.

Gold Medal.—The Duke of Portland, Welbeck Abbey, Worksop (gardener, Mr. J. Gibson), for fruit; Sir Jeremiah Colman, Bart., Gatton Park, Reigate (gardener, Mr. Collier), for orchids; Hon. Vicary Gibbs, Aldenham House, Elstree (gardener, Mr. Beckett), for fruit and vegetables; Leopold de Rothschild, Esq., Gunnersbury House, Acton (gardener, Mr. J. Hudson), for terrace plants; Messrs. James Carter and Co., High Holborn, W.C., for Japanese garden; Messrs. W. Cutbush and Son, Highgate, N., for carnations, etc.; Messrs. H. B. May and Sons, Upper Edmonton, for flowering plants and exotic ferns; Messrs. Paul and Son, Cheshunt, for roses; Messrs. Wm. Paul and Son, Waltham Cross, for roses; Mr. Amos Perry, Enfield, N., for delphiniums; Messrs. Rivers and Son, Sawbridgeworth, for fruit trees in pots; Mr. L. R Russell, Richmond, Surrey, for ivies and water lilies; Messrs. Sander and Sons, St. Albans, for orchids; Messrs. Sutton and Sons, Reading, for sweet peas and culinary peas; and Messrs. J. Veitch and Sons, Chelsea, S.W., for stove and foliage plants, etc.; and Messrs. R. Wallace and Co., Kilnfield Gardens, Colchester, for streamside and paved garden.

Silver Cups.—To Sir Randolph Baker, Bart., Blandford (Mr. Usher), for sweet peas; the Marquis of Salisbury, Hatfield (gardener, Mr. Prime), for fruit; the Rt. Hon. Lord Llangattock (gardener, Mr. Coomber), for pine apples and strawberries; T. C. Raphael, Esq., for carnations and vegetables; S. Heilbut, Esq., for fruit trees in pots; Messrs. W. Cutbush and Son, for shrubs and herbaceous plants; Messrs. J. Veitch and Sons, for carnations and flowering plants; Messrs. S. Low and Co., for orchids, carnations, roses, and berries; Messrs. Barr and Sons, for pigmy trees, iris, gladioli, herbaceous plants, etc.; Messrs. G. Jackman and Son, for roses, herbaceous plants, and clematis; Messrs. T. S. Ware, Lim., for begonias, alpines, and herbaceous plants; Messrs. Blackmore and Langdon, for begonias and delphiniums; Messrs. G. and A. Clark, Lim., for herbaceous plants and hardy flowers; Messrs. Fromow and Sons, for Japanese maples and hardy plants; Messrs. G. Bunyard and Co., for herbaceous plants; Messrs. B. R. Cant and Sons, for roses; Messrs. A. Dickson and Sons, Lim., for roses; Messrs. D. Russell and Son, for hardy trees and shrubs; Messrs. Dobbie and Co., for sweet peas; Miss H. Hemus, for sweet peas; Mr. H. Burnett, for carnations; Messrs. Charlesworth and Co., for orchids; Messrs. Hugh Dickson, for roses; Messrs. Mansell and Hatcher, Lim., for orchids; Mr. Maurice Prichard, for water garden; and Messrs. J. Cheal and Sons, for pergola group.

Silver-Gilt Hogg.—Leopold de Rothschild, for fruits; Messrs. Laxton Bros., for strawberries.

Silver-Gilt Flora Medal.—E. J. Johnstone, Esq., Groomsbridge (gardener, Mr. Paskett), for sweet peas and carnations; Messrs. G. Paul and Son, for hardy shrubs and herbaceous plants; Messrs. W. Artindale and Son, for hardy plants, violas, etc.; Messrs. J. Cheal and Sons, for pergola group and alpines; Messrs. J. Peed and Son, for caladiums, gloxinias, etc.; Messrs. Hobbies, Lim., for roses; Messrs. F. Cant and Co., for roses; Mr. A. F. Dutton, for carnations; Mr. Frank Lilley, for hardy gladioli: Mr. G. Lange, for carnations; and Messrs. R. and G. Cuthbert, for flowering plants.

Silver-Gilt Knightian.—Mr. W. Poupart, jun., for bottled fruits.

Silver Flora Medal.— Messrs. L. R. Russell, for stove and greenhouse plants; the Hon. Vicary Gibbs, Elstree (gardener, Mr. Beckett), for pelargoniums; Lord Burnham, for carnations; H. S. Goodson, Esq., for orchids (odontoglossums); Messrs. S. Bide and Sons, for sweet peas; Mr. C. W. Breadmore, for sweet peas; Mr. C. Engelman, for carnations; Messrs. Forbes, Hawick, Lim., for phloxes, pansies, etc.; Messrs. R. Harkness and Co., for roses; Mr. H. Hemsley, for alpine and rock garden; Misses K. and C. Hopkins, for herbaceous and alpine garden; Messrs. E. W. King and Co., for sweet peas; Miss W. J. Unwin, for sweet peas; Messrs. J. Waterer and Sons, for evergreens; Messrs. Whitelegg and Page, for herbaceous plants; Messrs. Carter Page and Co., for dahlias, pelargoniums, and violas; Mr. H. H. Crane, for violas and violettas; Messrs. Gunn and Sons, for phloxes; Messrs. B. Ladhams, Lim., for perennials, etc; Mr. H. Newman Ellison, for exotic ferns; Messrs. W. Wood and Sons, Lim., for pergola; Messrs. C. and W. Buswell, for garden tents, etc.; The Four Oaks Company, for sprayers, etc.; and Mr. Alex. Hamilton, for tubs for shrubs, etc.

Silver Knightian Medal.—Mr. S. Mortimer, for melons and cucumbers; and Messrs. Le Lacheur and Sherres, for netted melons.

Silver Banksian Medal.—E. S. Hanbury, Esq., for fruit; the Right Hon. Colonel Lockwood, C.V.O., for tracheliums; Messrs. W. and J. Brown, for herbaceous plants; Messrs. Godfrey and Sons, for campanulas; Messrs. Mallett and Co., for irises and herbaceous flowers; Mr. Clarence Elliott, for alpine and rock garden; Messrs. J. Piper and Son, for box and yew trees; Mr. H. J. Jones, for pelargoniums and sweet peas; Messrs. R. Sydenham, Lim., for sweet peas; Messrs. A.

Young and Co., for herbaceous plants; Messrs. G. Gibson and Co., for herbaceous plants; Messrs. J. King and Sons, for sweet peas; Messrs. H. C. Pulham, for herbaceous plants and alpines; Messrs. Seagrave and Co., for violas; Messrs. Bees, Lim., for primulas and herbaceous plants; Mr. A. L. Gwillim, for begonias; and the Alpha Extinguisher Company, for spraying machines.

Bronze Flora Medal.—Messrs. Bastock and Son, for violas and galegas; the Guildford Hardy Plant Nursery, for herbaceous plants; Messrs. Jarman and Co., for centaureas; Messrs. G. Stark and Sons, for sweet peas; Mr. A. J. Harwood, for herbaceous plants; the Castle's Shipbreaking Company, Lim., for garden furniture; Messrs. W. E. Chance and Co., for bell-glasses; Messrs. B. Maggs and Co., for teak seats; the Meath Home, for garden baskets; Messrs. John Pinches, for rose exhibition boxes, tubes, etc.; and Messrs. J. P. White, for garden seats.

First Class Certificate (Orchid Committee) to Cattleya Mendeli var. Stuart Low, from Messrs. Stuart Low and Co.; and Miltonia vexillaria Lambeauiana, from Messrs. Sander and Sons, St. Albans.

Award of Merit to Cattleya Mendeli, King George, from Messrs. Sander and Sons; Cypripedium Curtisi, Sander's var., and Cattleya Dietrichiana (C. superba × C. Hardyana), from Messrs. Sander and Sons, Bruges.

First Class Certificate (Floral Committee) to Rose Juliet, exhibited by Messrs. William Paul and Sons, Waltham Cross.

Award of Merit to Gladiolus King Edward VII., exhibited by Mr. Frank Lilley; Begonia Mrs. W. L. Ainslie, exhibited by Messrs. Blackmore and Langdon; Rose Mrs. Foley Hobbs and Rose Mary Countess of Ilchester, exhibited by Messrs. Alex. Dickson and Sons, Newtownards; Delphinium Belladonna semi plena and Delphinium Lamartini, exhibited by Mr. Amos Perry, Enfield, N.

Manettia bicolor. — Few, if any, greenhouse climbers are more continuous blooming than this, as the scarlet and yellow tubular-shaped blossoms are borne in great profusion. It is a native of South America, and has been long known in gardens, but until recently has been but little grown. In the States, where all climbers are vines, it is known as the Manettia vine.—W. T.

Lilium Hansoni.—A charming and distinct lily of the Martagon group, this is at its best towards the latter part of June and early in July. It reaches a height of 4ft. to 5ft., the stem being furnished with regularly whorled leaves, while the drooping flowers, which are borne in considerable numbers, are a couple of inches across, and orange, spotted with brown. The thick, wax-like character of the segments is a notable feature. This lily, which is a native of Japan, will thrive in loam and flower well the first season after planting.—W. T.

The Barr Recreation Club.—The members of this newly-formed club had their first annual outing on Saturday, July 2, when a most enjoyable day was spent at Arundel. On their arrival the members indulged in cricket and other amusements until lunch-time, when an excellent repast was enjoyed at the Black Rabbit Hotel. Excellent speeches were made by Messrs. G. Leslie, E. C. Mudge, W. Elmer, and S. Bass. Eloquent testimony was given to the great interest taken in the club by Messrs. Barr and Sons, and special reference was made to the good feeling which exists between the heads of the firm and the employees. Mr. P. Rudolph Barr, the president of the club, and Mr. G. H. Barr, the vice-president, both very much regretted their inability to be present at the outing. Able responses to the speeches were made by Miss Gardener and Messrs. J. Cox, S. Ray, and J. W. Ford, the hon. secretary of the club. The arrangements were excellent in every way, and reflected great credit on Mr. G. Leslie, chairman; Mr. E. C. Mudge, treasurer; and the hon. secretary.

CARDIFF AND COUNTY HORTICULTURAL SOCIETY. 22nd Annual Show. SOPHIA GARDENS, CARDIFF. WEDNESDAY and THURSDAY, July 20 and 21st, 1910. Liberal Prizes in every section, amounting in money and plate to nearly £500. Two Programmes of Music each day by His Majesty's renowned 1st Life Guards Band. A Grand Display of Fireworks each evening by Messrs. W. and J. Wilder, Birmingham. Mr. John Studts up-to-date Fun of the Fair, each day. Tents lighted by the Blanchard Patent Incandescent Oil Lamps. Popular prices. Tickets and Schedules may be obtained from the Secretary, Mr. A. MAURICE BAILEY, 24, Duke Street, Cardiff.

HANDSWORTH FLORAL FETE.
FRIDAY and SATURDAY, July 22nd and 23rd, 1910.

"Must now be recognised as one of the principal horticultural shows of the country."—Vide Press.

TWO SILVER CUPS (value 5 guineas each) FOR TRADE EXHIBITS.
Also the Society's Gold, Silver-gilt, Silver, and Bronze Medals, as may be awarded by the Judges.

Schedules and all information from
WILLIAM G. CARRADINE, Secretary,
82, Soho Hill, Handsworth.

LICHFIELD GREAT FLOWER SHOW, August Bank Holiday. Many open classes. Trade space free. Apply for Schedules to Mr. J. GLADMAN, Secretary, Lichfield.

POTTER'S BAR & DISTRICT AMATEUR ROSE SOCIETY.
(Affiliated to the National Rose Society.)
The Show will be held on THURSDAY, July 14th, 1910. Entries close July 7. Classes for Amateurs open to all England Classes for Members, Nurserymen, and Others.
For Schedule and Entry Forms, apply to H. R. EARLINGTON, Park House, Potters Bar.

THE YORKSHIRE SWEET PEA SOCIETY.
The EXHIBITION will be held in the ASSEMBLY-ROOMS, BEVERLEY, on WEDNESDAY and THURSDAY, the 20th and 21st July, 1910.
Many valuable prizes, Silver Cups and Medals will be awarded.
Judge: Walter P. Wright, Esq.
For Schedules apply H. G. SUMPNER, Hon. Sec., 1, Grovehill Road, Beverley.

WOLVERHAMPTON.
TWENTY-SECOND
GREAT FLORAL FETE,
12, 13, and 14 July, 1910.
NEXT WEEK.

YORKSHIRE AGRICULTURAL SOCIETY.
A GRAND HORTICULTURAL SHOW
will be held at
ROUNDHAY, LEEDS, July 26, 27, and 28, 1910.
For particulars and Schedules apply to PETER BLAIR, Trentham Gardens, Stoke-on-Trent.
Entries close July 9th.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Windsor, JULY 2.

There was a very fine exhibition, held in delightful surroundings, on the slopes of Windsor Castle, on Saturday last. The roses were very beautiful, and the competition throughout was keen. There were a large number of the leading rosarians present, amateur and professional, and all thoroughly enjoyed the flowers, the weather, and the music of the Grenadier Guards. The arrangements were good, and the officers of the Windsor and Eton Society work with a will. Judging at a rose show usually begins from half an hour to an hour after scheduled time, but all was ready at Windsor at 11.5 a.m. We have one suggestion to make, and it is that the addresses of competitors be written on the class cards. We hope the financial success was as good as the horticultural one.

There were a few interesting non-competitive exhibits, and these included roses and a fine lot of spikes of Eremurus Warei from Messrs. James Veitch and Sons, Chelsea; ornamental shrubs, roses, gloxinias, and Brassia verrucosa from Mr. Charles Turner, Slough; floral designs from Messrs. Fitt and Son, Windsor; a fine lot of sweet peas from Mr. W. J. Unwin, Histon, Cambs; the new Juliet and other roses from Messrs. William Paul and Son, Waltham Cross; ferns from Messrs. H. B. May and Sons, Edmonton; and roses from Mr. T. Tubb, Farnham.

ROSES—OPEN CLASSES.

There were nine competitors in the class for forty-eight roses, distinct, and here the coveted King's Cup, offered as first prize, was won by Messrs. Alex. Dickson and Sons, Newtownards, with one of the finest sets we have seen for a long time. There was only one flower that could in any way be called weak; Comte Raimbaud, Countess of Annesley, S. M. Rodocanachi, Mrs. W. J. Grant, Harry Kirk, Mrs. J. Laing, Mrs. T. Roosevelt, Frau K. Druschki, Killarney, Mildred Grant, Mrs. Foley Hobbs, Ulrich Brunner, A. K. Williams, Duke of Wellington, Horace Vernet, Xavier Olibo, G. C. Waud, Mrs. E. Mawley, and Dean Hole were all beautiful. Messrs. B. R. Cant and Sons came second, and Messrs. D. Prior and Son third in this close competition. Mr. G. Prince, Longworth, scored for eighteen teas or noisettes, his best flowers being Madame de Watteville, Molly Sharman Crawford, Medea, Maman Cochet, The Bride, Madame Jules Gravereaux, and Mrs. E. Mawley; Messrs. Frank Cant and Co. second, and Mr. H. Drew, Longworth, third.

For a dozen trebles Messrs. A. Dickson and Sons were again to the front, scoring with magnificent examples of Mrs. T. Roosevelt, Marquise Litta, Mildred Grant, Mrs. W. J. Grant, Ulrich Brunner, Mrs. David McKee, Lady Ashtown, Horace Vernet, Countess of Annesley, A. K. Williams, Bessie Brown, and Dean Hole; Messrs. D. Prior and Son, a good second; and Messrs. B. R. Cant and Sons, third. Ten competitors. Messrs. R. Harkness and Co., Hitchin, scored for a dozen blooms of any H.P. or H.T., with Mrs. J. Laing; Messrs. A. Dickson and Sons, Newtownards, second, with Lady Ashtown; and Messrs. B. R. Cant and Sons, Colchester, third, with Dean Hole. Twelve entries. First place for a dozen blooms of a Tea rose was won by Messrs. A. Dickson and Sons with a beautiful box of Mrs. Foley Hobbs; Mr. G. Prince, Longworth, second, with Molly Sharman Crawford; Messrs. B. R. Cant and Sons, third, with Madame Jules Gravereaux; eight entries.

In the class for eighteen bunches of decorative roses there were four good entries, and first place was won by Mr. Charles Turner, Slough, with lovely bunches of Ecarlate, Lady Battersea, Edu Meyer, Clara Watson, Liberty, Madame Ravary, Gardenia, Bardou Job, and Madame Abel Chatenay; Messrs. Frank Cant and Co., Colchester, second; and Messrs. W. and J. Brown, Peterborough, third. Messrs. Frank Cant and Co. led for a dozen blooms each of a white and a crimson rose with J. B. Clark and Frau Karl Druschki; Mr. F. C. Drew, second; and Messrs. G. and W. H. Burch, Peterborough, third; eight competitors.

AMATEURS.

In the open amateurs' class for two dozen distinct blooms the coveted Windsor Cup was won by Mr. E. B. Lindsell, Hitchin, with a beautiful set of clean flowers. Mildred Grant, Horace Vernet, Charles Lefebvre, A. K. Williams, Mrs. T. Roosevelt, Bessie Brown, W. Shean, Comte Raimbaud, and Mrs. J. Laing were his best flowers. Mr. Skeys, gardener to F. Dennison, Esq., second; and Mr. G. A. Hammond, third. The cup presented by the Princess Alexis Dolgorouki for the best eight trebles was also won by Mr. Lindsell, with Mildred Grant, François Michelon, Mrs. T. Roosevelt, Helen Keller, Bessie Brown, J. B. Clark, Frau Karl Druschki, and Dean Hole, in good form; Mr. Dennison, second; and the Rev. J. H. Pemberton, Havering, third; seven entries.

For a dozen teas or noisettes Mr. Conway Jones, Hucclecote, Gloucester, led the way with a moderate set, Niphetos, Comtesse de Nadaillac, and White Maman Cochet being the best; Mr. C. Page, gardener to J. B. Fortescue, Esq., Dropmore, second; and Mr. F. Slaughter, Steyning, third. The Rev. J. H. Pemberton was placed first for a dozen bunches of decorative roses, but it must have been a near thing between him and Mr. Stevenson, gardener to A. E. Mocatta, Esq., Addlestone, who was placed second, but appeared to have the finer bunches; Mr. Conway Jones third.

The Owston Challenge Cup, open to growers of less than 2,000 plants, for the best eighteen blooms, was won by Mr. Sharp, gardener to W. Onslow Times, Esq., with a very fresh set, in which Madame Melanie Soupert, Hugh Dickson, J. B. Clark, A. K. Williams, and Gustave Piganeau were excellent; Mr. Binches, gardener to W. Jarratt Thorpe, Esq., second; and Mr. E. B. Lehmann, third. Mr. A. C. Turner led for a dozen blooms with a very good set of popular varieties; Mr. T. Stevenson second, and Mr. E. B. Lehmann third. In another class for twelve blooms Mr. Smart, Rev. L. C. Chalmers Hunt, and Rev. J. B. Shackle won as placed.

The Islet Cup, open to Berkshire growers, for the best two dozen flowers, was won by Mr. C. Page, Dropmore, who had a good set that included a fine flower of White Maman Cochet. The cup now goes to Dropmore for good; Mr. W. C. Romaine, second. The Fortescue Cup, for eighteen blooms, was secured by Mr. E. F. Brown, with a fresh set of rather small flowers; Rev. J. B. Shackle, second, and Mr. W. C. Romaine, Old Windsor, third.

Mr. C. Page led for six teas or noisettes with White Maman Cochet; Mr. R. House, second, with Madame Jules Gravereaux; Rev. J. B. Shackle, third, with the latter variety. For six H.P. or H.T. roses, one variety, Mr. A. F. Govett led with F. K. Druschki; Mr. T. Stevenson second with Lyon Rose; and Mr. Page third with Mrs. J. Laing. The Rev. H. Tower scored for three vases of decorative roses with Reine Olga Wurtemberg, Mrs. Alfred Carriere, and Tea Rambler; Miss Langworthy second, and Mr. R. Sunner third.

In other rose classes Mr. Stevenson was first for six bunches of decorative roses, and Mr. E. F. Brown and Mr. R. House secured other first prizes.

PLANTS AND FLOWERS.

These were fairly well represented, but the roses were the outstanding feature of the exhibition. Fruits were not largely shown, but there were some excellent vegetables, and a keen competition, but the classes for these were packed closely in a small tent; they deserved more room.

Premier award for a group of plants was won by Mr. D. Phillips, gardener to E. Wagg, Esq., The Islet, Maidenhead, with a pretty display of Francoa ramosa, Oncidium flexuosum, Dendrobium Phalænopsis, liliums, and carnations, associated with palms, ferns, and crotons; Mr. G. West, gardener to F. Ricardo, Esq., came second, and his groundwork of ferns and Celsia arcturus was capital; Mr. Goodbourne, gardener to A. H. Benson, Esq., third. Mr. Phillips scored for ten plants, five in flower, with well-grown examples of stove and greenhouse subjects. Mr. Phillips and Mr. Page were first and second respectively for a vase of carnations, and each showed pink Malmaisons.

Mr. C. Page, Dropmore, led for six kinds of hardy flowers with fine vases of delphiniums, liliums, gladioli, campanulas, and alstromerias; Rev. J. B. Shackle, Dropmore Rectory, was disqualified because he had two vases of irises. Mr. E. Jennings, gardener to the Stoke Poges Golf Club Company, led for a dozen bunches of sweet peas, his Frank Dolby and Countess Spencer being the best vases; Mr. R. Brown, gardener to Lady Tress Barry, Windsor, second; and Mr. West, gardener to F. Ricardo, Esq., third.

Mrs. Max Epstein led for a table decoration with a clever arrangement of pink Malmaison carnations and gypsophila; Mrs. de Buriatte, second, with cream and pink sweet peas; and Mrs. R. Sargent, third, with Fair Maid carnations.

Hanley Flower Show.

JULY 6 and 7.

Hanley Show is always of a high order of merit, and it is pleasant to record that the exhibition held in the public park, which is one of the features of the district, was well up to the average, and, in some respects, even better than those of previous years. The big groups, the roses, hardy flowers, and sweet peas were both plentifully and well shown, and the fruit tables were as usual a source of great delight to the visitors, who, in spite of inclement weather, turned up in great numbers. The committee and officials of the Hanley Horticultural Society long since won the esteem of exhibitors by reason of their excellent organising abilities, which are ever blended with genial and wholehearted endeavours to make everybody comfortable, and an evident willingness to render assistance to one and all. Mr. William Poulson is a model secretary, energetic and methodical, but never domineering or unreasonable. He evidently cherishes a strong affection for the society, and fully appreciates the importance of keeping everybody interested in the show. Among the side attractions, which are always up to date at Hanley, an aeroplane was the great centre of attraction, but, owing to wind and rain, no flight could be made. Owing to the late commencement of the judging, we were unable to obtain a complete list of awards in some of the smaller classes by the time we were compelled to leave for the train.

PLANTS.

The principal class was for a group of plants in and out of bloom, occupying 300 square feet of space. There were five entries, and a view of the whole was a splendid sight. A total of £76 in cash was offered in this class, of which £25 went to the first-prize group, to which was added a special prize of the value of £3 3s. The judges had a very difficult task, and before a decision could be arrived at between the first and second groups, an umpire had to be called. Eventually Messrs. J. Cypher and Sons, Cheltenham, were declared winners, and we thoroughly endorse the decision of the judges. The point that from the first glance appealed to us in Messrs. Cypher's group was that from the orange-berried Nertera depressa, used as an edging, to the kalanchoe flammed at the top of the central column and in mounds, intervening with Fuchsia triphylla, Clerodendron fallax, and the deeper-coloured crotons, the colour scheme was well devised, and perfect in detail. The general arrangement was much on the lines so frequently described. Mr. William Holmes, West End Nurseries, Chesterfield, was a good second, but a weak point was the distribution of blue lobelias among orange and red shades, with which the colour did not agree. A light and airy touch was well sustained throughout this group. Mr. William Vause, Leamington, was third; Messrs. R. Simpson and Sons, York, fourth.

Messrs. Cypher and Sons were at home in the class for a group of orchids arranged on 100 square feet of tabling, their cattleyas being especially fine. Oncidium papilio, Vanda caerulea, and a number of choice odontoglossums and cypripediums afforded variety, and a piece of Stanhopea tigrinum with a couple of handsome flowers marked the centre of the group, and was the object of many eulogistic comments from visitors. Only one group of Malmaison and other carnations in pots was forthcoming, the first prize being awarded to Mr. E. Gilman, gardener to the Right Hon. the Earl of Shrewsbury, Ingestre, Stafford.

Messrs. Cypher led for six specimen stove plants in bloom, Mr. W. Vause following; the same order being maintained for six flowering and six foliage plants, and again for six foliage plants, some very fine palms being staged. For the best twelve caladiums Mr. A. H. Ruff, gardener to J. Tams, Esq., The Hayes, Stone, Staffs, received first.

In the amateurs' group class Mr. H. Ruff gardener to J. Tams, Esq., The Hayes, Stone, Staffs, came first, his arrangement of crotons, palms, and lighter foliage, with liliums, gloxinias, and clerodendrons being very effective. Mr. Charles Roberts, gardener to Mrs. Swann, Halston Hall, Oswestry, had a somewhat heavier group, for which second was awarded.

ROSES

were as usual shown in large quantities and in fine form, the cool weather serving to keep the blooms in good condition. In the big class for seventy-two varieties, Messrs. R. Harkness and Co., Hitchin, led off with a collection of much merit. The Lyon Rose, Earl of Warwick, Mrs. T. Roosevelt, and many other roses of high quality were included in the stand. The King's Acre Nurseries, Lim., Hereford, came second, Mr. W. H. Frettingham, Beeston, Notts, third, and Messrs. Perkins and Sons, Coventry, were fourth. Messrs. Harkness and Co. repeated their success in the class for forty-eight varieties, and again in the class for thirty-six, being followed by the King's Acre Nurseries in each instance. For twenty-four Hybrid Teas Messrs. Perkins and Sons, Coventry, scored with a very level lot of first-rate blooms. The best twelve blooms of any one white variety came from Messrs. Harkness and Co., Mr. Frettingham leading for twelve blooms of a pink variety with a superb stand of Mrs. J. Laing. Mr. W. T. Mattock, Headington, Oxford, was first for twenty-four Teas with Mrs. E. Mawley, White Maman Cochet, Innocente Pirola, and other favourites.

SWEET PEAS.

Mr. William Chapman, New Oscott, Erdington, Birmingham, scored for a collection of sweet peas, showing Mrs. Bell, Countess Spencer, Evelyn Hemus, and others in good style. Mr. Stephen Sims, Borrowash, came second, and Mr. William Marple, The Nurseries, Penkridge, third. Mr. Robert Madeley, Market Drayton, led in the special class provided by Mr. Henry Eckford, and Mr. J. Bowler, Woodseaves, Market Drayton, scored in Messrs. Webbs' class. Messrs. Bakers, Wolverhampton, offered prizes for six bunches, and Mr. R. Madeley, Market Drayton, secured premier place, Mr. Bowler following.

For a collection of hardy flowers Messrs. Harkness and Sons, Bedale, scored with a brilliant array of Oriental poppies, pyrethrums, delphiniums, and other seasonable subjects. Messrs. G. Gibson and Co., Bedale, were second; Messrs. Artindale and Son, Sheffield, were third.

FRUIT.

A strong class was that for a table of fruit, allowing fourteen dishes, with floral decorations. Mr. J. H. Goodacre, Elvaston Castle Gardens, Derby, led with splendid peaches, nectarines, pears, figs, and grapes, using sprays of francoas and heucheras to good purpose as decoration. The second prize went to Mr. W. Parker, gardener to J. Drakes, Esq., Orford House, Market Rasen; third, Mr. William Nicholl, gardener to Right Hon. Lady Beaumont, Carlton Towers, Yorkshire; fourth, Messrs. Lewis and Sproson, Pinkhall Nursery, Stoke-on-Trent. For twelve dishes, Mr. Goodacre again led, with a choice lot of fruit, Mr. Parker coming second, and Mr. W. Nicholl third.

FLORAL DECORATIONS.

Prizes were offered for the best and most varied collection of floral designs on a space 15ft. by 6ft., and some startling, almost weird, devices, were exhibited. The winners were Messrs. M. Jenkinson and Son, Newcastle, who had crosses, crowns, and jugs in pink and white stocks; a very nice harp and anchor with a number of smaller pieces of good workmanship. On the second prize stand, staged by Messrs. Lewis and Sproson, Stoke-on-Trent, a hideous "Teddy bear" in pinks, a lighthouse in hydrangeas, cushions, muffs, fans; such designs bore evidence of painstaking work, but did not, to our mind, display artistic taste. On the third stand, which was occupied by Mr. Amos

Carr, 60, High Street, Cheadle, Staffs, a lion in dyed gnaphalium and grasses, a church built of sweet peas, and a pagoda were put up with some really nice wreaths, harps, and similar designs.

The table decorations were very strong both in numbers and quality.

NON-COMPETITIVE.

A varied collection of violas was staged by Mr. W. L. Pattison, Cherry Orchard, Shrewsbury, whose varieties were of useful bedding kinds, and were represented by fresh-looking flowers of good substance. Roses and delphiniums were the principal features of the exhibit from Messrs. Dicksons, Lim., Chester, who, however, had a number of interesting hardy flowers. Messrs. Jarman and Co., Chard, put up good carnations, zonals, and roses, as well as their strain of sweet sultans. The big display of sweet peas from Mr. Henry Eckford, Wem, Shropshire, embraced about fifty of the best varieties obtainable, all represented by superb flowers. A new seedling, which might well be described as a "deeper coloured Henry Eckford," was staged, and was most attractive. Ferns in beautiful variety were well shown by Mr. H. N. Ellison, West Bromwich, also a few choice cacti.

The Edwardian table decorations and fern baskets were displayed by Mr. Arthur Edwards, Arnold, Notts.

Messrs. E. Webb and Sons, Wordsley, erected their big temple-like arrangement, which was very tastefully decorated with sweet peas; around the base of the stand were excellent vegetables, handsome melons, and an assortment of gloxinias, liliums, hydrangeas, and other flowers. The whole was a most imposing display, and was awarded a gold medal and the silver cup for the best non-competitive display. This is the third successive year Messrs. Webb and Sons have won this cup, which now becomes their property. A group of ornamental shrubs, rambler roses, and hydrangeas was arranged by Messrs. Clibrans, Altrincham. Dimorphanthus mandschuricus variegatus, Sambucus aurea, and several ornamental vines were well shown.

Southampton Flower Show.

JULY 5 AND 6.

The annual summer exhibition of the Southampton Horticultural Society was held on the county cricket ground, and was a great success in every department. Roses were very fine when we consider the untoward state of the weather of recent days. Vegetables were a distinct feature, as they always are here. Sweet peas are specially provided for at this show, and nowhere can better specimens of the various sorts now in commerce be seen than at this show. Trade exhibits were numerous and attractive.

ROSES.

Open Classes.—The leading class was for forty-eight distinct varieties, in which there were four contestants, making a fine display. Messrs. D. Prior and Son, Colchester, were easily first, with large, handsome blooms—fresh, on the whole, although some few showed the effects of the recent adverse weather. Oberhofgartner Terks, Dean Hole, Mrs. T. Roosevelt, Ulrich Brunner, Maurice Bernardin, Marie Baumann, White Maman Cochet, Avoca, and Mrs. W. J. Grant were the most noteworthy. Messrs. B. R. Cant and Sons, Colchester, were second; and Messrs. F. Cant and Co., Colchester, third. For twelve varieties, three trusses of each, three competed. Messrs. B. R. Cant and Sons were easily first with large, shapely blooms of Ben Cant, Lyon Rose, Dean Hole, J. B. Clark, Mrs. J. Laing, and Alfred Colomb; Messrs. D. Prior and Son second, with blooms a trifle smaller. In the class for twelve Teas or Noisettes distinct, there were four competitors, and Mr. H. Drew, Longworth, Berks, was first with small, clean blooms of White Maman Cochet, Mdme. Cusin, Maman Cochet, and Mdme. de Watteville; second, Messrs. D. Prior and Son, Colchester; and Messrs. B. R. Cant and Sons, third. In the class for six blooms any one dark variety five staged. Messrs. D. Prior and Son were first, with Horace Vernet, small, but grandly coloured; Messrs. B. R. Cant second, with Ben Cant. In a similar class for any one light variety, seven competed. Messrs. D. Prior and Son were again first, staging Mrs. T. Roosevelt; Mr. H. Drew second, with Mildred Grant. Prizes were offered for a display of decorative and other roses in a space 7ft. by 3ft., for which three entered. Mr. E. J. Hicks, Twyford, Berks, was easily first, with good H.T. blooms and ramblers, all tastefully arranged; Mr. B. Ladhams, Shirley, second.

Open to Gardeners and Amateurs only.—For eighteen blooms distinct, the "Munt" Silver Cup was offered, with a cash prize. Five entered. Dr. C. Lamplough, Alverstoke, was the winner with very fresh specimens of Mdme. Gravereaux, White Maman Cochet, Melanie Soupert, Frau K. Druschki, Florence Pemberton, and Bessie Brown; Mr. H. Richards, Ryde, second, with smaller fresh blooms; Mr. P. Sugden, Wimborne, third. For six varieties, three trusses of each, Dr. Lamplough was again first, with clean blooms of Hugh Dickson, Dean Hole, and Bessie Brown; Mr. Kent, gardener to Mrs. E. Croft Murray, Ryde, second.

A silver-gilt medal was presented for the best bloom in the show. This was awarded for Mrs. T. Roosevelt, Messrs. D. Prior and Son, a very fine specimen. This firm also won the silver medal offered for the best bloom in Classes 1 to 5, with Horace Vernet, extremely rich in colour. Dr. Lamplough won a similar honour in the amateur's section with a handsome specimen of Mdme. C. Gravereaux.

SWEET PEAS.

Quite a feature is here made of these flowers. In competition for the prizes offered by Messrs. Toogood for six bunches distinct there were eight competitors, making a fine display. Mr. H. H. Lees, Warblington Cottage, Havant, was an easy first with a charming exhibit of high-class blooms of Lavender G. Herbert, Mrs. C. W. Breadmore, John Ingman, Mrs. Routzhan, and Earl Spencer; Mr. Usher second, with smaller blooms.

Five prizes were offered by Messrs. E. Webb and Sons, Wordsley, Stourbridge, for eight varieties, and six competed. Mr. Usher was here first, with slightly superior blooms to those staged by Mr. Lees, who was a close second.

Messrs. James Carter and Co., High Holborn, London, provided prizes for six bunches distinct. Five competed, and Mr. F. Green, The Polygon, Southampton, was first with high quality blooms of popular varieties.

Messrs. Sutton and Sons, Reading, offered prizes for one bunch each of Sutton's Queen and Sutton's Marbled Blue, and the premier award in each class was secured by Mr. Usher with high-class flowers.

MISCELLANEOUS CLASSES.

For a collection of plants arranged for effect on a space 10ft. by 8ft., two only competed. Mr. T. Hall, gardener to Lord Swaythling, South Stoneham House, was first with a bright arrangement; Mr. H. C. Swyom, gardener to Mrs. Farman, Rownham, second. The best single specimen flowering plant was Bougainvillea Sanderi, from Mr. J. C. Hosey, gardener to J. C. E. D'Esterre, Esq., Elmfield, Southampton; and the best foliage plant was from Mr. Wills, Kentia Belmoreana.

FRUIT.

For two bunches of black grapes, Mr. F. L. Westron, gardener to L. Walker Munro, Esq., Brockenhurst, was first with excellent Black Hamburgh; Mr. Ellwood, gardener to W. H. Myers, Esq., Swanmore House, second. In a similar class for white, Mr. Westron was first with Foster's Seedling, nicely coloured. Peaches were best shown by Mr. J. F. Duncan, Douglas House, New Milton, the variety Condor. Nectarines were not numerous, but good, Mr. Swyom winning with Lord Napier. Melons were a small show. Mr. Usher, gardener to Sir R. Baker, M.P., first with a seedling. Strawberries are usually well shown here. For two dishes Mr. Duncan was first with Royal Sovereign and Laxton of good quality.

VEGETABLES

at the shows of this society have long been famous for quantity and quality also, liberal special prizes being provided by various seedsmen. For six distinct varieties Messrs. Toogood and Sons offered ten prizes; eight competed. Mr. Ellwood was an easy first with high-class examples of White Mammoth Tripoli onion, Toogood's Timely cauliflower, Duke of Albany pea, Best of All tomato, Express potato, and Garden carrot. Mr. H. Pearce, gardener to Mrs. Tragett, Romsey, second; Mr. Hall, third

In competition for Messrs. Sutton and Sons' prizes for six dishes distinct, Mr. Ellwood was again easily first with high-class produce. Ideal potatoes, Perfection tomato, and Alderman pea were the most conspicuous dishes. Mr. H. Pearce second, with a good exhibit also.

For Messrs. James Carter and Co.'s prizes for six varieties, Mr. Ellwood was again the most successful with typical examples of high-class culture.

MISCELLANEOUS EXHIBITS.

Mr. C. F. Waters, Balcombe, Sussex, had, not for competition, a grand group of carnations, Hoary Morn, Britannia, White Perfection, and Edith Waters being leading and attractive sorts. Mr. Bealing, Burgess Street Nurseries, Southampton, had a group of well-grown gloxinias. Messrs. B. Ladhams and Son, Shirley, Southampton, arranged at one end of the large marquee an old English garden. Messrs. Toogood and Sons, Southampton, had a huge exhibit of sweet peas. Mr. E. Wills, nurseryman, Southampton, had small flowering and foliage plants with floral designs. Messrs. W. H. Rogers and Son, Red Lodge Nurseries, Southampton, had a charming exhibit of roses, shrubs, etc. Mr. J. Stevenson, Wimborne, staged fifty bunches of sweet peas.

Brighton Rose and Sweet Pea Show.

JULY 5 AND 6.

This show, which was held in the Dome and Corn Exchange on the above dates, was a great success as regards competition and excellence of exhibits.

For a group of roses, either plants or cut blooms, Messrs. G. Mount and Sons, Canterbury, were the winners of the first prize, and were very closely followed by Mr. G. W. Piper, Uckfield. The arrangements in each case were tasteful and effective, but the winner was the freshest in bloom. For a smaller group Messrs. Mount and Sons were the only exhibitors. For a table of roses and plants in flower Mr. J. Box, Lindfield, was awarded first for a very pretty table, but rather heavy compared to the second prize from Mr. G. W. Piper, Uckfield.

For forty-eight blooms distinct, Mr. F. Woollard, Lewes Road, Brighton, obtained premier honours, the winner's best blooms being the Lyon Rose, Mrs. J. Laing, Mrs. T. Roosevelt, and Queen of Spain E. M. Eversfield, Esq., Denne Park, Horsham, was a good first for 36 blooms, his best flowers being J. B. Clark, Comte Raimbaud, and Mrs. Theodore Roosevelt; Mr. F. Woollard, Lewes Road, Brighton, was second; Messrs. G. Mount and Son, third. In this class Mr. Woollard had a very high-coloured Lyon rose. In the class for twenty-four Teas and Noisettes, E. M. Eversfield, Esq., appeared to be the only exhibitor, but he had a fine box of blooms.

One of the most successful amateur exhibitors was Mr. E. W. Morris, who gained first for six distinct blooms, for six Teas or Noisettes, and for six blooms in vase.

The best table of carnations came from Mr. C. F. Waters, Balcombe, who was very good indeed. A very tastefully-arranged table, consisting of superb blooms. For a collection of sweet peas, arranged with foliage, Mr. C. F. Waters was also a good first, with loosely arranged stands of one variety. Mr. J. R. Box, Lindfield, being second with a much heavier and mixed arrangement. Mr. F. Webber, florist, Tonbridge, was first for a bride's bouquet of roses, and Miss Kate James, Bedford Street, Brighton, first for a ballroom bouquet; reversing the positions for second prize in each class.

For a basket of sweet peas, with foliage, Mrs. Rapley, Warblington House, Havant, was first with a pretty and graceful arrangement, followed rather closely by Mrs. B. C. Martin, West Hill Place, Brighton. The best thirty spikes of white sweet peas came from Mr. W. H. Smith, George Street, Hailsham, and remarkably good they were. The best white grapes came from Mr. C. Earl, Somerhill Gardens, Tonbridge, who was also first for blacks, with good examples of cultural skill.

Fruit was not well exhibited, but the show throughout was beyond the average.

Bournemouth, JULY 1.

A private rose show was held in the gardens of Michelgrove House and Boscombe Place on the above date, by kind permission of Mr. Clark, of the former residence, and Mr. Hamilton, of the latter. Mr. Clark gave the prizes, and defrayed all expenses. The last-named gentleman kindly invited the members of the Bournemouth Gardeners' Mutual Improvement Association to come and see his roses on a certain date last year, but before the day came a gale of wind destroyed nearly all the blooms, and so the visit did not take place. This year, however, Mr. Clark—who takes a great deal of interest in the Bournemouth Gardeners' Association—said he would have a private rose show, and invited the members to compete, as well as ladies and gentlemen in the district. By the kind permission of Mr. Hamilton, the tent was erected on the lawn at Boscombe Place, and so both gardens were open for visitors to inspect. The admission charges were given to the Boscombe Hospital funds, an institution which Mr. Clark generously supports. Refreshments were also provided free to all visitors.

Mr. Clark is a great lover of roses, and in his charming gardens at Michelgrove House there are twelve hundred plants grown, which is a considerable number for a private garden. A feature of these gardens is the climbing roses which are trained on the trunks of the pine trees, and allowed to grow naturally.

THE EXHIBITS.

In class one, for twelve blooms, distinct varieties, Mr. D. Lorriner, of Bournemouth, was successful. His chief blooms were Caroline Testout, Frau Karl Druschki, Earl of Warwick, Hugh Dickson, Captain Hayward, Victor Hugo, and Mrs. John Laing. Mr. E. Wilkins, Benhilton, Bournemouth, was second prizewinner, Lady Ashtown, Frau Karl Druschki, and Mrs. Hugh Dickson being the best blooms. The class for six blooms, distinct, was well filled, Mr. W. J. Kaye, Boscombe, being placed first; Duke of Albany, Paul Neyron, Beauty of Waltham, and Margaret Dickson were the most noteworthy flowers. Mr. A. Dunn, Branksome, was a close second, Charles Lefebvre being fine in this stand. Miss Gowan was the principal prizewinner in the class for four blooms, distinct, followed by Mr. Dunn. Mr. Wilkins led in the class for four distinct varieties, three blooms of each. He had Frau Karl Druschki, Hugh Dickson, Marquis Litta, and Mrs. Roosevelt. Mr. W. Weaver, of Christchurch, was a close second, and Caroline Testout was very fine in his stand.

Mr. Wilkins again led in the class for three vases of roses, H.P.'s, distinct, three blooms in each vase. Mr. Humphries was second. Mr. W. J. Kaye was placed first for three vases of roses H.T., T., or noisettes, distinct, three blooms in each vase; Mr. Humphries was again second. For six distinct varieties of garden or decorative roses, Mr. Wilkins also won the first prize, and Mr. Weaver had the best three vases of ramblers or climbing varieties.

FLORAL DESIGNS.

These in themselves made a very charming exhibition. There were nine table decorations and fifteen epergnes and baskets. Mr. R. Chamberlain had the best hand bouquet, and Mr. Lorrimer was placed first for table decoration. Mrs. George G. Hamilton was the prizewinner for a lightly-arranged epergne, and Mrs. Gyers for a basket of flowers. The two last-named classes being confined to ladies only.

TRADE AND OTHER EXHIBITS.

Mr. Clark exhibited roses and gloxinias, Mr. Hamilton a nice lot of clarkias in pots. Mr. J. Stevenson, sweet pea specialist and nurseryman, Wimborne, had a fine exhibit of sweet peas—about fifty vases—the flowers were large, borne on strong stems, and of rich colours. This collection was greatly admired. Messrs. Wm. Paul and Son, of Waltham Cross; Messrs. D. Stewart and Sons, of Wimborne; and Messrs. W. Watts and Sons, of Bournemouth, showed roses.

The weather was fine, and the show so great a success that it may lead to the holding of a regular rose show in Bournemouth.

METEOROLOGICAL OBSERVATIONS.

TAKEN IN THE ROYAL HORTICULTURAL SOCIETY'S GARDENS AT WISLEY, SURREY.

SATURDAY, July 16.—Edgware Horticultural Society.
Reading Rose and Sweet Pea Show.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

TRAINING ALLAMANDAS. — H. B., Loughton: No time should be lost in training the allamandas round the balloon trellises or there will not be time for the leaves to face round, or the flower buds to look natural before the show-day arrives.

PROPAGATING HOLLYHOCKS. — C. T. S., Newark: It is a comparatively easy matter to propagate hollyhocks at this season of the year by removing the young basal growths and inserting these singly in small pots of sandy soil. Place them in a close cold frame, and shade heavily until roots form, when light and air may be gradually increased.

BEST CLIMBING CLUSTER ROSES.—F. E. C., Leicester: It is no doubt to the awards made in the Nickerson Competition in 1907 that you refer. We gave the complete list of the best roses for garden decoration, as ascertained in this competition, in our issue of June 6, 1908. The best climbing roses with their flowers in clusters are as follows: Crimson, Crimson Rambler, Gruss an Teplitz, and Hiawatha. Pink, Dorothy Perkins, Blush Rambler, and Minnehaha. White or blush, Climbing Aimee Vibert, Félicité et Perpétue, and Bennett's Seedling. Yellow shades, Alister Stella Gray, Claire Jacquier, and Aglaia.

HOT WATER AND INSECT PESTS.—D. B. J., Exmouth: We have repeatedly stated that water heated to 130 degrees Fahr. is a safe and efficient insecticide. The difficulty associated with the use of hot water is that of keeping the water up to the required heat while the plants are being dipped.

DISEASED SWEET PEAS.—R. A. L., Beckenham: Your sweet peas are suffering from the dreaded "Streak" disease that has so far baffled all attempts to eradicate it. The National Sweet Pea Society is this year making a great effort to discover the cause of, and provide a remedy for, the disease, and all its members have been circularised for information. A special committee has been appointed to deal with the matter, and two well-known experts in plant diseases are giving their assistance. We suggest that you write to the hon. secretary of the society, Mr. C. H. Curtis, Adelaide Road, Brentford, Middlesex, who will forward you a sheet of questions concerning the conditions of cultivation, etc., and also probably ask you to forward two diseased plants for investigation. We understand that any help in this direction will be welcomed by the society, and for such help amateurs must be largely depended upon.

GARDENING DICTIONARY.—A. H. W., Carshalton: The handiest and best of the modest-priced books of the gardening dictionary class is the "Encyclopædia of Gardening," published by Messrs. W. H. and L. Collingridge, 148, 149, Aldersgate Street, post free for 3s. 10d.

NUMBERS OF FRUITS AND VEGETABLES.—C. C. J., Woking: It is a quite easy matter to settle the number of specimens per dish early in the season, and unless this is done confusion is sure to arise. The following would be a very suitable regulation: "In exhibiting vegetables and fruits for competition the following regulation as to number must be observed unless otherwise stated in the Schedule:—Tomatoes and potatoes, 6 of each; broccoli, cabbage, cauliflower, celery, kale, lettuce, 3 of each; Brussels sprouts, beans, and peas, 25 of each; cucumbers and vegetable marrows, 2 of each; beet, carrots, leeks, onions, parsnips, turnips, 6 of each; melon, 1; grapes, 2 bunches; peaches, nectarines, 3 of each; apples, pears, quinces, 5 of each; apricots, figs, 6 of each; plums, 9; damsons, 15; medlars, 10; strawberries, 15; gooseberries, 20; currants, 20 bunches; cherries, raspberries, blackberries, loganberries, mulberries, and nuts, 25 of each."

CATTLEYA BOWRINGEANA.—W. E., Retford: Do not disturb the plant it there is room for further development, as C. Bowringeana resents interference with its roots. The plants vary a great deal in their manner of growth, some rooting much earlier than others, but potting should only be done when new roots are being produced. Carefully shade for a few weeks after potting.

AGRICULTURAL CREDIT BANKS.—W. S., Star Cross: You should first obtain Leaflet No. 214, post free on application to the Secretary, Board of Agriculture, 4, Whitehall Place, London, S.W., which sets forth very clearly the constitution of and operations of agricultural credit banks under the Small Holders and Allotments Act of 1907.

THRIPS ON MELONS.—H. S., Llandudno: As the plants are small there should be no difficulty in carefully sponging the leaves with a nicotine or quassia insecticide, repeating the operation within a week. When syringing the plants be sure that the undersides of the leaves are thoroughly wetted. Maintain a moister atmosphere, and close the house early in the afternoon after syringing.

LARCH SHOOT MOTH.—W. T. E., Ambleside: The Larch Shoot Moth (Argyresthia lævigatella) is a tiny insect. It issues through a flight-hole already prepared in the larch twig at the end of May and the first part of June. The eggs are laid then on the lower part of the shoot of the year, one egg being laid for each shoot chosen. The egg soon hatches. At the time the caterpillar hatches out and starts feeding, by boring below the epidermis, the new larch branch is still developing, and the feeding of the caterpillar at this early stage is not sufficient to prevent the shoot reaching its normal length. As the year goes on the damage is greater, owing to the increased size of the caterpillar and its more extended feeding. Winter overtakes the caterpillar before it is full grown, and hibernation takes place in the boring it has made. The borings or galleries are partly filled with black excrement and bore-meal. In late March or in the month of April the caterpillar starts feeding again, destroying right to the wood and ringing the shoot to an extent—in the longitudinal direction—of four-fifths of an inch. The portion of twig above this place of ringing dies. The caterpillar is full fed in May, and previous to its pupation it bites a hole through the bark that will serve as a place of exit for the adult moth when pupation is over. This flight hole is very small. After making the hole the larva spins a light web, which covers over the little hole, and pupates. The moths issue in May and June. The empty pupal covering does not, as is the case with some moths whose caterpillars are branch-borers, show itself projecting from the flight-hole, but the moth itself when ready works or pushes its way through the web covering the flight-hole, and so reaches the outside. In the spring of the second year the attacked shoot fails to develop its buds, and remains brown and withered and without needles. Occasionally the dwarf shoot just above the flight-hole may produce undersized needles. As the shoot is most markedly eaten in the neighbourhood of the flight-hole, breaking takes place here easily, and these broken, bent-over shoots mark the infestation. According to the Board of Agriculture the treatment that follows from a review of the life history is to break off the infested shoots and destroy them before the escape of the moths. Unfortunately no outflow of resin or appearance of excrement at the exterior is noticeable at the place of infestation (marks which in other insect enemies of trees call timely attention to the fact that they are at work), and the first sign that anything is wrong may only be observed after the moth has flown. Where the caterpillars have already been at work the damage may be expected to be repeated, and this suggests special observation.

MARKS ON NECTARINES.—W. E., Farnham Royal: We find no development that would indicate a fungus attack. The trouble is only skin deep, and appears only to slightly affect the appearance of the fruits. It is not "cracking" in the ordinary sense, but possibly the tree receives rather too much water after stoning, when the fruits being to swell rapidly. Another year give it less moisture than the others, and allow a little extra growth to extend.

NAMES OF PLANTS.

W. J. S., Oxford: 1, Genista virgata; 2, Centaurea macrocephala; 3, Ligustrum chinensis.

D. R. M., Chester: 1, Rosa Wichuraiana; 2, Escallonia macrantha; 3, Robinia pseudacacia.

G. G. C., Aylesbury: 1, Aconitum napellus; 2, Gaura Lindheimeri; 3, Mina lobata; 4, Oncidium flexuosum.

P. R., Londonderry: 1, Oncidium macranthum; 2, Cypripedium superciliare; 3, Odontoglossum crispum; 4, Lælia purpurata.

E. B., Kent.—We could not recognise the roses, as the flowers had fallen to pieces. Send flowers to your nurseryman for naming.

S. O. H. Ringwood: 1, Spiræa aruncus; 2, Strobilanthes Dyerianus; 3, Nertera depressa; 4, Dactylis glomerata variegata; 5, Tilia argentea.

R. R., Newbridge.—1, Lastrea dilatata; 2, Aspidium aculeatum; 3, Athyrium felix-fœmina—a very pretty and elegant variety; 4, Blechnum spicant; 5, Ceterach officinarum; 6, Cystopteris fragilis; 7, Asplenium viride; 8, Polystichum angulare proliferum.

F. W., Fareham.—It is quite impossible for us to undertake the naming of florists' flowers, because, as we have so frequently pointed out in these columns, a considerable collection is necessary for purposes of comparison now that varieties are so numerous. Send specimens of your zonal pelargoniums to Messrs. H. Cannell and Sons, Swanley, and we have no doubt they will oblige you with the names, as they are large growers.

GARDENING ENGAGEMENTS.

Mr. W. Munt for the past ten years head gardener at Stagenhoe Park, Welwyn, Herts, and previously foreman in the Aldenham House Gardens, has been engaged as head gardener to E. Chandler Walker, Esq., Willistead, Waterville, Ontario, Canada.

Mr. Thomas Newman has been appointed head gardener to E. A. Hankey, Esq., Notton House, Lacock, Chippenham.

Mr. L. Bailey has been appointed superintendent of the Public Parks and Gardens at Abertillery, Monmouthshire.

DAHLIAS TO PERFECTION.—A thorough guide to the successful culture of these popular flowers, "Dahlias and Their Cultivation," by J. B. Wroe, price 1s. net, by post 1s. 2d., bound in cloth 1s. 6d., by post, 1s. 8d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

Employment THE GARDENERS' MAGAZINE Register.

The charge for an Advertisement INCLUDES A FREE ENTRY ON THE REGISTER. Immediate Notice must be given when an engagement is secured.

A List of Gardeners on the Register will be supplied to employers only upon application to the Publishers if a stamped envelope is forwarded, addressed 148 and 149, Aldersgate Street, London, E.C.

Situations Wanted.

HER GRACE THE DUCHESS of DEVONSHIRE wishes to recommend J. THOMPSON to any Lady or Gentleman requiring the services of a HEAD GARDENER, where several are kept; 20 years' experience in all branches. Holker Gardens, Cark-in-Cartmel, Lancs.

HEAD GARDENER seeks RE-ENGAGEMENT (abstainer); age 36; married; eighteen years' practical experience; also landscape experience; first class references. Apply E. PANNELL, Oban House, Boughton, Faversham, Kent.

MR. TAYLOR, Head Gardener to Sir James Mackay, Chesterford Park, Essex, can highly recommend J. WREN as HEAD GARDENER, where two or more are kept; thoroughly experienced in all branches, Inside and Out; good references; age 31; married, three children; leaving when suited. J. WREN, Meesden, Buntingford, Herts.

MR. E. R. BEVAN highly recommends his late HEAD GARDENER; 13 years in his service; life experience in all branches; most capable and trustworthy; 39; married, one child. H. KING, Rempstone, Corfe Castle.

GARDENER (Head Working); experienced in the cultivation of Fruit, Plants, Flowers under Glass, Flower and Kitchen Garden, Forcing, etc.; also Hardy Fruit culture; good references; married, no family. W. S., 16, Warwick Place, Maidstone, Kent.

GARDENER (Head of two or three), age 34; life experience in all branches; Inside and Out; well recommended; two children, 3½ and 6 years. W. SAWYER, 4, Gun Road, Knebworth Stn.

GARDENER (Head Working); age 44; life experience; 21 years' excellent references from first-class establishments; thorough knowledge in all branches; prize winner; leaving own request; no young children; youngest 14. W. BLOOMFIELD, Staplehurst, Kent.

GARDENER (Head Working, where two or more are kept); life experience Inside and Out, can be well recommended; age 36; married, one in family, 13 years. T. WEST, near New House Farm, Ninfield, Sussex.

GARDENER (Head).—Mr. PRINSEP, Buxted Park, Uckfield, will have much pleasure in recommending his Foreman, J. BROWN, to any Nobleman or Gentleman requiring the services of a thoroughly practical Man; age 32.

GARDENER (Head Working, where one or two more kept, or good Single-handed); experienced Inside and Out; good references, and recommended; age 27; married when suited. W. CROUCHER, 11, North Terrace, Hythe, Kent.

GARDENER (Head Working, where two or more are kept); good all-round; can be well recommended; married when suited; age 36. PEARCE, Ridley, near Wrotham, Kent.

GARDENER (Head or Single-handed); 30 years' practical experience; ten years' reference; fifteen previous. G. R., 227, Cavendish Road, Balham.

GARDENER (good Single-handed where help is given or Head of two); good all round experience, both inside and out; 8 years and 10 months' reference; eldest boy of three 14 years old; life experience; wife willing to help in house or laundry; good ironer. HARRY GOOD, Ivinghoe, near Tring, Bucks.

GARDENER (Single-handed); married; age 27, seeks SITUATION; experienced Inside and Out; 5½ years' excellent reference last situation. Apply W. G. CONN, 7, Coombe Road, Sydenham.

GARDENER (Single-handed or Under); life experience; age 26; 2 years last place; good references; willing and obliging. A. TICKNER, 9, Carlos Road, Godalming.

FOREMAN (Inside).—Mr. DYE, Tring Park Gardens, Tring, Herts, wishes to recommend C. BALCHIN as above; 12 years' experience in Fruit, Plants, Carnations, and Malmaisons, House and Table Decorations; age 26; good references.

FOREMAN (Inside or General); age 27; 13 years' practical experience; three years as Foreman; good references; highly recommended. NORGATE, Bagshot, near Hungerford, Berks.

FOREMAN (inside), age 27. — Mr. ELLIOTT, Bramcote Hall, Bramcote, Notts, recommends his Foreman as above; 12 years' experience with Fruit and Plants. House Decorating, etc.; good recommendations from previous situations; disengaged when suited; Bothy preferred.

MR. HODGSON, Hesley Hall Gardens, Tickhill Rotherham, highly recommends G. ELY as Inside Foreman; age 28; good experience in Fruit, Plants, House, and Table Decorations; 3 years here; leave when suited.

GARDENER (Second, Inside and Out, where three or four are kept); life experience and good references; disengaged when suited; age 23. J. F. EATON, Rochford, Essex.

JOURNEYMAN-IMPROVER, age 20, seeks SITUATION, inside, or inside and out; well recommended; 3 years' good experience, inside and out at The Moot, Downton. S. FURNELL, Morgan's Vale, Downton, near Salisbury.

JOURNEYMAN (Inside and Out), age 24; 8 years' experience; can be well recommended; nearly 2 years' present situation. A. FUZZENS, Ossington Hall Gardens, Newark.

JOURNEYMAN, Inside or Inside and Out; age 21; 8 years' experience; good recommendations. Apply W. BRADSHAW, Station Cottages, Huntingdon.

MR. FINLAY, The Hall Gardens, Bushey, Herts, will be pleased to recommend J. SHAW as JOURNEYMAN (Inside); over five years' experience; age 19½; abstainer; Bothy preferred.

MR. MILES, The Gardens, Caversham Park, Reading, wishes to recommend C. RICHES as JOURNEYMAN (Inside); age 21; six years' experience.

GENTLEMAN wishes to recommend Young Man as GARDENER (Under) in Kitchen Garden, or Kitchen Garden and Pleasure Grounds; age 21; abstainer; good references. BARRELL, Frating, Colchester, Essex.

HANDYMAN and GARDENER seeks SITUATION, Painting, Glazing, Bricklaying, Carpentering, etc., or with Pigs and Poultry. A. BRETT, 72 Leahurst Road, Hither Green, Lewisham.

HANDY MAN (deaf); Carpentering, Painting, Glazing, rough Brick-laying on Estate or Nursery; help in garden, poultry, etc. Used to Estates; ex. refs. A. GERMAN, 475, Commercial Road, Portsmouth.

SITUATION WANTED, Inside and Out; age 24. Apply A. COX, Peaselake, Gumshall, Surrey.

MR. W. HUMPHREYS, Buckden Towers, wishes to highly recommend a respectable YOUNG MAN under a good Foreman; age 20; Bothy preferred. G. WORLEY, Buckden, Huntingdon.

YOUNG MAN, age 24, seeks SITUATION as ESTATE HANDY MAN; good all-round experience; excellent references. HALL, 4, Oakfield Road, Cockfosters, New Barnet, Herts.

YOUTH (18) wants SITUATION in gentleman's garden where two or more kept; Inside or Inside and Out. Apprenticed two years, altogether three years' experience; best references; Bothy preferred. L. PENNINGTON, 49, Victoria Grove, Stoke Newington, London.

Situations Vacant.

WANTED, at once, YOUNG MAN aged 15 or 16, for Outside Garden work (eleven kept); good reference necessary. Apply HEAD GARDENER, Pyrford Court, Woking, Surrey.

WANTED, active YOUNG MAN, Second of three, chiefly for Pleasure Grounds and Kitchen Garden; must have some experience of Inside, and capable of alternate duty. Preference to abstainer; wages 24s. GARDENER, Homewood, Eden Park, Beckenham.

THE BEST CABBAGES FOR AUGUST SOWING.
SUTTON'S APRIL,
Per packet, 1s., post free.
SUTTON'S FLOWER OF SPRING,
Per ounce, 1s., post free.
SUTTON'S FAVOURITE.
Per packet, 1s., post free.
"One of the earliest is Sutton's April, and this is a model Cabbage of very compact growth and quite free from bolting. It is remarkably early, and is rightly named, for I have had it the first week in April after a severe winter. Another very reliable early Cabbage is Sutton's Flower of Spring. This is a little larger than April, but equally valuable where quantities are required. It forms a compact head of a most beautiful shape, and is exceedingly delicate in flavour. — G. Wythes, The Gardens."

SUTTON AND SONS, THE ROYAL SEED ESTABLISHMENT, READING.

KELWAY'S "COLOUR BORDERS"
(Regd.)
Artistic and permanent—arranged for continuous bloom and colour effect.
These Borders can be purchased BY THE SQUARE YARD for any position all ready arranged for planting.
"I am thinking of planting a few borders with perennials. I am tired of continually planting bedding plants. Mrs. ——."
Write now stating your area, position, soil, etc., for planting in the Autumn, to
KELWAY AND SON, The Royal Horticulturists, LANGPORT.

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

Grubs.

Grubs, as representing intermediate forms of insect life, mostly in the form of caterpillars or maggots, constitute undoubtedly the most pernicious and destructive pests to which plant life is subjected. It is really they which do practically all the damage in connection with moth and butterfly tribes, which in their perfect flying form content themselves with the light and innocuous fare provided by floral nectaries, and in return for which they perform in many cases the essential service of conveyance of pollen from one flower to another. Unhappily, however, these ambrosial repasts suffice to enable them, after their nuptial flights, to perfect an immense number of eggs, which they deposit with great dissemination upon the stems and foliage of such plants as are best adapted to nourish the future broods of devastating grubs. Since, therefore, every moth or butterfly may be regarded as a potential mother of a brood of hundreds, it is clear that it behoves the mere plant lover, as distinct from the entomologist, to wage war upon them, and particularly under glass, where the appearance of a fluttering intruder should be the signal for a chase of the most ardent description. The caterpillar is, indeed, one of the most voracious creatures in existence; it rarely rests from feeding; and thus a single individual, if unobserved, can reduce a fair-sized plant to a thing of rags and tatters within the period commencing when it whets its baby teeth on promising buds and leaflets, and when finally it enwraps itself in a cocoon in some secluded corner in the vicinity of its last repast, as a prelude to the butterfly stage later on. They vary much in their habits, however; some restrain their appetites during the day, hiding themselves in the soil, only to sally forth at night, and make up for their abstention by redoubled energy in feeding; the hapless owner of the plant finding its still more hapless remains in the morning in the shape of bare twigs minus a trace of the depredator. The day and night feeders are, however, more easily discovered, since, as a rule, their droppings betray both their presence and their position; but some, like the woolly bear, are wide rangers, and travel rapidly from plant to plant, leaving only partial wrecks behind them. Apart from the traces indicated, evolution has endowed these pests with peculiar modes of disguising their presence. Sometimes they so closely imitate the foliage in colour, and even markings, as to need a sharp eye to distinguish them; while others imitate, both in colour and position, the twigs in their vicinity, and thus baffle the would-be destroyer. Sometimes, but rarely, we may find individuals of a wrong colour on a plant; but the very fact of its instant discovery and destruction affords a capital example of how evolution works in favour of the fittest and adversely to the unfit, since birds' eyes are equally keen. The grubs of the maggot persuasion, such as those of the weevil and the crane-fly (Daddy Longlegs) are even more insidious and destructive than the caterpillar. Plants are beneficently gifted by nature with a large reserve of vigour as regards foliage, and will survive a large amount of denudation; but the pests in question devour the roots and root-stocks, which are the very foundation of plant life; and hence, if left undisturbed, utter destruction is the result; and we may find the unfortunate plant with all its foliage intact, but wilted, lying loose upon the soil, and dead beyond redemption. Wherever, therefore, the presence of such grubs is suspected, it is better to lift the plants, remove the pests, if present, and then replant. Unfortunately most of this tribe of depredators are immune from such toxic remedies as would not be fatal to plant life also. Then we have the wireworm type and innumerable insidious borers, whose life histories in these later days are becoming rapidly mastered, together with the weak points at which they are best assailed. Fortunately, too, in the insect world there are innumerable members which wage war upon other species, and thus help mankind to reduce them. Ichneumon flies are always at work depositing frustrating eggs in the bodies of alien larvæ; insidious fungoid diseases attack some of the pests; but perhaps the most curious case of foe versus foe is recorded in which a wireworm was caught in the very act of boring through the body of a living weevil in a fernery we are familiar with. Finally, we may refer to such grubs as those of the bees and wasps, which are fed, as it were, at home, in the nests provided for them by the community, and which therefore do no direct harm, save in so far as they serve as a link of continuity in a race which, as with the wasp, may do much damage in the winged state. The grubs of the house-fly and blue-bottle may be regarded as doing more good than harm, since they act as scavengers of dead and refuse matter, and leave living plants alone.

MR. CHARLES G. WYATT.

Mr. C. G. Wyatt, whose portrait we have the pleasure of giving in this issue, possesses a remarkable breadth of view, and, as the head of Messrs. Keynes, Williams, and Co., he takes an active interest in classes of plants that are of the most diverse character. His name is, however, the most closely associated with roses and dahlias, which have long occupied prominent positions in the Salisbury nurseries, and he is acknowledged as one of the leading authorities by all classes of growers. While cultivating largely and well all the finest of the varieties of both dahlias and roses, Mr. Wyatt is strongly impressed with the importance of breaking away from traditional lines and introducing as opportunities arise quite new types as a means of retaining the public interest in the several classes of flowers that have a prominent position. We have evidence of this in the fact that the large number of beautiful hybrid briars raised by the late Lord Penzance were distributed by his firm. Then, in turning to dahlias, in which Mr. Wyatt takes a special interest, we find that he has raised and introduced several cactus varieties that differ materially from the florists' type, as well as many that conform to it. Of the former mention may be made of such varieties as Arachne, Innovator, and Progenitor, which, if no longer new, are none the less interesting or useful in the garden where departures from the ordinary type are appreciated. Mr. Wyatt is a mine of information on all that relates to the dahlia and its cultivation, and is always listened to with pleasurable interest when he takes part in discussions relating to the flower, as, for example, at the conference held by the National Dahlia Society in March last. While Mr. Wyatt has given much time and thought to the raising and cultivation of cactus dahlias, his efforts in connection with them has not appreciably diverted his attention from the show, fancy, and pompon dahlias, of which he has raised many excellent varieties, and grown immense numbers of blooms of so high a quality as to place him in the front rank of exhibitors of these flowers.

Chief Officer of the London Parks.—The London County Council invites applications for the position of Chief Officer of the Parks Department, and the wording of the advertisement suggests that the importance of a knowledge of horticultural matters to the Chief Officer is not fully appreciated by the Council, notwithstanding the great change in its composition that it has undergone since the appointment of a military officer to the post in February last. The invitation is as follows: "The London County Council invites applications for the appointment of Chief Officer of its Parks Department, who will be required to give his whole time and energies to the duties of his office. Members of the staff of the Council are not precluded from making application for the position. The person appointed will be responsible for the management of all the parks, gardens, and open spaces maintained by the Council, which at present are 114 in number and of an aggregate area of about 5,100 acres. He will also be responsible for organising the recreative arrangements in the parks, including gymnasiums, boating, game pitches, and bands; for the management of the conservatories and the horticultural and other buildings therein, for overlooking the refreshment facilities, and for the management and discipline of the staff employed in the parks service. The average number of the staff is 1,000, including in its ranks men well qualified as specialists in their separate departments; and, while for the chief officership knowledge of surveying, landscape gardening, forestry, and horticulture is desirable, the principal requirement must always be a capacity for intelligent general supervision of the very varying duties which have to be performed under the chief officer's authority. The person appointed will not be allowed to take any private business or other paid employment, and any fees received by him, either as a witness or in any other capacity, are to be paid to the Council. He must not be more than 45 years of age on September 1, 1910. The commencing salary attaching to the appointment is £700 a year. No fixed allowance will be made to him for travelling expenses, but he will be repaid any such expenses as he may actually incur." It will be seen that, while the Chief Officer will have the supervision of public parks and gardens, with an aggregate area of upward of 5,000 acres, the knowledge by which alone they can be successfully managed is regarded as a quite secondary matter. This is certainly what we understand from the statement that, "while for the chief officership knowledge of surveying, landscape gardening, forestry, and horticulture is desirable, the principal requirement must always be a capacity for intelligent general supervision of the very varying duties which have to be performed under the Chief Officer's authority." This is surely a contradiction of terms, for it is impossible for anyone to exercise an intelligent supervision over a large number of parks and gardens devoted to public use without a full acquaintance with the details of their management. The fact of the superintendents being well qualified as specialists does not in any way render it unnecessary for the Chief Officer to be a horticulturist of the first rank, as well as possessing administrative abilities of a high order. On the contrary, the more thorough the acquaintance of the superintendents with the science and practice of horticulture, the greater is the necessity of the officer placed in authority over them possessing similar knowledge.

Extension of Wimbledon Common.—For the purpose of preserving the view from Wimbledon Common, the Maldens and Coombe Urban District Council has decided to purchase, at a cost of £3,500, the 15 acres 3 roods and 15 poles of land lying between Robin Hood and Coombe Bridges. This will give a walk from Coombe Bridge to Richmond Park.

Vacant Land Cultivation Society.—The second annual meeting of this extremely useful society was held in the Council Chamber, Guildhall, on Wednesday last, when a report of much interest was presented. As we have previously mentioned in these pages, the object of this society is to utilise vacant land in London and other cities in giving employment to needy working men and women. The society was founded three years ago, and its method of procedure is to obtain the loan of vacant land from the owners and to let it rent free to members of the working classes who are out of employment or are otherwise in poor circumstances. The progress made has been so rapid that the society has now the control of 60 acres, and on this area 500 men and women have plots in cultivation, and it is estimated that, by including the families, 2,400 persons are deriving benefit from the produce of the land. There are, in addition, 250 applicants for plots, and to provide for these 30 acres more land are required. It is estimated by the society that the gross annual retail value of the produce raised by the occupants of the plots exceeds £5,000, and that for every £1 spent by the society the plot-holders have had £5 worth of useful vegetables. When it is remembered that the whole of the land thus utilised had practically been waste—in some cases for many years—the advantages are obvious. The society, it should be mentioned, when it has obtained the loan of land, fences it, and then clears and otherwise prepares it for the tenants, who are also assisted with seeds and advised on garden management. Thus a considerable annual expenditure is involved, and, as this is met by voluntary subscriptions, it is not possible to proceed so rapidly with the work as could be desired. The honorary secretary is Mr. J. Fels, 39, Wilson Street, Finsbury, London, E.C., who, we observe, contributed about one-third of last year's income, and the garden superintendent is Mr. R. Lewis Castle. The society will welcome contributions of seeds, tools, etc., as well as subscriptions.

R.H.S. General Examination in Horticulture.—From the recently issued report on the general examination in horticulture, held by the Royal Horticultural Society on April 20 last, we learn that in the examination of seniors (over 18 years of age) there were 174 candidates, of whom seven did not present themselves on the appointed date. The examiners, the Rev. Professor Henslow, V.M.H., and Mr. James Douglas, V.M.H., report that of the 165 English candidates securing a place in the pass list, 42, or 25 per cent., secured places in the first class; 88, or 53 per cent., obtained the second class; while 35, or 22 per cent., appear in the third class. Of seven candidates in India, four were placed in the second and three in the third class. Of four in South Africa, two were placed in the first, and two in the third class. Comparing the results of the questions in Section A with Section B, it was found that 43 excelled in A, or 25 per cent., and 55 in B, or 31 per cent.; while 57 were within 10 marks of each other, or 32 per cent.; and, lastly, 21 candidates obtained exactly the same total number of marks in each paper, i.e., 12 per cent. Cases of wide variation in the marks secured in the two sections were very few, and were mostly confined to the third class. These results, therefore, seem to indicate that candidates had studied both the theoretical and practical sections of the syllabus with equal attention, a slight balance in favour of practical knowledge (Section B) over physiological (Section A) being perhaps perceptible. In the junior (under 18 years of age) examination there were 112 candidates, and of these eight were placed in the first, 29 in the second, and 37 in the third class; while 21 were placed in a fourth class. Those securing less than 25 per cent. of the full marks do not appear in the list.

Conservatory Design.—In the continuation of the article on "Conservatory Design," which appeared on page 512, we inadvertently credited another firm with the erection of the whole of the glass structures in the Royal Horticultural Society's gardens at Wisley, whereas Messrs. W. Richardson and Co., of Darlington, erected, in competition, the fine plant and fruit houses which have from the first formed an important feature of the Wisley gardens, and brought the builders much praise. Messrs. W. Richardson and Co. have just completed a new orchid house in these gardens, which has been erected under the superintendence of the R.H.S. Orchid Committee.

Horticultural Club Excursion.—By the invitation of N. N. Sherwood, Esq., the members will visit Prested Hall, Kelvedon, Essex, on Thursday, July 28, and not July 30, as stated in the preliminary notice. All applications for tickets, which are 7s. 6d. each, should be made to Mr. H. J. Veitch, Royal Exotic Nursery, Chelsea, before July 20.

Paris Floods.—The final list of subscriptions opened by the National Horticultural Society of France for the benefit of French nurserymen who suffered by the floods has just been published. The amount raised reached the sum of over £1,500.

Saxifraga umbrosa. — Mr. J. Fraser directed attention at a recent meeting of the R.H.S. Scientific Committee to seedlings of a compact form of Saxifraga umbrosa, with prettily-spotted flowers differing from the type in stature and in the closeness of the rosettes. The seedlings came true in habit, but showed some variation in the spotting of the flowers.

EXHIBITIONS AND MEETINGS.

◆

National Rose Society.

In some respects the weather on the occasion of the great Metropolitan Rose Show, held at the Royal Botanic Gardens on July 8, was not of the best. The wind was cool and the sky overcast, and everyone knows it had rained more or less, chiefly more, for many days previously. But the cool weather made the crowded tents bearable, and the cool, damp days that preceded the show made it possible for growers to stage many of the grand old highly-coloured roses in beautiful condition. The disadvantage was that the ground on which the tents were erected had in some of the low, wet places been churned up by hurrying feet in the small hours of the morning, and was therefore not in a pleasant state to walk upon, especially in the case of the many ladies elegantly gowned for the occasion.

The show was a good one, not the best, but very good, and the competition in most of the classes was very keen. Of course, the society is perfectly right in catering for its small growers, but to the visitor who is not a competitor and comes to see good roses the repetition of classes and also of varieties becomes very bewildering and monotonous; but it is a mistake to quite overlook the small classes, because often they contain some very fine flowers.

THE CHAMPION TRADE CLASS.

There is always a great fight in the Nurserymen's Champion Class, where the Trophy, Gold Medal, and money award are offered as the premier prize for seventy-two blooms distinct. There were six competitors on this occasion, and the championship rests for the season with Messrs. Alex. Dickson and Sons, Newtownards, co. Down, who staged splendid, fresh, bright, and good-sized flowers. The leading varieties were Mrs. David McKee, Frau Karl Druschki, Mrs. C. W. Kershaw, Mdme. Vermorel, Helen Keller, Mrs. Hugh Taylor, Mrs. Foley Hobbs, Mildred Grant, Charles J. Grahame, Etienne Levet, Ben Cant, Mrs. E. Mawley, Horace Vernet, Mrs. T. Roosevelt, Ulrich Brunner, A. K. Williams, Gustave Grunerwald, Duchesse de Morny, Mrs. R. G. Sharman Crawford, Lyon Rose, S. M. Rodocanachi, G. C. Waud, Marie Baumann, Mdme. Melanie Soupert, Gustave Piganeau, J. Stuart Mill, and Caroline Testout. Messrs. D. Prior and Son, Colchester, were second with good flowers, but the stand needed a few lighter-coloured varieties; Messrs. B. R. Cant and Sons, Colchester, third; and Messrs. Frank Cant and Co., Colchester, fourth.

Forty varieties, three blooms of each, is a good class, and is a severe test of quality. There were five contestants, and first prize fell to Messrs. Alex. Dickson and Sons, Newtownards, for a very bright set of medium-sized flowers, some of which showed traces of bad weather. The best flowers were Frau Karl Druschki, Marquis Lita, Heinrich Schultheis, Mrs. T. Roosevelt, Horace Vernet, G. C. Waud, A. K. Williams, Lyon Rose, Mrs. W. J. Grant, Mrs. David McKee, Gustave Piganeau, Caroline Testout, Mrs. Hubert Taylor, Mrs. R. G. Sharman Crawford, Marie Baumann, Mrs. E. Mawley, John Ruskin, Victor Hugo, Ulrich Brunner, and Mildred Grant; Messrs. Benjamin Cant and Sons, Colchester, came second with a good set, in which Lyon Rose, G. C. Waud, Captain Hayward, and Ben Cant stood out well; Messrs. D. Prior and Son, Colchester, third.

NURSERYMEN'S CLASSES.

The Colonial Cup, offered as the chief award for forty-eight blooms, distinct, was secured by Mr. George Prince, Longworth, Berks, with flowers of wonderful brightness but small, and also with weather-stained outer petals. The best varieties were Captain Hayward, A. K. Williams, Earl of Warwick, Mrs. D. McKee, G. C. Waud, White Maman Cochet, Lyon Rose, and Dean Hole; there were eight competitors, and Mr. Hugh Dickson, Royal Nurseries, Belfast, gained second award; Mr. H. Drew, third, and Messrs. G. and W. H. Burch, fourth.

For two dozen roses, distinct varieties, there were nine entries, and Mr. J. Mattock, Headington, secured the leading award with C. J. Grahame, Lyon Rose, Mrs. J. Laing, Earl of Warwick, Hugh Dickson, and J. B. Clarke, specially good; Mr. J. Pigg, Royston, second; and Messrs. Perkin and Sons, third. The best sixteen trebles were shown by Messrs. G. and W. H. Burch, who contributed excellent blooms of J. B. Clarke, Ulrich Brunner, Frau Karl Druschki, Lyon Rose, Mrs. J. Laing, and Horace Vernet; Mr. George Prince, a close second; and Mr. W. Leggett, Rose Gardens, West Bergholt, Colchester, third.

A curious class was the one for sixteen varieties of H.T. roses, distinct, not less than three or more than five blooms of each, to be shown in two twenty-four boxes. There were six competitors, and Mr. Hugh Dickson scored here with Joseph Hill, Mdme. A. Chatenay, Laurent Carle, Countess of Gosford, Richmond, Pharisaer, Mdme. Melanie Soupert, General McArthur, Lyon Rose, etc. Mr. J. Mattock was second, and Messrs. Frank Cant and Co., third.

NURSERYMEN'S TEA ROSES.

The D'Ombrain Challenge Cup for the best two dozen distinct T. or N. roses fell to Mr. George Prince, Oxford, who had what was only a fair set for him; his best flowers were Medea, Miss E. Brownlow, Mrs. E. Mawley, Souv. de Pierre Notting, White Maman Cochet, Maman Cochet, Molly Sharman Crawford, Mdme. Vermorel, Bridesmaid, and Muriel Grahame; Mr. Henry Drew, Longworth, second; and Messrs. Frank Cant and Co., Colchester, third. Mr. J. Mattock, Headington, led for a dozen flowers, and his best specimens were The Bride, Mrs. E. Mawley, Maman Cochet, and White Maman Cochet; Messrs. J. Burrell and Co., Howe House Nurseries, Cambridge, second; and Mr. John Pigg, Royston, Herts, third; six entries.

Fourteen trebles of tea roses, shown in vases, was a class that brought out four competitors, and here Mr. George Prince scored, and his cleanest flowers were of Mrs. E. Mawley, Molly Sharman Crawford, White Maman Cochet, Catherine Mermet, The Bride, and Mdme. Jules Gravereaux; Mr. H. Drew, second; and Messrs. F. Cant and Co., third.

NURSERYMEN'S VASE CLASSES.

There were four entries in the class for twelve exhibition varieties of roses, seven blooms of each, and here the flowers were remarkably fine, especially the winning set, from Messrs Alex. Dickson and Sons, Newtownards, whose card was endorsed "very good" by the judges. The varieties were Mildred Grant, Horace Vernet, Mrs. J. Laing, Countess of Ilchester, William Shean, Mrs. W. J. Grant, Mrs. Theodore Roosevelt, Duchess of Portland, A. K. Williams, Mrs. E. Mawley, Frau Karl Druschki, and Ulrich Brunner; Messrs. D. Prior and Son, Colchester came second, and their flowers were splendidly set up; Messrs. J. Jefferies and Sons, Lim., Cirencester, third.

There were three competitors in the class for nine vases of exhibition tea roses, seven blooms in each vase; Mr. George Prince led here, and he had fine fat flowers of Mrs. Mawley, Mdme. C. Soupert, Bridesmaid, Molly Sharman Crawford, Medea, and White Maman Cochet. Mr. J. Mattock second, and Mr. H. Drew, third.

Mr. J. Mattock, Headington, led for a table of thirty-six vases of decorative roses, and he had Trier, Lady Curzon, Papillon, Gottfried Keller, and Betty in good condition; Messrs. Frank Cant and Co., Colchester, a very close second with an attractive exhibit; Mr. G. Prince third. Mr. Chas. Turner, Slough, led for eighteen bunches of decorative roses, and showed Le Progres, Mdme. Abel Chatenay, Betty, and Lady Battersea finely; Messrs. W. Spooner and Son, Woking, second, and Mr. J. Barrow, Oadby, Leicester, third.

Messrs. Frank Cant and Co. had the best display of eighteen bunches of summer roses (H.P.'s, H.T.'s, T.'s, and Chinas not admitted), and in their set they had grand bouquets of Crimson Damask and Hebe's Lip; Messrs. W. Spooner and Son, Woking, second, and Mr. Charles Turner, third. Premier award for eleven bunches of decorative roses was won by Mr. George Prince, who had Mdme. Abel Chatenay, Mdme. Ravary, Crimson Rambler, Betty, etc., in good style; Messrs. G. Jackman and Sons, Woking, second, and Messrs. G. Mount and Sons, third. Mr. G. Prince had the best six new roses, and was followed in order by Messrs. Paul and Son and Mr. J. Mattock.

GROUPS OF ROSES.

Two very fine groups of roses, each arranged on one hundred square feet of space, were staged, and there was not much to choose between them. Messrs. Paul and Son, Cheshunt, were awarded first prize, and they had standard roses of the Wichuraiana type in plenty over smaller plants, and a whole host of cut flowers. Messrs. Hobbies, Lim., Dereham, had specimen Wichuraianas set in an excellent ground work of cut blooms, prettily arranged.

For a representative group of roses arranged on a space of 100 square feet, Mr. J. Mattock, Headington, Oxford, secured the gold medal and first prize with a wonderful and effective exhibit; there was a backing of rambling roses, with tall stands of Lyon Rose, Frau Karl Druschki, Gustave Regis, Mrs. J. Laing, Ulrich Brunner, Countess of Derby, Cramoisie Superieure, and Lady Curzon in the front, with small vases of popular T. and H.T. varieties to fill in the foreground; Messrs. G. Mount and Son, Canterbury, were equal second, and had trophies of Frau Karl Druschki, Liberty, Lady Hillingdon, Mdme. Abel Chatenay, Killarney, and Mrs. W. J. Grant; and Messrs. W. and J. Brown, Peterborough, were awarded equal second for a light and pretty arrangement, in which Lyon Rose, Mrs. Laing, and Liberty were finely shown. Mr. F. M. Bradley, Peterborough secured an extra prize.

OPEN CLASSES.

In the open classes Mr. Walter Bentley led for eighteen crimson roses, one variety, arranged in a bamboo stand, with J. B. Clarke in fine form; Mr. H. Drew, second, with Ben Cant and Messrs. D. Prior and Son, third, with Marie Baumann; eight competitors. The best stand of eighteen of any white or yellow rose were huge examples of Frau Karl Druschki, shown by the King's Acre Nurseries, Hereford; Messrs. B. Cant and Sons, Colchester, second, with White Maman Cochet; Mr. G. Prince, third, with Lyon Rose; ten entries.

Messrs. D. Prior and Son, Colchester, came first for a stand of eighteen blooms of any other than a white, yellow, or crimson rose with champion blooms of Mrs. Theodore Roosevelt; Mr. Walter Bentley, Leicester, second, with the same variety, very clean and good; Messrs. Harkness and Co., Hitchin, third, with Mrs. J. Laing; twelve entries. Messrs. A. Dickson and Sons led for nine flowers of any new rose with lovely specimens of Walter Speed; Mr. Hugh Dickson second, with the deep crimson Leslie Holland; and Messrs. S. McGredy and Son, Portadown, third, with Ethel Malcolm; and Mr. Elisha J. Hicks, Twyford, Berks, equal third with Lyon Rose.

For a dozen new roses, Messrs. Hugh Dickson, Belfast, scored with Commander Jules Gravereaux, Miss Cynthia Forde, Mrs. P. H. Coates, Mrs. Holland, Leslie Holland, Walter Speed, Mrs. Sophy Neate, Margaret Molyneux, Lyon Rose, Nita Weldon, Countess of Shaftesbury, and Molly Sharman Crawford; Messrs. Frank Cant and Co. second; and Messrs. A. Dickson and Sons, third. In the Nita Weldon class for a dozen vases of roses not sent out before November, 1909, Mr. Hugh Dickson, Belfast, was first; and Messrs. A. Dickson and Sons, Newtownards, second; there were excellent blooms of most of the recent novelties.

Messrs. Frank Cant and Co., Colchester, scored for a dozen bunches of single roses in the open division, their best being Crimson Damask, Jersey Beauty, Joseph Billiard, Lady Curzon, Macrantha, Irish Glory, Morganroth, and Moschata alba; Mr. G. Prince second; and Messrs. Paul and Son, Cheshunt, third. For three baskets of bedding roses, a quite new class, Mr. J. Mattock, Headington, won the piece of plate offered by the President, Rev. F. Page Roberts, with beautiful arrangements of Marie Van Houtte, Mdme. Abel Chatenay, and Betty—a lovely set; Messrs. G. and W. H. Burch, Peterborough, second, with Richmond, Mdme. Abel Chatenay, and Mdme. Ravary; Mr. J. Barrow, third.

AMATEURS' CLASSES.

Mr. E. B. Lindsell, Bearton, Hitchin, won the amateurs' championship once more, and showed three dozen fine flowers, the finest of which were Yvonne Vacherot, Mrs. E. Mawley, F. K. Druschki, Gladys Harkness, Gustave Piganeau, Hugh Dickson, Bessie Brown, Mrs. T. Roosevelt, Ulrich Brunner, Mildred Grant, Charles Lefebvre, and Horace Vernet. There were eight competitors, and Mr. F. Dennison, Cranford, Leamington, was a good second with large blooms of Mrs. J. Laing, Mildred Grant, Mrs W. J. Grant, and F. K. Druschki; Mr. Conway Jones, Hucclecote, Gloucester, third; and Rev. T. G. Henslow, Chippenham, fourth.

Mr. E. B. Lindsell was also chief prize winner in the class for two dozen blooms, and again had fine examples of Caroline Testout, Duchess of Bedford, F. K. Druschki, Ulrich Brunner, Mrs. T. Roosevelt, and Mildred Grant; Mr. G. A. Hammond, Cambrian House, Burgess Hill, second; and Mr. F. Dennison, third. The best set of twelve trebles came from Mr. Conway Jones, whose Mrs. J. Laing, Earl of Warwick, Frau Karl Druschki, and Caroline Testout were excellent. Mr. Mease, gardener to A. Tate, Esq., Downside, Leatherhead, second; and the Rev. T. G. Henslow, third. Mr. R. Foley Hobbs, Thorneloe, Worcester, scored for nine blooms of one variety with superbly clean and full flowers of Frau Karl Druschki; Mr. E. B. Lindsell, second, with Mrs. T. Roosevelt; and Rev. T. G. Henslow, third, with La France.

The Hobbies Cup for twenty-four blooms, open to growers of less than 3,000 plants, fell to Mr. E. M. Eversfield, Horsham, who had a superb bloom of Victor Hugo in a good stand, Rev. J. A. Fellowes, Attleboro', second, and Mr. W. Boyes, Middleton-in-the-Wolds, Yorks, third. In this section Mr. Eversfield also scored for a dozen trebles, with Rev. J. A. Fellowes second. Also in the same division Mr. Eversfeld led for nine blooms of one variety with F. K. Druschki; Mr. Boyes second.

The Christy Cup for two dozen blooms, open to growers of less than 2,000 plants, was won by Mr. W. J. Thorpe, Hucclecote, Gloucester, with blooms of good size and colour; Mr. W. R. Hammond, second, and Mr. W. O. Times, Hitchin, third. In this section Mr. Hammond led for six flowers of one variety with Dean Hole, and Mr. E. C. Williamson, Wilstead, Canterbury, led for any other than a tea rose, six blooms, with F. K. Druschki. Also in the same section Mr. G. R. Bonner, Tillingbourne, Burnwood, Gloucester, beat Mr. T. E. Pallett, Earls Colne, Essex, and Mr. G. Speight, Market Harborough, for two dozen blooms, and all showed well. Mr. W. O. Times was first and Mr. C. Page, second, for eight trebles.

Mr. C. F. H. Leslie, Epscombs, Hertingfordbury, scored for a dozen blooms in the class for growers of fewer than 1,000 plants, Dr. C. Lamplough coming second, and Mr. M. Whittle, third. For six of any variety Mr. A. C. Turner, the White House, Walton, led with F. K. Druschki, with Mr. G. Moules, Hitchin, second; thirteen entries.

Growers of fewer than 750 plants came forward in large numbers. For a dozen blooms the Rev. J. Chalmers Hunt, Willian Rectory, was first, and he also led for six tea roses. Dr. C. Lamplough, Alverstoke, beat Mr. G. W. Cook for six trebles.

The Charles Grahame Memorial Prize for nine blooms, open to growers of fewer than 500 plants, was won by Mr. H. W. Richards, Ryde, who had a fine Frau Karl Druschki, Her Majesty, and Marie Baumann; Mr. J. Stuart, Broomhill, Harrow, led for six blooms, and Mr. Upton, second.

The Charles Grahame Memorial Prize for blooms, open to growers of fewer than 350 plants, was won by Captain R. Kilbee Stuart, Evendine House, Colwall, Herts; Dr. F. G. Hayes, Dunster, Somerset, second; and Mrs. E. Moulden, Bandra, Stevenage, third; twelve entries. In the same division Mr. Alan Searle, Ashton Grange, Bassett, was to the front for six blooms, with F. K. Druschki, and Mr. F. J. Nightingale, Sutton, second.

Growers of fewer than 200 plants came forward in goodly numbers, and here the Rev. G. F. Henshaw, Corsley Rectory, Warminster, was first for six blooms and also for four trebles, with Mr. F. A. George, Red Hill, Worcester, second; for six flowers of one variety, Mr. R. House, Odds Farm, Woburn, led with the inevitable F. K. Druschki. For six flowers, not less than four varieties, Mr. H. F. Matthews, Berkeley House, Stevenage, went to the front in a strong competition.

The Challenge Cup for six blooms grown within eight miles of Charing Cross, was won by Mr. H. W. Whitmee, The Briars, Finchley, who was closely followed by Mr. W. E. Martin, Alexandra Grove, Finchley. Mr. F. A. Tubby, Fairview, Torrington Park, Finchley, was first for six blooms in not less than four varieties.

Mr. G. W. Cook, Radstock, Whetstone, scored for six blooms grown within ten miles of Charing Cross, with Mrs. J. Laing, W. Shean, Hugh Dickson, Princess M. Mertchowsky, Mrs. G. Kershaw, and Lady Ursula in good form; Mr. E. R. Smith, Metford Lodge, Muswell Hill, second, and Mrs. A. E. Clarke, The Hurst, Mottingham, Kent, third.

In the maiden growers' section Capt. R. K. Stuart won the piece of plate offered for twelve blooms with a good set; Mr. H. L. Weltern, Waratta, Sanderstead, second, and Mr. D. H. Church, Farleigh Road, Warlingham, third. Mrs. White, South Hill Cottage, Harrow, first for nine flowers, with Miss Aylmer, Donalda Lodge, Southampton, second, and Mr. W. Ames, Church Farm, Bourton, third. In the new members' class Mr. J. Dodwell, Perseverance Place, Hereford, had a fine six blooms, his best varieties being those of Beauty of Waltham and Mrs. J. Laing; Mr. L. Thomson, Ailsa Craig, Fornly, second.

Mr. Eversfield led in the extra class for two dozen flowers, with Mr. E. R. Bonner, Barnwood, Gloucester, second, and Mr. G. Speight, Market Harborough, third.

The Harkness Cup for a dozen blooms, open to all amateurs, was won by Mr. R. Foley Hobbs, Thorneloe, Worcester, and he had F. K. Druschki, Mrs. Laing, Bessie Brown, Her Majesty, in fine condition; Mr. D. Pallett second, and Mr. E. M. Eversfield, third. Mr. Conway Jones led for six blooms each of the Lyon Rose, and Mdme. Melanie Soupert, and he won the Hammond cup for six new roses with Lyon Rose, Albatross, G. C. Waud, Lady Ursula, Molly Sharman Crawford, and Laurent Carle; Mr. F. Dennison, second.

Miss B. H. Langton, Raymead, scored for seven bunches of roses arranged effectively, and she showed Perle d'Or, and other varieties charmingly; Mr. H. R. Darlington, Potters Bar, second. For six varieties of hybrid teas, three blooms of each, the Rev. J. H. Pemberton won.

AMATEURS' TEA ROSES.

The championship for eighteen Teas or Noisettes was won by Mr. Alexander Hill Gray, Beaulieu, Bath, with a superb stand of White Maman Cochet, Molly Sharman Crawford, Mdme. H. Berger, Medea, Frau Von Marschall, Dr. F. Guyon, R. W. Smith, Mdme. Vermorel, Mrs. E. Mawley, Maman Cochet, Innocente Pirola, E. V. Hermanos, Mdme. Cusin, Muriel Grahame, Mdme. J. Gravereaux, Auguste Comte, The Bride, and Mdme. Constance Soupert; Mr. Conway Jones, second; Mr. Page, gardener to Mrs. B. Fortescue, Dropmore, Maidenhead, third; and Mr. O. G. Orpen, West Bergholt, fourth.

Mr. A. Hill Gray was also first for a dozen Tea or Noisette varieties, and here he had a lovely set, White Maman Cochet, R. W. Smith, Mdme. J. Dupuy, and Muriel Grahame being fine; Mr. Conway Jones, second; and Mr. E. M. Eversfield, Denne Park, Horsham, third. Mr. Hill Gray continued his successful career in the class for eight trebles of Tea or Noisette roses, and here he showed Mrs. E. Mawley, White Maman Cochet, and Mdme. Jules Gravereaux finely; Mr. Conway Jones, second; and Rev. T. E. Henslow, Stanton St. Quintin, Chippenham, third.

Mr. Eversfield led for six blooms of any Tea or Noisette rose with Mrs. Edward Mawley, very good; Mr. A. Hill Gray, second, with White Maman Cochet; and Mr. Conway Jones, third, with Mdme. Jules Gravereaux. The Prince Memorial Prize for a dozen Teas or Noisettes, in the third division, was won by Dr. F. H. Cooke, Birch, Colchester, who had a grand flower of Mrs. E. Mawley in his set; Rev. J. B. Shackle, Dropmore Vicarage, Maidenhead, second; and Mr. F. Slaughter, Steyning, third.

Mr. M. Whittle, Belgrave Avenue, Leicester, led for nine blooms in the section for growers of less than 200 teas; and Mr. W. Upton, Claremont Street, Leicester, was first for six blooms in the same section, while for six blooms of one variety Dr. Charles Lamplough, Alverstoke, scored with Mdme. Jules Gravereaux. Dr. T. G. Hayes, Dunster; Dr. Cooke, Mr. Slaughter, and Mr. H. L. Willern won prizes in other small growers' classes.

Exhibition roses in vases were finely shown by Mr. Conway Jones, who led for five blooms each of nine varieties, with Countess of Derby, White Maman Cochet, Frau Karl Druschki, Mrs. J. Laing, etc; Mr. A. Hill Gray, second. Mr. Eversfield scored for six tea roses under similar conditions, with Mrs. Mawley, The Bride, Souv. d'un Ami, Mdme. Jules Gravereaux, White Maman Cochet, and Maman Cochet; Mr. Orpen second, and Mr. Hill Gray third.

LADIES' SECTION.

Premier award for a table decoration of roses (ladies' class) was won by Miss E. S. Scott, Albury, Earlstown, with the beautiful Lyon Rose; Mrs. O. G. Orpen, West Bergholt, second, with a dainty display of Mdme. Melanie Soupert, Una, and Irish Elegance—a lovely table; Mrs. J. W. Smith, Sparrows, Herne Hill, third, with Irish Elegance; Miss Harwood, St. Peter's Street, Colchester, fourth.

In the class for a table decoration, open to ladies who had not hitherto won a prize, Mrs. Tisdall scored with a simple arrangement of Liberty roses; Miss E. M. Robinson, [illegible], Hornchurch, second, with [illegible] Flight. Mrs. W. E. Pedley, Hillside, Hoddesdon, had the best bowl of roses in the section.

For an upright vase of roses and suitable foliage, Mrs. O. G. Orpen led with Chatenay roses in a dark wicker-cased vase; Lady Willmott, Binfield Grove, Bracknell, second;

and Mrs. J. W. Smith, third. For a basket of roses Mrs. Orpen led with a splendid arrangement of Frau Karl Druschki and dark rose foliage; Mrs. Sawday, second; and Mrs. G. W. Cook, third.

In the bowl class, Miss J. B. Langton scored with the lovely Irish Elegance; Mrs. T. A. Tisdall, Woodford Green, second, with Liberty; and Mrs. J. W. Smith, equal second with Mdme. Pernet-Ducher. In another bowl class Mrs. Hammond led with Mdme. Melanie Soupert; and Mrs. Howard Williams, Willow Cottage, Finchley, second; Mrs. Sawday, Weybridge, third. Mrs. Barrow scored for a bowl of decorative roses with Irish Elegance; and Miss Foden, Hemel Hempstead, second with Mdme. Abel Chatenay.

AMATEURS' DECORATIVE ROSES.

Miss B. H. Langton, Rev. J. H. Pemberton and Dr. Cooke were placed in order as given for seven vases of decorative roses in the amateurs' division, while for five varieties, the Rev. J. B. Shackle, Maidenhead, was first, and Dr. Cooke second. For five varieties of garden roses arranged in stands Mr. O. G. Orpen was a capital first with Jersey Beauty, Lady White, Mrs. O. G. Orpen, Lady Wilson, and Crimson Damask; Mr. J. W. Smith, Sparrows, Herne Hill, second, and Rev. J. H. Pemberton, third.

There were some good displays in the class for eighteen bunches of decorative roses, and here Mr. Mease, gardener to A. Tate, Esq., Leatherhead, scored with a fine lot of Gardenia, Rosa Mundi, Papillon, Bardou Job, Leon Schmidt, Michel, etc.; Rev. J. H. Pemberton, Havering, second. For a dozen bunches honours were divided between Mrs. Wightman, Bengeo, Herts, and Viscomtesse Enfield, Dancer Hill House, Barnet. Mr. A. C. Turner had the best six bunches of decorative roses. Mr. C. L. Gordon Clark coming second and Mr. Edward Mawley third

BEST BLOOMS.

Professional Classes.—H.P., Horace Vernet, from Messrs. A. Dickson and Sons; T., White Maman Cochet, from Mr. G. Prince; H.T., Mdme. Melanie Soupert, from Messrs. S. McGredy and Son.

Amateurs.—H.P., Beauty of Waltham, from Mr. J. Dodwell, Hertford; H.T., Mrs. T. Roosevelt, from Mr. C. Page, Dropmore; T., Maman Cochet, from Dr. F. H. Cooke, Birch, Colchester.

NEW ROSES.

Gold medals were awarded to new roses as follows: Mrs. Joseph H. Welch, a rose-pink H.T., and Edward Mawley, a big deep crimson H.T., from Messrs. S. McGredy and Son, Portadown, Ireland. To Lady Hillingdon, a long pointed yellow rose from Messrs. Lowe and Shawyer, Uxbridge, and to Rayon d'Or, a yellow rose apparently of the Pernettiana type, from Dr. Baldock Waddell.

Silver-gilt medal to Evelyn Dauncey, a salmon and pink H.T. from Messrs. S. McGredy and Son. To Mrs. George Shawyer, a soft rose-pink H.T. from Messrs. Lowe and Shawyer. To St. Helena, soft yellow, shaded with cream and apricot, from Messrs. B. R. Cant and Sons, Colchester. And to Mrs. Foley Hobbs, an ivory-white H.T. from Messrs. A. Dickson and Sons, Newtownards.

Cards of Commendation were awarded to Colcestria from Messrs. B. R. Cant and Sons, and to Mrs. Gordon Sloan from Messrs. A. Dickson and Sons.

NON-COMPETITIVE.

In the long corridor there were several good non-competitive displays, notably those of carnations and roses from Messrs. Stuart Low and Co., Enfield; of delphiniums, from Messrs. R. H. Bath, Lim., Wisbech; of Sweet Peas from Messrs. Dobbie and Co., Edinburgh; of roses from Mr. Frettingham, Nottingham; of violas from Mr. H. Crane, Highgate; and of gardening books from the Gardeners' Magazine Office, including the most recently published book, "Window and Indoor Gardening."

National Sweet Pea Society.

On July 12 and 13 this young and energetic society held its tenth annual exhibition at the Royal Horticultural Hall. The show was not quite so large as some of its predecessors, but it surpassed all that have been held in point of quality. The flowers were superb in size, colour, and substance, while their delicate perfume filled the hall. The arrangement of the show merited all the encomiums passed upon it, as it was probably the prettiest seen at Westminster. There were about fifteen hundred bunches in competition, and the competitive classes were surrounded by a ring of superb trade displays, the growers and seedsmen vying with each other in the arrangement of their flowers, and the society is to be congratulated upon its many strong supporters. Sir Randolf Baker's flowers were superb, and everyone was sorry that his gardener, Mr. Usher, just missed the Eckford Cup by an oversight. The rules admit twenty spikes only per bunch—Mr. Usher had twenty-one in one vase, and had perforce to be disqualified. But he won so well in other classes, and annexed two cups, so that he had ample consolation. The music gallery was prettily decorated with palms, asparagus, and sweet peas; and in the centre of the hall, under a great spreading palm, the novelties of the year and the society's cups and plate were disposed. There was a very large attendance of interested visitors, and the takings at the gate were only a few shillings short of last year, notwithstanding the increase of members and ticket-holders.

A BEAUTIFUL DISPLAY OF SWEET PEAS.

Arranged by Mr. R. Bolton, at the National Sweet Pea Society's Exhibition, in competition for the W. Atlee Burpee Challenge Trophy, of which for the third time he was the winner.

SUTTON CUP.

The Sutton Cup for eighteen bunches of sweet peas, distinct, brought out a magnificent competition. Mr. A. E. Usher, gardener to Sir Randolph Baker, Bart., M.P., after winning the cup, had to be disqualified through one vase containing one spray too many. His flowers were superb, and much regret was expressed by all concerned. The first prize was awarded Mr. J. Haycocks, Gyfela, Wrexham, who staged fine vases of the following varieties, Menie Christie, Clara Curtis, Mrs. A. Ireland, Countess Spencer, Helen Lewis, The Marquis, Elsie Herbert, Frank Dolby, Mrs. H. Sykes, The King, Mrs. Henry Bell, Etta Dyke, Evelyn Hemus, Aurora Spencer, Helen Pierce, John Ingman, Nora Unwin, and Constance Oliver. The second prize went to Mr. Edward Keith, gardener to the Rt. Hon. Sir G. O. Trevelyan, Bart., Wallington Hall, Cambs, who had a good display of the following varieties, Helen Lewis, Helen Pierce, Mrs. A. Ireland, Countess Spencer, Elsie Herbert, Constance Oliver, and Clara Curtis. The third prize was won by Mr. G. F. Hallett, gardener to Lady Fermor Hesketh, Easton Neston, Towcester, who staged some really good bunches, though with shorter stems. Mrs. A. Tigwell, Harrow View, Greenford, was fourth.

For twenty-four bunches (distinct) Mrs. A. Tigwell won first position with a good collection. The varieties employed were George Herbert, Seedling, Miriam Beaver, Mrs. Townsend, Evelyn Hemus, Helen Pierce, King Edward Spencer, Masterpiece, W. T. Hutchins, Dazzler, Prince Olaf, Tennant Spencer, Senator, Mrs. H. Sykes, M. Linzee, Mrs. Tigwell, Elsie Herbert, Flora Norton Spencer, Mrs. Hugh Dickson, Doris Burt, Arthur Unwin, and Zero. Mr. S. Horscroft, gardener to Mrs. A. J. Norris, Longshaw, Chipstead, was second with well-arranged vases, the best of them being Captain of the Blues Spencer, Asta Ohn, Paradise Ivory, Mrs. Hardcastle Sykes, Clara Curtis, and Apple Blossom Spencer.

ECKFORD CUP.

Ten competitors faced the judges in the Henry Eckford Memorial Class. Mr. A. E. Usher secured the coveted award with some magnificent vases. The varieties were nearly all carrying four flowers on a two-feet stem, a wonderful display of cultural skill. The varieties were Mrs. C. W. Breadmore, John Ingman, Audrey Crier, Marjorie Linzee, Mrs. Hugh Dickson, Marquis, Othello, Lavender George Herbert, Helen Lewis, Elsie Herbert, The King, and Clara Curtis. Mr. Thos. Stevenson, gardener to E. G. Mocatta, Esq., Woburn Place, Addlestone, was an excellent second, the most striking varieties being Spencer America, Princess Victoria, Earl Spencer, Princess Juliana, Elsie Herbert, Constance Oliver, and Prince of Asturias. Mr. T. Jones, Bryn Penylan, Ruabon, had to be content with third place.

while Mr. W. Hopkins, gardener to Mr. F. A. Wellesley, Westfield, Woking, brought up the rear.

For twelve bunches (distinct), the varieties to represent twelve colour classes. Here Mrs. A. Tigwell won well with nicely disposed bunches. The best were Mrs. C. W. Breadmore, Prince Olaf, Clara Curtis, John Ingman, The King, Lord Nelson, and Etta Dyke. Mr. G. F. Hallet was second, having good examples of Lord Nelson, Clara Curtis, Etta Dyke, and Mrs. Chas. Foster.

There was a keen competition for six bunches (distinct), in which Masterpiece and Mrs. Hugh Dickson had to be staged. Mr. W. E. Usher was placed first with splendid vases of Othello Spencer, Masterpiece, Mrs. Hugh Dickson, Audrey Crier, Elsie Herbert, and Helen Lewis. Mr. T. Jones was second with good vases, though a little coarse. The best were Eric Harvey, Masterpiece, and Audrey Crier. Mr. W. H. Prophet, gardener to Mr. E. P. Broad, Rosehill Par Station, Cornwall, was third with splendid flowers of Masterpiece, and Clara Curtis. Mr. Thos. Stevenson was fourth.

The Breadmore Challenge Class for twelve bunches was won handsomely by Mr. W. H. Prophet, with Dazzler, Prince of Asturias, Mrs. C. W. Breadmore, Paradise Red Flake, George Herbert, Mrs. A. Ireland, Etta Dyke, Prince Olaf, James Grieve, Henry Eckford, Mrs. H. Bell, and Frank Unwin. Dr. J. E. Phillips, Malpas, followed with a fine exhibit; while Mr. E. Cowdy, Grenhall, Loughgall, co. Armagh, was third with some very long-stemmed vases.

Class Seven was for six bunches (distinct), and in a large competition Mr. Edward Keith came out first with fine bunches of America Spencer, Princess Juliana, and Tom Bolton. Mr. F. J. Harrison, Rosedene, Ulverston, won second prize, having good examples of Elsie Herbert, Mrs. H. Sykes, and Asta Ohn. Mr. A. Moring, gardener to Mr. A. W. Stirling, Holme Lea, Goring, had well-arranged bunches for third place; while Mr. F. Fairbairn, gardener to Mr. E. Otter, Stanhope Park, Greenford, was fourth. The Humphrey Cup for three bunches went to Mr. A. E. Usher, who staged three splendid vases. His varieties were Lavender George Herbert, America Spencer, and Earl Spencer. Mr. T. Stevenson was second with a fine vase of Silas Cole; while Mr. W. H. Prophet was third.

AN EFFECTIVE ARRANGEMENT OF SWEET PEAS

Exhibited by Mr. W. E. Alsen at the National Sweet Pea Society's Exhibition. The bouquets of flowers down the centre of the arrangement represent the fine new variety, Stirling Stent.

CLASSIFICATION CLASS.

In the open classes the display was wonderfully good, the classification class for eighteen varieties being particularly so. Mr. A. E. Usher was again placed first with a glorious display. The varieties were Mrs. Breadmore, Constance Oliver, Helen Lewis, Helen Pierce, Mrs. H. Sykes, Rosie Adams, Clara Curtis, Menie Christie, Frank Dolby, The King, Mrs. A. Ireland, Hannah Dale, Countess Spencer, Etta Dyke, Prince Olaf, John Ingman, Marquis, and Aurora Spencer. Mr. C. W. Breadmore, 120, High Street, Winchester, was a capital second, his best varieties being Clara Curtis, The King, Marquis, Mrs. H. Sykes, Countess Spencer, and Mrs. Breadmore. Mr. Jas. Box, Lindfield, Sussex, was third with some fine vases. The class for sixteen bunches again saw Mr. A. E. Usher in the first place; his best examples were Picotee, A. J. Cook, Mrs. A. Watkins, Frank Dolby, Nora Unwin, and E. J. Castle. Mrs. A. Tigwell was second with a weaker display.

Twenty-four bunches (distinct) made a large class, Mr. C. W. Breadmore winning first prize with some splendid vases. The most noteworthy varieties were Prince Olaf, Mrs. H. Bell, Marjorie Willis, Senator Spencer, Princess Juliana, Sybil Eckford, Dazzler, Countess Spencer, Ivy Herbert, Lavender George Herbert, Constance Oliver, and Dusky Monarch. Mr. A. E. Usher had to be content with second place, though he had some lovely vases, the best being Helen Grosvenor, A. Unwin, Audrey Crier, George Stark, Marquis, Earl Spencer, and Rosie Adams. Messrs. E. W. King and Co., Coggeshall, were placed for twelve bunches of distinct varieties; they were Constance Oliver, Mrs. W. King, Rosabelle, Evelyn Hemus, Anglian Orange, and Anglian Pink. Mr. W. Hopkins was second with very large flowers, though rather spotted with the weather, the varieties Earl Spencer, Masterpiece, Marie Corelli, Dazzler, Mrs. A. Ireland, and Helen Lewis being most conspicuous. Mr. S. Miller, Newport, Isle of Wight, was third. For one bunch of new sweet peas, Mr. C. W. Breadmore secured the premier award with Iris, a pale salmon. The second prize was given to Earl Spencer, while the third went to a beautiful vase of Dazzler.

The classes for varieties with waved standards were particularly attractive. For twelve bunches Mr. Thos. Stevenson won first prize with Clara Curtis, Mrs. Chas. Foster, Dazzler, Black Knight Spencer, John Ingman, Mrs. Hugh Dickson, Spencer America, Rosie Adams, Helen Lewis, Evelyn Hemus, Sun-proof Crimson, and Etta Dyke. Mr. A. J. Paskett, gardener to E. J. Johnstone, Esq., Burrs Wood, Groomsbridge, was second with a collection of good clean flowers. Mr. O. Hayles, gardener to Sir Chas. Hadden, K.C.B., Rossway, Berkhamsted, was third with some nicely developed vases.

For six bunches in the same section there was again a keen contest. Mr. Maclean, gardener to H. le Blanc Smith, Esq., The Lordship, Standon, Herts, won first prize with Elsie Herbert, Mrs. C. W. Breadmore, Princess Juliana, and Constance Oliver. Mr. F. J. Harrison came next with beautifully clean flowers. The best were Apple Blossom Spencer and Mrs. Hardcastle Sykes. Mr. A. Moring was third. Mr. A. E. Usher was first for four bunches of the stipulated varieties Colleen, Queenie, Winifred Deal, and Winsome.

For three varieties with waved standards there was a large contest. Mr. W. H. Prophet won well with George Herbert, Paradise Ivory, and Lavender. Mr. J. Haycocks was second, and Mr. A. L. Thomas, Kenley, third.

The three bunches of pink varieties was won by Mr. W. H. Prophet with fine examples of Audrey Crier, Mrs. H. Sykes, and Olive Bolton. Dr. J. E. Phillips, Malpas, was second with Olive Ruffell, Syeira Lee, and Countess of Northbrook; Mr. F. J. Harrison was third. The whole of the exhibitors in this class staged contrary to regulations. For two bunches cream and pink waved varieties Mr. W. H. Prophet was placed first with fine examples of Mrs. Henry Bell and Constance Oliver. The second prize contained beautiful Syeira Lee and Mrs. H. Bell. Mr. F. J. Harrison was third.

THE KING CUP.

The E. W. King Challenge Cup brought out a number of exhibitors, Mr. W. H. Prophet securing the coveted award. The varieties were simply splendid, especially George Herbert, Mrs. A. Ireland, Phenomenal, St. George, Mrs. C. W. Breadmore, Menie Christie, Mrs. Chas. Foster, and Elsie Herbert. Mr. A. Basile, gardener to the Rev. O. Turner, Woburn Park, Weybridge, proved a good second, the flowers being extra good in colour; while Dr. J. E. Phillips brought up the rear with some fine bunches.

BURPEE CUP.

For the Atlee Burpee Challenge Cup the exhibitors had to arrange a display on a space 4ft. by 3ft. This was won by Mr. Robert Bolton, Carnforth, who has now won it three years in succession, and consequently secures it as his own property. The quality was excellent, and the varieties mostly new. Charles Foster was much admired, as were also R. F. Felton, Earl Spencer, Clara Curtis, George Stark, Monitor, Elsie Herbert, Tom Bolton, and Olive Ruffell. Mr. Jas. Box, Lindfield, Sussex, was placed second with a good table, lacking a little, perhaps, in arrangement. Messrs. Kelway and Son, Langport, were third, with a flatter exhibit. For twelve bunches of stipulated varieties Mr. A. E. Usher was again successful, staging some fine, lightly-arranged vases. The best were Asta Ohn, F. Morse Spencer, Flora Norton Spencer, Senator Spencer, Tennant Spencer, Othello Spencer, and Queen Victoria Spencer. Mr. T. Jones had some good examples of Flora Norton Spencer, Primrose Spencer, Mrs. Routzahn, and Marie Corelli. Mr. Robert Wright, Halsall Lane, Formby, third. Six bunches of Spencer type produced a goodly display. Mr. A. E. Usher still added to his triumphs by winning first prize with fine.

(*Continued on page* 557.)

TURNIPS.

Summer sowings of turnips can be made in moist situations from mid-summer to the beginning of August in light, loamy soils. The crop also succeeds in loamy soils containing a large proportion of sand, and when well manured and deeply cultivated these soils give the quickest and best results. The latter advantage, namely, a rapid growth, is a highly important factor in turnip culture—as it also is in the cultivation of radishes, for the quicker the bulbs are formed the more tender and shapely will they be. Also they have a more attractive colour than slowly-grown roots, for which reason a better market is always secured. Stiff, heavy soils and wet, retentive loams must be avoided, as these tend to make early crops run to seed. They can, however, be somewhat improved by incorporating a generous quantity of partially decayed light farmyard dung or stable manure with them; and may then be expected to produce fairly good results. In old garden soils containing an excess of humus or organic matter, superphosphate of lime or bone dust may be advantageously employed, either in conjunction with farmyard manure or separately. These stimulants are very essential for the turnip crop, as they quickly force the young seedlings into their first "rough" leaf, and hasten the development of the bulb Half the battle of turnip culture is fought when this rough leaf is developed, as at that stage the plants are tolerably free from insect attack.

It is useless to sow turnips during drought, as the seedlings are checked immediately upon germination. They then fall an easy prey to the dreaded turnip fly, and all hopes of a sucessful crop have to be abandoned. There is no better plan, especially during the present season, than that of reserving specially-prepared plots for this crop, so that sowings can be made whenever possible during showery weather. The seeds will then germinate quickly, and the young plants will grow away without receiving any check. The main crops of late autumn and winter turnips, are sown during August.

Culture.

Ground intended for turnip culture cannot be too well cultivated; hence, where large breadths are being sown, it is advisable to take a little extra trouble in the preparation of the seed-bed, especially as regards breaking up the surface so as to secure the finest possible tilth. In small gardens where the size of the bulbs is a secondary consideration, quality and tenderness of flesh being first, seeds are frequently sown broadcast. But in heavy, tenacious soils and for market culture, it is a good plan to draw drills about 15 inches apart. This may serve as a preparation for what is known as the ridge system of growing turnips, a system which, however, is wholly unsuitable for light soils and dry seasons, as a bed on the flat naturally takes the water better. After the drills have been drawn they are filled with well-rotted manure, and this covered with about two inches of soil. The ridges thus formed must be flattened somewhat on the top by means of a light roller and a groove opened along the centre of each ridge in which the seed is sown as regularly as possible.

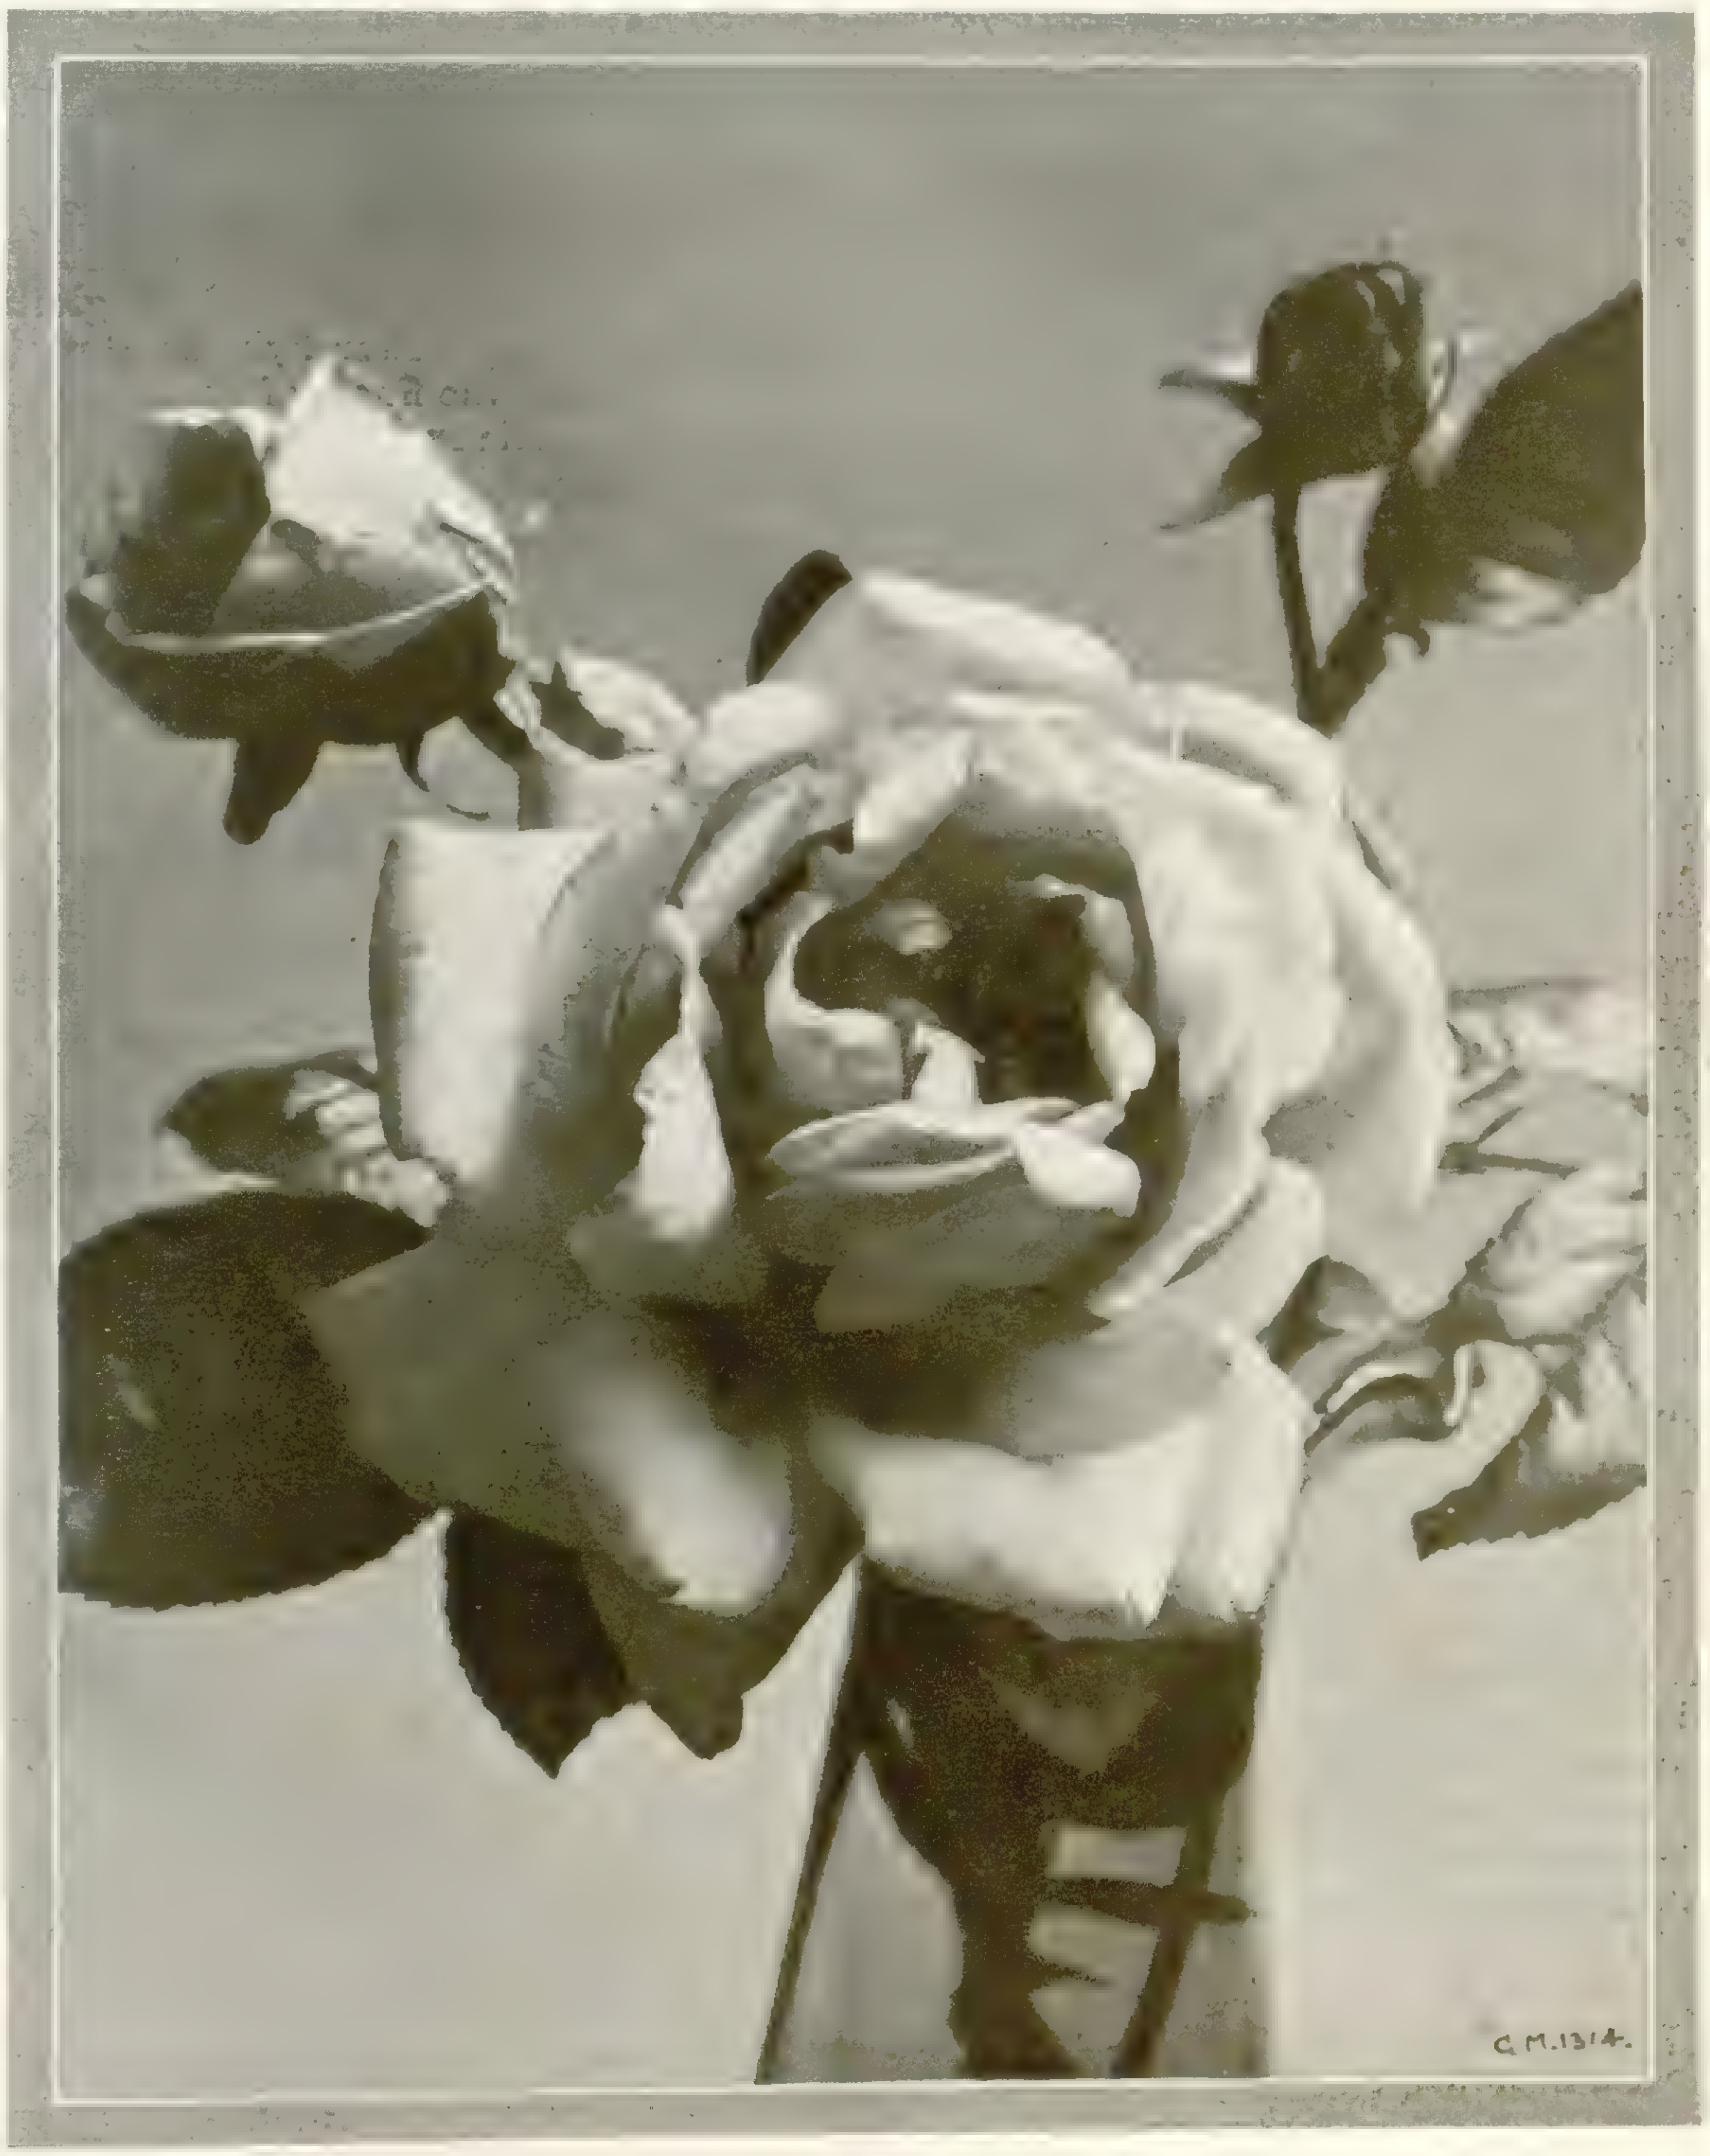
The nourishment underlying the plants is immediately available as soon as they require it, and the soil in the ridge, however stiff and tenacious it may be, will always be of a looser texture than the same soil on the flat. Thick sowings are the greatest mistake in turnip culture, as they tend to overcrowd the plants in the rows, with the result that the work of thinning is very laborious and tiresome. In addition to which, the seedlings, if disturbed unduly in this process, do not make such vigorous growth as they would otherwise have done.

As soon as the young plants are in rough leaf, or, say, when the leaves are an inch or two in breadth, they must be thinned out to about nine or ten inches apart in the rows. A horizontally extending leaf growth is more to be desired than an upright growth, as this is more conducive to shapeliness and size of bulb; hence the necessity for ample space in the rows. The hoe should be kept constantly at work between the rows, as there is no better method of supplying the growing plants with moisture, apart from keeping down weeds and so destroying the hiding-places of the "fly." The deep stirring of the surface soil acts as a mulching as it were, which keeps the ground well supplied with moisture even through the driest seasons.

There is a constant demand for turnip tops in spring, when other green vegetables are scarce, and where these are specially required, seed should be sown early in September, when the plants will generally become strong enough to stand through the winter in seedling form.

The turnip fly is a most dreaded insect pest among kitchen garden crops. It can be easily recognised by its black shining coat and its peculiar and rapid means of locomotion. The female beetle lays her eggs on the underside of the seedling turnip leaves, and in about ten days' time white yellowish maggots make their appearance. These commence to feed on the tender succulent leaf growth, and subsequently fall to the ground and lie buried near the base of the plant until after the larval stage, when they emerge as fully-developed beetles. Prevention consists of sowing the seed only during showery weather, when the plants are enabled to grow right away from their enemies.

Cure consists of spraying—at least, this is the only means that I have found at all effective in destroying the pests. The standard mixture is composed of four gallons of kerosene, two pounds of soft soap, and rain water to make up 25 gallons. The soap is boiled in two gallons of rain water until dissolved, and afterwards put into a large tank containing the oil, the whole being well stirred so as to form an emulsion. The contents of the tank can then be made up to 25 gallons with the rain water. Another method which proves helpful in checking the pest is vaporising. When the soil is treated in this manner, the flea beetle does not so readily enter the ground for the purpose of laying eggs, nor do the larvæ survive if so treated.



NEW ROSE RAYON D'OR.

A distinct variety, with rich yellow flowers, raised by Pernet-Ducher, and exhibited by Dr. Waddell at the National Rose Society's Show, July 8, when it was awarded a Gold Medal.

The main crops intended for autumn or winter supplies are best left in the ground and lifted as they are required. But to provide against frosty weather it is a good plan to take up a portion of the bulbs, topping and tailing them and storing them in sand. The more tender varieties should also be taken up as soon as they are fully matured, especially in cold situations, and stored in clamps like potatoes.

Old Basing. J. C. Newsham.

CABBAGES.

Every good kitchen gardener knows how valuable a bed of early spring cabbages is. When the seeds are sown every cultivator should make up his mind to have at least a good number of the resultant seedlings planted in their permanent quarters in October, if possible. Even where clayey soils prevail, I think that the plants do better planted in October than in spring, as the soil is warmer in October than it is very early in spring, and the young plants have an opportunity of getting established, and making some sturdy growth before the really cold weather comes.

There is much difference of opinion as regards the proper, or most suitable, date for seed sowing. Some cultivators advocate sowings to be made about the middle of July, others quite a month later. If one date only had to be given I should say August 5, but it would not be wise to sow the seeds too early in the southern counties, nor too late in the northern. I have found the best results follow in the south when seeds were sown about August 12, and in the north when they were sown about July 25.

Very few plants "bolted," and, furthermore, I found that fewer plants went wrong in this way when they were finally put out in October than in the new year.

I favour sowing the seeds broadcast, and thinly. Usually, one finds that the only sturdy specimens are those growing at the extreme edge of the bed, those in the centre being too much crowded to be useful. Thick sowing means waste of seed, time, space, and plants.

It is not always necessary to transplant the seedlings where they are put out in their permanent quarters in October; but if left until the new year before being finally planted transplanting in a nursery bed is very essential.

Firm soil, but deeply stirred, both in the seed quarters as well as the main planting, is better than a loose one, as the plants grow more sturdily and are less liable to injury by severe frosts. I like to have the permanent quarters prepared several weeks prior to the date of planting, so that the soil can settle down firmly. If light, I would not hesitate to tread it thoroughly while in a dry condition, and then just loosen the surface again with a wooden rake.

There are some sorts that we cannot do without very well, but I know that different cultivators have their own favourites. Mine are Myatt's Early Offenham, Mein's No. 1, Flower of Spring, Ellam's Early Dwarf, and Wheeler's Imperial. For a small garden and comparatively close planting I like Little Pixie, Nonpareil, and Myatt's Early Offenham.

Geo. Garner.

Rose Lady Rossmore.—This H.T. rose was introduced by Dr. J. Campbell Hall in 1910, and should be freely planted. The claret shading over the reddish-crimson renders it an attractive variety in the matter of colour, and it is a shapely flower rather than one of the huge section, and a valuable addition.—E. M.

JULY ROSE NOTES.

The present season has once more shown how very quickly roses will come on when favoured with a few days of suitable weather. Our first growths and buds were much injured by frost, and again by four degrees of frost early in June. Even up to the last week of June we were having very chilly early mornings here in Mid Sussex, but only very early risers saw frost, and that in low-lying districts. But it is not necessary to have actual frost to check tender growth, the harm being done by the extremes between midday and sunrise, and my thermometer has shown as much as eighty degrees difference upon more than one occasion. Much of the weak and suddenly checked young growth at the tips of otherwise promising shoots I believe can be attributed to these sudden changes.

But with only a few days of more uniform temperature roses have grown far more satisfactorily than seemed likely in June. I do not think I ever saw the Wichuraianas better, and with the glorious shadings of many newer hybrids this class is fast becoming the finest of our decorative roses, more epecially as weeping standards. William Allen Richardson has given, and is still giving, one of the best displays I have ever seen upon this grand rose. Whether as standards, on low fences, walls, or pillars, it has surpassed itself, and few can be more pleasing than a well-flowered and highly-coloured William Allen Richardson. A few of the darker hybrid perpetuals are coming grand in colour, especially during the last few days.

At the end of June we were favoured with some delightful rains, and fine opportunities for using artificial manures; I often think we make use of these too early in the season. Generally of quick and exciting action, if applied just as the flower buds form, and well watered in, we have had the best results here, and the recent rains were just what were wanted. Roses upon arbours, pergolas, and arches are often unreasonably treated at this time of year. There are almost always footpaths around and beneath them, and, in spite of their vigorous growths and more need for food and surface culture, they too often receive much less than weaker growers in open beds, with a full root run. By making the surface soil loose much help might be afforded with liquid manures, but to be really effectual these should be applied with a liberal amount of water. Mere surface moisture I believe to be harmful rather than beneficial. We need to reach the roots, and nothing but a thorough soaking will do this.

It may seem early to write of pruning, but my plants of Electra, and other very early summer bloomers, are already out of flower, and we intend cutting away much of the flowered growth at the earliest opportunity. By removing such from pillars and arches as occasion demands there does not appear such a wholesale mutilation as I have sometimes noticed when practising what is called summer pruning, and it seems more reasonable to do this by degrees and so avoid such a great unbalancing of root and growth.

Roses in pots must not be neglected at this season, or we shall not have good wood to work upon when housing them once more. We do not allow any flower buds to form now that a good supply is available from the open. All weakly growths need removal, and it is not well to give too copious root waterings. What we are aiming at is well-matured wood, and so our plants are being afforded, as nearly as possible, the equivalent of late autumn conditions.

A. Piper.

THE PEACH-LEAVED BELLFLOWER.

Like most of the campanula tribe, C. persicifolia and its varieties thrive better in a soil which is not of too clayey a character, though, on the other hand, they are disappointing in a very dry soil, the blossom, which is of all too short duration at best, often lasting only a few days in such a soil in hot weather. It soon deteriorates alike in a very dry soil and a very wet one, the ideal soil being one naturally rather heavy, which has been enriched by years of liberal manuring. It is not unusual for the plants to flower themselves to death, the amount of blossom which a small example will sometimes produce being out of all proportion to its size, and such may generally be regarded as the beginning of the end.

Where one has a specially fine variety which it is desired to propagate, it is a good plan to pull a plant to pieces just after flowering time, and insert the small pieces in pots or pans of light soil in a frame, keeping them there through the winter, when, after a season's growth, they will make a nice lot of flowering plants for another year. In a general way, however, and where the soil thoroughly suits them, it is not necessary to take this trouble, for pieces may be taken off the large clumps in the autumn with a ball of earth attached, and these will flower the following year. Where they grow none too strong the stems should be cut down immediately after the main crop of blossom is over, without waiting for the second lot of smaller blooms, which may be obtained by removing the dead flowers, and some light rich soil worked in amongst the plants, which will speedily root into it, and grow the stronger for it.

The varieties of C. persicifolia are numerous, being mainly single or semi-double forms, with white or blue flowers, the two best varieties, or two which, at least, are unsurpassed, being C. p. Moerheimi, with large white semi-double flowers, and C. p. alba grandiflora, with large single white flowers. Both grow about two feet in height, the former having very stiff, erect stalks. The beautiful snow-white variety, Backhousei, was an accidental find in a cottage garden in Yorkshire. It is a good plan to obtain a packet of seed of mixed large-flowered varieties, which, if sown in February in gentle heat, or even a month later in a cold frame, will make nice flowering plants the following year. The seed is very small, and needs careful raising, the seedlings being pricked out into pans in some light sandy soil as soon as they can be handled, and afterwards put out on a nursery border of well-prepared soil, preferably damp, and in partial shade. When they have reached this stage they soon begin to make rapid progress, and the size of the plants by October generally exceeds one's expectations. Slugs are fond of most campanulas in a young state, and they have to be guarded against.

Fine varieties may sometimes be obtained from a packet of good seed, and a careful selection of plants to save seed from may result in some very choice plants. Some recommend sowing the seed as soon as it is gathered, and keeping the little seedlings in a house or frame through the winter.

Alger Petts.

Globe Artichokes.—The heads, when of a size suitable for kitchen, should be cut; those not required immediately can be placed with their stems in jars of water, which should be changed regularly. Apply a good mulch to maintain a supply over as long a period as possible.—G. E.

THE GENTIANELLA AND SOME VARIETIES.

None of our dwarf flowers surpass in beauty and in real interest to us the Gentianella, Gentiana acaulis, whose great bells of the most glorious deep blue flowers in spring give us inexpressible pleasure, as we see them on their carpet of persistent green leaves. It is a truly exquisite plant, and it loses nothing in our eyes from the fact that some people find it difficult to induce it to flower. But it is a flower worth striving for success with, and happy are they who can pride themselves on the possession of long lines or large masses blooming plentifully from year to year.

The causes of the shy blooming are still rather obscure, and some who attribute the scarcity of flower on established plants to the fact that they were planted at the wrong season are apt to forget that the reputed cause of the want of bloom has long lost its force in the case of plants which have been in the same position for years. One cannot thus presume to dogmatise on the causes of this shy flowering in some gardens, but a study of the most thriving plants in many gardens enables one to give some hints which will probably be helpful to many.

In the first place, it appears to like a good deal of sun, and, in the second, it seems to prefer a gravelly or stony soil, with, preferably, a sloping position. The stony or gravelly soil is not an essential, but firm planting is one, and the writer has found that newly-transplanted specimens of G. acaulis firmly trodden down when put in early in the autumn, have flowered well the following year where the other conditions were good. Some have recourse to pulling their plants to pieces, and replanting soon after flowering in almost separate crowns. This appears to induce flowering, but the result is not nearly so fine as big clumps affording plenty of flower.

As bearing on the question of position, the writer has experimented with plants in various parts of his garden, and the best in their flowering properties are those which were planted against a stone edging facing south-west, and in poor and rather stony soil, and well trodden down when planted. But there seems to be something in some soils which induces floriferousness, and some suggest lime, although I do not believe it is essential for this flower specially.

Apart from the well-known typical form, Gentiana acaulis, there are a few varieties, none more beautiful than it, but of interest and value to the special lover of such flowers.

First may be named G. acaulis alba, the white gentianella, which is very beautiful, though lacking in the glorious blue which delights us in the common gentianella. It seems to vary a good deal, and some forms are purer or more floriferous than others. The Darley Dale variety is one of the best. In G. acaulis alpina, the alpine gentianella, we have a smaller counterpart, and a lovely little thing for the choice rock garden, although doing in the border also.

Clusius's gentianella is another form, with fine dark blue flowers, and characterised by the spreading form of the large lobes. It may be added to the gardens of those who take special pleasure in the varieties of the best flowers.

All of these forms require the same treatment as the common gentianella, and all are increased by division or by seeds.

The white variety will scarcely come true from seeds, but in exchange for this failing there is the possibility of obtaining light blue shades among the seedlings.

Seeds are slow of germination, and should be sown as soon as ripe in a half-shaded position in shallow drills, covered slightly with fine soil, pressed gently down, and kept moist. A greater number of plants will be secured by sowing in pots or pans, the compost consisting of loam, leaf-soil, and a good quantity of sand, covering the seeds slightly with the same soil, and putting the pots into a shaded cold frame or cold or cool house. When the seedlings are large enough to handle conveniently they can be pricked out into beds in the open, or into other pots or pans. Where seeds have to be purchased they should be sown as early as they are received. This fine plant and its varieties are of such beauty that a strenuous effort should be made by every gardener to induce them to grow and flower in his garden.

S. Arnott.

THE ROCK GARDEN OF TO-DAY.

Though the present popularity of the rock garden and rock plants betokens a great advance during the last few years, it must not be taken that the rock garden has reached its zenith, neither have its exponents reached the high-water mark of perfect knowledge.

One cannot generalise in rock gardens; it would be folly to try, and a design of formation and a system of planting up the spaces, which answers admirably in one position, will not necessarily give the same telling or pleasing effect in another. Moreover, although we have passed the days when burr bricks, shells, flints, etc., were found to represent "the rockery," we are not free from fault, and though many really noteworthy rock gardens are in existence, yet there are others which certainly do not deserve the name. Many of these creations look well only when overgrown with masses of flowering subjects, and even then the lack of design and thoughtful study militate against its general appearance.

The rock garden (unless it be completely isolated) should harmonise with that portion of the garden which adjoins it. The one should fall naturally into the other. A blending of scenery is necessary for a pleasing garden. Ofttimes I have noted so-called rock gardens built on the style of a cairn of stones which marks the resting place of byegone warriors.

Again, how often do we perceive that the indiscriminate use of comparatively small stones fails miserably to achieve the effect which a few large bold rocks would certainly secure. Too much small stone is used as "rockery" stone, and no words are too hard to denote the bizarre effect. Again, the stone itself calls for distinct notice. Some of the Derbyshire, Yorkshire, and mountain limestones are of great service, but for the health of the majority of plants there is nothing better than a good sandstone formation, such as one obtains in many districts in Sussex. The absorbent nature, and veinous texture of this stone assists to retain moisture, and to afford a foothold on the face for the tiny rootlets of many plants.

Pathways must necessarily have attention, for a rock garden that does not afford one the means of traversing it from end to end, and of bringing one into close contact with the plants themselves, is obviously a partial failure.

In addition to obtaining a good rock formation effective and pleasing to the eye, one must not lose sight of the fact that one has to provide a safe home for many plants and shrubs. This has been rather a drawback with some otherwise fine rock formations, the rocks being well arranged and of bold appearance, yet the disposition failed to provide suitable accommodation for the "planter's subjects." The value of a rock garden is twofold. It must typify a pleasing setting of rocks, and render a good effect by its drapery of plants. If it fails at either point then the garden itself loses in value and charm.

Of the much-discussed modes of planting rock gardens, a brief word of advice may be given. Too often the planter errs in the matter, either by the weak planting of a myriad single specimens or else in trying to effect bold stretches of colour to the elimination of everything else.

Colour in the rock garden is desirable, especially for distant effect, but it should be used with care. Arabis albida plena, Aubrietia Dr. Mules, and Alyssum saxatile are each very attractive in their way, but it is not good policy to plant such subjects in quantity to the exclusion of many other plants. I like a touch of colour. It is pleasant to note a cascade of snowy whiteness, a torrent of gold, or a sweep of rich blue, but from these my eye loves to wander to the softer hues and daintier beauties, the rarities and "small colonists," whose charms are quite as great though they may lack the robust growth and bright hues of many of their confreres.

It is of the highest importance that a succession of blossom is maintained throughout the year. More is expected of the rock garden by reason of the lavish manner in which Nature has given of her wealth for our purpose. Flowers are looked for when everywhere else is devoid of beauty, thus the planter must see to it that sufficient generic and varietal forms are selected to give a long continued series of colour pictures are planted.

For early-flowering a good selection of bulbs are quite as greatly important as a good collection of plants. Irises, anemones, chiondoxas, crocus, puschkinias, scillas, leucojums, galanthus, tritelias, tulips, narcissi, muscari, etc., etc., in varied forms, help to increase the beauty of early blossom, and it may be said that spring is the season of seasons for the rock garden.

In the case of the garden devoted to alpines great advance is noted. Plants nowadays receive better attention and more rational treatment, and the result is strikingly apparent. Even now, however, a few persist in carrying into the rock garden schemes of mulching and manuring which would be better reserved for the kitchen garden. What would my readers say to the mulching of a goodly collection with hot stable manure "to keep the frost away," or, in another case, the using of certain compounded manures for forcing a luxuriant growth in alpines. It is remarkable how, in their native habitats, a great number of alpines subsist in the most meagre allowance of soil. The rain carries to their roots simple sustenance and new soil particles for their enrichment. The keen, crisp mountain air, the hardening winds, and the ripening influence of the sun, all combine to keep these little plants sturdy, hard, and floriferous. Follow nature in your rock garden work, simple top dressings occasionally, gritty sound soil mixings, lime for limestone plants, sand for the majority. An open situation where sun and wind will bring out foliage colourings as well as plenty of blossom. Keep them free from our rapacious lowland weeds, and renew old plants by cuttings, seedlings, or offsets.

P. S. Hayward

SMALL GARDENS BEAUTIFUL

It is not the size of a garden that makes its beauty; supposing a small garden and a large one to be equally well cultivated, the latter will be of superior excellence by reason of its size, but, as a matter of fact, the more space the more probability of neglect, if not positive ugliness, within it. Perhaps, however, it is the medium-sized garden that too frequently shows signs of neglect, because insufficient labour is spent upon it. In degree, if not in importance, it is as fatal to underman a garden as a ship. Miniature pleasure grounds become, therefore, almost perfect under one individual's care, and it is not too much to say that England owes a great deal of her beauty to the love of floriculture that is annually increasing amongst us.

Concentration is a secret of notable success, as distinct from an all-round level of excellence. The man possessed of very limited ground space will derive much more pleasure from cultivating two or three special kinds of plants, with a sprinkling of others, introduced only to show these off, than from gathering together specimens of many. Instead of each small garden having its rosery, how much finer it would be if one or two were wholly of roses, the others given up to lilies, carnations, chrysanthemums, etc.

I was once in a delphinium garden, so unimportant in dimensions that, during winter, the plots back and front looked scarcely larger than the house, yet, when summer reigned, the display of stately flowers was so remarkable that it was spoken of throughout several counties; the delphinium is one of those blossoms that offer blues of every shade, since the effect of pink, copper, and purple shadings within the blue petals of some varieties is, at a slight distance, the creation of different blues. The plant goes on blossoming during four months if properly treated, and, as a foliage subject even has distinct merit. Where it is studied, combined, and managed tenderly, accompanied by the new dwarf forms that can be grown from seed to bloom in a few months, it yields, perhaps, a more glorious colour display even than the phlox or hollyhock, both of which hardy plants might well reign supreme in other small gardens.

Summer and autumn phloxes, by the bye, offer great variety of heights now, as well as hues, and would flourish in a semi-shady place; it would be advisable to choose the classes of colours with regard to the appearance of the dwelling, since rose and carmine masses can never rejoice the vision if close by red walls, while there are vermilion, orange-cerise, and salmon shades that will tone with these perfectly, even soften down their new crudeness. White, cream, blue-lilac, and bronze-crimson may accompany the red; mauve, purple, cream, and white, the rose and carmine.

An avenue of hollyhocks following the path, or little carriage sweep, will give a rare importance to the entrance to a villa; hedges of the stately plants can shut off roadway or tradesman's walk, for there are four-foot althæas now, in addition to the giants; shrubberies made of a few evergreens and numerous hollyhock groups are always satisfactory. Single plants dotted round a lawn, a different kind of viola carpeting each of the round beds cut for them, will have, to some eyes, a fairer effect than that produced by similar employment of standard roses.

Small gardens given up to one colour, either with or without white, prove pleasing; gold is probably most cheering of all, as it seems to catch and retain the sunshine; the use of yellow-leaved shrubs, such as golden privet and euonymus, immensely aids the effect. Artists tell us that only by having large expanses of pure colour spread out can the vision ever hope to appreciate their intrinsic beauties, and there is no doubt that we spoil half our gorgeous flowers by scattering them among others of different hues. It has been well said that few persons of taste would tolerate the combination of tints in a room that are to be found in nine herbaceous borders out of ten.

Overcrowding is to be avoided: this does not mean that the modern method of carpeting must not be pursued, but the dwarf plants should seem to be nestling naturally at the feet of the taller ones, and ought each to have room to develop fully. A rockery fails to be pleasing unless some of its rocks rise out of the vegetation and florescence. The viola family has never, perhaps, been represented thoroughly in one small garden, yet this could easily be done. Giant fancy and show pansies, violas or bedding pansies, the various forms of the Horned Violet (Viola cernuta), sweet violets in profusion, are not the only beautiful border and bed fillers. There is also the Bird's-Foot Violet (Viola pedata), the Colorado Violet (V. Rydbergi), the shade-loving blue Viola calcarata, and the Summer Violet (Viola cucullata). Pansies on the shady side, and bedding pansies on the sunny one, will blossom until winter in the window boxes.

There remains another uncommon scheme. By means of evergreen shrubs and plants, used alone, flowering ones intermixed with those valued only for foliage, a small pleasure ground can be made beautiful in winter as well as in summer.

M. H.

BASKET OF ROSE MADAME ABEL CHATENAY.
One of the three baskets of garden roses for which Mr. J. Mattock was awarded the First Prize at the National Rose Society's Show.

THE VINE MAPLE.

A quite large number of acers possess flowers of a showy character, as is instanced by the small red flowers of A. rubrum, which appear in March; the yellow flowers of A. obtusatum, which open a little later; the long, drooping racemes of yellow blooms found on A. macrophyllum, and the common sycamore, the small red blossoms of A. palmatum varieties, the subject of the present note, and many others.

The Vine Maple, Acer circinatum, is a Californian species, which is met with either as a small tree or large shrub, the latter being more frequently the habit presented under cultivation in Britain. The leaves are distinct from those of other maples by their somewhat rounded character. Each one is divided into six or seven lobes, of which five are considerably larger than the others. When they first appear they are of a delicate shade of green flushed on the upper surface with reddish-brown. The flowers appear early in May as the leaves are developing, and are arranged in drooping inflorescences. The most conspicuous part is the calyx, which is red. As a contrast there are yellow stamens, while the corolla is white. As the flowers are borne with great freedom a pretty effect is made amongst the delicately coloured leaves. A further period of beauty obtains in autumn, for, previous to falling, the leaves take on brilliant orange and scarlet tints. Like the majority of the maples it succeeds in any ordinary garden soil, whilst it may be expected to grow in most parts of the country.

D.

Asparagus.—This is now growing very freely, and will need supports to prevent the stems being broken by the winds. Good pea sticks are very useful for this purpose. Stakes and strings can also be used. Hoe carefully through the beds and keep them perfectly clean; a sprinkling of artificial manure will do the beds good, and will strengthen the growths.—Geo. Ellwood, Swanmore Park Gardens.

Russelia juncea.—What a pretty object this makes in the warm greenhouse if the main shoots are secured to an upright stake, and the minor rush-like branchlets allowed to dispose themselves at will. They have all more or less a drooping tendency, and when laden towards the points with their small bright red, tubular-shaped flowers, present a very pleasing effect. Not only this species, but R. sarmentosa and Lemoine's hybrids, are well worth growing.—W. T.

HARDY AZALEAS.

The month of May, remarkable though it be for its wealth of flowering trees and shrubs, has nothing to surpass the various hardy azaleas; indeed, for brilliant effect their only rivals are their near allies the rhododendrons. Of these last the range of colour is not nearly so great as in the case of the azaleas, whose flowering season is nearly over before many of the rhododendrons are at their best. Botanists, as is now generally known, include all the azaleas in the genus Rhododendron, but from a gardening standpoint the two are so distinct that for general purposes they may well be kept separate.

The charm, to many, of novelty cannot be claimed for these hardy azaleas, as they have been popular for generations, and in my young days an annual treat was afforded by the azaleas in flower in Messrs. Osborn's nursery at Fulham, long since covered with the all-conquering bricks and mortar. Again, to my personal knowledge, the azalea beds of Kew have during the season been the Mecca of devoted flower lovers for over forty years, and at that time many of the specimens were old bushes. That their popularity is in no ways diminished was well shown by the endless stream of visitors during the time they were in bloom. Quite a long list of garden varieties is given by Loudon as occurring in the catalogue of Messrs. Loddiges for the year 1836, as having been raised at High Clere in 1830, or before, and the Belgian varieties of 1829 or earlier.

The raisers of that time made use principally of A. calendulacea, a North American species, with brilliantly coloured blossoms, to whose influence we owe many of the orange, orange scarlet, and various red forms; A. nudiflora, also from the Western Continent, whose flowers are of varied tints; A. occidentalis and A. viscosa, also American kinds; and A. flava or pontica, a native of the Black Sea region, with yellow blossoms.

As might be expected from the intercrossing of the several species with flowers of such diverse tints, there is a wide range in the colour of the blossoms, as they vary from white to vivid scarlet, through all the intermediate shades of yellow, orange, salmon, and orange-scarlet, as well as different tints of pink.

Some of the older varieties have honeysuckle-like blooms, thus showing a good deal of the influence of A. nudiflorum, but in all, or nearly all, of the newer hybrids the blossoms are larger, and the petals broader owing to the important part that A. sinensis, or mollis, as it is generally called, has played in their production. From this source we have obtained such varieties as Anthony Koster, perhaps the most popular of all the hardy azaleas, and for flowering under glass is extensively cultivated. As a great number of the older varieties of hardy azaleas were raised in Belgium, they are often known as Ghent azaleas.

The Chinese A. sinensis, or mollis, is characterised by a dwarfer habit and larger flowers, borne in more massive clusters than the older hybrids. They are also earlier in expanding, so that they are sometimes cut by late spring frosts, added to which their somewhat lumpy habit renders them decidedly lass graceful than some of the others. From an artistic standpoint those varieties whose tender unfolding leaves serve as a setting to the newly-expanded blossoms, are decidedly preferable.

Azalea occidentalis, a white-flowered species from California, incidentally alluded to above, flowers naturally towards the latter part of June, and on account of its late blooming qualities it has been employed by the hybridist in the production of varieties that serve to extend the azalea season.

Other species of azalea that have played but little, if any, part in the production of the garden varieties of to-day are A. ledifolia, a native of China and Japan. Its blossoms are pure white, and the entire plant is very hairy. A. rhombicum, from Japan, is remarkable from its rhomboid leaves, while the lilac-purple flowers are borne, as a rule, in April. A. Vaseyi, a native of the mountains of North Carolina. The flowers are white, suffused with pink, and expand early in the season. It is a delightful species, and though now known in gardens for many years, is still decidedly uncommon.

Considering their great merits, it is difficult to understand why these hardy azaleas are not more generally planted. There is a widespread idea that peat soil is absolutely necessary to their well doing, but such is by no means the case, as they will thrive in loam provided it is free from lime. If the soil is of too adhesive a nature leaf-mould, peat, or sand, may be incorporated with it to the advantage of the azaleas. A very important matter in connection with these handsome shrubs is to bear in mind that in common with many of their relatives they are very impatient of drought, hence it is useless to expect them to thrive in a parched-up soil. Their roots are so fine as to be almost hair-like, hence they quickly suffer if allowed to become too dry. Owing to the close, compact nature of their root system these azaleas, even when they have been standing in one spot for years, may be removed with but little risk; in fact, if it is done early in the autumn, and the plants are well watered so as to settle the soil around the roots, they will flower well the following spring.

The different hardy azaleas are seen to the best advantage if planted in bold masses or groups, in which case a judicious selection of colours is necessary. For gardens of limited extent, planted as single specimens, or as groups of three on the grass, a very pleasing effect is produced. Though the above remarks refer solely to the beauty of the flowers, it may be noted that the foliage of most of the hardy azaleas is in the autumn very richly tinted.

W. T.

FIRST PRIZE COLLECTION OF EIGHTEEN VARIETIES OF GARDEN ROSES.
Exhibited by A. Tate, Esq. (Mr. W. Mease, gardener), at the National Rose Society's Show.

Everyone interested in a garden should obtain a copy of the ALPHABET OF GARDENING, by T. W. Sanders. Thoroughly practical information is given as to soils, manures, seed sowing, planting, potting, budding, pruning, grafting, forcing, hybridising, etc., with explanatory diagrams. Price, bound in cloth 1s. 6d. net, post 1s. 9d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

AN ATTEMPT TO INTRODUCE OLEARIA SEMIDENTATA INTO THE BRITISH ISLES.

(Concluded from page 506.)

I was now anxious to get farther afield towards the Horns, at the southern part of the island, and was fortunate in finding Mr. W. Jacobs, who volunteered to accompany me. It had rained 15 parts during the day, and the next morning broke thick and foggy, delaying our start, but we got away on horseback about 9 a.m. and travelled south, our destination being Mr. Blyth's place, about fifteen miles off. The track—for there are no roads—lay over the higher country, undulating and boggy, with occasionally a deep ravine through which flowed a small river considerably swollen by the rains. The country over which we passed was covered with Pteris esculenta (the Bracken Fern), some Phormium tenax, Dracophyllum arboreum, and Styphelia robusta in the drier parts; while Dracophyllum paludosum occupied the more swampy ground. The fog was fairly thick, and I could get no general view of the island, and it was so boggy that we constantly had to dismount and lead over the bad places; while at the best the horses were nearly up to their hocks in the peat. After some time we came across Olearia semidentata in full flower: it is a beautiful sight, covered with its purple daisy flowers like a glorified Michaelmas daisy. The ray florets are light mauve, and the centre is a dark purple. Masses of plants were to be seen, the largest being about 3ft. to 4ft. high, and in places where patches had been burnt seedlings were coming up in thousands. I endeavoured to photograph some of them, but it was most difficult in the wind and fog. A peculiar kind of rush-like grass, Lepyrodia Traversi, seems to grow in association with Olearia semidentata, and greatly helps to harden the bog and make it easier to walk about on. The beautiful Epacrid Dracophyllum paludosum was also in full flower, and the white patches made a lovely contrast with the olearia and the brilliant red berries of Styphelia robusta, a combination which existed on the edges of the drier ground. At last we came to a lonely, steep gully full of bush, including tree ferns and Senecio Huntii in abundance, where we halted for lunch and where, in spite of the fog, I was able to obtain some good photographs. Eventually we arrived at the Te Tuku gully—very steep and precipitous—across which a bad track led. The gully at the mouth where we crossed is about 600ft. high, about half a mile wide, and covered with bush. When we arrived at Mr. Blyth's house, about four o'clock, I explained to him that my mission was to obtain specimens of a rare plant (Aciphylla Dieffenbachi), which I had heard grew on the cliffs near his house, and he immediately led me to the spot. It was growing on the precipitous slopes of the cliffs, which are here 600ft. high, one flowering plant only being accessible, which we obtained. The edge of the cliff was covered with Phormium tenax, long grass, some Astelia nervosa, Veronica chathamica, more erect than the type, and the lovely little pink or white-flowered Geranium Traversi; while on a ledge of the cliff below I noticed some of the ordinary forest trees, also a mass of Myosotidium nobile (the Chatham Island Lily), and the giant nettle, Urtica australis. I also found Olearia chathamica in abundance growing on the cliff a little farther along, also Senecio lautus and S. radiolatus. Through the kind hospitality of our hosts we stayed at Te Tuku the night, with the promise of more Aciphylla Dieffenbachi the next day. Sure enough, on a small detached cliff island some two miles on our way back Mr. Blyth showed me a quantity of it growing, and I was able to take good photographs and get some specimens and plants. Unfortunately only the male plants were still in flower, the females having already gone to seed. This was most disappointing, because Mr. T. F. Cheeseman in his "Flora" is inclined to agree with Mr. Kirk in considering that it will ultimately form the type of a new genus; but hitherto no flowering specimen of the female has been obtained. The plant is very scarce except in patches in inaccessible places, and is said to occur also on Pitt Island in places similar to where I found it. It is probable that it is a good deal scarcer than formerly, since it must have suffered from the depredations of cattle, which eat it readily wherever they can get at it. Other plants are similarly threatened with extinction, namely, Myosotidium nobile, Phormium tenax, and Aciphylla Traversi.

"The weather continued foggy and damp all this time, but when we were nearly back again at Weitangei it cleared, and came out a glorious evening, so that I was able to get a view at last. When next morning broke, however, it was as bad as ever, and it rained in torrents all that day, and continued throughout the next, making it quite impossible to get about the country. On the 11th it seemed finer, and I started off with Mr. Cox to visit the shores of the Great Lagoon (Te Whanga) and the country between it and Lake Huro. Growing on the low limestone cliffs bordering the lagoon I found Styphelia Richei (which does not occur in New Zealand, but is found again in New South Wales), Styphelia robusta, Sophora tetraptera (Koi), Phormium tenax, Linum monogynum, Geranium Traversi, Veronica Dieffenbachi, and Samolus repens, the latter a lovely little creeper, which, like Salicornia, seems to like a place where the salt spray can reach it. The samolus resembles the plant found in New Zealand, but is altogether a finer thing, and probably deserves the distinction of var. chathamicus. The country between the lagoon and Lake Huro, and especially along the lagoon coast, is very pretty and park-like, and the forest trees growing close together form woods. Here corynocarpus reaches a maximum height of 45ft., with a thick stem in proportion, and the other forest trees are all larger than I had before seen them. In these woods occurs Plagianthus chathamicus, referred by Cheeseman to P. betulinus. It appears to differ in having larger flowers and foliage; and, as the small-leaved form of the mainland is not present in the Chathams, it seems reasonable to follow Dr. Cockayne and call it P. chathamicus. Before getting home we were wet through again, but during the morning I managed to get some photographs showing Veronica gigantea, 20ft. high. Thus ended the first seven days of my visit, the total rainfall being 3.10in., with only once a glimpse of the sun. The 12th was spent in getting dry and in packing the plants, but I got wet again after a short excursion into the Lake Huro swamp in search of carex.

"In the evening our steamer appeared on the scene; but, as I soon learned from the captain that he had yet two more days' work down the coast and loading at Weitangei, I started off with Mr. Cox on the 13th, which was fine and calm, for what is known as the Tobacco country. This district is so called not because it grows tobacco, but because it was once purchased for a few cigars. It is the country lying southward, and comprises the highest ground, worst bogs, and greatest quantity of Olearia semidentata; the place of all others I was longing to get to, but up till now quite impossible owing to the bad state of the weather. The way first led through fine pasturage and patches of lowland forest, including a very fine patch of Cyathea Cunninghami. Out on the moorland we saw Dracophyllum arboreum and Styphelia robusta—a bush of the latter standing isolated attracted my attention more than two hundred yards off by the scarlet colour of its berries. After crossing a fine gully, in which was Senecio Huntii, the giant groundsel, in full flower, the ground about a mile further on became wetter, and Dracophyllum paludosum, tiny plants a mass of flower, appeared. Soon came Olearia semidentata, at first odd plants, then in masses, acres and acres of it everywhere and in full flower, and presently we found Olearia chathamica scattered about; and next came to a large bog all yellow with sphagnum and green, apparently, with watercress; patches of flax here and there, and also Carex appressa var. sectoides. Here we halted for lunch, and I discovered several bushes of an entirely white form of O. semidentata, unknown to Mr. Cox; he also found a lovely pink variety. Through the bog flowed a small stream, and it seemed there would be a difficulty in obtaining water to wash down our sandwiches; but on getting nearer I discovered the supposed watercress to be a mass of Marchantia cephaloscypha, and that one could walk on it everywhere, as it formed a crust over the surface of the bog. On going farther across the bog I was surprised to find a very large area of this liverwort nearly an acre in extent, growing on a considerable slope; so much so that one could slide on it. The ground at its edges was some feet higher, irregular, and covered with O. semidentata; it immediately gave me the idea of a glacier, the lateral moraines being formed by the olearia. I obtained several photographs of this remarkable formation, which I called the "glacial bog," as a distinction from the Olearia-Lepyrodia bog. The day was fine throughout, and by far the most enjoyable one I had spent on the island. We returned early in order that I might pack the plants obtained, which included one nice plant of the white variety of O. semidentata. The 14th was spent in embarking the plants and repacking them into a Wardian case which I had on board, and we sailed in the evening about 6 p.m., reaching Lyttelton on the 17th, just in time to catch the evening boat to Wellington, where I left the plants ready to bring them to England on the 30th December. Thus ended a very rough but interesting trip, in which I was very greatly assisted by the kindness and hospitality of the inhabitants of the Chatham Islands. My thanks in particular are due to Mr. Cox and Mr. Alec Shand."

LAVENDER.

The fragrance of lavender is one of the happiest and most lasting memories of the floral year, and although not a native plant, it is nevertheless quite typically English, as it has been known to English gardens for over three hundred years. There are several forms of Lavandula vera cultivated in gardens; the type grows into a bush some two to three feet in height, and produces dingy-coloured flowers. The corolla segments are small, and of a weak shade of blue. The best-known form is a counterpart of this, except in regard to the flowers, which are conspicuous, and in handsome spikes of a deep violet blue. Curious, but interesting, is the fact that both these forms are reproduced in miniature. The dwarf forms are very compact in growth, and much greyer in the leaves, indeed both forms, by lightly pruning them, may be kept under twelve inches for several years. The best form is that having violet-blue flowers; this I had originally from France, under no particular name, but it is identical with the variety known as the Munstead lavender. So charming a subject should be largely used in every garden, and, if possible, in broad masses; this particular form begins to flower early in July, quite a month before the other kinds. On any large scale the Munstead lavender can be employed to excellent purpose as a foreground to the taller kinds; alone, in masses, or in lines, it wins general approval. Varieties of lavender are readily propagated by cuttings inserted in sandy soil during September and October, treating them on similar lines to bedding violas; the plants may be placed in their permanent positions any time during the following year. Lavender succeeds best in a well-drained soil, preferably that containing limestone or chalk in an active form.

Thomas Smith.

NEW PLANTS, ETC.

ROSES.

Juliet.—This lovely rose we have previously described on the occasion of its receipt of an Award of Merit on July 20, 1909. It is a wonderful rose, and improves on acquaintance, its bright orange-red and yellow colouring combining to produce a colour effect absolutely unique among roses. The fragrance of the variety is very delightful, and there is little doubt that Juliet has a great future. F.C.C., R.H.S., July 5. Messrs. W. Paul and Son, Waltham Cross.

Mrs. Foley Hobbs.—A fine H. T. variety, with very shapely flowers of a deep cream or ivory-white colour. It is broad-petalled, and promises to be a good exhibition rose. A.M., R.H.S., July 5. Messrs. Alex. Dickson and Sons, Newtownards.

Mary Countess of Ilchester.—A large full centred rose of great beauty; it is broad-petalled and of a rich rose colour shaded with pale violet. A.M., R.H.S., July 5. Messrs. Alex. Dickson and Sons.

Rayon d'Or.—A distinct and effectively coloured variety that has Soleil d'Or for one of its parents. The flowers are rather large, moderately full, and of a rich yellow colour, the back of the outer petals splashed with crimson. It was raised by Pernet-Ducher, and attains a height of about thirty inches. Gold Medal, National Rose Society, July 8. Dr. Waddell, Roselands, Baldock, Herts.

BEGONIA MRS. W. L. AINSLIE.

This is not a new variety, but it is an excellent one, free in growth and bloom. It has big double flowers of the purest golden yellow hue. A.M., R.H.S., July 5. Messrs. Blackmore and Langdon, Twerton-on-Avon.

DELPHINIUMS.

Belladonna semiplena.—This variety has almost double flowers, and these are of a pretty soft shade of blue. A.M., R.H.S., July 5. Mr. Amos Perry, Enfield.

Lamartine.—A splendid variety of comparatively dwarf habit, and bearing fine spikes of large deep violet-purple flowers. A.M., R.H.S., July 5. Mr. Amos Perry, Enfield.

GLADIOLUS EDWARD VII.

An elegant gladiolus, said to be a cross between Ardens and Crimson Queen. It belongs to the early-flowering group, and adds needful colour to it. The flowers are larger than those of most early varieties, and they open well. The colour is deep rich orange-red, with a large whitish central area, shaded with purple on each of the three lower segments. A.M., R.H.S., July 5. Mr. Frank Lilley, Guernsey.

Radishes.—Sow seeds, at ten-day intervals, in good ground partially shaded. Good radishes are assured if a dressing of old potting soil is applied at sowing time. Protect from birds.—G. E.

Cucumber Lockie's Perfection is one of the most reliable varieties for frame culture; free in setting and continuous in bearing, it yields a prolific crop of excellent quality under the most trying conditions. I have grown it for a number of years without the use of the orthodox hotbed. A double-light frame vacated by violets is relined with fresh soil, the cucumber being planted without further preparation. Close and careful attention is necessary both in regard to airing and damping down, as the only warmth obtained is that from the sun's agency, consequently early closing is diligently observed. Frame cucumbers require to be thinly trained, and once the plants are in full bearing, a light top-dressing of rich soil at intervals will enable the plants to produce the maximum yield over the longest period. The earliest fruits from frames under this system were cut on May 26 this season, and as a rule the supply from this source is prolonged until October. —Thomas Smith.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

COOL-GROWING ONCIDIUMS.—There are several oncidiums that thrive excellently under cool or intermediate house treatment. Some of them are annually imported in large quantities, so that they are procurable at a modest cost. The flowers of the different species and natural hybrids of this genus vary considerably both in size and the colour of the flowers. In the majority of cases they are attractive, and exceedingly useful subjects for decorative purposes. There are numerous methods under which the plants may be cultivated. They are often found growing in greenhouses on a piece of rough bark or stump of wood, on rafts, in baskets and pots; while only recently I noted in one of the miners' greenhouses several large specimens of O. flexuosum covered with flower spikes growing in tubs, these being exhibited at most of the local shows in the North of England. They are in most cases profuse in flowering, and it may be reasonably suggested that the free-flowering characteristics of some of the species often lead to detrimental effects, especially where they have not been relieved of their flower spikes within a reasonable time after they have become expanded.

NEW ROSE JULIET.

A remarkably distinct and beautiful rose raised by Messrs. William Paul and Son, and exhibited by them at the Holland Park Show, when it received a First Class Certificate; the flowers are bright orange-red and yellow.

ONCIDIUMS suitable for cultivation in a temperature normally from 50 to 55 deg. in winter belong to the Brazilian section, which includes such well-known and popular species as O. concolor, O. crispum, O. curtum, O. Forbesi, O. Mantini, O. Gardnerianum, and others of this section. The whole of the above-mentioned species are best procured as imported plants. When received they should be carefully cleaned of all dead and decaying matter about the base; also of any scale or insect pests that may have secreted themselves. This is desirable, as only last year we found several imported plants of O. Marshallianum literally infested with mealy bug.

POTTING ONCIDIUMS.—Select pots or shallow pans just large enough to contain the roots comfortably. Fill to one-half their depth with clean broken crocks. After the plants are placed in position fill in the remaining space with a compost consisting of about equal proportions of fibrous peat, chopped sphagnum moss, and broken leaves, with sufficient silver sand added to render the compost porous. This compost should be pressed firmly about the base of the plants. They should be watered as soon as potting is completed. Rain water should always be used, for it will be found that with hard water the sphagnum moss rarely grows satisfactorily. More frequently it dies, and the decay thus set up quickly causes decomposition of the remaining constituents of the potting compost. After the first watering very little water will be required until the new growths are produced, when more liberal treatment must be afforded, and continued until the plants have flowered. After flowering they take a prolonged season of rest, during which time only sufficient root moisture is necessary to retain the pseudo-bulbs in a normally plump state.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

POINSETTIAS.—The latest batch of these plants should now be nicely rooted and transferred to a position where they will obtain more light and air, though at the same time they must not be allowed to get the full force of the midday sun, the young leaves being especially susceptible to burning. The earlier batches will at least be ready for transferring into 48's or 32's, and if they have been fairly well hardened they may, after potting, be transferred to a brick pit where just a small amount of heat may be given in cold or wet weather; but as mentioned in a previous calendar do not grow them too sappy, as long, ungainly plants are not useful for decorative purposes. Pot the late batches on as soon as fit, for they should all be well established in their flowering pots by the middle of August.

EUPHORBIA JACQUINÆFLORA.—This bright and useful winter-blooming plant should also be ready for transferring to its flowering pots as soon as established; if an empty melon house is available the young plants may be trained up the wires, but before doing this it is wise to give the house a good cleaning down to rid it of all spider or thrip, both of which are rather apt to attack the euphorbias. If this position can be accorded them, and they are given a fair amount of heat and sun, they will grow quickly, and, what is very essential, be well ripened; as the pots get full of roots liquid manure may be given them pretty freely, but on no account must they be overwatered.

OTHER WINTER-BLOOMING STOVE PLANTS that should be potted on are Ruellia macrantha, justicias in variety, Thyrsacanthus rutilans, etc. Most of these plants like a fairly light mixture of loam and peat, with a good sprinkling of sand to keep the soil very porous, and all of them may be cultivated in a warm frame, at least for a month or two, until such plants as caladiums, gloxinias, etc., are taken out of the warm houses, where they should be transferred from the frames. When rooted nicely most of these plants will take water pretty freely, and thorough good syringings overhead should be given on all fine days, and the frames be closed fairly early in the afternoon to conserve the sun-heat.

CELOSIAS.—These prove very useful for decorative purposes during the late autumn and early winter, and young plants raised from seed last month should be moved on as they require it. A fairly warm temperature, with a fair amount of moisture, suits these plants well, and whilst in the young state frequent syringings should be given them to keep down spider, which is rather a troublesome pest to celosias during the generally hot, dry months of July and August. These late-sown plants should not be over-potted, 48's being quite large enough to flower them in, and in this size pot they will make plants quite large enough for most purposes, provided they are liberally fed with liquid manure when coming into bloom, at which time syringing should be withheld and rather more air given to the plants.—Thomas Stevenson, Woburn Place Gardens.

FRUITS UNDER GLASS.

LATE GRAPES.—In changeable weather similar to that experienced last month, houses containing late grapes will require more than usually close attention, in order to prevent the vines receiving injury from chills, or from their leaves becoming scalded. It is easy at such times, unless we are constantly on the alert, to be caught napping by sudden bursts of sunshine, especially when they take place after spells of dull weather, and then the vines may be considerably injured in a surprisingly short space of time, and disfigured for the season. The bunches of grapes should be examined now, while the scissors can be conveniently used, and any seedless berries be carefully removed. Keep sub-lateral growths (except in spaces where there is a dearth of leaves) closely stopped at one leaf. Mildew is sometimes troublesome, particularly if the proper temperature is not maintained, and should it appear flowers of sulphur and skim milk should be mixed to the consistency of paint, and the pipes, after being made quite hot in the evening after the house is closed, should be painted with the preparation. This, if carefully carried out, will readily destroy the parasite, but if excessively followed may bring trouble by causing the berries to rust. Thrips seldom appear in vineries that are carefully managed with respect to atmospheric moisture. Fumigating is the best remedy, but the good flavour of the grapes would be sacrificed if it was practised at this stage of the fruits' development, and should this pest appear the best means to adopt would be to sponge the leaves with soft soap solution. The roots of young vines planted in newly-made borders are liable to attacks of wireworm; should this be troublesome bury carrots in the surface of the border, examine them frequently, and destroy the pests found attached to them. Give needful attention to watering, mulching the borders, and feeding with suitable liquids or compound manures.

YOUNG VINES.—Vines raised this year and intended for yielding an early crop of fruit next season, will have made considerable progress in their fruiting pots, and will require more frequent attention to watering, and a moderate amount of manurial assistance. Train the leading growths as they lengthen to a trellis placed near the glass, stop them when they have reached about nine feet in length, and also all side growths at one leaf. Well syringe the vines in the morning, and again when the house is closed for the day; this will both invigorate the plants, and keep them clean and free of red spider. Once the rods commence to brown use less atmospheric moisture, increase the ventilation of the house, and leave the ventilators slightly open at night, by which means the vines will be prepared for removal to a sunny sheltered position outdoors. Newly-planted young vines that have limited rooting space should have needful attention to watering, and have, if necessary, the borders mulched. If properly managed the leading growths will have been stopped after having reached a length of about six feet, and beneath this point the lateral growths should be stopped at one leaf, but sufficient of the upper shoots to cover the top portion of the trellis should be allowed to extend.

TOMATOES FOR FRUITING IN WINTER.—There should be no further delay in sowing seeds for the winter crop of fruit. Sow thinly in shallow pans, place them in a cool frame, and as soon as the plants have made rough leaves put them singly in small pots, and subsequently shift into large pots as required. Keep the plants sturdy by freely ventilating the frame by day and night, or by placing them outdoors in a sheltered position with their pots plunged in ashes. Good loam, with a little manure from a spent mushroom bed, and some crushed mortar rubble, made firm by ramming, answers well as a rooting medium.—T. Coomber, The Hendre Gardens.

THE KITCHEN GARDEN.

TOMATOES UNDER GLASS. — The plants raised from the spring sowing being in full bearing, will need care and attention to keep them fruitful and healthy. They must not be allowed to become dry, or they will crack after watering; and do not overfeed them, but rely on light top-dressings of loam. With the loam mix a little burnt garden refuse and a small quantity of a suitable artificial manure, and occasional waterings of liquid manure from the farmyard. Good liquid manure for tomatoes is made up with one bushel of cow manure, one bushel of fresh horse droppings, a peck of soot, and a tub of water. Place the material in separate bags of good size, where it would have room to be well pressed when placed in a tub of water. When plants from later sowings are ready for their fruiting pots, the best materials are turfy loam and small quantities of mortar rubble and burnt garden refuse.

TOMATOES ON OUTSIDE WALLS are growing away and flowering well where old lights were placed over them at planting time. Lightly tap each stake daily to assist in dispersing the pollen and thus ensure the setting of the fruits. Top-dress with a moderate quantity of the above compost. Should hot weather return later, top-dress with horse droppings.

AUTUMN SOWN ONIONS.—The bulbs have now attained their full size almost, and as a preventive from splitting they can now be safely lifted. They must be lifted with care and well dried before they are stored. No better place can be provided for them than under garden lights. Allow a free passage of air under the frame by placing a brick under each corner. Remove the lights in dry weather, and turn the onions over daily to well dry and ripen them.

SPRING SOWN ONIONS.—Those raised from seed sown in boxes early in the year are now bulbing nicely. Keep the bed clean and use the Dutch hoe regularly, and occasionally sprinkle artificial manure or soot during the next month. Keep a sharp look out for mildew; treat it by speedily removing any and every affected part of the growth and at once burn it. As a cure, try equal parts finely crushed powdered lime (fresh) and sulphur, and dust the plants with the mixture when moist from dew. The main crops should be treated similarly to the above, but in this case finely sifted burnt garden refuse can be mixed with the regular sowing of soot broadcast.

CABBAGE.—Before further notes appear on this calendar of operations, the first sowing of cabbage must be made. A sowing should be made about the 21st of the present month, and seven days later. Sow in firm but well-prepared ground, and use a fair amount of burnt garden refuse with the soil. Net the seed bed to protect the seed from birds. From this sowing very nice little cabbages should be obtained towards the end of March and early in April, if in a sheltered position. For this crop sow Sutton's April and Ellam's Early.—Geo. Ellwood, Swanmore Park Gardens.

EXHIBITIONS AND MEETINGS.

National Sweet Pea Society.

(*Concluded from page* 548.)

well-coloured bunches of King Edward Spencer. Etta Dyke, George Herbert, Othello Spencer, Countess Spencer, and Clara Curtis. Mr. T. Jones followed, and Mr. F. J. Harrison secured the third place.

In the class for four bunches of American varieties there were but four entries staged, Mr. A. E. Usher again leading with Miriam Beaver, Marie Corelli, W. T. Hutchins, and Senator Spencer. Mr. T. Jones was a good second, while Mr. Robert Wright was third. The maiden growers class for six bunches was well supported, though some of the entrants failed to stage. The first prize went to Mr. Geo. Reid, Downfield, Dundee, for some well-grown peas. Dr. J. E. Phillips was second, with Mr. G. Baldwin third. The Horace Wright Challenge Cup for small growers was well supported, Mr. F. Green, Morris Road, Southampton, winning with good examples of Helen Lewis, Elsie Herbert, Clara Curtis, Evelyn Hemus, John Ingman, and Osta Ohn. Mrs. Howard Young, Filton Avenue, Horfield, Bristol, was second with a nice level display; while Mr. L. C. B. Hockin, High House, Sutton Green, was third, the whole forming a very fine class.

VOSS CUP.

The Walter Voss Challenge Cup for small growers was a good class, though some of the exhibitors had dropped out. Mr. E. D. Marshall, Early Rise, Reading, was first with neat examples of Mrs. Hardcastle Sykes, Etta Dyke, and Elsie Herbert. Mr. W. T. James, Kempston Hoo, Bedford, followed with larger flowers, though not so good. Mr. A. J. Dixon, Culmington Road, Ealing, was third. The smaller classes were well filled and the flowers good, taking them all round.

FLORAL DECORATIONS.

The dinner tables were, as usual, numerous and particularly well done. Mrs. W. Maslin, Ongar Hill Cottages, Addlestone, was first with a beautiful display in pink and cream, with light foliage; Mrs. A. Robinson, Park Hill, Carshalton, was second, and Mrs. de Buriatte, Wraysbury, third. Mrs. W. Maslin was again first for an epergne with a very dainty design; Mrs. Vokes, Horsell, Woking, was second, and Miss M. Jones, Wem, third. There were nine entries in the vases, most of which were excellent. Mrs. Vokes won the first prize with a beautiful arrangement; Mrs. W. Maslin was second, with similar colouring, and Miss. M. Jones was third.

TRADE DISPLAYS.

Messrs. Jarman and Co., Chard, had a tasteful exhibit, having a nice background, with trails of asparagus. An arch of Mrs. Townsend was the feature; but other good varieties were noted, all being well arranged. Messrs. Jones and Sons, Shrewsbury, had a fine floral arch covered with receptacles of various varieties, while underneath were tall vases nicely arranged. Messrs. Kelway and Son, Langport, had a nice display in vases and bamboo stands. The latter were lightly arranged with asparagus and gypsophila. From Messrs. E. W. King and Co., Coggeshall, came a charming exhibit. An arch, the pillars of which were formed with Mrs. W. King, was really fine, as were also the masses of Anglian Orange, Anglian Pink, Paradise Ivory, and Queen Mary.

Messrs. Sutton and Sons, Reading, had a splendid exhibit, arranged most gracefully in columns, Helen Lewis, Mrs. Hardcastle Sykes, Kitty Clive, Paradise Ivory, Yankee, and Primrose Spencer being especially fine. Mr. C. W. Breadmore also had a good exhibit with blooms arranged in tall bamboo stands, also in vases, King Alfonso, George Breadmore, Dazzler, Elsie Herbert, and Freda being especially good.

From Messrs. H. J. Jones, Limited, Lewisham, came a fine stand of his white sweet pea, Beatrice Stevens. Miss Hemus, Upton-on-Severn, had a really fine display, Primrose Paradise, Helio-Paradise, Cerise Paradise, and Paradise Apple Blossom being noteworthy.

Mr. R. Bolton, Carnforth, had a fine exhibit, which included vases of Charles Foster, Mrs. Wilcox, King Edward Spencer, Marjorie Willis, and Audrey Crier. The large masses at the back gave them a good effect. Messrs. Dobbie and Co., Edinburgh, had a delightful display. The chief varieties were Masterpiece, Earl Spencer, St. George, Clara Curtis, and some promising seedlings.

Messrs. G. Stark and Son, Great Ryburgh, staged some fine kinds in a variety of stands. Giant Pale Rose, Florence Wright, Mrs. Duncan, Improved George Stark, and Mrs. C. W. Breadmore were all good. From Messrs. W. Atlee Burpee and Co., Philadelphia, came vases of Dainty Spencer, W. T. Hutchins, Maud Adams, Mauve Spencer, and Mrs. Routzahn.

A pretty arrangement came from Mr. Jas. Box, Lindfield. The tall arches were gracefully filled with delicately coloured varieties, while Dodwell F. Browne formed a good centre. Mr. W. Deal, Kelvedon, exhibited some nice vases of his specialities, which included Bertrand Deal, Colleen, Queenie, Winsome, Prince Olaf, and Giant Waved Cream.

Messrs. S. Bide and Sons, Limited, Farnham, Surrey, also had a large display, most varieties being arranged in blocks of colour. Mr. W. O. Cautley, Bury St. Edmunds, also put up a pleasing exhibit. Messrs. G. and A. Clark, Limited, Dover, had an attractive bank of vases. The flowers were particularly bright. Mr. W. E. Alsen, Denmead, Hants, exhibited a highly effective display of kinds raised by Mr. J. Agate, Havant. The blooms were of high quality, and the fine new variety Stirling Stent was strongly represented. The varieties Moneymaker, Mrs. E. Noakes, and A. A. Fabious were also very fine.

Mr. J. Stevenson, Wimborne, also brought a display of well-coloured flowers. Orange Queen, Rosie Adams, and Mrs. Hardcastle Sykes being good.

The decoration of the music gallery by Mr. C. H. Curtis, hon. secretary, and Mr. H. D. Tigwell, Harrow View, Greenford, was quite a feature of the show. Large palms occupied the background, while vases of sweet peas added to tall epergnes well filled with blooms produced a fine effect, and appropriate greenery gave the whole a pleasing finish.

A FINE GROUP OF CHOICE DELPHINIUMS.
Exhibited at Wolverhampton by Messrs. Blackmore and Langdon, who were awarded the first prize in the class.

MEDALS.

Gold.—To Messrs. E. W. King and Co., Coggeshall; Messrs. Sutton and Sons, Reading; Mr. C. W. Breadmore, Winchester; Mr. Robt. Bolton, Carnforth; and Messrs. Dobbie and Co., Rothesay.

Silver-gilt.—To Messrs. Jones and Son, Shrewsbury; Mr. W. J. Unwin, Histon; Mr. W. E. Alsen, Denmead; Mr. Jas. Box, Lindfield; and Messrs. C. H. Curtis and H. D. Tigwell.

Silver.—To Messrs. Jarman and Co., Chard; Mr. J. Stevenson, Wimborne; Messrs. J. K. King and Sons, Coggeshall; Messrs. Robt. Sydenham, Limited, Birmingham; Messrs. J. Kelway and Son, Langport; Miss Hemus, Upton-on-Severn; Messrs. Stark and Son, Great Ryburgh; Mr. W. Deal, Kelvedon; Messrs. S. Bide and Son, Farnham; Mr. W. O. Cautley, Bury St. Edmunds; and Messrs. G. and A. Clark, Dover.

NOVELTIES.

First-class Certificate and Silver Medal and best variety of the year to Stirling Stent, a rich orange-salmon variety, from Mr. J. Agate, Havant.

Award of Merit.—To Masterpiece, a lavender variety, from Messrs. Dobbie and Co., Edinburgh; Arthur Green, a purple and mauve variety from Messrs. Dobbie and Co.; Mrs. Hugh Dickson, a fine cream pink, from Messrs. Dobbie and Co.; and to Cherry Ripe, from Messrs. Gilbert and Son, Dyke, Bourne, Lincs, a charming cerise variety.

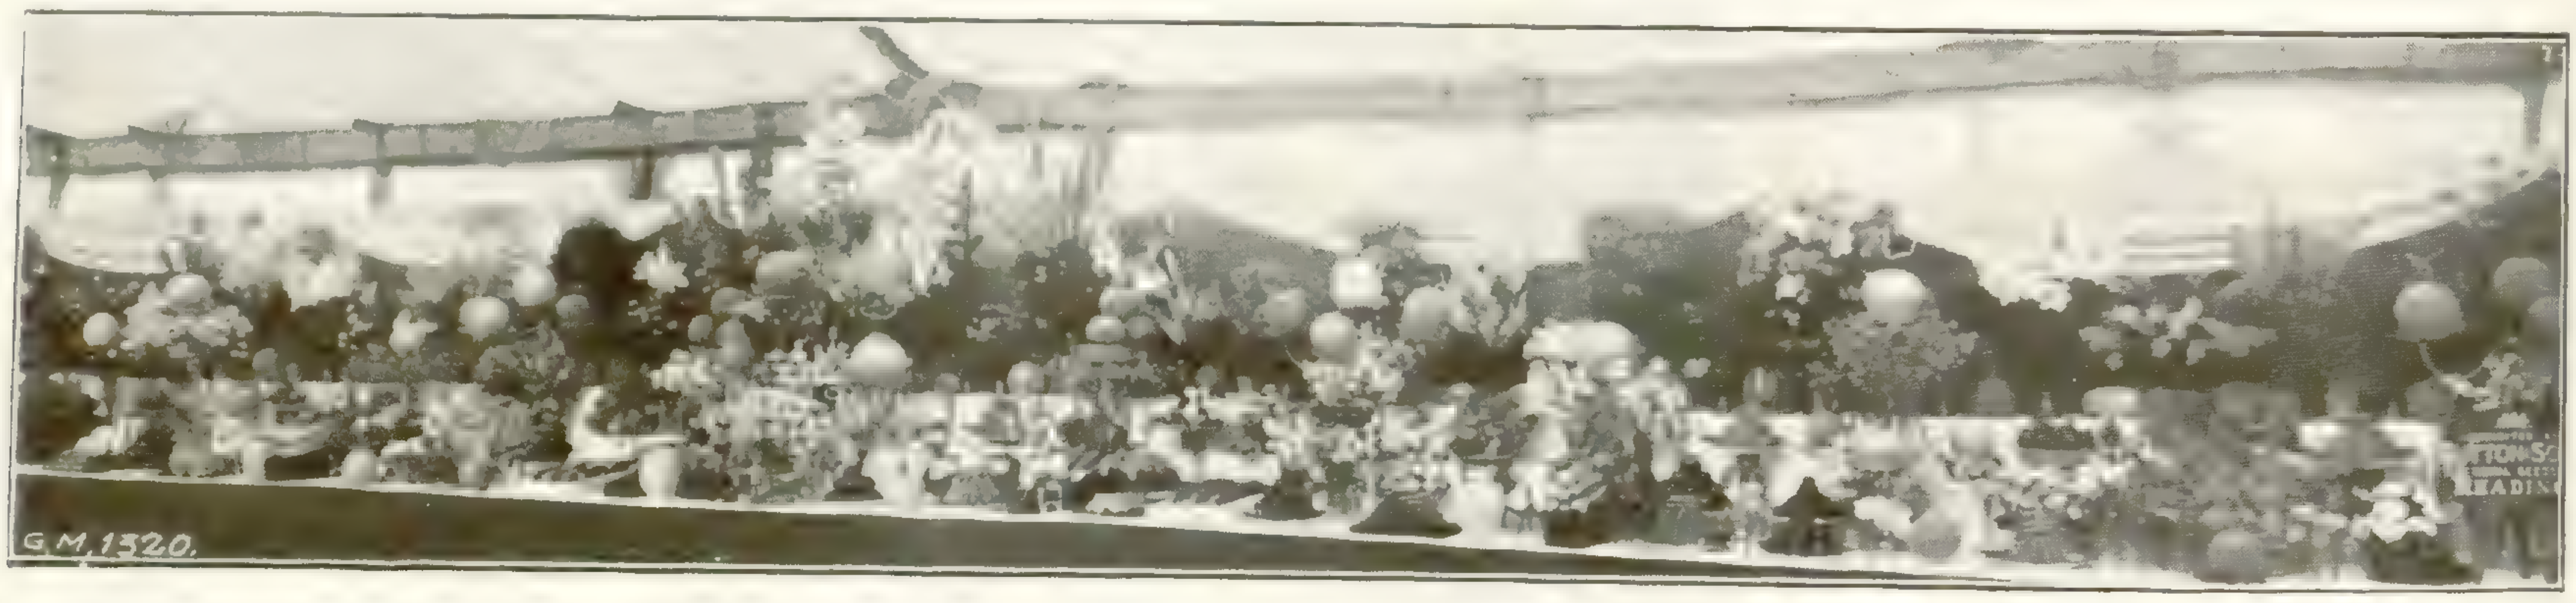
Wolverhampton Floral Fete.

For twenty-two years the Wolverhampton Horticultural Society has held its annual Floral Fête, and great has been the success that has attended their efforts. The show of the present week, which opened on Tuesday in glorious weather, was one of the largest and most beautiful of the whole series, and everybody seemed delighted. The reasons for the great success of the Wolverhampton shows are not far to seek. A capable and obliging secretary is backed up by a band of enthusiastic and energetic workers, and the affairs of the society go with a swing because they have never fell into a rut. Year by year new classes are added, good prizes are offered, and everything possible is done to make it a pleasure to exhibit here. The organisation of the show is about perfect, even in minor details. These are the reasons why we are once more able to record a most successful show.

GROUPS.

Four groups were built by well-known competitors, Messrs. J. Cypher and Sons, Cheltenham, being the victors. The groups were rather different in style to the stereotyped squares, being arranged on a ground space of 30ft. by 12ft., thus giving a first-rate frontage; and, moreover, the four exhibits moulded together, as it were, in a far more pleasing manner than is usually the case. Messrs. Cyphers' group was remarkable for rich colouring and the abundance of choice orchids and other stove plants that were set up in a very masterly manner. Mr. J. V. Macdonald, gardener to Sir G. H. Kenrick, Birmingham, was second, his group being a trifle hollow, but very good in the foreground. Mr. W. A. Holmes, Chesterfield, came third, and Mr. W. Vause, Leamington, fourth.

Messrs. Cypher and Sons also led in the group restricted to foliage plants, showing some beautiful crotons, caladiums, aralias, and other good things, all arranged with good effect. Second prize went to Mr. W. Holmes, and Mr. Wm. Vause came third. In a class for twenty plants confined to eight-inch pots, in and out of bloom, Mr. Vause was given the leading place. He had nice ixoras, an example or two of Erica Bothwelliana, and some crotons. Messrs. Cyphers' second prize lot was more varied in character, three-parts of the plants being well flowered. Mr. C. Weaver, gardener to B. H. Maunder, Esq., Tripull, was third.



A TASTEFUL ARRANGEMENT OF FLOWERS, FRUITS, AND VEGETABLES.
Exhibited by Messrs. Sutton and Sons at Wolverhampton.

Mr. F. Davis, Pershore, took first in a class for a group of any one kind of flowering plant, Messrs. Blackmore and Langdon, Bath, being second. Begonias were the subject in both groups. Mr. W. B. Burchill claimed first for a collection of coleus, showing some beautiful pyramidal plants. Classes were provided for fuchsias, caladiums, pelargoniums, and one or two other old favourites, but were not well filled.

Great interest centred around the class for a rock and water garden arranged on 25ft. by 12ft. space. Messrs. J. Backhouse and Sons, York, who scored, had a bold and massive arrangement of stones, rising abruptly at back, and finished off with a background of bamboos, maples, and conifers. Water trickled down the rocks, and found its way to a deep gulley spanned by a rustic bridge, and partly hidden by boulders in the foreground. Choice plants were used with great taste and discretion. Mr. J. E. Knight, Tettenhall Nurseries, Wolverhampton, came second, his plan being on the lines of rocky recesses with a lily pool and rock mounds in front. Shrubs were freely used, and the rocks were clothed with a variety of flowering plants. Messrs. W. Artindale and Son, Sheffield, were placed third. Their exhibit was very interesting, and contained a quantity of good alpine plants bearing an abundance of bloom. Yellow and white callas were plentiful around the margins of the water pool.

ROSES.

Wolverhampton would have been a good show even if roses were the only feature. This has been so for several years, and 1910 is no exception, in spite of weak blooms here and there. In the big class for seventy-two varieties, Mr. Hugh Dickson, Belfast, was awarded premier place, showing a very even and well-made lot of flowers. King's Acre Nurseries, Hereford, were second, big blooms of Mildred Grant and William Shean being among their best. Messrs. R. Harkness and Co., Hitchin, third; Messrs. F. Cant and Co., Colchester, fourth. Messrs. Harkness and Co. led for forty-eight blooms; Mr. H. Dickson second; Messrs. Townsend and Son, Worcester, third. King's Acre Nurseries scored for twelve triplets, their Lyon and Mildred Grant being strong points; Messrs. Townsend and Son second; Messrs. Harkness and Co. third. The competition was keen in this class.

Mr. W. T. Mattock, Oxford, came first for twenty-four varieties, showing Dean Hole, White Maman Cochet, Mrs. E. Mawley, and other well-known sorts; Messrs. Perkins and Son, Coventry, were second; King's Acre Nurseries third. For twelve varieties of introduction within the last three years, King's Acre Nurseries led with Lady Ursula, Joseph Lowe, Walter Speed, Mrs. E. J. Holland, His Majesty, Mrs. H. Brocklebank, Lyon, Pius X., Margaret, Rhea Reid, White Killarney, and Col. R. S. Williamson. The second prize went to Mr. Hugh Dickson; Messrs. F. Cant and Co., third. For twelve dark (one variety) Mr. Hugh Dickson scored with Hugh Dickson; King's Acre Nurseries, second, with the same variety.

Messrs. Frank Cant and Co. led for twelve light-coloured, with Mrs. Theodore Roosevelt; second went to Messrs. Townsend and Son, Worcester, with Dean Hole. For twelve varieties teas Mr. W. T. Mattock led, followed by Mr. John Mattock, New Headington, Oxford. Mr. W. T. Mattock also scored for nine vases of teas, five blooms of each. The class for twelve bunches of decorative roses made a capital show, Mr. J. Mattock's winning lot including such good things as Betty, Madame Melanie Soupert, and Richmond. Mr. W. T. Mattock came in second with ramblers and other small-flowered sorts. Mr. J. Barrow, Oadby, Leicester, came third. Messrs. Perkins and Sons' bowl of Lyon rose with foliage was grand. It was the best of the large number of entries in its class. Mr. Barrow, Leicester, scored for a vase of roses arranged for effect, the blending of colour being well carried out.

AMATEURS' ROSES

were in strong force, R. Foley Hobbs, Esq., Worcester, claiming first in thirty-six varieties, and again for six triplets. For twenty-four varieties the first went to Mr. J. O. Hinckley, gardener to J. A. Fellows, Esq., Attleborough. Mr. Foley Hobbs again came to the fore for twelve varieties, while Mr. Hinckley scored for twelve teas. In the local class for eighteen blooms Mr. J. Eggington was victor; a lady exhibitor, Miss Leeke, of Shifnal, winning for twelve. The best bowl in the amateurs' section came from Miss Jenks, Codsall; and Miss E. Davis, of Pershore, won for a vase of roses. The amateurs' and cottagers' tent contained some excellent exhibits, but we regret space forbids a detailed account of all the classes.

HARDY FLOWERS.

The three collections of hardy herbaceous flowers, arranged on 15ft. by 5ft. of staging, which were entered for competition for £30 total prizes, were a very powerful class, and the winners, Messrs. W. Artindale and Son, Sheffield, had a big job to wrest the coveted award from their fellow competitors. The several varieties of liliums, choice iris, good delphiniums, and a few such things as Tritoma Tucki, were the points on which their strength lay. Messrs. Harkness and Sons, Bedale, were a close second, with gorgeous salmon poppies and delphiniums, together with a great variety of smaller subjects. Messrs. G. Gibson and Co., Bedale, were third.

An imposing display was made by half a dozen collections of delphiniums, and competition was very keen. Messrs. Blackmore and Langdon, Bath, led off with a choice and varied lot of really first-rate varieties. Size of individual bloom, substance, and symmetry were excellent, while colours to suit all tastes were included. Messrs. Harkness and Sons came second with another very interesting lot, length and density of spike being particularly good. Messrs. Gibson and Co. were third.

A very interesting class was that for an artistic display of violas and pansies on a 7ft. table. Mr. W. Pemberton, Bloxwich, who secured first prize, had vases filled with fine blooms, backed up by a mirror festooned with violas and fern. Messrs. Bostock and Son, Birmingham, were second for a display carried out on similar lines. A bright yellow viola, Moseley Perfection, was conspicuous on the stand. It was a fine flat flower, of capital colour, and was awarded a first-class certificate. Mr. W. Chipman, New Oscott, came third, large flowers being staged well, but on either side the group too much bare mirror was rather a drawback.

SWEET PEAS

occupied a large amount of space, and were well shown, in spite of recent bad weather. In the society's class for eighteen varieties Mr. E. Jones, gardener to G. H. F. Robertson, Esq., J.P., Gresford, led off with a very creditable lot of flowers nicely arranged, and including some very choice things. Mr. W. Marple, Penkridge, came second, his Constance Oliver and Herbert Marple being good; Mr. W. Marden, gardener to Dr. Phillips, Malpas, third.

In the class provided by Mr. Henry Eckford, Mr. Jones again led, showing fine vases of John Ingman, Henry Eckford, Apple Blossom, etc. The same exhibitor carried off honours in Mr. Robert Sydenham's class, where he was followed by Mr. A. H. Hickman, Kidderminster. Mr. W. Marden scored for the six vases, with beautiful blooms, Mr. E. Jones being second. Messrs. Bakers, Wolverhampton, offered prizes for twelve bunches sweet peas. Mr. W. Marden again winning, with Mr. G. Atkins, Wrexham, and Mr. J. F. Simpson, gardener to Lieut.-Col. C. T. Mounder, Tettenhall Wood, following.

Messrs. Perkins and Son, Coventry, were awarded first for bridal and two bridesmaids' bouquets, the former being of white orchids and lily of the valley, and the others of pink carnations.

FRUIT.

Mr. N. F. Barnes, gardener to the Duke of Westminster, Eaton Hall, Chester, secured premier award for a collection of fruit. Mr. Barnes had eight grand bunches of grapes, a large Countess melon, and dishes of Royal George peach, Souv. du Congrès pear, Worcester Pearmain apple, and Elruge nectarine, all being excellent. Second prize went to Mr. W. Parker, gardener to J. Drakes, Esq., Market Rasen. Mr. S. Barker, gardener to the Duke of Newcastle, Worksop, led for four bunches of grapes with Black Hamburgh, Buckland Sweetwater, Madresfield Court, and Muscat Alexandria. The same exhibitor led for six nectarines; whilst Mr. H. Taylor, gardener to Lord Hatherton, Penkridge, had the best three dishes of strawberries. Mr. Barker was again first for peaches, and Mr. W. Parker, of Market Rasen, for tomatoes. In another class for six varieties of fruit, confined to gentlemen's gardeners, Mr. Barnes, of Eaton, again led, the quality of every dish being superb,

A class was provided for ten varieties of vegetables, and Mr. J. Gibson, gardener to the Duke of Portland, Welbeck, was accorded first prize with good peas, Globe beet, Canadian Wonder beans, etc. Mr. A. R. Searle, gardener to the Marquis of Northampton, had very well-grown peas, cauliflowers, tomatoes, and carrots on his second prize stand. A group of choice fruits in pots came from King's Acre Nurseries. A fan-shaped Cardinal nectarine carried about fifty well-coloured fruits, and standard currants and gooseberries were really pretty.

NON-COMPETITIVE CONTRIBUTIONS.

Non-competitive exhibits were numerous and excellent. Indeed, year after year, the trade advances a stride or two beyond their best achievements of the past, and we wonder what our leading exhibitors will do in another decade. Messrs. Dobbie and Co., Edinburgh, made a brave show with sweet peas and violas. Among the herbaceous plants so well shown by Messrs. Dicksons, Limited, Chester, was a grand bunch of Lilium odorum, a long trumpet variety of a rich cream colour, with chocolate anthers. Mr. C. H. Herbert, Acocks Green, showed his perpetual-flowering pink Progress, and a perfect laced border pink, Princess May. A new galega, Her Majesty, was shown by the same exhibitor.

Messrs. E. Webb and Sons, Wordsley, Stourbridge, occupied two tables, between which a series of arches were stretched, forming a covered walk. Sweet peas and smilax adorned the arches, and on the tables were a host of vegetables, interspersed with gloxinias, lilies, and other flowers. Mr. F. Green, gardener to Lady Grey, Enville Hall, showed a big group of Malmaison carnations. The plants showed robust vigour, and many of the blooms were very fine.

The display of choice melons, tomatoes, peas, and other vegetables, staged by Messrs. Sutton and Sons, Reading, were of superb quality, and were staged in a most pleasing manner. The sweet peas, poppies, and other flowers used for decoration, were beautifully arranged, and the whole effect was charming.

An artistic arrangement of sweet peas came from Messrs. W. H. Simpson and Son, Birmingham. Some very elegant and tasteful floral designs were staged by Messrs. E. and H. Suckling, the Wolverhampton florists. Mr. H. N. Ellison, West Bromwich, once more displayed charming ferns, among which the new Polypodium glaucum crispum was conspicuous. The carnations shown by Mr. C. F. Waters, Balcombe, Sussex, were a grand lot, and most admirably staged. A bank of violas, embracing about 100 choice varieties, came from Messrs. W. Artindale and Son, Sheffield. Grand roses were put up by Mr. Edwin Murrell, Shrewsbury. A two-dozen stand of Lyon were of rich colour, and several choice garden roses were set up on tall bamboo stands.

Messrs. Clibrans, Altrincham, grouped immense hydrangeas in a setting of choice ornamental shrubs. The popular centaureas were shown in fine form by Messrs. Jarman and Co., Chard, who also had bright zonals, and a good lot of roses. Messrs. Robt. Sydenham, Limited, showed sweet peas in their rural table decorations. The arrangement was tasteful, and the peas were of good quality.

Messrs. Tom B. Dobbs and Co., Wolverhampton, arranged in the open a model garden with beds of summer flowers, neatly edged with box, and interspersed with grass walks. Rustic pillars and a canopied arrangement of woodwork in the centre were draped with pink rambler roses, and an old-time well-head, styled the Wishing Well, draped with ferns, were among the features of an exhibit that attracted much attention. Rustic arches, pillars, and seats were displayed by Mr. J. E. Knight, Wolverhampton. Between the various devices were beds of scarlet zonals, clipped box trees, and other ornamental shrubs.

A PORTION OF A MODEL GARDEN.
Arranged by Messrs. Tom B. Dobbs and Co., at the Wolverhampton Show.

Cambridge Horticultural Society.

JULY 7.

The summer exhibition of this society was held on the above date in the grounds of Trinity College, which, by reason of their beauty and high keeping, are admirably adapted for the purposes of a flower show. The weather was cold and dull, and the exhibition suffered somewhat from the unfavourable weather experienced during the earlier part of the week. The arrangements were, as usual, remarkable for their completeness, and reflected much credit upon Mr. A. Matthews, the hon. secretary, and Mr. F. E. Fordham, the assistant secretary.

ROSES.

Roses usually form a glorious feature of the summer flower shows at Cambridge, and this year a remarkably fine display was expected. The entries were more numerous than usual, and a considerable proportion of these came from the leading trade growers. But, owing to the heavy rains, more particularly in the Colchester district, at least two-thirds of the entries had to be cancelled. Notwithstanding this reduction in the number of the entries, there was a good display of roses, and this was remarkable for the preponderance of the high-coloured varieties, which produced a brilliant effect. In the open class for thirty-six blooms Messrs. J. Burrell and Co., Cambridge, were first with an even stand of finely-developed blooms, conspicuous among them being Ulrich Brunner, Mrs. E. Mawley, G. C. Waud, Her Majesty, Caroline Testout, and Liberty. The Rev. A. J. Fellowes, Attleborough, was a good second with blooms that were rather uneven, some being exceptionally fine, while others bore evidence of the unfavourable weather that had been experienced. In the open class for twenty-four blooms, distinct, Messrs. J. Burrell and Co. again occupied the first place, and had a good stand, in which The Lyon, Frau Karl Druschki, Ben Cant, Gustave Piganeau, and His Majesty, a crimson rose of recent introduction, were especially well represented. The Rev. A. J. Fellowes was again second with an excellent box of blooms. The best box of twelve teas was that shown by Messrs. J. Burrell, whose blooms of Mrs. E. Mawley, The Bride, Golden Gate, Catherine Mermet, and Harry Kirk were of high quality.

The five or six classes for roses, in which the competition was limited to members, were remarkably well filled, the entries being numerous, and the quality higher than might have been expected. Mr. W. Dyson was successful in obtaining premier honours in the class for twelve blooms, distinct varieties, with an even box, in which the pure white Frau Karl Druschki was conspicuous. Mr. W. Dobbs followed closely for second place with blooms of great excellence, and Mr. H. Lowe, gardener to H. E. Inglis, Esq., was third. In the class for six blooms Mr. Dobbs was successful in obtaining the post of honour with finely developed blooms remarkable for their uniformity, and the other successful exhibitors in the class were Mr.

H. Coulson and Mr. W. Dunn, the last-named exhibitor being also first for triples, both of mixed varieties and teas, and for six teas.

MISCELLANEOUS CUT FLOWERS.

Several classes were provided for cut flowers of zonal pelargoniums, and the finely developed trusses produced a brilliant display of colour. For twelve varieties of zonal pelargoniums, not more than three trusses of each, Mr. W. Farrington, gardener to R. J. Fuller, Esq., was first with tastefully arranged trusses of high quality; Mr. J. Andrews, gardener to J. H. Linton, Esq., followed closely for second place, but his flowers suffered from the trusses having been tied in too closely. Mr. Farrington was first also for six varieties, and Mr. W. Abrahams was second. Annuals in vases were admirably staged, and the premier award was made in favour of Mr. Todd, gardener to W. A. Briscoe, Esq., for a collection of six kinds of exceptional excellence, and Mr. A. Edwards, gardener to Dr. Keynes, was a close second. Sweet peas were splendidly shown, the entries being numerous, and the flowers high in quality. In the great class for eighteen bunches the competition was very strong, and the premier place was occupied by Mr. A. Pepper, gardener to A. Hurrell, Esq., with a collection comprising the leading varieties that evinced high-class cultural skill and much taste in arrangement. Mr. A. Nightengale, gardener to G. French, Esq., was second with a meritorious collection, and Mr. J. Hall was third with a collection containing good flowers, but rather too closely packed to show them to advantage. For twelve vases Mr. W. Dobbs was a splendid first, and Mr. Nightengale was a good second; and for six Mr. T. S. Watson occupied the first place.

Seldom are cut flowers of stove and greenhouse plants so well shown as on this occasion, all the collections being more or less meritorious. Mr. R. Smith, gardener to R. C. Foster, Esq., was successful in winning the first with a collection in which Allamanda Hendersoni was splendidly represented. Mr. J. Todd was a capital second. In the first-prize six from Mr. T. W. Birkenshaw there was an exceptionally good spike of the brilliantly coloured Clerodendron fallax; Mr. H. Ansell was second with a collection that contained some good orchids, but lost in the setting up. The collections of hardy flowers, arranged in vases, were numerous, well arranged, and of high quality, and formed a splendid feature. Mr. H. Ansell was first for six, in which the richly-coloured Centranthus coccineum and a crimson sweet william were especially good; Mr. J. Wright, gardener to A. Matthew, Esq., was a very close second with flowers of high quality. The classes for twelve vases of hardy flowers were especially strong, and at the head of the numerous exhibitors was Mr. R. Bowyer, gardener to Mrs. R. Burn, with a collection in which Lilium umbellatum, L. candidum, Lychnis chalcedonica, Alstroemeria aurantiaca, and other well known subjects were represented at their best. Messrs. Warren and Son and Mr. J. Hall were second and third respectively with excellent collections.

PLANTS.

Tuberous begonias formed a feature of outstanding importance, for the classes provided for them were numerous, and the collections with which they were so well filled were of a high order of merit. For twelve Messrs. Warren and Son were first with finely flowered examples; for six Mr. J. Wright won with grand specimens; and for three Messrs. Warren and Son were first. In competition for the prizes for six doubles the leading prizewinners were Mr. Nightengale and Messrs. Warren and Son. Coleus were largely shown, and, on the whole, of great excellence. Mr. R. Smith, gardener to R. G. Foster, Esq., was first for six; and Mr. Dyson and Mr. Wright were first and second for three, with finely coloured examples. Mr. H. Ansell and Mr. J. Wright staged splendidly flowered specimens in the class for six gloxinias, and in the class for three the exhibitor last-named obtained premier honours with specimens of much merit. Zonal pelargoniums are usually well shown at Cambridge, and on this occasion they were, on the whole, of great excellence, the most successful of the exhibitors being Mr. F. Newman, who was first both for twelve and six specimens.

There was a brisk competition in the classes for stove and greenhouse plants, ferns and groups. Chief among the competitors in the class for groups was Mr. Kirkpatrick, who was first with a bold arrangement of plants of high quality. Mr. Dyson was second with a group in which caladiums were strongly represented. Mr. Kirkpatrick was first also for six specimen fine foliage plants and for six exotic ferns, in both cases staging well-known kinds. Mr. H. Ansell obtained premier honours for three ornamental-leaved plants, and also for six and three stove and greenhouse plants in bloom, and for six orchids, Mr. Kirkpatrick being second for the last-named. British ferns were represented by a well-grown collection of scolopendriums staged by Mr. J. Hall, who obtained premier honours.

FRUIT AND VEGETABLES.

Fruit and vegetables constituted two strong features, for both classes of products were plentiful, and the quality was high throughout. The class for collections of six dishes of fruit was well filled, and at the head of the several competitors was Mr. T. W. Birkenshaw with fine grapes, peaches, cherries, nectarines, and a ripened melon. Mr. T. Todd was a capital second, his peaches, cherries, and strawberries being of high quality. Mr. R. Smith was first with Black Hamburgh in splendid condition, and Mr. T. W. Birkenshaw was first with fine Buckland Sweetwater. The last-named was first for peaches, and for a melon. In competition for the prizes for a collection of six kinds of vegetables Mr. T. Todd won with very fine cauliflowers, carrots, potatoes, and tomatoes. Mr. A. Pepper had an excellent collection for second place, and Mr. T. W. Birkenshaw, who was third, also had a collection of great excellence. The single dishes were particularly strong, and prominent among the successful exhibitors were Mr. Todd, Mr. Lelliott, Mr. T. W. Birkenshaw, Mr. Jones, Mr. Pepper, Mr. Linton, and Dr. Keynes.

Bath Floral Fete.

In the beautiful and famous Sydney Gardens, Bath, another success was added to the already long series of splendid flower shows held under the direction of the Bath Floral Fête and Band Committee, on Wednesday and Thursday, July 6 and 7. In many senses Bath is a garden city, and within easy distance of this old city there are a large number of interesting and beautiful private gardens, therefore it is small wonder that the annual show is a good one. So many people also visit Bath for its waters, consequently, given fine weather, the fête is sure of a large and fashionable attendance. Excellent music is provided, in addition to beautiful flowers displayed in a beautiful garden

NURSERYMEN'S ROSES.

In the principal class for roses, seventy-two blooms, distinct, are required, and here the leading award fell to Messrs. Alex. Dickson and Sons, Newtownards, who were in good form, and had Dr. Andry, Suzanne M. Rodocanachi, A. K. Williams, A. Hill Gray, Countess of Annesley, Mrs. Foley Hobbs, Lyon Rose, and Frau Karl Druschki. Second prize fell to Mr. J. Mattock, New Headington, and third to Messrs. G. Cooling and Son, Bath. Thirty-six trebles makes a fine class, and here again Messrs. A. Dickson and Sons led the way, and showed fine sets of Countess of Annesley, Lady Helen Vincent, Frau Karl Druschki, Dean Hole, Mrs. W. J. Grant, Mrs. Sharman Crawford, and Chas. J. Grahame; Mr. J. Mattock and Messrs. G. Cooling and Son were second and third respectively.

Mr. H. Drew, Longworth, led for eighteen trebles, and had Frau Karl Druschki, Marie Baumann, and Captain Hayward in good form; Mr. Rowland Adams, Bath, second. Mr. Drew also scored for thirty-six blooms, distinct, and was followed in order of mention by Mr. R. Adams and Messrs. A. A. Walters and Son, Bath. Mr. J. Mattock secured the leading honours for eighteen teas and noisettes, and his best blooms were Mdme. Jules Gravereaux, Marechal Niel, White Maman Cochet, Mrs. Edward Mawley, and Catherine Mermet; Mr. Drew second.

AMATEURS' ROSES.

In the leading amateurs' division the Rev. G. T. Henslow, Chippenham, had things very much his own way, and he showed splendid flowers, remarkably clean and bright. He appeared to be the only exhibitor of twenty-four blooms, and of a dozen trebles, and here he was awarded first prizes, and showed remarkably fine specimens of Mrs. Roosevelt, La France, Caroline Testout, A. K. Williams, W. Shean, Mrs. J. Laing, Countess of Derby, Frau Karl Druschki, David Harum, and Kaiserin A. Victoria.

In another division the Rev. R. Powley, Upton Scudamore, Warminster, took first prize for eighteen blooms, his best being White Maman Cochet, Mrs. J. Laing, Caroline Testout; Mr. Wm. Smith, Box, second; and Mr. W. J. Ball third. For eight trebles the Rev. R. Powley again scored, and White Maman Cochet and Pharisaer were excellent in his stand.

In the open amateurs' class for nine T. and nine H.T. roses, the Rev. G. T. Henslow won first place with beautiful specimens of Jean Sisley, Elizabeth Barnes, Francisca Kruger, etc., and here, as well as in the class for a dozen H.T. varieties, where he was again first, his flowers were very bright and fresh; Miss Fisher, Potterne, Devizes, was second for a dozen H.T. roses. Mr. W. J. Ball, Chippenham, was first for a dozen blooms in another section, while for four trebles the awards were given in order to Mr. W. J. Ball, Mr. Pryor, and Mr. W. Smith. In the local section Mr. W. Smith, Box, was first for a dozen roses, distinct, with Mr. E. V. Pryor second, and Dr. R. G. Knox, Freshford, came to the front for six blooms. The Rev. G. T. Henslow led for eighteen teas or noisettes; and the Rev. R. Powley scored for a dozen blooms, showing a very fine Mrs. Mawley. For six trebles, teas or noisettes, the Rev. G. T. Henslow led with Auguste Compte, White Maman Cochet, and Mollie Sharman Crawford, with the Rev. R. Powley second. In a lower division Mr. W. Smith and Mr. W. J. Ball were first and second respectively for six tea roses.

OPEN ROSE CLASSES.

Messrs. A. Dickson and Sons, Newtownards, put up a fine dozen vases of roses, five blooms in each, and secured the premier award in this open class with Horace Vernet, A. K. Williams, Florence Pemberton, Ulrich Brunner, Mrs. W. J. Grant, etc.; Rev. T. G. W. Henslow, Chippenham, second, and Mr. J. Mattock third. The Rev. T. G. Henslow scored for twelve blooms of any other than a tea rose with La France; Mr. J. Mattock second with Mrs. J. Laing; and Mr. H. Drew third with Dean Hole. Messrs. A. Dickson and Sons led for twelve blooms of a tea or noisette rose with the beautiful Mrs. Edward Mawley; Mr. J. Mattock second with the same variety, and the Rev. T. G. Henslow third with the pretty Auguste Compte.

Messrs. A. Dickson and Sons led for six blooms of any new rose of 1908-9 with Walter Speed, Mr. J. Mattock coming second with Lyon Rose. The most decorative arrangement of roses on a space 10ft. by 4ft., was made by Mr. Rowland Adams, who had fine flowers of popular varieties in stands and boxes, backed by sprays of rambling varieties; Messrs. G. Cooling and Son, second.

Mr. J. Mattock scored for a display of eighteen bunches of garden roses with, as usual, a very tasteful effort, that contained fine bunches of Papillon, Mdme. Abel Chatenay, Marie Van Houtte, Betty, Mdme. An-

toine Marie, and Liberty; Messrs. A. A. Walters and Son, second; and Messrs. G. Cooling and Son, third. The Rev. R. Powley had the best nine bunches of garden roses; Mr. W. F. Godwin, gardener to W. A. Hicks, Esq., Batheaston, second.

GROUPS AND PLANTS.

Two very artistic groups of plants were set up, and here the premier award was secured by Mr. W. Sim, who used palms, ferns, Lilium auratum, carnations, Humea elegans, and a few orchids with excellent effect; Mr. E. C. Pearce, gardener to W. Wailes, Esq., second. Messrs. Blackmore and Langdon, Twerton, put up the best collection of begonias, on a space 12ft. by 3ft., and here they displayed some of their own superb varieties, splendid flowers, and excellent plants; Mr. J. Walter second. For a tastefully arranged table of plants Mr. W. Sims took chief honours, followed by Mr. Pearce; both showed stove and greenhouse plants.

Begonias are always a good feature. For six plants in 10in. pots, single varieties, Mr. J. Walter, Bath, and Mr. J. Dyke, Bath, were placed in order of mention, while for double varieties, under similar conditions, Mr. A. C. Palmer, Twerton, scored with a grand lot, carrying splendid blooms; Mr. J. Dyke second, and Mr. J. Walter third. Mr. J. Walter was first for a specimen single as well as for a specimen double begonia.

Mr. W. H. Coles, Bath, had the best gloxinias, with Mr. R. Adams a good second. Mr. Strugnell beat Mr. J. T. Curtis for table plants in a close competition. In Messrs. Sutton and Sons' class for gloxinias Mr. W. Sim, gardener to Major H. Doherty, Bath, was well to the front.

CUT FLOWERS.

Mr. G. Humphries, Chippenham, annexed the chief award for twelve bunches of sweet peas, and his best vases were of Mrs. Hardcastle Sykes, W. T. Hutchins, Senator Spencer, Marjorie Willis, Evelyn Hemus, Miriam Beaver, and Primrose Spencer; Mr. T. H. Bolton, gardener to the Earl of Devon, Powderham Castle, Exeter, second; and Mr. L. Fletcher, gardener to G. A. H. White, Esq., third. For a table of sweet peas Mr. E. Viner, Bath, was the victor, followed in order by Mr. M. L. Pierce, Bristol; and Mr. J. T. Curtis, gardener to Sir W. Howell Davies, Bristol.

Mr. G. Humphries led for six bunches of sweet peas with beautiful blooms of Mrs. Routzahn, Mrs. Hardcastle Sykes, Asta Ohn, Paradise Red Flake, Paradise Ivory, and The Marquis; Mr. J. Wicks second; and Mr. W. F. Godwin third; there was a good competition. Mr. E. Viner, Frome, led in another class for six bunches of sweet peas, followed by Mr. T. H. Bolton and Mr. Strugnell.

Mr. L. Fletcher, gardener to G. A. H. White, Esq., Chippenham, had the best set of a dozen bunches of herbaceous flowers, and was followed by Mr. J. Wicks, gardener to Lady Sybil Codrington, Badminton. Mr. Charles Wall, Bath, was awarded first prize for a collection of carnations, and Messrs. Blackmore and Langdon were placed second.

Two dozen bunches of zonal pelargoniums proved an attractive class, and here Mr. G. Humphries, Chippenham, was first, and among his best varieties were Shelley, Mentmore, Cassiope, and Mrs. Ewing; Mr. J. Wicks, gardener to Lady Codrington, second.

In the classes for floral decorations Mr. J. T. Curtis, Mr. W. H. Coles, Miss Iris Hicks, Batheaston; Miss Scott White, Bath; and Mrs. E. Hall, Warminster, were leading prizewinners.

FRUIT AND VEGETABLES.

Mr. W. Strugnell, gardener to Captain Walter Long, D.S.O., Rood Ashton, had the best collection of dessert fruits, showing Holborn Favourite melon, Brown Turkey figs, Black Hamburgh grapes, and Humboldt nectarines.

Strawberries were splendid. For six dishes of thirty berries each Mr. J. Ricketts scored with Eleanor, The Laxton, Royal Sovereign, and Sir Joseph Paxton in good style; Mr. E. J. Ricketts second; and Mr. E. Fisher, Batheaston, third. Mr. Thomas Evry led for three dishes with Sir Joseph Paxton, Givon's Prolific, and Royal Sovereign; Mr. J. Ricketts and Mr. E. J. Ricketts following. Mr. J. Ricketts scored for one dish with grand fruits of Royal Sovereign.

Mr. F. Wart, Bath, scored for a collection of vegetables, his Model tomatoes, onions, and peas being excellent dishes. He was followed by Mr. G. Horsell, jun., King Street, Bath, who was first prize winner in the class for six dishes of vegetables, beating Mr. A. J. Andrews, of Batheaston. Mr. Thomas Evry had the best collection of salading. In Messrs. Sutton and Sons' class for six kinds of vegetables Mr. A. J. Adams and Mr. T. H. Bolton were first and second respectively, while in a similar class provided by Messrs. Webb and Sons Mr. Strugnell and Mr. Evry took first and second prizes.

NON-COMPETITIVE.

Messrs. Sutton and Sons, Reading; Mr. J. Milburn, Bath; Messrs. A. A. Walters and Son, Bath; Mr. W. H. Coles, Weston Road; Messrs. Young and Co., Hatherley; Messrs. Blackmore and Langdon, Twerton; and Mr. F. Eames, Frome, all put up non-competitive displays that added to the interest and extent of the show.

Penarth.

The Penarth Rose Society is quite juvenile as on July 6 it held its second annual exhibition in the Penarth Cricket Field. The show was a fairly large one, and roses and sweet peas were extensively and finely shown, some of the competitors coming from long distances. Penarth Show is a fine example of what an enthusiastic set of officers and committeemen can do in a new district, and we feel sure that if financial support is forthcoming Penarth will soon be numbered among the really good provincial shows. There are many good gardens in the neighbourhood, and it ought to be possible to stir up the enthusiasm of the miners and dockmen of Penarth and Barry, and so create a show that will compare with those already so famous in the Newcastle district. Mr. Gerhold, the secretary, throws his heart and soul into the work of the society, and Mr. Maurice Bailey, secretary of the Cardiff Society, is a member of committee, and the society is fortunate in having the Earl of Plymouth as its president.

Although rain held off, the day was not a pleasant one, as a gale of wind was blowing in the morning, and in the small hours of the day it overturned one tent, and played havoc with the plants already arranged in the group class.

ROSES.

Roses were the leading feature, and the chief class was for a collection of cut roses arranged artistically on a space 9ft. by 4ft., with their own foliage and buds. There were two beautiful displays, and not much to choose between them. Both competitors had good flowers, and made excellent use of the brighter-hued tea and hybrid tea varieties, and showed bold arrangements that were just a trifle crowded. Premier award was in favour of Messrs. S. Treseder and Sons, Pwyel Coch Nurseries, Cardiff, and second prize was awarded to Mr. W. J. Crossling, of Penarth.

Mr. Crossling was first for a dozen varieties, five blooms of each, in vases, and his best blooms were of Dean Hole, Frau Karl Druschki, Mrs. J. Laing, S. M. Rodocanachi, Caroline Testout, and Ulrich Brunner; second award fell to Messrs. J. Jefferies and Son, Cirencester, and third to Messrs. Stephen Treseder and Son.

The King's Acre Nursery Company, Hereford, scored for twenty-four roses, distinct, with good flowers of Countess of Oxford, Frau Karl Druschki, Liberty, Mildred Grant, Marie Baumann, Fisher Holmes, Lady Helen Vincent, etc. Messrs. S. Treseder and Son, second; and Messrs. J. Jefferies and Son, third. These three competitors were placed in similar order for two dozen tea and H.T. roses, and, though they showed well, the light flowers showed plainly the effects of recent storms.

The King's Acre Nursery Company, Hereford, led the way for a dozen trebles, and were followed in order by Messrs. S. Treseder and Son, and Messrs. J. Jefferies and Son. There was a strong competition in the class for a dozen blooms of one variety, and here Messrs. J. Jefferies and Son scored with A. K. Williams in fine form and colour, Messrs. S. Treseder and Son coming second with J. B. Clark; and the King's Acre Nursery Company third with Hugh Watson.

For twelve blooms of any one light rose Mr. J. Dean, gardener to J. W. Pyman, Esq., Raithwaite, led with handsome specimens of Frau Karl Druschki; Mr. W. J. Short, Lynwood, East Road, second with Mrs. Sharman Crawford. In the amateurs' section, for six trebles, Mr. R. Foley Hobbs, Gloucester, won the first prize and the cup, presented by Mr. E. J. Luen, with a handsome set of flowers of Frau Karl Druschki, Mdme. Jules Gravereaux, Bessie Brown, Victor Hugo, etc., all clean and of large size; Mr. W. Jarrett Thorpe, Hucclecote, second.

Mr. Foley Hobbs also scored for eighteen blooms, in not less than a dozen varieties, thus winning a cup, presented by Messrs. Kaiser and Sons, Cardiff; Mr. Wheeler, gardener to Mrs. Jenner, Wenvoe Castle, last year's winner, was second, and Mr. Jarratt Thorpe third. For six bunches of decorative roses, Mr. Febray, gardener to J. W. Courtis, Esq., Farrenden Croft, Llandaff, led with good bunches of Mdme. Jules Gravereaux, William Allen Richardson, Mrs. Flight, etc.; Mr. Foley Hobbs coming second, and Mr. F. A. George, Redhill, Worcester, third. Mr. Foley Hobbs scored in the class for a dozen blooms in not less than six varieties, and here he had fine specimens of Frau Karl Druschki, Mamie, and Mrs. J. Laing; Mr. Wheeler, second, and Mr. Jarratt Thorpe third.

In a local class for a dozen blooms, in not less than six varieties, Mr. H. Hand, Plymouth Road, led, with Mr. E. R. Payne, Plymouth Road, second.

Mr. Foley Hobbs had the best five flowers of one variety, in a vase, winning with Frau Karl Druschki; Mr. Wheeler, second.

Mr. Foley Hobbs was chief prizewinner in the class for an arch of roses and rose foliage, scoring with Blush Rambler; Mr. H. Smith, gardener to Mrs. G. Morel, Rogermoor House, second; and Mr. W. Paton, Westbourne Road, Penarth, third.

SWEET PEAS AND OTHER FLOWERS.

Mr. Wheeler, Wenvoe Castle Gardens, won first prize in the open class for eighteen bunches of sweet peas, distinct varieties, with well-grown, clean flowers of Nancy Perkins, Senator Spencer, Mrs. A. Ireland, Ralph Crossling, Mrs. Chas. Foster, Helen Grosvenor, and Wenvoe Castle; Mr. W. Shackson, gardener to Mrs. Rees Jones, Porthkerry, Barry, second; and Mr. E. Harvey, Victoria Bridge, Penarth, third. Mr. Shackson scored for nine bunches of sweet peas, distinct, with very bright flowers, Mr. Wheeler coming second, and Mr. Jarratt Thorpe, third. Mr. E. Harvey was a good first in the local class for nine bunches, distinct; Mr. F. Jones second, and Mr. Vaughan, gardener to Miss Jenkins, Min-y-don, Marine Parade, third.

Mr. Wheeler was again to the fore in the class for six varieties of sweet peas, and here he showed Wenvoe Castle, Nancy Perkins, Sveira Lee, Mrs. Gerhold, and Mrs. Hardcastle Sykes in fine form; Mr Shackson, second; and Mr. Wood Davey, Stanwell Road, Penarth, third. Mr. J. H. Lees, Greenfield Avenue, Dinas Powis, scored for six vases of sweet peas, and was followed by Mr. J. Phillips, Redlands Road, Penarth. Mr. C. W. J. Williams had the best three bunches, and Mr. E. Harvey the best single bunch arranged for effect. Mr. Wheeler had the best bunch of one variety artistically arranged, and he showed Mrs. C. W. Breadmore in fine style.

In the open class for a collection of carnations, arranged on a space 5ft. by 3ft.,

Please send me "SWEET PEAS AND THEIR CULTIVATION" *by Post, for which I enclose remittance of* 1s. 2d. (*if bound in cloth,* 1s. 8d.).

Name ....
Address ....

there were two competitors, both of whom showed creditably; first prize was won by Mr. C. Wall, and second by Mr. Dean, gardener to J. W. Pyman, Esq., Raithwaite. Mr. Wall and Mr. Wheeler were first and second respectively for six vases of carnations, three blooms in each. Mr. J. Wadley Stuart, Ponteanna House, Cardiff, had the best six vases of border carnations in an amateurs' class, while Mr. Wheeler scored for half a dozen bunches of Malmaison varieties, and was easily first for a vase of twelve blooms of any one carnation with Cecilia in good form.

Mr. T. Richards, gardener to A. R. Moxey, Esq., St. Maeburns, led for half a dozen bunches of violas or pansies, but it was a mistake to provide so small a class and admit both pansies and violas.

Six bunches of hardy flowers was a fine class, and though the competition was good, Mr. W. Horne, gardener to Major-General Lee, The Mount, Dinas Powis, was an easy first with grand bunches of Coreopsis grandiflora, Galega officinalis, Lilium elegans, L. tigrinum, etc.; Mr. C. A. Williams, Wean-y-Cwm, Dinas Powis, second; and Mr. J. W. Kaiser third.

GROUPS AND PLANTS.

In the class for a group of plants arranged on a circular space of 50 sq. ft., there were two competitors, and first prize fell to Mr. Horne, gardener to Major-General Lee, and second to Mr. G. Wall, gardener to J. E. Morgan, Esq., Brynderwen, Llandaff, but neither was in proper form owing to the damage done to the plants by the fall of the tent over night. It was agreed beforehand that the prize money should be equally divided, and the silver cup be withheld for the year.

Table plants were very well shown, Mr. G. Wall, gardener to J. L. Morgan, Esq., scoring with a neat, bright set of crotons, dracænas, aralias, and pandanus; Mr. T. Richards second. Mr. Wall and Mr. Richards were also first and second respectively for six ornamental foliage plants in six-inch pots.

Mr. S. F. Jones, gardener to Lady Morel, The Lindens, led for six tuberous begonias in a very fine competition, and he scored with big specimens a yard through; Mr. W. Davies, Grove Place, was second; and Mr. J. James, 2, Redlands Road, was third. For six begonia blooms, three double and three single, Mr. H. J. Pilcher, Station Road, was first. Gloxinias, six plants, made another good class, and here Mr. F. Jones was to the front with large plants that would have looked a great deal better had the flowers been neatly staked; Mr. T. Mann, gardener to G. Lewis, Esq., Cathedral Road, Cardiff, second.

There were a few non-competitive exhibits, notably those of hardy flowers from the King's Acre Nurseries, Hereford; carnations from Messrs. Young and Co., Hatherley; and hardy flowers, including some of the new primulas, etc., from Mr. W. E. Evans, Llanishan.

CARDIFF AND COUNTY HORTICULTURAL SOCIETY. 22nd Annual Show. SOPHIA GARDENS, CARDIFF. WEDNESDAY and THURSDAY, July 20 and 21st, 1910. Liberal Prizes in every section, amounting in money and plate to nearly £500. Two Programmes of Music each day by His Majesty's renowned 1st Life Guards Band. PERTHSHIRE SWEET PEA SOCIETY'S
EXHIBITION.
(OPEN CLASSES).

The above Exhibition will be held on
SATURDAY, JULY 30th, 1910.

Judge, Mr. Walter P. Wright.

Schedules from Hon. Secretary—
Mr. [illegible] HALLEY,
Priory Villa, Glover Street, Perth.

ANSWERS TO CORRESPONDENTS.

DAHLIAS. B. G., Brighton: Limit the growths to six per plant, and very carefully tie these up or they will be damaged by wind. You will find half a dozen growths quite sufficient.

COLOUR CHART FOR FLOWERS.—S. P. M., Badminton: The colour chart or "Repertoire de Couleurs" can be obtained from the Secretary, Royal Horticultural Society, Vincent Square, Westminster, for 15s. post free.

GROWTHS ON APPLE STOCK.—H. P. W., Canterbury: All growths that appear below the union of the graft with the stock should be removed so that all the energy is directed towards the proper development of the scion. The latter needs some care, especially in wet windy weather, and if not carefully tied to a stake there is a danger of its being wrenched out at the point of union. Loosen the ties so as to afford room for the swelling.

WINTER FRUITING TOMATOES.—S. W., Twyford: Sow seeds at once, and place them in a warm pit to germinate. Keep the seedlings near the glass and pot them singly into large sixties as soon as fit. Larger pots, say ten-inch, will be needed before long, but as soon as they are established in their first pots a position in a cool house should be provided, while as soon as in their fruiting pots, they should be put out of doors for a while, bringing them indoors again before cold weather sets in.

DAMAGED SWEET PEA BUDS.—W. E. J., Hounslow: The damage to the flower buds of your sweet peas is due to the action of sparrows. Why these little pests tear open the buds at this season of the year it is difficult to understand, but possibly they have discovered a little nectar is available, or it may be the damage is done from sheer mischievousness. We have experienced similar trouble this last week or so, and have recottoned the rows of sweet peas, hung up some pieces of bright tin and old mirror glass, but with only partial success. If it were not for killing the blackbirds and thrushes, we should set abundant traps of red-leaded pea seeds for the sparrows; at any rate, we feel like slaughtering the latter by some means, and think that the fear of death is about the only thing that will stop these birds from continuing their depredations.

CREAM-PINK SWEET PEAS.—C. S. T., Leamington: The National Sweet Pea Society regards the following cream-pink sweet peas as too much alike for inclusion with each other in any stand of sweet peas set up in competition at its exhibitions: A. B. Bantock, Earl of Plymouth, Holdfast Belle, Kitty Lea, Mrs. Hugh Dickson, Mrs. Henry Belle, Mrs. Routzahn, Sutton's Queen, and Romani Rauni. Another set of too-much-alike cream-pink varieties is Constance Oliver, Doris Usher, and Nell Gwynne. The complete lists of too-much-alike varieties is published in the society's schedule.

PROPAGATION OF HYDRANGEAS.—H. G. T., Newport: Hydrangea Hortensia may be propagated any time during July and August from cuttings of the partially-ripened new growths. Many growers wait until the old plants have finished flowering, and then put in a batch of cuttings, inserting these firmly in a mixture of loam, old mushroom bed manure and sand, and putting each cutting in a two-inch pot. Water well, and place in a cold frame, keeping the cuttings shaded in bright weather.

INEXPENSIVE DAFFODILS.—L. E. R., Felixstowe: The following is an excellent selection of inexpensive varieties: Emperor, Golden Spur, Henry Irving, Her Majesty, and P. R. Barr, of the yellow trumpets; Empress, Grandee, J. B. M. Camm, Mrs. Walter Ware, and Victoria, of the bicolor trumpets; Albicans, C. W. Cowan, Mrs. Thompson, and William Golding, of the white trumpets; Queen of Spain, of the Johnstoni varieties; Beauty, Autocrat, Frank Miles, Mabel Cowan, Sir Watkin, and Stella superba, of the incomparabilis group; Barri conspicuus and Flora Wilson, of the Barri section; and Duchess of Westminster, Grandiflorus, and Ornatus, of the poet's section; M. Magdaline de Graaff, and Mrs. Langtry, of the Leedsi section.

EVERGREEN FLORAL EDGINGS.—M. D. H., Bristol: There are several plants available for edging beds or borders, and that look well all the year round, but especially so when in bloom. These include double and single arabis, London Pride, various aubrietias, sedums, Cerastium Biebersteini, thrift, and even violas if they are regularly replanted.

ROSES.—T. S., Purley: "Roses and Their Cultivation" will meet your requirements in every way. It may be obtained post free for 2s. 10d. from the GARDENERS' MAGAZINE office, 148, 149, Aldersgate Street, E.C.

EMPLOYMENT AT WISLEY.—O. R., Woodbridge: Full particulars respecting employment at the Royal Horticultural Society's gardens at Wisley may be obtained from the secretary of the society, but you will find the conditions attaching to admission in the society's "Book of Arrangements" for 1910.

NAMES OF PLANTS.

W. G. J., Wendover.—1, Genista cinerea; 2, Cytisus scoparius; 3, Centranthus ruber.

B. B., Northampton.—1, Hoya carnosa; 2, Tacsonia Van Volxemi; 3, Fuchsia triphylla; 4, Plumbago capensis alba.

L. J. S., Saffron Walden.—1, Selaginella amœna; 2, S. hæmatodes; 3, Asplenium Fabianum; 4, Adiantum tenerum.

C. N. N., Sydenham.—1, Strobilanthes Dyerianus; 2, Molucella lævis; 3, Sonerila Hendersoni; 4, Panicum plicatum.

N. F., Birmingham.—1, Abies Douglasi; 2, Juniperus chinensis; 3, Sequoia sempervirens; 4, Spiræa Douglasi; 5, Phalaris arundinacea.

G. E., Ryde.—1, Erigeron speciosum; 2, Odontoglossum concinum; 3, Alstroemeria peruviana; 4, Lilium Martagon; 5, Clarkia elegans; 6, Nigella Miss Jekyll.

FORTHCOMING ENGAGEMENTS.

SATURDAY, July 16.—Edgware Horticultural Society.
Reading Rose and Sweet Pea Show.
TUESDAY, July 19.—Royal Horticultural Society; Committees meet at 12 o'clock; Lecture at 3 p.m. on "Insects Affecting our Crops," by Mr. Fred Enock, F.L.S., F.E.S.; Scientific Committee at 4 o'clock.

Situations Wanted.

ACCOUNTANT AND CASHIER, or CORRESPONDENT. — Advertiser, 20 years with Messrs. B. S. Williams and Son, and three years with Messrs. J. Veitch and Sons. Ltd., is open to re-engagement, and will be glad to hear from any firm requiring the services of a capable man; good knowledge of Plants, Botany, and Foreign Languages. G. K. GUDE, 45, West Hill Road, Wandsworth, S.W.

HER GRACE THE DUCHESS of DEVONSHIRE wishes to recommend J. THOMPSON to any Lady or Gentleman requiring the services of a HEAD GARDENER, where several are kept; 20 years' experience in all branches. Holker Gardens, Cark-in-Cartmel, Lancs.

HEAD GARDENER seeks RE-ENGAGEMENT (abstainer); age 36; married; eighteen years' practical experience; also landscape experience; first class references. Apply E. PANNELL, Oban House, Boughton, Faversham, Kent.

MR. TAYLOR, Head Gardener to Sir James Mackay, Chesterford Park, Essex, can highly recommend J. WREN as HEAD GARDENER, where two or more are kept; thoroughly experienced in all branches, Inside and Out; good references; age 31; married, three children; leaving when suited. J. WREN, Meesden, Buntingford, Herts.

GARDENER (Head, where one or more are kept); life experience in all branches; age 35; married, no family WELLS, 40, Malden Road, Boreham Wood Herts.

GARDENER (Head Working); experienced in the cultivation of Fruit, Plants, Flowers under Glass, Flower and Kitchen Garden, Forcing, etc.; also Hardy Fruit culture; good references; married, no family. W. S., 16, Warwick Place, Maidstone, Kent.

GARDENER (Head of two or three), age 34; life experience in all branches; Inside and Out; well recommended; two children, 3½ and 6 years. W. SAWYER, 4, Gun Road, Knebworth Stn.

GARDENER (Head Working, where two or more are kept); life experience Inside and Out, can be well recommended; age 36; married, one in family, 13 years. T. WEST, near New House Farm, Ninfield, Sussex.

GARDENER (Head Working); age 44; life experience; 21 years' excellent references from first-class establishments; thorough knowledge in all branches; prize winner; leaving own request; no young children; youngest 14. W. BLOOMFIELD, Staplehurst, Kent.

GARDENER (Head Working, where one or two more kept, or good Single-handed); experienced Inside and Out; good references, and recommended; age 27; married when suited. W. CROUCHER, 11, North Terrace, Hythe, Kent.

GARDENER (Head Working where two or more are kept); life experience in all branches; age 42; 7 years in present place as Head. STEVENS, 197, Blackstock Road, Finsbury Park, N.

GARDENER (Head Working, where two or more are kept); good all-round; can be well recommended; married when suited; age 36. PEARCE, Ridley, near Wrotham, Kent.

GARDENER (Head). — Mr. PRINSEP, Buxted Park, Uckfield, will have much pleasure in recommending his Foreman, J. BROWN, to any Nobleman or Gentleman requiring the services of a thoroughly practical Man; age 32.

GARDENER (Head Working or good Single-handed); life experience in all branches; good references from present and previous employers as to ability and trustworthiness; no family. GARDENER, 28, Martell Road West, Dulwich, S.E.

C. T. HOARE, Esq., Bignell, Bicester, Oxon, highly recommends W. TOGHILL as HEAD WORKING GARDENER, where four or five are kept; 15 years' good experience in all branches, including Badminton and Benham Park; age 30; married when suited.

SITUATION WANTED.—Gardener (Head Working, where two or three are kept); well up in Vines, Melons, Figs, Cucumbers, Tomatoes, and Flowers; early and late forcing; age 41; life experience; abstainer; married, 1 child; good refs. W. E. S., 52, Corporation Road, Gillingham, Kent.

GARDENER (good Single-handed where help is given or Head of two); good all round experience, both inside and out; 8 years and 10 months' reference; eldest boy of three 14 years old; life experience; wife willing to help in house or laundry; good ironer. HARRY GOOD, Ivinghoe, near Tring, Bucks.

GARDENER (Single-handed), thoroughly experienced Inside and Out; married; age 31; 2 children; excellent refs.; disengaged July 23. A. H. PLUMRIDGE, Winchester Hill, Stockbridge.

GARDENER (Single-handed, or where help is given); good experience Inside and Out; married, no family; age 37; excellent references. SAUNDERS, Lyndale, Crutchfield Lane, Walton-on-Thames.

GARDENER (Single headed) seeks SITUATION; 12 years' good experience; good reference. Address, A. DODD, 64, Northfield End, Henley-on-Thames.

THE BEST CABBAGES FOR AUGUST SOWING.

SUTTON'S APRIL,
Per packet, 1s., post free.

SUTTON'S FLOWER OF SPRING,
Per ounce, 1s., post free.

SUTTON'S FAVOURITE,
Per packet, 1s., post free.

"One of the earliest is Sutton's April, and this is a model Cabbage of very compact growth and quite free from bolting. It is remarkably early, and is rightly named, for I have had it the first week in April after a severe winter. Another very reliable early Cabbage is Sutton's Flower of Spring. This is a little larger than April, but equally valuable where quantities are required. It forms a compact head of a most beautiful shape, and is exceedingly delicate in flavour.—G. Wythes, "The Garden."

SUTTON AND SONS, THE ROYAL SEED ESTABLISHMENT, READING.

KELWAY'S "COLOUR BORDERS"
(Regd.)

Artistic and permanent—arranged for continuous bloom and colour effect.

These Borders can be purchased BY THE SQUARE YARD for any position all ready arranged for planting.

"I am thinking of planting a few borders with perennials. I am tired of continually planting bedding plants. Mrs. ——."

Write now stating your area, position, soil, etc., for planting in the Autumn, to

KELWAY AND SON, The Royal Horticulturists, LANGPORT.

NOTE OF THE WEEK.

Insects and Flowers.

Undoubtedly one of the most wonderful phases of floral evolution is embodied in the relations of the insect world to that of flowers in connection with the reproduction of the latter. To the old botanists the fertilisation of seed by the pollen was a profound mystery, presenting so many apparently contradictory phenomena that the fundamental principles were obscured; and even when it was recognised that the pollen and the embryo seed represented separate sexual elements, which needed to be brought together by some agency in order to ensure reproduction, how this was effected in many instances failed to be detected. It was not, indeed, until Charles Darwin discovered, and made known, the great underlying principle that cross-fertilisation, and not self-fertilisation, was established as a fundamental factor in the economy of vigorous plant life, that the agency of the insect tribes in effecting this was established as another. The older botanists were puzzled by many facts which militated against the primary and natural idea that the pollen of an individual flower was destined to fertilise the embryo seed in the immediate vicinity, that is, of the same flower. It was often noticed that when the stigma matured the anthers bearing the pollen were already depleted and withered, or vice versa, the period of maturity not coinciding, so that the assumed object appeared to be always frustrated by this lack of agreement, and in many other ways, the flowers were so designed as to lead to a similar apparently fruitless result. Hence every theory which was put forward found vigorous opponents, and was destroyed by further evidence owing to the lack of recognition of the principle Darwin eventually enunciated. The same ignorance also blinded even the keenest investigators as to the reason of the multiformity of flowers, and the intricacy of many of their structures. The operation of self-fertilisation assumed by them was so fundamentally simple, why then should such diversity exist in the forms designed to carry it out? Still more puzzling was the question, Why should Nature so often frustrate her own plans by the phenomena of non-conformity observed? Darwin's observations directed to the most puzzling flowers of all, the orchids, threw, however, a flood of light upon this question. In them, as in other members of the floral world, it became clear that they were individually designed with the utmost skill to attract particular insects to them, and that their visits resulted in the transference of the pollen away from the flower which produced it to another at a distance. It was then recognised at once that this operation not only solved all the previous puzzles of non-accordance in the periods of maturity of stigma and stamen, but also accounted for the multiformity of floral structure by its special adaptation to the multiform types of the fertilising agents, the insect world. By this discovery enormous additional interest was imparted to botanical study. Every flower became an absorbingly interesting study when it became clear that its form, colour, scent, nectaries, markings, and internal arrangements were all cunningly designed to ensure, first, a visit from a bee, moth, or other insect, and then that this visit should ensure the involuntary attachment of some of the pollen to the visitor's body, either as dust or adhesive masses, which it was bound, on its next visit to another flower, to bring into contact with the ready stigma. The insects themselves became also more interesting to the entomologist, since it was also recognised that they were so formed, and provided with hairs as to be particularly adapted for the office which they thus performed. The deep, narrow corolla had its long-tongued moth, the shallow calyx its corresponding bee, covered with retaining hairs, and so on, and the discovery furthermore aroused the interest of the agriculturist, since, among many other instances, it revealed the secret of non-fertilisation of the clover introduced into the Antipodes, and the necessity of the subsequent introduction of the essential humble-bee, which alone was so constructed as to fertilise it. A further proof of this interrelation between the floral and the insect worlds as an essential to the production of more and more attractive flowers was then recognised in the fact that whenever this was dispensed with, as in the case of the wind-borne pollen of conifers, willows, and other plants, involving, of course, no selection by greater attractiveness of colour or other lures, the flowers were always inconspicuous, and of the simplest form. Furthermore, Darwin proved that the cross-fertilisation, to which end so much diversity and beauty had been engendered, invariably resulted in more vigorous offspring, a greater number of seeds, and of larger size; and, in short, constituted Nature's provision against that weakness which is, as we know, engendered by constant inbreeding. Another proof of the far-seeing and beneficent Power which dominates the universe.

MR. W. J. UNWIN.

Mr. W. J. Unwin, of Histon, Cambridge, whose portrait we give in this issue, occupies a high position in the sweet pea world, because of the many beautiful varieties he has raised and distributed. Mr. Unwin used to grow sweet peas largely for market, but the growing enthusiasm for, and popularity of the Queen of Annuals, led him to take a keener interest in the flowers he grew. He discovered a wavy sport of lovely pink colouring about the same time Countess Spencer appeared, but it differed from the latter in shade, and also proved to be fixed when grown in quantity; it was named Gladys Unwin. Mr. Unwin is a member of the Executive Committee of the National Sweet Pea Society, and has been a strong supporter of the society's policy of conducting independent trials of sweet peas, and he also very heartily supported the movement for the promotion of the Sweet Pea Conference held last winter. Mr. Unwin has given to the floricultural world such good sweet peas as Gladys Unwin, Edna Unwin, Doris Burt, E. J. Castle, A. J. Cook, Frank Dolby, Mrs. Alfred Watkins, Nora Unwin, Phyllis Unwin, and the newer Mrs. W. J. Unwin, and a fine new stock of Clara Curtis, that gained a F.C.C. in 1909. Mr. Unwin is continuing his work as a raiser, and has a number of beautiful new seedlings on trial.

Baron Schroder's Will.—The will, dated August 6, 1908, with four codicils, of Baron Sir John Henry William Schröder, Bart., has been proved. The estate has been sworn for probate as of the gross value of £2,079,611 9s. 4d., the net personalty being sworn at £1,970,927 16s. 2d. The late Baron bequeathed large sums to charities, and he left to the Gardeners' Royal Benevolent Institution £1,000 and to the Royal Gardeners' Orphan Fund £500. To Mr. Henry Ballantine, for so long a period head gardener at "The Dell," he left a legacy of £1,000, and, in addition, "one original orchid, to be chosen by him, and all the smaller plants which have been taken from it." To Mr. Clark, orchid foreman at The Dell, he left one original orchid, to be chosen by him after Mr. Ballantine has made his choice, and all smaller plants which have been taken from it. The sum of £3,000 was left for distribution amongst all the servants in his employ at the time of his death, including garden and stable employees, not otherwise mentioned in his will.

Horticulture at Reading.—Considering that Reading is surrounded by gardens of more or less importance, that it has a horticultural college, and numbers among its commercial activities a seed firm whose reputation is world-wide, it is surprising that the horticultural society which has its headquarters there is so indifferently supported that unless there is a change for the better the exhibitions will have to be discontinued. The society held its annual meeting the other day, and this had been adjourned from the previous week owing to a quorum not having been present. According to the balance-sheet the subscriptions for 1909 amounted to £115 11s. 6d.; special prizes, £31 19s. 6d.; and admission to the exhibition, £27 5s. The expenditure included £110 11s. 6d. for prizes and medals, £18 1s. for band, £22 19s. 3d. printing and stationery, and £11 for illuminations. The net result, as stated by Mr. W. Dunlop, who presided, was a loss of £25 on the year's work. As this loss reduced the reserve fund to £40, the shows would, he said, have to be discontinued unless greater support was forthcoming. Subsequent to the annual meeting, it was decided by the executive committee to hold this year's show on August 24. The Reading Horticultural Society was established 53 years ago, and for a long period was prosperous, its exhibitions being some of the finest held in the provinces. Her Majesty the Queen has consented to become a patroness of the Reading Rose Society, of which Lady Rufus Isaacs is the president.

R.H.S. Examination of School Teachers.—We have received from the Rev. W. Wilks the recently issued report on the Royal Horticultural Society's examination of school teachers in cottage and allotment gardening, held on April 27 last. From this we learn that 362 candidates presented themselves for examination, an increase of 75 per cent. on the previous year. Of these 47 obtained a place in the first class, Mr. H. Newman, Dudley Port, Tipton, and Mr. F. N. Smart being bracketed for the premier position. The examiners, Mr. Alexander Dean, V.M.H., Mr. F. Chittenden, F.L.S., and Mr. James Hudson, V.M.H., report that they experienced much difficulty through candidates failing to comply with the printed instructions for the conduct of the examination. This applies particularly to the answering of two or more questions on the same sheet of foolscap, although each sheet had a plainly printed heading "Commence each question on a fresh sheet." This carelessness was not to be expected from school teachers accustomed to examinations, the more so since it has not been experienced in the three examinations of the society for gardeners held this year under precisely similar regulations. In Section A many candidates were too discursive, and wasted time in enlarging on the botanical or physical nature of plants rather than concisely expressing their practical knowledge of the actual cultivation, when such information only was required by the question. In most answers on successional cropping the routine was correctly described, but the replies of many showed a want of practical experience. A marked improvement was discernible in familiarity with fruit and flower culture, and there was evidence of dependence on personal observation rather than on the authority of text-books. In Section B. there was also an improvement on last year, a greater proportion of the candidates having given attention to illustrative experiments. Still, many again regarded a text-book statement of fact as proof of its truth, and a paraphrase of a question as an answer to it.

M. Nonin.—This well-known French chrysanthemum grower, the president of the Paris Chrysanthemum Committee, has recently been appointed a Knight of the Legion of Honour. It is rare for a chrysanthemum grower to obtain so high a distinction, and we are sure M. Nonin's English friends will unite with us in offering him our congratulations.

Nomenclature of Garden Hybrids.—The nomenclature of plants received a full share of attention from the members of the recent International Horticultural Congress held at Brussels. As regards garden hybrids, it was, as recorded in "Nature," agreed that the specific name may be expressed in Latin, or in a vulgar tongue and written in Roman characters; if possible, it should be a single word, but, at any rate, not more than three words. Various suggestions had been made as to the system of nomenclature for artificial hybrids in which two, three, or more genera are involved. In the case of bigeneric hybrids, the general custom was confirmed of forming a Latin generic name by the combination of the names of the parents; the specific name, also in Latin form, is to be separated from the generic by the sign of hybridity, thus, Læliocattleya × Smithii. For plurigeneric hybrids the recommendation of the Royal Horticultural Society of London was adopted, namely, the use of a conventional generic name, derived from that of some person of distinction, with the termination ara, e.g., Lawrenceara.

Cross-bred Pinks.—Mr. J. Douglas contributed to the recent meeting of the R.H.S. Scientific Committee a number of flowers of seedlings, the result of crossing the ordinary white form with the pink called Rubican. The seedlings showed in a marked manner the influence of the latter, and some very beautiful forms were among them; 10 to 12 per cent. of the seedlings bore single flowers, and no fringed flowers were among the singles.

Value of Seaweed as a Fertiliser.—The high estimation in which seaweed is held as a manure for farm crops is shown by the compensation that has been awarded to three farmers in Fifeshire, who have been deprived of the privilege of gathering seaweed in consequence of the construction of the Rosyth naval base. The case was submitted to arbitration, and evidence was heard at great length on behalf of both parties. The award has been issued and seaweed has been assigned a place of considerable importance as a fertiliser. The claims of the three farmers were £1,137 10s., £1,523, and £750, and the referee awarded them £544 10s., £630 14s. 5d., and £385 5s. 9d., with costs. The respective offers made by the Admiralty were £440, £484, and £330.

Japan-British Exhibition.—On the 15th inst. there was a distribution, under the presidency of Prince Arthur of Connaught, of the first instalment of the awards made to British and Japanese exhibitors at the White City. Messrs. William Paul and Son, of Waltham Cross, were awarded the Grand Prize for their large and beautiful display of roses, which includes dwarfs, standards, and pillars, and is not less remarkable for the taste shown in the arrangement than for the development of the many hundreds of plants. Messrs. Kelway and Son, of Langport, were awarded a gold medal for their extensive, attractive, and interesting exhibit of plants in the grounds of the exhibition.

Monument to Ernest Calvat.—In recognition of the services rendered to horticulture by the great French chrysanthemum raiser, M. Ernest Calvat, it has been decided by the French National Chrysanthemum Society to start a subscription list to raise the necessary funds for the erection of a monument to his memory. Those of our readers who desire to contribute are requested to send their subscriptions to Mr. Harman Payne, 141, Wellmeadow Road, Catford, S.E.

Grasses at Whitechapel.—A highly interesting feature of the Country in Town Exhibition, at the Whitechapel Art Gallery, was the series of grasses arranged by Mr. W. Mark Webb, F.L.S., the hon. secretary of the Selborne Society. Messrs. Sutton and Sons, of Reading, specially prepared a series of useful grasses, and Mr. J. F. Rayner, F.R.H.S., of the Botanical Garden and Laboratory, Highfield, Southampton, contributed a large series of other forms.

Students at R.H.S. Gardens, Wisley.—We are informed that there are now but very few vacancies remaining for students wishing to commence the two years' course of study at the Wisley Gardens of the Royal Horticultural Society in September next. Youths over the age of sixteen and young men wishing to avail themselves of the tuition and training offered by the society should make application immediately on forms to be obtained from the Secretary of the R.H.S., Vincent Square, Westminster. An entrance fee of £5 5s. is charged, and students board and lodge at their own expense in the adjoining villages. The training given includes both a scientific and a practical knowledge of gardening, and various germane examinations are prepared for, including the diploma of the school, given to students who show a sufficiently high standard of knowledge at the completion of the two years' course.

Plant Diseases.—We have to acknowledge several leaflets from the Board of Agriculture relating to gardening and farming. Those of special interest to gardeners are: "Leaf Diseases of Celery," and "Leaf Shedding in Conifers." Copies of these leaflets may be obtained, free of charge, and post free, on application to the Secretary, Board of Agriculture, Whitehall Place, London. Letters of application need not be stamped.

EXHIBITIONS AND MEETINGS.

Royal Horticultural Society.

JULY 19.

The hall on this occasion was not quite so crowded as at the last few meetings, still the floor space was quite full. The best features of the show were undoubtedly the large exhibits of fruit trees in pots and the numerous exhibits of hardy flowers, while the sweet peas would have done credit to the National Sweet Pea Society.

FLORAL COMMITTEE.

Messrs. Barr and Sons, Covent Garden, arranged a nice display of hardy flowers, in which the collection of liliums were the chief feature. Amongst the best were L. chalcedonicum, L. canadense, L. testaceum, L. croceum, L. superbum, and L. Browni. The decorative sage, Salvia virgata nemorosa, made a pleasing feature throughout the exhibit, while the brilliant colours of the phloxes were very striking.

Messrs. Jas. Veitch and Sons, Lim., Chelsea, occupied a large run of tabling with a varied display. The Java hybrid rhododendrons at once attracted attention, as did also a group of Kalanchoe flammea. Some well-flowered plants of Hibiscus magnificus were also attractive. Fuchsias, both as standards and decorative plants, were interesting. The best of the latter were Brilliant, Rose Phenomenal, the hybrid Coralle, Sylvia, Masterpiece, and Beauty of Exeter. Abutilons in variety were also in evidence, while a basket of sweet williams denoted a fine strain. The same firm also staged a good exhibit of border carnations in pots, the most attractive being Countess of Radnor, Bendigo, Mrs. R. Morton, Bedemere, and Ben Beale.

Mr. Frank Lilley, Guernsey, had a splendid display of early-flowering gladioli, arranged in bamboo stands. Some of the most conspicuous varieties were Sarnian Gem, General Scott, Blushing Bride, Princess Victoria, Princess May, and Ne Plus Ultra.

Hardy flowers from Mr. M. Prichard, Christchurch, Hants, were very fine. The chief features were Dianthus Napoleon III., Hemerocallis Baroni, astilbes in variety, Iris Kæmpferi, and some good bright phloxes.

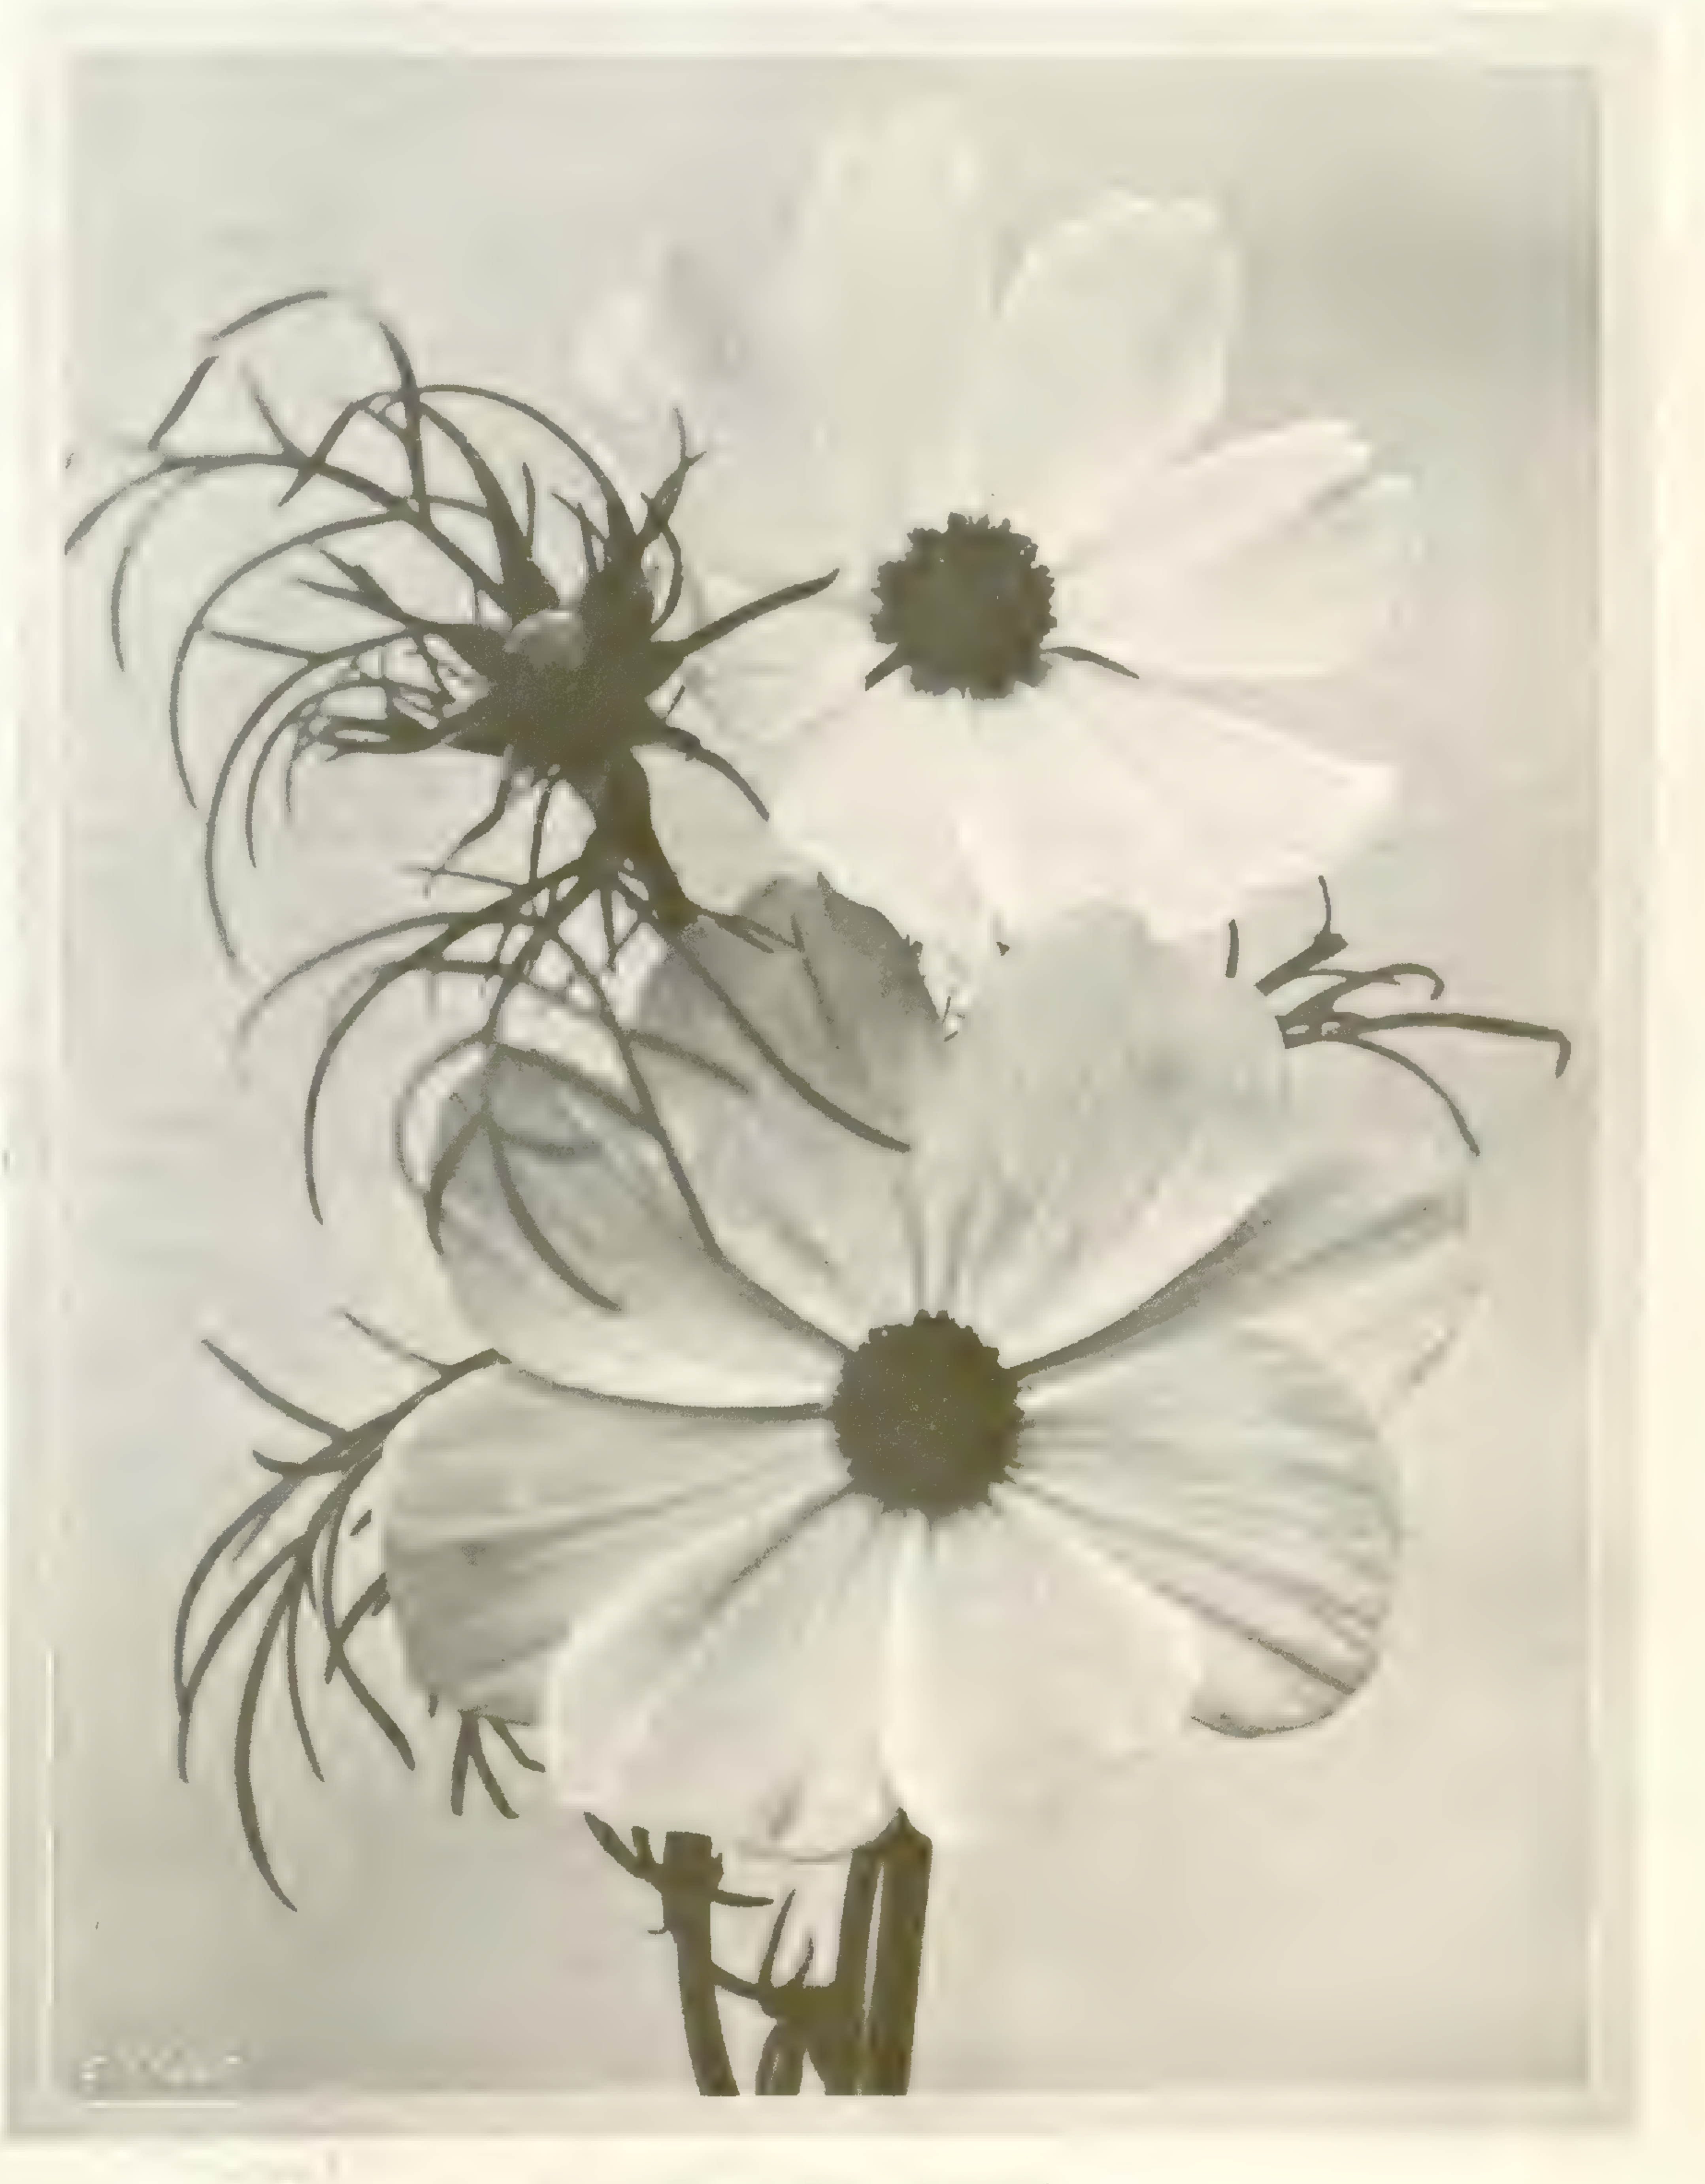
Mr. Clarence Elliott, Six Hills Nursery, Stevenage, presented a pleasing rock garden, on which the chief items were the masses of Campanula pusilla and its white form, while Tunica saxifraga fl. pl., was also much admired.

Hardy flowers from Messrs. G. Bunyard and Co., Maidstone, occupied a large space, and were nicely set out. Perhaps the campanulas were the most prominent vases. They included C. urticifolia alba, C. lactiflora, and C. verticifolia. Phloxes were also seen in good variety, as were also spiræas and potentillas.

Messrs. R. Wallace and Co., Colchester, had a delightful display of aquatic plants surrounded with hardy flowers. A very natural pool of water contained nymphæas, well opened, with magnificent clumps of Iris Kæmpferi, astilbes in variety surrounding it, while somewhat apart from the natural display were grouped, with other hardy flowers, celsias, liliums, and eremuri, the whole forming a charming exhibit.

Messrs. H. B. May and Sons, Upper Edmonton, arranged a fine exhibit of crotons on the floor of the hall. Needless to say, the whole of them were well grown, but the colour was very fine. The most attractive were B. Comte, Mars, Baron James de Rothschild, Thomsoni, and Emperor Alexander, while on the opposite stage was arranged a beautiful table of ferns, chiefly adiantums, nephrolepis and gymnogrammas.

Phloxes and violas from Messrs. W. Wells and Co., Lim., Merstham, were very fine, the former being exhibited in pots. The most striking varieties were Mrs. J. Harkness, Iris, Mrs. A. Baker, and Elizabeth Campbell. The violas were displayed in vases, and formed a pleasing front.



COSMOS ROSE QUEEN.

An early-flowering variety of great merit. The flowers are large, of fine form, and a rich rose colour. A.M., R.H.S., July 19. Messrs. Dobbie and Co.

Messrs. W. Paul and Son, Waltham Cross, staged a splendid exhibit of roses. Tall specimens of White Dorothy Perkins and Hiawatha occupied the background, while bamboo stands and baskets were filled with individual varieties. The new hybrid tea, Florence Haswell Veitch, a deep red, impressed one with its vigour, while the Lyon Rose was staged in a mass. Other noteworthy baskets contained Wm. Shean, Dorothy Page Roberts, and Grace Molyneux.

The exhibit of sweet peas from Messrs. Dobbie and Co., Edinburgh, consisting of varieties of their own introduction, was very fine, the tall columns of such varieties as The Marquis, John Ingman, Mrs. Hugh Dickson, Masterpiece, Menie Christie, Isobel Malcolm, and Mrs. Collier being superb, while the vases in front were equally beautiful. These included several new varieties, notably the orange Earl Spencer, and the mauve-pink Marion Cuthbertson. Mr. F. A. Wellesley, Woking, exhibited Sweet Pea Mrs. F. A. Wellesley, a fine pure white variety. Mr. C. W. Breadmore contributed a vase of Sweet Pea Iris, a beautiful salmon-pink variety; and Messrs. J. R. Pearson and Sons, Lowdham, contributed their bright pink Sweet Pea Elfrida Pearson. Messrs. Dobbie also exhibited several annual flowers, notably the new early-flowering Cosmos Rose Queen; Gypsophila carminea, a charming form, with carmine coloured flowers; and a fine strain of calendulas.

From Messrs. Gunn and Son, Oulton, Birmingham, came a fine, well-displayed exhibit of phloxes. Some of the prominent varieties were Tapis Blanc, Dr. Charcot, Iris, Selma, and Countess of Ilchester. The same exhibitors also had baskets of violas.

Mr. F. Dutton, Iver, Bucks, staged a large exhibit of cut border carnations, which were quite a change from the perpetual varieties of the past few months. A few of the most attractive were W. H. Parton, Miss Willmott Helmsman, Heatherbell, Bendigo, and Lemberg.

Mr. Jas. Douglas, Great Bookham, also staged some fine carnations. A few of the best were Daffodil, Ellen Douglas, Hercules, Renown, and Mrs. Robert Berkeley.

Mr. Amos Perry, Hardy Plant Farm, Enfield, had a fine group of astilbes and spiræas arranged on the floor of the hall in imposing style. Each variety or species was represented by huge clumps. The best were Spiræa venusta magnifica, S. v. elegans, S. v. Peggy, and Astilbe Ceres, A. Gerbe d'Argent, with some very promising seedlings, while some well-grown funkias and a fine clump of Senecio macrophyllus completed the display.

Roses from Messrs. B. R. Cant and Sons, Colchester, were chiefly of the decorative type, though many vases of exhibition varieties were displayed. Some of the best were General Gallienne, White Dorothy Perkins, and Peggy, while a number of new varieties were of great promise. These included St. Helena, Elizabeth, the pink seedling from Frau K. Druschki, and Claudius.

Astilbes from Mr. George Arends, Ronsdorp, Germany, attracted much attention, for they were splendidly developed and contained new colourings. The most distinct were Salmon Queen, Venus, Ceres, Cream Pearl, Pink Pearl, and Vesta. Some of these varieties are destined to become very popular with the market growers.

The upper end of the hall was occupied by a fine collection of carnations from Sir Daniel Gooch, Bart. (gardener, Mr. Wilkinson), The Hylands, Chelmsford. They were nicely displayed in bamboo stands and vases. The most conspicuous varieties were Princess of Wales, Duchess of Westminster, Maggie Nettlefold, Marmion, and H. J. Jones, with a few good border varieties. The exhibit was materially assisted with suitable foliage plants.

Mr. Webster, gardener to E. J. Preston, Esq., Kelsey Park, Beckenham, sent specimen stove plants, so seldom seen at the hall. The whole were well grown and in fine condition. The foliage plants were Dracæna Victoria, a fine plant and in grand colour; Kentia Belmoreana, Pteris Childsi, and the flowering plants included Clerodendron Balfouri, a fine specimen in the pink of condition; and Statice profusa. Suitable decorative plants formed the background, with Caladium argyrites as an edging.

Messrs. W. Cutbush and Son, Highgate, had a large exhibit of hardy flowers on the floor of the hall. The chief features were Pentstemon Newbury Gem, Erica coccinea, potentillas in variety, campanulas, and well-coloured plants of Shortia galacifolia, while a pool of nympheas was surrounded by suitable subjects.

Messrs. Stuart Low and Co., Bush Hill Park, had an effective exhibit of roses arranged in bamboo stands and vases, Betty, Madame Ravary, and Lyon Rose being most conspicuous.

H. D. Broughton, Esq. (gardener, Mr. Gregory) sent a box of nice, clean, fresh roses, chiefly hybrid teas.

A nice group of carnations in pots came from Mr. Chas. Turner, Slough. The plants were well grown and the flowers rich in colour. A few good ones were Sylvia, Sunset, King George, Jocelyn, and Pearl. Mr. Turner also exhibited cut trusses of his new rambling rose Flame, a beautiful variety with rose-pink flowers.

Messrs. T. S. Ware and Co., Lim., Feltham, had a good display of hardy flowers, with some boxes of rock and alpine plants. The phloxes were very varied and bright. The crinums, too, were interesting.

ORCHID COMMITTEE.

Orchids were not numerous, but Messrs. Sander and Sons, St. Albans, made a nice exhibit, in which the cattleyas were the most prominent. They included a fine specimen of Cattleya Gaskelliana alba, C. Rex, C. mollis, and C. Wavriniana. Pescatorea Lehmanni was a good form. Odontoglossums figured largely, some being very good, especially O. excellens, O. crispum, with a wealth of flowers, O. Xanthotes, and O. ardentissimum.

Messrs. Stuart Low and Co., Bush Hill Park, also had an interesting and beautiful group, in which were noted nice plants of Cattleya gigas, several plants of Cattleya Rex, C. Miss Williams, and C. Gaskelliana alba. Oncidiums in variety were much in evidence, while the quaint Stanhopea Wardi was conspicuous. Dendrobium Dearei and Odontoglossum Pescatorei were also noted.

From Sir J. Colman, Bart. (gardener, Mr. Collier), Gatton Park, Merstham, came a small collection, which included two beautiful forms of Odontioda Bradshawæ, Cattleya Rex in fine flower, Odontoglossum Queen of Gatton, and Pachystoma Thomsoni.

Sir Trevor Lawrence, V.M.H., Burford Lodge, Dorking, sent Cypripedium W. R. Lee, with eight beautiful flowers; Brasso-Cattleya Joan, Calanthe japonica purpurea, and some very interesting botanical species.

FRUIT AND VEGETABLE COMMITTEE.

Messrs. Jas. Veitch and Sons, Lim., Chelsea, staged a large collection of vegetables nicely arranged. Ellam's Early Cabbage was grouped in the centre, with a collection of cabbage lettuces running through the whole exhibit. Good examples were Crystal Palace Gem, Marvel, and Ohio. The tomatoes were also in force, and included good dishes of The Hastings and Sunnybank. Turnips in variety, vegetable marrows, spinach, and carrots were all seen in numerous varieties.

From the Church Army Garden Association, 55, Bryanston Street, W., came a table of vegetables, grown on the waste plots of ground in Westminster. They could not be described as first class, but they were serviceable, and had been grown on what were rubbish heaps a few months ago.

Messrs. G. Bunyard and Co., Maidstone, had a fine collection of fruit trees in pots, chiefly peaches and nectarines, all carrying a wealth of ripe fruit. In the former were noted excellent examples of Peregrine, Duke of York, and Earliest of All. A large standard Fig St. John was carrying a fine crop of ripe fruit, while plums were represented by good examples of Early Orleans. A pair of Foster's Seedling grapes were trained fan shape, and had first-rate crops.

Another very large exhibit of fruit trees in pots came from Messrs. Jas. Veitch and Son, Lim., Chelsea. A central group of standard figs attracted much attention. All were well fruited, and especially Brown Turkey, Castle Kennedy, and Violette Sepor. The peaches were the picture of health and carried good crops, the chief being Duke of York and Peregrine; while the nectarines included Lord Napier, Early Rivers, and Dryden. A fine fan-trained tree of Peach Royal George was also conspicuous. A few pears were also included in this really fine and instructive display.

AWARDS.

Gold Medal.—To Messrs. Jas. Veitch and Sons, for collection of fruit trees in pots.

Silver-gilt Knightian.—To Messrs. Jas. Veitch and Sons, for collection of vegetables; to Messrs. G. Bunyard and Co., for collection of fruit trees in pots.

Silver-gilt Flora.—To Messrs. Dobbie and Co., for sweet peas; to Sir D. Gooch, for carnations; to Messrs. H. B. May and Sons, for crotons and ferns.

Silver-gilt Banksian Medals.—To Mr. Amos Perry, for spiræas; to Messrs. R. Wallace and Co., for hardy plants; to Mr. E. J. Proctor, for specimen plants.

Silver Flora.—To Messrs. H. Cannell and Sons, for begonias; to Messrs. B. R. Cant and Sons, for roses; to Mr. Jas. Douglas, for carnations; to Messrs. S. Low and Co., for orchids; to Messrs. Sander and Son, for orchids; to Messrs. W. Paul and Son, for roses; to Messrs. Jas. Veitch and Son, for greenhouse plants.

Silver Banksian Medals.—To Messrs. G. Bunyard and Co., for hardy flowers; to Messrs. Carter Page and Co., for violas; to Messrs. W. Cutbush and Son, for hardy flowers; to Messrs. Gunn and Son, for phloxes, to Mr. F. Lilley, for gladioli; to Mr. M. Prichard, for hardy plants; to Mr. G. Reuthe, for hardy plants; to Messrs. T. S. Ware, Lim., for hardy plants; to Messrs. Barr and Sons, for hardy flowers.

Bronze Flora.—To Mr. L. R. Russell, for hardy fuchsias.

Bronze Banksian.—To the Church Army Association, for vegetables.

First Class Certificates were awarded to Cattleya Warscewiczi Low's variety, from Sir G. Holford; to Cattleya O'Brieniana alba, Messrs. S. Low and Co.

Awards of Merit.—To Oncidium Sanderæ, from Messrs. Sander and Son; to Cattleya Artemis, from Sir G. Holford; to Pescatorea camellosa, from Messrs. Charlesworth and Co.; to Sweet Pea Iris, from Mr. C. W. Breadmore; to Fuchsia Sylvia, from Messrs. Jas. Veitch and Sons; to Sweet Pea Mrs. F. A. Wellesley, from Mr. F. A. Wellesley; to Astilbe Salmon Queen, from Mr. G. Arends; to Astilbe Venus, from Mr. G. Arends; to Rose Flame, from Mr. Charles Turner; to Sweet Pea Elfrida Pearson, from Messrs. J. R. Pearson and Sons; to Senecio glastifolius var. Hon. Vicary Gibbs, from Mr. E. Beckett; to Cosmos Rose Queen, from Messrs. Dobbie and Co.; to Sweet Pea Earl Spencer, from Messrs. Dobbie and Co.; to Sweet Pea Marion Cuthbertson, from the same firm; to a strain of calendulas, from Messrs. Dobbie and Co.; to Carnation Mrs. Robert Berkeley, from Mr. J. Douglas; to Gypsophila carminea, from Messrs. Dobbie and Co.

Cultural commendations were also granted to Sir G. Holford, Sir T. Lawrence, and Sir J. Colman.

National Rose Society.

SALISBURY, July 13.

It is a pleasure to be able to state that the exhibition held in the spacious Victoria Park, at Salisbury, was as successful as the great show held a few days previously in Regent's Park. There was good competition and fine roses everywhere, while the display of new seedling roses was especially fine, and, according to Mr. Mawley, the hon. secretary of the N.R.S., this display of new varieties was a record one. The show was held in conjunction with the Wilts Horticultural Society, and was blessed with a gloriously fine summer day.

NEW ROSES.

The new roses were a great feature, and the two Irish firms were very much in evidence.

A gold medal was awarded to Arthur E. Coxhead, and to Mrs. Amy Hammond, from Messrs. S. McGredy and Son, Portadown. To Mrs. Cornwallis West and to Mabel Drew, from Messrs. A. Dickson and Sons.

Silver-gilt medal to Earl of Gosford, from Messrs. S. McGredy and Son.

Card of commendation to Mrs. T. W. Massey, from Messrs. S. Bide and Sons, Farnham. To Mrs. Lucy Williams, and to Rescue, from Mr. J. Mattock, Headington, Oxford.

NURSERYMEN.

There were six entries in the Jubilee Trophy class, where three dozen blooms, distinct, are required, and here Mr. Hugh Dickson annexed the trophy with a very fine set of full, clean blooms, among which Konigin Carola, Mildred Grant, Rhea Reid, Mrs. D. McKee, Leslie Holland, Helene Guillot, Pharisaer, and Mrs. Stuart Clarke were magnificent. It was a rare good box. Messrs. A. Dickson and Sons, Newtownards, came second, and they had H. V. Machin, S. M. Rodocanachi, and Molly Sharman Crawford very fine. Messrs. D. Prior and Son third.

There were four competitors in the large class for seventy-two blooms, distinct, Messrs. D. Prior and Son securing the leading award with a moderate set, in which C. J. Grahame, Mdme. Melanie Soupert, Mrs. Cocker, Bessie Brown, J. B. Clarke, and Liberty were good; Messrs. Frank Cant and Co. second, and Mr. Hugh Dickson, Belfast, third.

There were four competitors in the class for two dozen trebles, and here, by an oversight, Messrs. A. Dickson and Sons were disqualified for duplication. Mr. Hugh Dickson, Belfast, was awarded first prize for fine flowers that, however, opened very fast in the heat of the tent, and were showing open centres before all the judging was finished; Lady Helen Vincent, Richmond

Mildred Grant, Lyon Rose, Mdme. Melanie Soupert, Mrs. T. Roosevelt, Lady Ashtown, Hugh Dickson, and Mrs. Stewart Clark were the best flowers; Messrs. Frank Cant and Co. second; and Messrs. D. Prior and Son third.

The best thirty-six blooms were contributed by Mr. George Prince, Longworth, Berks, who had excellent examples of Dean Hole, Mrs. E. Mawley, Mrs. D. McKee, and Mrs. J. Laing. There were seven competitors, and the remaining awards were secured in order by Messrs. G. W. and H. Burch, Peterborough; and Messrs. J. Burrell and Co., Cambridge. Five competitors staged in the class for sixteen trebles, and here Messrs. G. and W. H. Burch were first with a good set, in which Mdme. Jules Gravereaux, Wm. Shean, Lyon Rose, Ulrich Brunner, and F. K. Druschki, were the best; Mr. G. Prince, Longworth, was placed second; and Messrs. G. Cooling and Son, Bath, third.

For twelve flowers of any white or yellow rose, Mr. G. Prince led with a lovely lot of the Lyon Rose, though how this can be called a yellow passes understanding; Messrs. F. Cant and Co. second with Frau Karl Druschki: and Mr. W. Leggett, West Bergholt, third, with Bessie Brown. Mr. H. Drew, Longworth, led for a dozen blooms of any light pink or rose coloured rose, with some excellent flowers of Mrs. Edward Mawley. Messrs. F. Cant and Co., Colchester, second, with Mrs. Theodore Roosevelt; and Mr. G. Prince third with Mrs. E. Mawley; there were six entries. Mr. Hugh Dickson scored for a dozen flowers of a crimson rose with the new and handsome Leslie Holland; Mr. H. Drew second with Alfred Colomb; and Messrs. F. Cant and Co. third with Hugh Dickson.

Messrs. D. Prior and Son scored for a dozen exhibition roses in vases, five blooms of each, with a handsome set of F. K. Druschki, Killarney, Mrs. J. Laing, Mrs. T. Roosevelt, Lady Ashtown, Caroline Testout, etc.; Mr. G. Prince second. Messrs. F. Cant and Co. led for nine blooms of Harry Kirk with handsome flowers; Mr. H. Drew second, and Mr. G. Prince third.

Mr. G. Prince had the best set of a dozen trebles, teas or noisettes, and here he had Mdme. Jules Gravereaux, Souv. de Pierre Notting, Maman Cochet, Medea, Mrs. E. Mawley, and Comtesse de Nadaillac in fine form; Mr. H. Drew second.

There were four displays of decorative roses, each consisting of eighteen distinct varieties. Mr. J. Mattock, Headington, secured the premier award with a beautiful collection, in which Maharajah, Bellefleur, Lady Waterloo, Betty, Macrantha, Mrs. F. W. Flight, and Hebe's Lip were finely shown; Messrs. Cooling and Son second; and Mr. G. Prince third. Messrs. W. Spooner and Son, Woking, appeared to be the only exhibitors in the class for a dozen bunches of decorative roses, and they were awarded first prize for a clean, bright set of Harry Kirk, Lady Battersea, Betty, Mrs. P. Blair, Marquis de Sinety, etc.

AMATEURS.

The amateurs' Jubilee trophy for the best two dozen blooms, distinct, was won by Mr. F. Dennison, Leamington, who scored among seven competitors with a very bright, clean set of good sized blooms that included C. J. Grahame (silver medal H.T.), Mrs. E. Mawley, Lady Moyra Beauclerc, Lady Ashtown, Ulrich Brunner, Mildred Grant, Caroline Testout, W. Shean, Hugh Watson, F. K. Druschki, and Mdme. Jules Gravereaux; Mr. E. B. Lindsell second; and Mr. P. Foley Hobbs third. Mr. F. Dennison was also first for three dozen blooms, and here he had G. L. Paul, Caroline Testout, Her Majesty, Lyon Rose, and S. M. Rodocanachi as his best; Mr. E. B. Lindsell had again to be content with second place; and Mr. W. Boyes, Middleton-on-the-Wolds, was third; Mr. H. V. Machin, Worksop, was awarded an extra prize.

For eight trebles, Mr. H. V. Machin scored with A. K. Williams, Mildred Grant, J. B. Clark, Her Majesty, F. K. Druschki, Ulrich Brunner, Mrs. J. Laing, and Gustave Piganeau, all in good form; there were six competitors; Mr. E. B. Lindsell second, and Mr. Dennison third. For nine H.T. blooms, one variety, Mr. F. Dennison led with Her Majesty; Mr. Conway Jones second with Dean Hole; and Mr. Machin third with Mrs. T. Roosevelt.

In the division for growers of fewer than 1,000 plants, the Rev. F. Page Roberts annexed the premier award for six trebles with good specimens of F. K. Druschki, Mrs. T. Roosevelt, Mrs. J. Laing, Lady Ashtown, and Mildred Grant; Rev. R. Powley second, and Mr. W. Jarratt, Thorpe, third. The Rev. F. Page Roberts, Strathfieldsay Rectory, Mortimer, led for eighteen blooms, and he had Earl of Warwick, Mrs. J. Laing, Mildred Grant, and F. K. Druschki in good style; Rev. R. Powley, Upton Scudamore, second; and Mr. W. Jarratt, Thorpe, Gloucester, third. Rev. R. Powley scored for six H.P. roses, one variety, with Frau Karl Druschki; Mr. Jarratt, Thorpe, second, with Gladys Harkness; and Rev. Page Roberts third with F. K. Druschki.

In a lower division Dr. Lamplough, Alverstoke, scored for a dozen blooms, with Miss Fisher, Potterne, Dorset, second, and Mr. M. Whittle, Leicester, third. Mr. G. W. Cook, Radstock, Whetstone, scored for nine blooms in a class open to growers of fewer than 1,000 plants, and he was followed by Mr. A. C. Turner, Walton-on-Thames, and Dr. Hayes, Dunster. In a lower division Mr. Upton and Mr. Richards were first and second respectively for nine blooms, and in the same division Mr. W. Partington, Petersfield, led for six blooms, followed by Rev. T. Kershaw, Corsley, and Miss H. C. Aylmer, Southampton.

In the extra amateurs' class Mr. Upton was first for four trebles, with Dr. Hayes second, the latter gaining a silver medal for his Maman Cochet. Dr. Lamplough had the best six blooms of one variety—Bessie Brown; while for six blooms of new roses Mr. Conway Jones scored with Lyon Rose, Lady Ursula, Queen of Spain, Molly Sharman Crawford, Avoca, and Albatross; Mr. Dennison was second, and Mr. W. Boyes third.

In the open amateurs' class for a dozen tea roses, Mr. Alex. Hill Gray, Bath, scored for White Maman Cochet, Mdme. Blanche Martignat, Molly Sharman Crawford, Mdme. Jules Gravereaux, Medea, Mdme. Cusin, Muriel Grahame, Mdme. H. Berger, Dr. F. Guyon, Maman Cochet, E. V. Hermanos, and Mrs. E. Mawley, all very bright and clean; Mr. Conway Jones second. Mr. A. Hill Gray had the best nine flowers of a tea rose, and he showed White Maman Cochet; Mr. Conway Jones second, with Mdme. Jules Gravereaux.

In another division the Rev. R. Powley came to the front for nine tea roses, distinct, followed in order by Mr. W. Jarratt, Thorpe, and Mr. R. Foley Hobbs. Dr. Hayes, Dunster, had the best six tea roses, a good set, with Dr. Lamplough second, and Mr. A. Searle, Bassett, third.

In an extra class for six tea roses, three blooms of each, Mr. A. Hill Gray was well to the front again with Souv. de Pierre Notting, Auguste Comte, Mdme. Constance Soupert, Maman Cochet, Mdme. Jules Gravereaux, and White Maman Cochet; Rev. R. Powley second, and Mr. Conway Jones third. For six blooms of any tea rose, Mr. M. Whittle scored with Mdme. Jules Gravereaux, with Dr. Hayes second, and Mr. Whittle third.

The Rev. J. H. Pemberton, Havering, Essex, scored for a dozen bunches of decorative roses, and his bunches of Una, Mdme. Alfred Carriere, Lady White, and Lady Curzon were especially good; Mr. H. V. Machin second. Mr. A. C. Turner, Walton, led for six bunches of decorative roses, followed in order by Rev. R. Powley, and Mr. G. W. Cook.

DECORATIVE CLASSES.

Miss Hammond, Burgess Hill, led the way for a bowl of roses with a tasteful arrangement of Irish Elegance; Mr. C. Hall second, and Mrs. G. W. Cook, Whetstone, third. For a vase of roses, Mrs. Colston Hall, Warminster, scored a first, with Mrs. Carey, Stratford-sub-Castle, second; and Mrs. G. W. Cook third. Miss E. Burtt, Winterbourne, Dauntrey, led in the table decoration class with a light arrangement of Dorothy Perkins; Mrs. G. W. Cook second, with Lyon Rose; and Miss Hammond third, using the single Muriel Jamieson.

Ipswich.

In the beautiful grounds of the Upper Arboretum, the Ipswich and East of England Horticultural Society held a splendid exhibition on Thursday, July 7. One large cruciform marquee was well filled with roses, herbaceous flowers, groups, and plants; another tent was occupied by floral decorations and hosts of sweet peas; and yet another tent held a splendid display of fruits and vegetables.

CUT FLOWERS.

Cut flowers are always a strong feature at Ipswich, and this year, despite the weather, the display was well up to the average. The silver challenge cup for thirty-six roses was won by Messrs. D. Prior and Son, Colchester, in whose set Frau Karl Druschki, Liberty, Dr. Andry, Avoca, and Mrs. Laing were finely shown. Messrs. Frank Cant and Co., Colchester, were a close second, and they had a perfect bloom of the rich-hued Richmond, which secured the silver medal as the best bloom in the open classes. For a dozen trebles, a dozen teas or noisettes, six blooms of one H.P., six blooms of a T. or noisette rose, and for a dozen tea or hybrid tea roses, Messrs. D. Prior and Son secured premier awards, and in most cases were the only exhibitors. For twelve long-stemmed blooms of a H.P. rose Mr. E. W. Mowers, gardener to W. F. Paul, Esq., Ipswich, led with Frau Karl Druschki, very clean and good, with Messrs. D. Prior and Son second with larger blooms of the same variety, but less perfect in form.

In the amateurs' classes for roses the good old favourites, Frau Karl Druschki, Mrs. J. Laing, Caroline Testout, and Horace Vernet, and such moderns as Mrs. E. Mawley, Richmond, and Mildred Grant, were all very much in evidence. Mr. W. Cooke, gardener to the Rev. H. Berners, Polstead Hall, Colchester, scored for twenty-four blooms, and for twelve teas, and was second to Mr. F. Farrow, gardener to F. Corder, Esq., Ipswich, for twelve blooms, the latter showing Oscar Cordell, Caroline Testout, and Frau Karl Druschki finely; Mr. B. S. King, Rushmere, second. Mr. Corder led for six H.P.'s, one variety, with Frau Karl Druschki, and had the best (silver medal) bloom in this set. Mr. B. S. King led for six teas and six H.P.'s, distinct, but Mr. Corder was to the front again for six tea roses, and for twelve blooms, not more than two of one variety. For three vases of roses Mr. Corder was to the front with fine arrangements of big blooms, with Mr. Cook second, and Mr. Salter, gardener to Colonel Reade, Stutton Hall, third. Mr. Andrews, gardener to the Hon. W. Lowther, Campsea Ashe, was first for garden roses.

Thirty-six bunches of herbaceous flowers makes a big class, and here there were two entries; Mr. R. C. Notcutt, Woodbridge, scored, and had good liliums, yellow irises, alstroemerias, delphiniums, galega, campanulas, spiraeas, etc., well set up. Mr. C. Jacobi, Henley Road, Ipswich, second, with some fine gaillardias, delphiniums, anthemis, campanulas, etc., but with smaller bunches than Mr. Notcutt had. Mr. H. Rogers, gardener to Lord Rendlesham, Rendlesham Hall, had the best set of four varieties of carnations, three blooms of each, with Malmaison varieties. Mr. Andrews had the best set of six bunches of irises, and showed English varieties well. Twelve spikes of delphiniums formed an effective class, and here Mr. Notcutt just managed to beat Mr. Andrews, but both had splendid spikes of these useful stately flowers.

Mr. F. J. Cheesman, Barham, led for a dozen bunches of sweet peas in the open class, in face of a keen competition, and he had pink varieties conspicuously good; Mr. B. Brooks, gardener to C. K. Norman, Esq., Brantham, second. There were from six to a dozen entries in most of the sweet pea classes open to amateurs, and it was interesting to notice that such varieties as Constance Oliver, Frank Dolby, Mrs. C. W. Breadmore, Countess Spencer, Etta Dyke, and Mrs. A. Ireland were very popular and well represented. Mr. Cheeseman led for nine varieties, with Mr. S. Farrow, gardener to Mrs. Luther Holden, Rushmere, second; and Mr. G. E. Gooding, Ipswich, third. Mr. W. F. Paul scored for nine bunches of twenty spikes each, while for nine bunches of twelve spikes each Mr. Andrews just managed to beat Mr. Paul, his flowers being cleaner and fresher. Mr. E. Beaumont, gardener to Mrs. H. J. Shaw, High View, Belstead Road; and Mr. A. Hanson, Ipswich, were other leading prizewinners in classes for sweet peas.

Mr. Donald C. Warnes, Bramford, Ipswich, annexed the silver cup for eighteen bunches of hardy flowers, with Mr. R. Dow second; this is the second time Mr. Warnes has held the cup, and he was again a good first with popular border flowers and roses. The silver cup for six bunches of herbaceous flowers fell to Mr. T. Vinyard, with Mrs. Watkins, Carisbroke, Westerfield Road, a good second.

PLANTS AND GROUPS.

In the plant classes Mr. Paul scored for a specimen foliage plant with a well-coloured croton, and for a specimen flowering plant with a huge hydrangea. Mr. V. D. Colchester, Ipswich, had the best three ferns, showing beautiful plants of the maidenhair fern in the best possible condition. Mr. C. Boughey, gardener to the Rev. A. C. Johnson, Capel, scored for three hydrangeas, with large plants well furnished with large trusses of fine pink blooms. Mr. C. R. Steward, Anglesea Road, was to the front with six gloxinias, but he should not have left the cotton wool protection at the base of each flower—it spoiled the effect of his set. Mrs. W. H. Burroughes, Burlingham, Ancaster Road, had the best six tuberous begonias, but none of the entries in this class were quite up to the mark. Mr. Boughey had the best six zonal pelargoniums in a keen competition, and his neat, well-grown plants carried fine trusses of bloom; Mr. T. Vinyard second. Mr. Boughey was also first for an ivy-leaved pelargonium with a big Souv. de Charles Turner.

There were numerous group classes, but in most of the displays overcrowding was all too much in evidence. Mr. H. J. Southgate, St. Helen's Nursery, Ipswich, led in the open class with a pleasing exhibit, in which coleuses and begonias provided excellent colouring; Mr. V. D. Colchester second. Mr. W. F. Paul beat Mr. Colchester for a semicircular group of tuberous begonias, and had much the best exhibit, both culturally and artistically. Mr. S. Farrow scored in the amateurs' division for a group 9ft. by 5ft., and he had a very lightly disposed exhibit of popular greenhouse flowering plants; Mr. W. P. Burton, Ipswich, second, with a heavy-looking group. For a smaller group Mr. Paul was first, and Mr. Burton second.

FRUITS AND VEGETABLES.

Mr. W. Messenger, gardener to C. H. Berners, Esq., Woolverstone Park, was the chief prizewinner in the class for a decorated table of dessert fruit, winning with a splendid display of magnificent figs, good grapes, peaches, melon, nectarines, strawberries, etc. Mr. Andrews came second, but gained the highest points for decorations with cattleyas and francoa sprays and oleander blooms; Mr. W. F. Paul third. In the class for white grapes Mr. Messenger and Mr. Andrews were first and second respectively with Muscat of Alexandria, and they occupied similar positions for black grapes with Black Hamburgh. Mr. Messenger scored for nectarines, for peaches, for four dishes of strawberries, and for heaviest dish of strawberries.

In the vegetable classes Mr. Andrews scored in wholesale fashion, and had splendid produce all through; he was first for collections in Messrs. Sutton's, Webbs', F. Smith's, and Notcutt's classes, and led for potatoes, cauliflowers, carrots, etc. Mr. Messenger, Mr. Dow, Mr. H. Okedon, Mr. S. Farrow, Mr. C. B. Cowell, and Colonel Read were other leading prizewinners in the very fine vegetable division of the show.

NON-COMPETITIVE.

Mr. R. C. Notcutt, Woodbridge, had a pleasing array of hardy flowers and a miniature water garden. Mr. C. Buck, Ipswich, had roses and other hardy flowers, and a pool, in which ducks disported and round which irises, etc., were planted. Messrs. J. K. King and Co., Coggeshall, and Mr. W. O. Cautley, Nowton, Bury St. Edmunds, both showed sweet peas extensively, and groups of hardy flowers were contributed by Messrs. Fred Smith and Co., Woodbridge; Messrs. Abbott and Sons, Ardleigh; and Messrs. Thompson and Morgan, Ipswich.

Walsall Floral Fete.

JULY 18.

Ideal show weather ushered in the thirty-first annual floral fête of this enterprising society, which is so admirably managed by the committee and its capable secretary, Mr. W. H. Saunders. As usual, the show was held in the public arboretum, with its picturesque and spacious landscape features. The exhibition well maintained the traditions of the society.

PLANTS.

The leading feature was formed by the groups of plants arranged for effect (not to exceed a 12ft. circle). There were three groups, and the chief honours were obtained by Mr. G. V. Macdonald, gardener to Sir G. H. Kenrick, Whetstone, Edgbaston, and the artistic exhibit formed a pleasingly effective contrast to the larger one, which secured second honours at the recent show held at Wolverhampton. A very good second was Mr. W. R. Manning, Dudley, who had a well-balanced and light arrangement. Mr. W. Vause, Leamington, was placed third, with an excellent group. It may be stated that richly-hued codiæums prevailed in all three exhibits. Ferns were a refreshing feature, and the large specimens staged by Mr. S. Morris (gardener to Mrs. Brace, Walsall), and Mr. John Smith (gardener to Captain A. D. Cozens), were highly commendable, and the prizes were awarded in order of the names. Excellent also were the collections of plants for table decoration. These consisted of fine foliage plants, and Messrs. W. R. Manning, Wm. Vause, and S. Morris were the respective winners of prizes.

CUT FLOWERS.

Roses were largely and well staged, the blooms being in the main fresh and bright. In the class for forty-eight blooms Messrs. Perkins and Sons, Coventry, scored; Mr. W. H. Frettingham, Beeston, Notts, second; and Messrs. J. Townsend and Sons, Worcester, third. For twenty-four blooms the last-named firm led with a smart collection; second, Mr. W. H. Frettingham; and third, Messrs. Perkins and Sons. For twelve roses the Coventry grower was to the front with fine examples of Count Raimbaud, Florence Pemberton, Horace Vernet, Queen of Spain, Lyon Rose, Hugh Dickson, Mildred Grant, A. K. Williams, Gustave Piganeau, Her Majesty, Frau Karl Druschki, and Madame Chedane Guinoisseau. The second and third prizes were allocated to Mr. W. H. Frettingham and Messrs. Townsend and Sons, in close order. In the class for twelve blooms (not less than six varieties), open to amateurs and gentlemen's gardeners, Mr. C. F. Hurst, Streetly, Mr. H. J. Kirby, Streetly, and Mr. W. H. South, Walsall, were the highly creditable winners.

Sweet peas were numerously staged, and claimed equal admiration with roses. In the class for six varieties (25 sprays being considered an ideal vase), Mr. W. Marple, Penkridge, led with beautiful examples of Isabella Lady Stainer, a delectable white, Syeira Lee, a gem, Helen Grosvenor, Queen Victoria Spencer, John Bolton, and Elsie Herbert; second, Mr. J. R. Burd, Penkridge, with Frank Dolby, Apple Blossom Spencer, John Ingman, Evelyn Hemus, Marjorie Willis, and Helen Lewis; and Mr. H. Wakeman, Freshfield, third. There were several other exhibits more or less meritorious. Pansies and violas were most attractively set up by Messrs. W. Pemberton, Bloxwich; Mr. W. Chapman, Erdington; and Mr. A. Marshall, Leamore; and won in the order named. Dinner table decorations, arranged by ladies only, were notable, especially in the winning exhibits, for much artistic taste was displayed by the competitors. Miss F. Jenks, Codsall, won the coveted position with an exquisite arrangement of pink sweet peas and Selaginella caesia, with also a few dainty fronds of maidenhair fern. Mrs. R. Chapman, Erdington, was a close second with pink carnations and sprays of Francoa racemosa.

Mr. W. Marple, Penkridge, offered prizes for six distinct varieties of sweet peas. Mr. J. Delbridge, Penkridge, had a walk-over with fine examples of Helen Lewis (2), Mrs. C. Foster, Paradise, Elsie Herbert, John Ingman (2), Frank Dolby, Marjorie Willis, Tom Bolton (2), Mrs. Collier, and Paradise Ivory. Messrs. Robert Sydenham, Lim., Birmingham, Lim., provided prizes for nine distinct varieties of sweet peas. The first honours fell to Mr. A. H. Hickman, Kidderminster, with a grand collection, comprising Helen Lewis, Mrs. Hardcastle Sykes, Etta Dyke, Paradise Ivory, Evelyn Hemus, The King, Constance Oliver, George Herbert, and Black Knight. A close second was Mr. W. Chapman, with Sunproof Cream, Etta Dyke, Black Knight, Countess Spencer, The Marquis, Mrs. Hardcastle Sykes, as the best; third, Mr. W. Delbridge. Messrs. Bakers, Wolverhampton, also offered prizes for six distinct varieties of sweet peas; and Mr. H. Wakeman, Finchfield, scored with a fine collection; Mr. J. R. Burd, Penkridge, second, and Mr. F. T. Massey, Finchfield, third.

For the society's prizes for twenty bunches of herbaceous cut blooms Mr. W. Chapman annexed the first honours with a well arranged assortment of bright and fresh flowers; second, Mr. W. Pemberton.

VEGETABLES.

Messrs. Webb and Sons, Wordsley, provided prizes for a collection of vegetables, six distinct kinds. Mr. E. Deakin, Hay Mills, won with neat and bright cauliflowers, onions, Intermediate carrots, Duke of York potatoes, Giant Long-pod beans, and a symmetrical dish of runner beans; second, Mr. E. Stonehouse, and third, Mr. A. H. Hickman, [illegible] with good specimens. Messrs. Daniels Bros., Norwich, offered prizes for six distinct kinds, and the winners were Mr. A. H. Hickman and Mr. W. Thompson, Walsall, with good exhibits. Mr. W. Pemberton, Bloxwich, provided prizes for a collection of vegetables, six kinds, and Mr. F. Webster, Walsall, and Mr. E. Stonehouse, Hammerswick, were first and second respectively.

Amateurs' and cottagers' productions were both numerous and highly creditable.

HONORARY EXHIBITS.

Silver medals were awarded to Messrs. Ellison and Son, West Bromwich, for [illegible]; to Messrs. Jarmans Bros., Walsall, for [illegible] designs; to Mr. Foden, for a collection of herbaceous flowers; to Mr. Gough, Wednesbury, for a collection of plants. Certificates of Merit were awarded to Mr. W. Marple, Penkridge, for new sweet peas, Federation, a beautiful rose and cream coloured self with white ground, and to Evelyn Stainer, a creamy white ground and lovely shade of pink. His Sir [illegible] Stainer, a beautiful deep carmine self, the judges desired to see again. Mr. W. Marple was awarded a silver medal for a collection of about three dozen varieties of sweet peas and half-a-dozen seedling delphiniums of promise.

(Continued on page 579.)

THE FRINGED PINK.

Were it not that it suffers so greatly in our winters that it is little better than a biennial with us, Dianthus superbus would be among the general favourites in a most delightful class of plants. It possesses the great virtue of fragrance, while the charmingly fringed petals add much to its attractions to the admirer of floral grace. The colour of the blooms is a kind of rose, as a rule, although it varies, and has a tendency to approach red. The petals are cut for almost half their length, and thus the flowers have a most distinct look we do not see in any other of the genus Dianthus with which I am acquainted. It varies in height, generally being from eight inches to as much as eighteen inches high. The leaves are rather like those of a sweet william in appearance, and the flowers rise well above the foliage.

This fringed pink delights in a rather poor soil, although it will grow vigorously on a rich one. It is in the former, however, that it has any chance of proving perennial, and it is thus worth while providing it with such a position as it prefers.

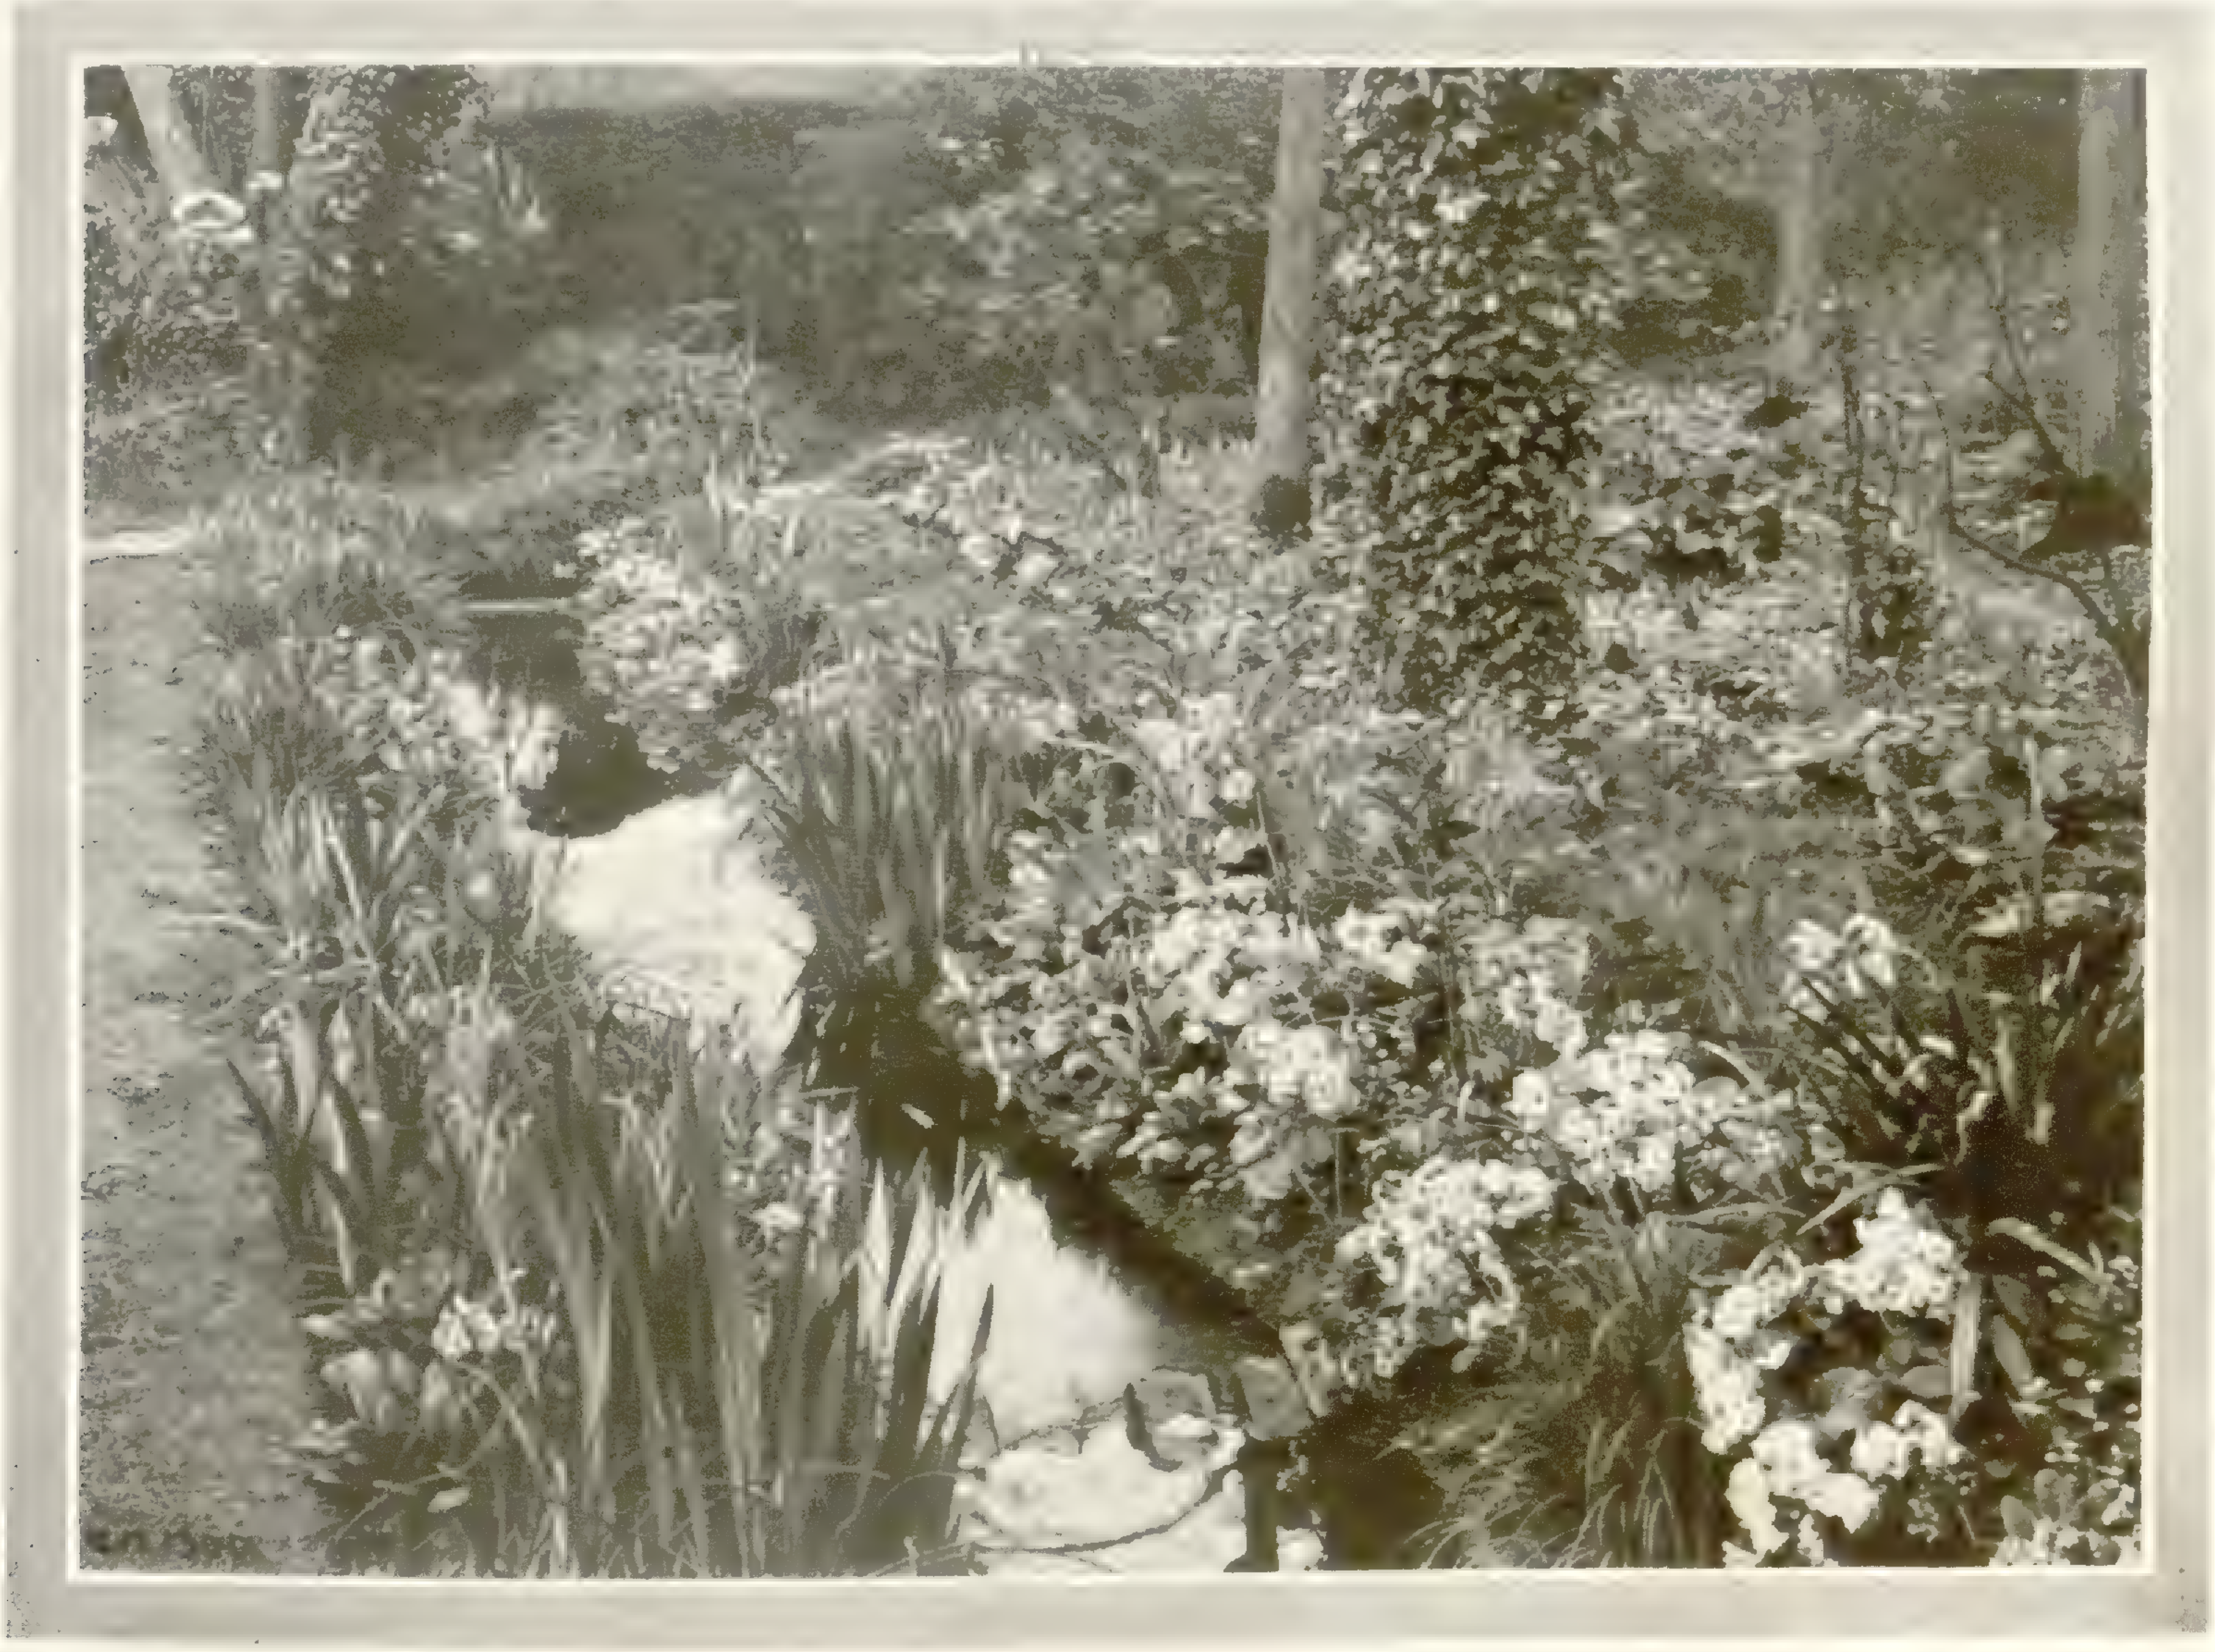
A choice position is not necessary, and a roughish part of the garden, with plenty of stones in the light soil, will give the fringed pink a better chance of remaining an occupant for two or three years.

It seeds freely, and seeds can be saved, or purchased, and sown in the open or under glass in May or June. It can be raised by putting a few seeds into the crevices of old walls with friable mortar, a little of which can be picked out and some soil put in, the seeds being placed a few together, and a little soil put on the top. Very small plants can also be put in. The short life of D. superbus is its great drawback, and this deters many from cultivating it. The late Rev. C. Wolley Dod raised hybrids between D. superbus and D. caesius, the Cheddar pink, and some of these are much more perennial in our climate than D. superbus itself. In addition to raising from seeds, which are easily procured from the seedsman or saved in one's own garden, D. superbus can be increased by cuttings or pipings, as in the case of the garden pinks. S. A.

PRIMULA OBCONICA BY THE WATERSIDE.

The great value of the varieties of Primula obconica in beautifying the conservatory and greenhouse from early in the autumn until the season of spring is well advanced is fully appreciated by the general body of horticulturists, and in a large number of gardens they occupy a prominent position among the plants grown for decorative purposes. Hitherto they have been used exclusively for the decoration of glass structures and indoor apartments, but recently attention has been directed to their suitability for enhancing the attractions of the flower garden, and a short time since an outdoor display came under our notice that proved to demonstration their adaptability for association with moisture-loving plants on the margin of water.

During the greater part of the ten years that Mr. J. Dickson has been head gardener at Woodside, Chenies, the charming seat of Adeline Duchess of Bedford, he has devoted a considerable share of his attention to the improvement of these primulas, and the success he has achieved in increasing the size of the flowers and the creation of new colours has been so great that their usefulness in the production of attractive colour effects has been materially enhanced. Not satisfied with the varied charms of the forms of Primula obconica as seen under glass, Mr. Dickson has turned his attention to their utilisation in water scenery, and employs them with good effect on the margin of a small stream that intersects the lower part of the wild garden, in which spring flowering bulbs annually constitute a surprisingly beautiful feature. Primula obconica and its varieties are not hardy, but when planted in a sheltered position, as at Woodside, they are well able to resist the effects of late spring frosts, and can be depended upon to produce a bright display of flowers from the time they are planted out until they are destroyed by severe frost in the autumn. The manner in which the plants are arranged on the banks of the stream is so clearly shown in the accompanying ilustration as to render description unnecessary. It must, however, be mentioned that the plants are put out about the middle of May, and strong examples in full bloom are invariably selected for garden adornment. As will be seen, the beautiful Primula Cashmeriana grows with great vigour, and blooms freely on the banks, as also do other primulas and polyanthuses in variety. G.



PRIMULA OBCONICA BY THE WATERSIDE

In the gardens of Woodside, Chenies, the residence of Adeline, Duchess of Bedford.

Weigela Eva Rathke.—This is now a well-known shrub, but, though it was distributed about twenty years ago, it still (as far as my experience goes) stands out as the most continuous flowering of all the varieties in cultivation. Out of doors its claret-red blossoms are borne throughout the entire summer.—W. T.

Erica cinerea.—Just now the different varieties of this erica form an exceedingly attractive feature among hardy heaths. A great point in favour of this species is that it comes into beauty after the spring-flowering kinds are past, and serves to bridge over the season until the heather develops its blossoms. In colour, the flowers of Erica cinerea vary from white to bright red.—W. T.

BELVEDERE ST. LAWRENCE, ISLE OF WIGHT.

Lord Walsingham has for many years taken the greatest interest in this garden, and has sent there numerous rare and tender plants, which he has procured from the Continent. I have visited it on several occasions, and, being in the Isle of Wight this summer, motored over to have another look at it.

Since my last visit there have been serious losses. The winter four years ago was a very severe one for that locality, 13 degrees of frost being registered, and the thermometer was down to that point for several days consecutively, while the wind was very cutting, and many of the tenderer subjects succumbed. The most serious loss was a splendid bush of the very rare Lagunaria Patersoni, from Norfolk Island. This shrub was 6ft. in height and 6ft. through, and every summer was covered with flowers. Belvedere is probably the only garden in England where this extremely scarce plant was successfully grown in the open. The echiums, of which there were quite a number in the old days, were also lost, as was a fine bush of Sparmannia africana, about 10ft. high, which flowered profusely; and many other plants perished.

However, in spite of this unfortunate experience, there are still a large number of rare and interesting plants in the garden. Watsonia Ardernei blooms finely here, as it does in other gardens in the Isle of Wight, and Hydrangea scandens was growing very strongly. There was a healthy young plant of Brachyglottis repanda, which should do well, as it flourishes to perfection in South Devon, and flowers freely. There was an extremely large and fine example of the beautiful autumn-flowering Perowskia atriplicifolia. I noticed a plant labelled Cornidia integerrima, a name that I am unable to find in the horticultural dictionaries. Drimys Winteri, 8ft. high, had just concluded its flowering, but Sophora flavescens was bearing its clusters of yellow blossoms. Purshia (Onosmodium) tridentata was studded up its stems with pale yellow flowers, and Salvia dichroa, for which this garden is famous, was commencing to perfect its flower spikes. This plant is a native of the Atlas Mountains in North Africa, whence it was introduced by Lord Walsingham. It dies down early in the autumn, and throws up new growth in October or November, which is sometimes injured by the frost. Though quite unprotected, I have never lost it, though it has died in colder districts in Devonshire. With me it exceeds 9ft. in height, and is a splendid sight when in full flower. I believe it is not in commerce. Of olearias there were a good specimen of O. macrodonta, several bushes of the uncommon O. Traversi, O. Fosteri, and O. stellulata. Fuchsia boliviana hybrida, 5ft. in height, was exceedingly pretty, with its clusters of long, drooping crimson flowers, as was the pink-blossomed Escallonia suspensa, a plant that is not mentioned in Nicholson's "Dictionary of Gardening." Shepherdia argentea was 10ft. high, and the Himalayan Hovenia dulcis, a white-flowered evergreen, was 8ft. in height.

There were great masses of Platycodon grandiflorum, and Æthionema grandiflora was a sheet of pink blossom, and there was also a large colony of Chelone (Pentstemon) barbatum, while a great group of Mertensia virginica was in full bloom. Lavatera maritima bicolor, common in the south-west, was doing well, and there was a healthy tree of Edwardsia (Sophora) microphylla 8ft. high, though it was said not to flower very freely. A curious creeper was Ephedra altissima, from Northern Africa. This is a very rampant grower, and had entirely covered with a maze of slender shoots a broken-down tree to a height of 8ft. Cytisus elongatus, unnoticed by Nicholson, was about to perfect its yellow blossoms, and Jasminum primulinum was the picture of health. Cassia floribunda appeared to be very similar to the better-known C. corymbosa, which is so largely grown in the open in Devon and Cornwall. Rehmannia angulata, which remains out all the winter, was in full flower, and very healthy, and there was a large colony of Gentiana thibetica, a herbaceous species, which dies down in the winter, and bears white flowers.

There were twelve little bushes of bouvardias, but they were badly cut down by the frost four years ago, and were not as large as at my previous visit. The sorts are the scarlet B. triphylla and the white Alfred Neuner. Veronica exaltata is a pretty variegated shrub, but Nicholson does not mention it. There were great bushes of Bowkeria Gerardiana, formerly known as B. triphylla. It is a native of South Africa, and bears a profusion of white flowers about an inch across, much resembling a calceolaria in form. It is a very rare shrub, and not in commerce, but succeeds admirably in South Devon. The Mexican Fendlera rupicola was smothered in narrow-petalled white blossoms about an inch across, and was a very pretty sight. At Belvedere it seeds freely. Stauntonia latifolia had formed an impenetrable mass over some rockwork, and Muehlenbeckia complexa had ascended a tree with a tangle of twining shoots to a height of 20ft.

There is at Belvedere a large specimen of Clematis tangutica, which has never flowered, though far smaller plants, the produce of seed procured from another source, have bloomed freely. This spring, when I was in Cornwall, I saw a very large specimen of this clematis, which its owner informed me had never flowered, so that there is evidently a shy-blooming form of it. Salpichroa rhomboidea, a native of Buenos Ayres, was a pretty climber, bearing countless small white flowers. A large colony of Brodiæa laxa in full flower made a delightful picture, and Bletia hyacinthina was blooming well, while a fine specimen of Kniphofia Northiæ was blossoming. Pancratium illyricum was evidently quite at home, as it flowers with the greatest freedom, and numbers of self-sown seedlings have sprung up around the parent plants.

Cyclamen persicum, generally a greenhouse plant, here thrives in the open on a sloping bank, and as many as 200 flowers have been produced by a single corm, while freesias, ixias, sparaxis, babianas, and tritomas are present in quantity. Cypripedium spectabile was in fine flower, and was evidently happy, while the splendid Ostrowskia magnifica was also in bloom. Curcuma angustifolia, with white flower spikes, was very attractive. This species is not alluded to by Nicholson.

Polygonum baldschuanicum had rambled for a long distance over the top of a pergola, and made a very pretty picture with its innumerable drooping flower clusters. A very fine plant of Solanum aviculare, many feet in height and diameter, was growing in front of a summer house, and was bearing its violet-purple flowers in abundance. This is a tender subject, and is often killed in the winter in South Devon. Of climbers there were present Vitis Thunbergi, which assumes gorgeous colouring in the autumn; Akebia lobata, Thladiantha dubia, a Himalayan plant remarkable for its brightly-coloured fruit; Bignonia Tweediana, growing over a summer house; Actinidia chinensis that had made shoots over 15ft. in length; Ramondia Nathaliæ was flowering well; and Androsace lanuginosa was a sheet of bloom; great clumps of Agapanthus umbellatus were the picture of health, and were commencing to throw up numerous flower spikes; and Erythrina crista-galli and Jaborosa integrifolia were evidently at home, and the rare Incarvillea compacta was flourishing.

Among the other shrubs noticed were Daphniphyllum glaucescens, Osteomeles anthyllidifolia, Cestrum elegans, Jamesia americana, with white corymbs of flower; Mallotus japonicus, just coming into bloom; Calophaca Woolgarica, Diervilla Eva Rathke, Tricuspidaria lanceolata, Deutzia kalmiæflora, the most beautiful of all the deutzias; Potentilla fruticosa, 5ft., with yellow flowers; Correa viridis, Nandina domestica, Carpenteria californica, Lagerstrœmia indica, 7ft. in height; Xanthoceras sorbifolia, 12ft.; Halesia tetraptera, 16ft.; Diospyrus cordata, Cassia corymbosa, Leonotis leonurus, Sutherlandia frutescens, Callistemon salignus, Clianthus puniceus, Distylium racemosum, just coming into flower; Clerodendron trichotomum Feijoa Sellowiana, and Parrotia jacquemontiana, which bears yellow flowers.

There was also a bed of seven good bushes of Citrus trifoliata, which should be handsome if they bloom well. Mesembryanthemums were a gorgeous sight, and there was a splendid collection of succulents planted in the crannies and fissures of the natural rock, which crops out in the garden. Among these were noted Opuntia salmiana, O. humilis, O. Rafinesqui, O. arborescens, O. xanthostema rosea, O. glauca, Agave Victoria Regina, Cereus peruvianus, C. flagelliformis, Mammillaria centricirrha, M. missouriensis, Echinopsis Zuccariniana, E. Eyriesi, Gasteria verrucosa, and numbers of other plants of the same section, many of which were in flower. There were large masses of Campanula punctata, a plant that is rare in gardens, and the pretty white Gazania nivea longiflora was an interesting plant. In the pond in front of the house, in which the best of Marliac's water lilies are grown, was Crinum aquaticum, which bears pink flowers, and Thalia dealbata. On a wall near the pond was a good plant of Cantua dependens, which often flowers well. On the house were climbing Clematis Nellie Moser, Clematis The Gem, blue; Ceanothus Veitchi, Jasminum primulinum, Ampelopsis sempervirens, which died down last year, and is now about 7ft. in height again; Bignonia grandiflora, and white Banksian rose.

Mandevilla suaveolens had reached to the eaves of the house, and was very strong, but last year, from some unexplained cause, it died down to the roots and is now breaking again from the base. Other plants in this portion of the garden were Romneya Coulteri, Dianella nemorosa, throwing up flower spikes over 2ft. in height, bearing lavender-blue flowers, Plectranthus fruticosus, and Andromeda japonica. The most ornamental of the climbers on the house at the time of my visit was undoubtedly Actinidia arguta, not mentioned by Nicholson, which had grown to the eaves of the house, and was covered with countless clusters of white flowers with black-tipped stamens.

Wyndham Fitzherbert.

NOTES FROM HERE AND THERE.

A strong characteristic of the rosarian is his intense enthusiasm, and the man who is in a position to grow hundreds of plants displays it to a marked degree when he is preparing his blooms for exhibition in July, but not one bit more so than the humble cottager, who, with his three dozen plants to cut from, brings all his skill as a grower and exhibitor to bear in order that he may board his modest dozen blooms at his own particular show. Tell it not in Gath, but it was on a Sunday evening recently that I spent a delightful hour in the garden of a cottager rose grower who was preparing for a show in the following week, and was fearful lest he should not be able to get a dozen blooms in the varieties asked for. How he bemoaned the fact that his best Mrs. W. J. Grant was just over, and with what concern did he bend over a promising-looking Druschki flower, and tie up the petals with a bit of soft wool! We went on from one plant to another, considering the prospects of this and that bloom for the show, wondering whether one would be over, and another not open enough, and the reward for all the preparation and dead earnestness of the man was, at the most, a seven and sixpenny prize. But there was the honour, I must not forget that, and the intense desire of the grower to beat a workmate of his who is also a keen rosarian. The initial expense was little, for the man had budded most of his roses with his own hands, his shades were primitive and home-made, and by force of necessity everything had been done with a view to economy, but no exhibitor in a class for seventy-two could display more zeal and whole-souled interest in the cult of the rose.

———

Speaking of roses, how the varieties of the rambling type have come to the front in the past few years, and, go where you will, you see attempts at pergolas clustered over with these charming members of the rose family. What you see at such shows as the Temple and Holland Park one year you get in gardens the years following, and as I write the gardens of cottagers and amateurs round about are aglow with Crimson Ramblers and Dorothy Perkins. These roses, by the way, have dropped out of Temple Show company merely through the fact that they are commonplace, and their places are taken by newer introductions, such as Excelsa, White Dorothy, Coquina, Debutante, Milky Way, and Minnehaha, but it does not take long for roses to be distributed, and it is surprising how quickly this is done even while the varieties are in the novelty stage, and the plants are at novelty price. I do not think that the popularity of other sections has declined one bit as a result of the advance of the ramblers, but it simply means that one more item has been added, and by the addition the interest in roses has increased. The rambling roses appeal to all, for they are beautiful in the extreme, and they grow for the most part in a delightfully luxuriant manner, in which one sees Nature as she appears in wild creation. Therefore I think the interest in this section must advance rather than decline.

———

"Have you a Japanese garden yet" "No; but I hope to have one soon." This little dialogue recently passed between two ladies who are noted for always being in the fashion where gardening is concerned, and I am reminded by it that Japanese gardening is the latest craze. Probably it has been increased by the examples of Japanese art in gardening that are on view at the Japan-British Exhibition; but I am wondering whether we have anything to gain by introducing Japanese ideas into English gardens. In Japan the Japanese style is correctly in keeping with the country, and the tastes of the people, but I wonder how many of the visitors to the Temple and Holland Park Shows were impressed with the specimens of Japanese gardens displayed, except in the sense that they were novelties, and pretty. I have seen several miniature Japanese gardens, with their pools, bridges, pigmy trees, stone lanterns, and the rest, and I have thought what wonderful fellows these Japanese must be, and then I have compared their creations with some old English gardens I know, where nothing is cramped and limited, and I have concluded that, whatever may be right for Japan, there is nothing for England like an English garden. In the way of ornament some may admire a stone lantern, but it flavours of the East, and for an English garden I should much prefer the disused stones from an old cider mill, such as are usefully employed with pleasing effect in many an old-world garden in the West of England.

———

In reading the leader on experiments in fruit culture which appeared in a recent issue of the Gardeners' Magazine, I note that at Woburn the experiments have proved that unpruned trees have given the best results, while those severely pruned are the least satisfactory. This information is useful to the market grower, who, by the way, has learnt that severe pruning is by no means profitable, but I am afraid it does not help the private gardener much, because he is bound by the laws of necessity to be a severe pruner. He has a kitchen garden, where he has to grow a supply of vegetables for household use, and by right of custom the vegetable quarters are surrounded by bush and pyramid trees, which are expected to produce their annual contribution to the fruit room. What is the gardener to do? While the trees are small there is nothing to trouble about, and he can withhold his pruning knife, but as they grow bigger he sees them encroach further and further on to the vegetable ground, and there is no help for it: they must be kept back. I will admit that the kitchen garden method of fruit culture is cramped and unnatural, so far as the pruning goes, and the trees, encouraged by the manure given to the vegetables, make rank growth, and ask as plainly as trees can, let me grow, and I will bear more fruit, but the gardener is a victim of circumstances, and for the sake of the cook and the kitchen he has to deny them. I contend that the gardener who succeeds by judicious root pruning and summer pruning in getting average crops of fruit, and keeping the trees within the limits of the space alloted to them, should be complimented on his skill as a fruit grower, and not be criticised because force of circumstances compel him to be a hard pruner. I see mistakes sometimes when the gardener keeps the head of the tree back by pruning severely but lets the roots have full play, and the result is that he grows wood that is more suitable for flower stakes than for producing fruit; but there are many skilful gardeners who know how to hold the balance even, and they do what is expected of them—grow fruit and vegetables as well on a limited space. If every gardener were provided with a kitchen garden in which to grow his vegetables, and a plantation or orchard for his apples and pears, he could then withhold his pruning knife, and allow his trees to grow more freely and naturally, but as things are he must remain a pruner of the more severe order, and do the best he can.

H.

THE VICTORIA PLUM.

This is undoubtedly the most popular plum of the present day, alike with the amateur and the market gardener, and, taking it all round, it is the most useful plum of its season. If one has space for only one plum tree one would not go far wrong in planting this. In 1907, that remarkable plum year, a grower told me he sold plums at £5 a ton, but as soon as the Victoria season was over he was able to get 10s. a bushel nearly £20 a ton. It is lacking in flavour except when grown under the best conditions, as on a wall, and allowed to hang until it is thoroughly ripened. It is then juicy and sweet. An important point in its cultivation is the thinning, which should never be omitted, as the fruit is of poor quality otherwise, while the tree may be exhausted for one, or perhaps two, seasons afterwards.

The Victoria succeeds in any form of tree, but it is a plum with a character, with considerable individuality. One of its peculiar traits is its liability, in some soils and situations, to the loss of whole branches by gumming. This loss may be reduced to a minimum by doing the final pruning as soon as the fruit is picked, instead of cutting the tree when the leaves are off. If such pruning as is necessary is done in mid-September there is a month or more for the wounds to heal up by the bark growing slightly over the cut edge. Another peculiarity of the tree is that of making very strong shoots, not necessarily from all parts of it, but sometimes only one or two on the tree. If these are allowed to run their full length they become very brittle, and if they ever bear a heavy crop of fruit they will probably break with the weight of it. This can be avoided by pinching out the points of these gross shoots as soon as they are noticed, and so preserving a balanced growth. This is a better way than letting the shoots grow their full length and then cutting them back late in the autumn, as they attain too great a strength, but either way is better than leaving the shoots till the winter, for shortening then is very likely to induce gumming. With trees which have been in full bearing a few years some recommend the thinning of the fruit spurs. This is easily done with dwarf trees, but less easily with standards, though it would pay even better with the latter in the increased size and improved quality of the fruit, with reduced loss from broken branches.

The Victoria is one of those famous varieties of fruits we owe to chance, for it was found growing in a garden at Alderton, in Sussex. It was first called Sharpe's Emperor, and was afterwards sent out by a nurseryman named Denyer, at Brixton, at a high price, as a new variety, in the middle of the last century. Alger Petts.

Mushrooms.—The late beds inside have been very fine indeed for the time of year. This is attributed chiefly to the external conditons which in this part have been invariably wet, with the exception of a dry week during June. It is wise to always spawn a bed inside during May, and thus be independent of the beds that are made up outside. These latter are the better if fresh material is placed over them, removing entirely that which has become decayed; at the same time, look closely for slugs.—G. Ellwood.

HYPERICUMS.

The numerous species of hypericums flower late in summer and early in autumn, and seeing that the majority of shrubs bloom at an earlier period, their brilliant colouring is very welcome. In common with many other families of plants very considerable diversity is found both as regards habit, size, and growth, and, further, they are widely distributed geographically, being found in Europe, Asia, Northern Africa, and North America. Almost without exception they are impatient of root disturbance, but established plants, groups, or colonies can be maintained in rude health over a long term of years by judicious thinning and pruning, together with enrichment of the soil with manure each winter, or season.

The hypericums are not adapted for very hot and dry positions, and seldom appear happy so placed, while, on the other hand, they are found to grow vigorously in partial shade.

Propagation is a very simple matter, as a stock can be raised either from seeds, layers, or cuttings. The seeds germinate readily when sown in pans, and placed in an unheated frame in spring. The seedlings, when large enough, should be planted in nursery beds in the reserve plot. Cuttings may be inserted early in the autumn, preferably in a bed of sandy soil made up in an unheated frame, and with the following spring they will start away very freely, and speedily grow into bushy little specimens. Layering can be carried out at any time, and I would advise that the selected growths be slightly notched at the point where they are pegged down, and held in position.

The following will form an excellent selection: H. densiflorum, which attains a height of about two feet, and has rich golden flowers. H. Androsæmum is a European species, and as seen planted in colonies of from six to a dozen plants is very effective. It bears large heads of yellow flowers, and the fruits are black when ripe. H. Hookerianum is worthy of notice, and perhaps may be regarded as one of the most desirable. It is a native of the Himalayas, and attains a height of four feet; the brightly coloured flowers are about two inches in diameter. H. Moserianum is free in growth, and possesses a continuous blooming habit, the display being maintained from midsummer until the autumn; the flowers are rich yellow. H. aureum is rendered very attractive by the fact that the lemon-coloured flowers possess rich golden stamens. It is of medium growth, and is seen at its best in September. The same applies to H. hircinum, a native of Southern Europe. H. Kalmianum is practically evergreen, or at least the foliage is retained until spring in the West of England. It is a native of North America, and rarely exceeds two feet in height. H. elatum, from the Canary Islands, forms a handsome specimen, and should be represented in every garden. H. Buckleyi, which is a capital plant for carpeting large tufts, is very showy upon the rockery. This is not intended as an exhaustive list, but it represents the best for garden decoration.

Walter H. Aggett.

CATTLEYA MENDELI STUART LOW.

A remarkably fine form of this handsome species. The flowers are pure white except that the throat of the lip is soft yellow. F.C.C., R.H.S., July 5. Messrs. Stuart Low and Co.

SOME GOOD ROSES FOR THE GARDEN.

Papa Gontier is not a new rose, it is an old one, but certainly not grown so extensively as it deserves to be. For many years I grew it in a corner facing north-east where, it seemed to me, there was always a cold current of air passing, even on hot summer days. The rose in question grew freely and flowered profusely; in their bud stage the blooms were long, pointed, and of exquisite colour. The foliage was ample, large, glossy, and never bore traces of mildew. For such bleak positions I can strongly recommend this variety, as it will thrive in an almost pure clay medium.

Comtesse de Nadaillac is generally recommended for exhibition only, but I have found it an excellent garden rose, and, moreover, very good for walls. I grew it in a cold north border, and trained the branches to a wall about 6ft. high, and the plants did remarkably well. The variety Madame de Watteville was similarly grown, and with equal success. Young shoots grew readily from the base of the plants, and the flowers borne on these were, in regard to both varieties, very richly coloured.

G. Nabonnand can scarcely be surpassed as a true garden rose. Its long, pointed buds, opening pale flesh colour with centres, are exquisite. The bushes are growing, and bear flowers from June October.

G. B.

NEW PLANTS, ETC.

◆

NEW ROSE EDWARD MAWLEY.

A large deep crimson hybrid tea rose, raised by Messrs. S. McGredy and Son, and exhibited by them at the National Rose Society's Show, July 8, when it was awarded a Gold Medal.

CATTLEYA MENDELI STUART LOW.

A fine form of this handsome species. The flowers are large, waxy in texture, and pure white with golden throat. F.C.C., R.H.S., July 6. Messrs. Stuart Low and Co., Bush Hill Park Nurseries, Enfield.

ROSES.

Edward Mawley, H.T.—A remarkably distinct and effective variety; the blooms of full size, with large petals, the colour deep crimson. Gold medal, National Rose Society, July 8. Messrs. S. McGredy and Son, Portadown.

Mrs. Joseph H. Welche, H.T.—A distinct variety, the flowers large, and of good depth, the colour rich rose-pink. G.M., N.R.S., July 8. Messrs. S. McGredy and Son.

Lady Hillingdon, H.T. — A beautiful variety that will be found a useful addition to the roses of special value for the supply of cut flowers; the blooms are of medium size, and a deep yellow colour. G.M., N.R.S., July 8. Messrs. Lowe and Shawyer, Uxbridge.

Evelyn Dauncey, H.T.—A pleasing variety, the blooms of average size, and of good form, the colour rich salmon-pink. Silver-gilt medal, N.R.S., July 8. Messrs. S. McGredy and Son.

Mrs. George Shawyer, H.T.—A promising variety, the flowers of good form, and a pleasing rose-pink hue. S.G.M., N.R.S., July 8. Messrs. Lowe and Shawyer.

St. Helena, H.T.—A beautiful variety, the blooms large in size, full, and of fine form, the colour soft yellow, with deeper centre. S.G.M., N.R.S., July 8. Messrs. B. R. Cant and Sons, Colchester.

Mrs. Foley Hobbs, H.T.—A beautiful variety, the flowers large, of good depth, and superb form; the colour ivory white. S.G.M., N.R.S., July 8. Messrs. Alex. Dickson and Sons, Newtownards.

Mrs. Cornwallis West, H.T.—A distinct and beautiful variety; the blooms large, very full, of great depth, and finely formed, white, highly fragrant. G.M., N.R.S., July 13. Messrs. Alex. Dickson and Sons.

Mabel Drew, H.T.—An exquisitely beautiful variety, the blooms large and of fine form; the colour sulphur-yellow. G.M., N.R.S., July 13. Messrs. Alex. Dickson and Sons.

Arthur E. Coxhead, H.T.—A beautiful variety, the blooms of good size, with very broad petals, the colour deep rose-red. G.M., N.R.S., July 13. Messrs. S. McGredy and Son.

Mrs. Amy Hammond, H.T.—A distinct and beautiful variety; the blooms large and of superb form; the colour rich cream tinted with flesh-pink. G.M., N.R.S., July 13. Messrs. S. McGredy and Son.

Earl of Gosford, H.T.—A fine variety; the flowers large and of good form, the colour crimson with scarlet shading. S.G.M., N.R.S., July 13. Messrs. S. McGredy and Son.

Mrs. T. W. Massey, H.T.—A very pretty single rose of a pleasing shade of sulphur-yellow, reminding one in form of Irish Elegance. Card of Commendation, N.R.S., July 13. Messrs. S. Bide and Sons, Farnham.

Rescue, H.T.—A single variety with large rose-pink flowers having a yellow centre. C.C., N.R.S., July 13. Mr. J. Mattock.

NOTES ON SOME GARDEN PESTS.

Celery Fly.

This pest makes itself specially obnoxious in many gardens, and in some years does much damage. The fly lays its eggs on the leaves any time from June to September, and when the eggs hatch out the little grubs burrow into the leaves and feed upon their internal substance, leaving only the skin or cuticle remaining. It is a troublesome pest sometimes, and when the maggot is once in the leaf, of course, no syringing is of any avail. If the plants are carefully looked over every week or so the grubs may be killed by pinching the part of the leaf in which a grub is resident without destroying the leaf. This will keep it at bay if it is noticed in time, but the better way is to prevent the fly laying its eggs, which is fairly easy in a long spell of dry weather, but impossible in wet. If the plants are syringed with a weak solution of paraffin and soft soap it will prevent the flies laying their eggs, and the same result may be accomplished by keeping the plants dusted with soot. When celery has been badly affected the surface soil should be buried deeply after the plants are taken up, as the chrysalis passes the winter in the soil.

Slugs

are some of the commonest pests on damp soils, though in many gardens on light soils they are scarcely ever seen. There is no royal road to success in getting rid of them. They seem to disappear in a dry spring or summer, and then when a damp time comes they multiply so quickly as to regain their wonted numbers in a very short time. They have a very decided liking for beer, and there is no better trap for them than small heaps of bran steeped in it, while brewers' grains are only less excellent. Dusting the ground with freshly-slaked lime on a damp morning will destroy many of those too small to pick off, though a second application is necessary to destroy the larger ones. Soot is an effectual barrier so long as no rain comes, though it needs using with care; while in dry weather a loose surface is scarcely less so. Good traps may also be made of many materials—lettuce or cabbage leaves, pieces of tile, inverted pans, slices of potato, etc.

The same remarks apply in part to snails, though for such big things the best remedy is hand-picking, especially with the aid of a lantern after dusk. Where stone fruit is grown on walls careful search should be made under the leaves occasionally, the apricots being their special favourite. In some gardens

Wood Lice

(alias sow bugs) are greater pests than the foregoing, greater, perhaps, than many are conscious of, as they seldom work by daylight. Nothing in the vegetable world seems to come amiss to them, as they will gnaw away the collar of a plant—its most vital part—or attack a peach just against the stalk a week or so before it is fully ripe, causing it to fall prematurely. Tidiness in a garden is a check upon their increase, and toads are very fond of them, but the most effective way is to set traps and regularly examine them. Inverted flower pots with a little hay in the bottom, hollowed out pieces of potato or carrot, pieces of tile or rotten board, are suggestions of what may be done in this direction. I recently caught 128 wood lice in a flower pot at one time. When caught they are rather fugitive things to step upon, and a vessel of boiling water is more convenient.

Earwigs

are often regarded as greater enemies than wood lice, their work being in similar directions, though perhaps florists' flowers are their special prey. Where flowers are attacked nothing is more effectual than inverted flower pots containing a little hay supported by the flower sticks to which the plants are tied, while in the case of wall fruit trees there is nothing so good as the hollow stems of broad beans cut into six-inch lengths, and fixed between the branches of the fruit trees and the wall. Both of these traps must, of course, be attended to, though not necessarily every day.

The above are some of the pests of most general occurrence with which I have had to contend in my own garden. But they are not by any means all. There is the

Asparagus Beetle,

the larvæ of which eat up the feathery foliage during the summer, and so weaken the plants for the next season. They may be kept at bay, if not exterminated, by spraying with a solution of paraffin emulsion of soft soap, and by drawing away the surface soil with a hoe in the autumn and burying it.

Apple Blossom Weevil.

We see birds pecking away at the apple blossom in the spring, and hear people remark upon the damage they are doing, whereas really they are picking out those weevils which, by the time the blossom is open, have eaten away or damaged the essential part of the flower. This is a very troublesome pest to combat, and here I can only give a general recommendation to keep the place tidy and the stems and branches of the trees clean.

Wireworms.

Wireworms must be mentioned, as so many are troubled with them, especially in gardens recently made out of meadow turf. The best way is to trap them with pieces of carrot, potato, or rape cake, especially the latter. The traps should be slightly under the surface of the soil, with a skewer stuck through each piece to show where it is. The perfect form of the wireworm, of which there are several species, is the click beetle or skip-jack.

Pear Midge.

This must be mentioned, as it is such a worrying thing to those who have it. You think you have a good crop of pears set on a given tree, but when they reach the size of medium gooseberries they fall off, and when you examine them you find them black inside, with little grubs in the decaying tissue. These bury themselves in the surface soil, and remain there till next year. The best thing is to clear up the dropped pears at this season every day, or even twice a day, and if the surface can be scraped off in the autumn and buried so much the better. A good dressing of kainit at the time the grubs are falling to the ground is effective, as it kills any that come into contact with it. But it may kill the grass too, or seriously damage it, as kainit contains a good deal of salt. ALGER PETTS.

BULBS.—A practical treatise on the cultivation of hardy, hothouse and greenhouse bulbous and tuberous rooted plants is "BULBS AND THEIR CULTIVATION," by T. W. Sanders, price 2s. 6d. net, or by post 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

SWEET PEA WEEK.

Notwithstanding the crowded hours of horticultural life during the early part of July the sweet pea enthusiasts made their arrangements so that in addition to the splendid two-days' exhibition at the Royal Horticultural Hall, Westminster, and a dinner and talk on Tuesday evening, they had two full days among the growing sweet peas out in the country. The show was a great success floriculturally, and we understand that the takings at the doors were sufficient to rather more than balance the increased expenditure of a two-day display.

Over fifty members started from Waterloo by the 9.20 a.m. train to Woking on Thursday, July 14, to pay a visit to the Society's trials of sweeet peas held this year under Mr. Charles Foster's direction at the Times Experimental Station, Sutton Green, Guildford. A heavy mist hung over London and gave promise of a fine day, a promise that was amply fulfilled an hour or two later, for the sun shone gloriously, and the weather was delightful. At Woking Station numerous members from other directions joined the party, and seventy-two proceeded by brakes to Sutton Green, four miles away, and a few others travelled by cycle or motor.

Mr. and Mrs. C. Foster met us at Sutton Green, and at once we proceeded to inspect the trials, after relieving the hon. secretary of a goodly number of "Trials Lists." Everyone had many good words to say for the conduct of the trials, and it was an agreeable surprise to find the plants so well grown and the flowers so fine and numerous, especially as the site was a clover field last year. It was evident that Mr. Foster had worked hard to secure such excellent results. There were 242 rows in the novelty trials, and a further 163 rows in the purity trials, making a total of 312 rows of sweet peas that exhaled a delightful fragrance which mingled with the scent of new-mown hay from the park beyond and the honeyed sweetness of the lime-tree blossoms.

After an examination of the trials one thing forcibly borne in upon the minds of all of us was the vast improvement in fixity that has taken place during the last three years. Raisers must not run away with the idea that there is practically no room for improvement—far from it, there is room for a great deal of improvement yet, and that improvement is absolutely necessary if the faith of the public in the reasonable stability of sweet pea stocks is to return. The Guildford trials also show that a very high percentage of fixity can be secured, and the public will soon find out the firms that maintain a high standard in this respect. However, there were plenty of "mixed" rows, both in the novelty and the purity trials, and a great joke of the day was that a trial of "mixtures" was mixed! In other words, an American stock of a supposedly fine mixture of Spencer varieties contained a considerable percentage of grandiflora or unwaved flowers. A French firm's stocks of fairly popular varieties were also badly mixed, and yet these were, we understand, only grown one year in France, from English stocks, before being sent to Guildford. But the sweet pea cult has not begun yet in France, though since the Comte d'Estienne and M. Vilmorin were both at the show, and visited the trials, we may expect a good beginning shortly.

Sterling Stent was somewhat of a disappointment to most of us in the trials, not that it was mixed or lacked colour, but because it was not a strong grower. What we want is a sweet pea the same colour as Sterling Stent, with the size of bloom and vigour of growth and constitution seen in Helen Lewis and John Ingman. The varieties that gained awards at the hands of the Floral Committee were good, but there were other varieties that appealed as strongly to the party of enthusiasts. Everyone appeared to be struck with the beauty of Ruby, one of Mr. Aldersey's seedlings, with brilliant orange shading and large flowers. It evidently needs shading, but is of good Spencer form, and a fine grower. Iris, from Mr. C. W. Breadmore, pink, with a beautiful orange-salmon flush was another good thing, and Mr. Bolton's red-maroon seedling was very generally admired, as it has good distinct colouring and big bold blooms. Mr. Bolton's Afterglow is a fine new blue-lavender, and there was only one rogue in the row. Other flowers that attracted attention were Lady Rose, Charles Foster, Mrs. W. J. Unwin, Uncle Sam, Helen Grosvenor, Mrs. George Charles, and Red Star.

Luncheon was served in a tent close to the sports ground, and the rest and refreshment were thoroughly enjoyed. Mr. C. Foster presided, and welcomed everyone in the name of Lord and Lady Northcliffe. Mr. N. N. Sherwood voiced the sentiments of all present in a few well-chosen words when moving the thanks of the society to Lord and Lady Northcliffe for permission to hold the trials at Sutton Green, and for their generous hospitality. To Mr. and Mrs. Foster heartiest thanks were also accorded. After lunch we strolled round the gardens of Sutton Place and enjoyed the beauties of the rose, rock, water, and lily gardens, the herbaceous borders, and the grand old trees in the gardens and park. A welcome cup of tea followed, and then our numbers were gradually reduced until about forty-five (about half the total) were left when Waterloo was reached at 6.50. It was a great day.

On Friday morning, in anticipation of another fine day, thirty-four sweet pea enthusiasts took tickets for Kelvedon and Mark's Tey, but others joined the early train on its way, and some met the party at Kelvedon, where brakes were waiting to convey us to Messrs. Hurst and Sons' trial grounds. We have seen the trial grounds of this firm on many occasions, but never have the sweet pea trials been finer there than this year, while the wonderfully extensive trials of culinary peas and of a large series of flowers and vegetables proved very interesting. Here sweet peas are grown only to test the purity and fixity of the stocks, being grown elsewhere for seed, and no special culture had been given, but the rows were well filled, and the hundreds of thousands of dainty blooms made a charming picture. It was very interesting to find so many one-time favourites here, varieties that have long since departed from the gardens of those who are keen growers, indeed, lots of these old varieties were quite unknown to many of the party, for many of the enthusiasts are new recruits to Flora's army.

Through the fields we walked to Prested Hall, where Mr. N. N. Sherwood, the society's president, is making for himself a very delightful garden. In a tent beyond he had provided luncheon to which we all showed the fullest appreciation. Mr. C. W. Breadmore tendered the thanks of the company in graceful fashion, and we all heartily joined in drinking to the health of the President, Mr. N. N. Sherwood, and the Treasurer, Mr. Edward Sherwood, both of whom responded. As ladies accompanied the parties in larger numbers than in previous years, "The Ladies" was given by the President, and acknowledged by the Hon. Secretary.

The time table of the day was rigidly adhered to, and soon we were on the way to Messrs. Dobbie and Co.'s grounds at Mark's Tey, and here the five acres of sweet peas, to say nothing of a long avenue of clumps of sweet peas, were a revelation of skilful culture. The purity or fixity of the stocks being grown for seed was remarkable, and it was obvious that in the great majority of cases scarcely a plant had been removed. Here we saw Syeira Lee in full beauty, and Mrs. Hugh Dickson in grand form, and Nubian, Sunproof Crimson, Clara Curtis, a variety practically identical with Cherry Ripe, the true John Ingman, Masterpiece, Mrs. Andrew Ireland, Mrs. C. W. Breadmore, Edrom Beauty, Elsie Herbert, Earl Spencer, Mrs. Hardcastle Sykes, and many another variety filled us with delight and envy. Mr. W. Cuthbertson smiled at our enthusiasm, and even his able henchman, Mr. Andrew Ireland, admitted that the sweet peas were "no so bad." There was one outstanding novelty among the host of seedlings, and it is a bold, beautiful flower, of excellent waved form, cream ground, with delicate red flaking at the base and centre of the standard. In colour, shape, and pose it was delightful, and everyone regarded it as a fine new break.

We could have stayed here for hours, but the time table was enforced, and the hon. secretary inexorable, and so we went into the great barn to tea, and, after Mr. Edward Sherwood had thanked Mr. and Miss Cuthbertson for their kindness and hospitality, we proceeded to Mark's Tey Station, and thence dispersed to our various homes—Scotland, Belfast, Chester, Winchester, Birmingham, Bangor, Colwyn Bay, Southampton, etc., etc.—all tired but very satisfied with the "outings," and promising to meet again under equally auspicious circumstances in 1911, if the fates are kind.

Charles H. Curtis.

VIEW OF THE NATIONAL SWEET PEA SOCIETY'S TRIALS
At the Times Experimental Station, Sutton Green, near Guildford.

Cocos Weddelliana as a Room Plant.—This elegant palm is often regarded as delicate, but in reality it will succeed quite as well in the dwelling house as most of the others. The roots are not at all vigorous, hence it must not be overpotted—indeed, this caution applies to palms in general. It should also not be allowed to stand in stagnant water, while shading from the sun is also essential.—W. T.

Pentstemons and Antirrhinums are making a bold show this season, and many exceptionally beautiful shades of colour are now to be found among these. Planted in bold clumps, either in beds or on the shrubbery borders, they are equally fine, and it is not to be wondered at that these are fast taking a prominent position in the flower garden during the summer months. The removal of the centre flower spike—when the flowers are beginning to fade—will cause the side growths to develop rapidly, which, in their turn, will give a good display of colour later in the season. Many of the dwarfer kinds of antirrhinum are exceedingly useful as bedders pure and simple, admirably taking the place of geraniums and other less hardy flowers, especially if grown in distinct colours, as can now be done either by cuttings or from seeds.—W. H. Warren, Aston Clinton Gardens.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

SELENIPEDIUMS.—This section of the so-called slipper plants are often included in gardens with cypripediums, from which they differ in having three-celled ovaries. The species are natives of the mountainous parts of South America. They are, in most cases, very interesting, and include some of the most beautiful of the lady's slippers. The hybrids that have been produced by the intercrossing of the different species are decided acquisitions. They are robust growers, and where they are provided with suitable accommodation they grow very quickly, and soon make large specimens. They require a warm intermediate house, but they will grow satisfactorily in the ordinary stove, under the same conditions as that usually provided for a collection of stove plants. I consider the conditions of a stove too warm, and would recommend a somewhat lower temperature, as their growth is then less rapid and they flower more freely. The whole of this section are what may be termed "out of fashion." I do not think it is from the want of appreciation, but more because the plants are such vigorous growers that they would soon require more space than can really be afforded. With the exception of one or two of the rarer species, they are plentiful in cultivation, and procurable for a modest outlay. Their potting requirements are the same as that usually given to cypripediums. The best time to attend to repotting is when the new roots make their appearance at the base of the newly-developing growth, plants being in a more or less active state throughout the year. They require liberal root moisture at all seasons, and a fairly moist atmosphere. The best species include S. caricunum, one of the smallest, but I think one of the most beautiful of the genus. It has a curious habit of growth; the narrow leaves spring in tufts from stout, creeping rhizomes, and quickly form into a close dense mass. It does not like being disturbed for repotting purposes, and I consider it is never so satisfactory as when the roots have become potbound. A plant will thrive in the same pot for a long time if care is taken annually to remove all decaying material and matter from the surface, and replace with fresh compost. S. caudatum and the white variety S. c. Wallisi are undoubtedly the finest members of the genus, and where they can now be induced to grow satisfactorily they are always subjects for admiration. The species is now seldom imported, and the plants have become scarce in cultivation. S. Lindleyanum is a robust growing species with quaint green and brown-purple marked flowers. It does best in a hot humid atmosphere. S. longifolium is a free-growing species, well worthy of consideration; the best varieties are S. l. Hincksianum and S. l. Roezli. The latter has always struck me as being a distinct species, but they have become so mixed up of late years that it is difficult to procure the original form. S. Schlimi and its variety, S. S. alba, are two of the most wonderful little plants we have. The pretty rose-tinted, ball-like flowers of the type are always admired. It is not over plentiful, and is not so frequently seen as formerly. The species is of dwarf stature, and does best in the intermediate house. It is from this miniature species that we have derived, by cross-fertilisation, the whole of what is termed the S. Sedeni family, including S. cardinalis, S. albo-purpureum, S. Cleola, S. leucorrhedum, S. Schroderæ, etc., all of which are so well known that they need no recommendation from me. In most cases these possess a robust constitution, and are suitable subjects for amateurs. The hybrids from S. caudatum, such as S. Dominianum, S. grande, S. nitidissimum, etc., are all worthy of consideration, and are easily procured.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

PELARGONIUMS.—The show and fancy will have ripened their wood and should now be pruned. The current year's growth of the show varieties should be cut rather hard back; but the fancy varieties should be less severely pruned. In each case the shape of the plant must be taken into consideration when pruning. After the plants are pruned and cleaned, place them in a cool frame till they start into growth; subsequently give more room; ventilate freely, and syringe overhead morning and evening. For the present water sparingly.

WINTER FLOWERING CARNATIONS.—Plants that were raised from layers some time ago will be ready for potting off, 2½-inch pots being the most suitable. When the plants are about six inches high, pinch out the points to induce them to produce side growths. When the pots are full of roots shift into 5-inch ones, and grow them in a cool house or frame. Strong plants for flowering early will derive benefit from supplies of weak liquid manure. Give attention to staking and tying the shoots, as when these become bent they do not readily recover.

MALMAISON CARNATIONS.—These and other summer flowering carnations should be layered immediately they go out of bloom to ensure strong plants for flowering next season. The best method is to turn the plants out of their pots and replant in frames. Only those in a healthy condition should be used for propagating purposes. If necessary, the foliage should be thoroughly cleaned. In preparing the layers care should be taken not to make the cut too long, about one inch being sufficient. When the layering is finished give the soil a good watering, and close the frame, the latter being kept somewhat close and the soil moist until the layers are rooted and ready to be severed from the parent plant, then give air freely.

CYCLAMENS.—If last season's plants have been kept with a view to their blooming in winter, they should now be turned out of their pots, and the greater part of the old material shaken from about the roots. Repot the corms at once, using clean pots of moderate size. After they have been potted they should be placed in an unheated frame near the glass. Syringe them overhead every morning and evening, but do not ventilate or give much water till growth has recommenced. The surroundings must be kept moist or red spider will put in an appearance.

CINERARIAS will now require a shift into larger pots, using leaf-soil, good fibrous loam, and sand, with some soot added. Avoid large pots, and grow in small ones, and keep well supplied with liquid manure. These will be found much handier for decorative purposes. Those newly potted should be grown in a cool frame, giving a little shade when the sun is strong, and syringe twice daily.

FREESIAS.—Bulbs that were grown last year must now be shaken from the soil and the largest bulbs be repotted, using 4½ or 5 inch pots. When potted, place in a shaded corner till about the end of August, when they can be given frame shelter.

ZONAL PELARGONIUMS for winter flowering should have attention as to pinching the points out to induce them to become bushy. When the pots are filled with roots apply liquid manure, and avoid allowing them to become dry; as when they become dry and remain so for any length of time the lower leaves suffer.—W. Staward, Belford Hall Gardens.

THE FLOWER GARDEN.

VIOLETS intended for winter flowering should receive unremitting attention for several weeks to come. Most of the plants are now making rapid growth, and producing runners in abundance, but these, if allowed to remain, will exhaust the parent plants, consequently their removal is important. The plants should be examined several times, and the surface of the beds kept stirred with the hoe; the recent heavy rainfall has, up to the present, kept red spider in check, but in case of a spell of hot weather, a sharp outlook must be kept for this pest. Occasional syringings overhead with one of the many approved insecticides will aid in keeping the plants in health. Liquid manure given at their present stage of growth will also keep the plants growing vigorously, and mature the crowns, which is highly essential.

WALLFLOWERS intended for spring bedding—if not already done—should be transplanted without delay. After they have become established they should, if inclined to be straggling in growth, have the points removed. This will keep them dwarf and of a more pronounced bushy habit, which for bedding purposes is absolutely necessary.

ERYTHRINA CRISTA-GALLI (Coral Plant) is an exceedingly useful and attractive plant for plunging in the borders, or as a specimen on the lawn. In sheltered and suitable positions it will withstand an ordinary English winter out of doors. Its large, brilliant scarlet flowers are very effective and lasting. It is of very easy cultivation, and if grown from seed will, with good treatment, bloom during the second or third season, usually in July and August. Ordinary greenhouse treatment will grow erythrinas to perfection. After flowering the plants should be stood out of doors in the full sun to ripen the crowns, after which the growths—which are semi-herbaceous—may be cut down to the woody crown, and the plants dry stored during the winter months, and restarted again in the spring.

GENERAL REMARKS.—As most of the subjects used in the flower garden have reached their maximum condition, it will be well to make notes of the general arrangements, so that errors may be rectified for another season. Roses should be examined now and again for the purpose of removing bad or decaying flowers, and the shortening back of abnormally long growths. All climbers should receive constant attention, releasing all twisted growths, and carefully securing these.—W. Hedley Warren, Aston Clinton Gardens, Tring.

HARDY FRUITS.

STRAWBERRIES.—Preparations should now—if not already done—be made for the planting of new beds in a few weeks hence; the ground should be trenched at least two feet deep at once. This will allow the soil to well settle down before the plants are set out early in September. As the work of trenching proceeds a liberal dressing of well-decayed farmyard manure should be added. If the soil is of a light sandy composition cow manure should be used, but in dealing with heavy, retentive soils use one-half rotten stable manure and one-half road scrapings and burnt garden refuse. Old beds that are to be retained for fruiting next season should be trimmed up, removing all runners and decayed leaves. At the same time give the soil a deep hoeing between the rows. Any plantations that are not required for next season should—as soon as the fruit is gathered—be dug up and burnt. Autumnal-fruiting varieties should be given copious supplies of water during this month and next, and clean straw should be laid around the plants. As soon as the fruits have formed frequent applications of weak liquid manure will be beneficial to accelerate the swelling. All runners should be pinched off as soon as they make their appearance, unless required for the propagation of plants for new beds.

GENERAL WORK.—Nets should be placed over Morello cherries to protect the fruit from birds. Continue to tie in the growths of all fruit trees grown on walls. These should be thinly dispersed to allow plenty of light and air to ripen the fruit and mature the wood. Strict attention should be paid to the giving of water to the roots of all wall trees if required. Keep in check insect pests by vigorously syringing the trees with clean water every afternoon. Sweet varieties of cherries which have had their fruits gathered should be thoroughly syringed with some approved insecticide to cleanse the wood and foliage of insect pests. In gathering fruit for preserving be careful to see that it is quite dry or the preserves will not keep. Nets that are not required for further protection of fruit should be rolled up when dry, with a label attached stating their length and width, and placed safely away in a dry shed or loft. Continue to summer prune apple and pear trees. In some cases it will be found that secondary shoots have developed; these should be cut back to one leaf. All trees that are carrying heavy crops should receive plenty of liquid manure, and at the same time give the final thinning to all trees that are carrying a superabundance of fruit. The scions on all newly-grafted trees will be growing away freely now; these should be examined, and, if required, should receive support with small stakes. Loosen all ties as the swelling of the stock and scions renders necessary. Examine raspberry plantations, and remove—by pulling them up—all superfluous growths that are not required to produce fruiting canes for next season. The budding of all kinds of fruit trees should now be taken in hand; where any of this work is undertaken patience must be exercised to ascertain whether or not the buds are in a fit state and the stocks in a proper condition to be operated upon.—Henry R. Farmer, Cardiff Castle Gardens.

Potato Sutton's Ringleader.—Potatoes have a value no other vegetable can boast of; their use extends to every section of society, and their season covers the entire year. Consequently the potato question is one of the gardener's "hardiest perennials." It is scarcely possible to produce new potatoes too early in the year, so that wherever facilities exist, forwarding of the crop in frames, or in pots under glass, should be liberally practised; while a warm, sheltered border in the open should always be reserved for the earliest outdoor produce. Among potatoes claiming recognition as the earliest, I find none to equal Sutton's "Ringleader," as from a comparative trial in the open during the past two years this variety has outclassed its competitors. From tubers planted on March 16 potatoes were ready for lifting on June 15, tubers weighing from 2½ to 3 ounces being produced in some twelve weeks. Sutton's "Ringleader" is a white-fleshed kidney potato, of moderate vigour as regards the haulm; the tubers are of excellent flavour, and the yield is high.—Thomas Smith.

NORTHAMPTON MUNICIPAL HORTICULTURAL & ORNITHOLOGICAL SOCIETY.

GRAND EXHIBITION OF
FLOWERS, FRUITS, VEGETABLES,
BEES, BIRDS, POULTRY, and RABBITS.
AUGUST 3rd and 4th, 1910,
At
ABINGTON PARK, NORTHAMPTON.

Entries Close July 27th.

Schedules on application to the Secretary,
JAS. B. PALMER.
56, Cyril Street, Northampton.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

(*Concluded from page 570.*)

◆

Gloucester.

JULY 12.

Delightful weather attended the twenty-second exhibition of roses held on the above date in the Spa Field, which proved a floral triumph, for, in addition to the Queen of Flowers competitions, there was even a keener competition in the several classes set apart for the multitudinous colours and development of the odorous sweet pea, fully 13,000 spikes having been arranged in some 700 vases, which filled a double staging 200 feet long in the centre of a monster marquee.

ROSES.

Of these, there was a decrease of entries in the amateur division, but in the trade class fully 1,000 specimen blooms were in competition, in boxes. In the big class, for four dozen single trusses, Messrs. Alex. Dickson and Sons, Newtownards, secured the champion award for a noble display, the back row blooms being massive and of perfect form, particularly noticeable being Mildred Grant, Dr. A. D. Browne, Marie Baumann, Lady Barham, F. K. Druschki, Mrs. T. Roosevelt, Her Majesty, Duchesse de Morny, Ulrich Brunner, Mrs. J. Laing, Hugh Dickson, Madame Hausmann, Mamie, Duchess of Portland, Horace Vernet, Princess Marie Mertschersky, Mrs. C. C. Harrison, Princess Marie (new), and Conway Jones, a new rich crimson. The second prize was awarded to the King's Acre Nursery Company, Hereford, whose collection included some fine blooms of Alfred Colomb, Gustave Piganeau, Mrs. E. Mawley, Earl of Dufferin, Ernest Metz, Gladys Harkness, Lyon Rose, Cynthia, Althea, and Dr. A. D. Browne. The Headington roses received the third award, Mr. J. Mattock's best being Earl of Warwick, M. Grant, J. B. Clark, Lohengrin, Mons. J. Hill, Ben Cant, Countess of Caledon, and Duke of Teck. For thirty-six singles, five competed, Mr. H. Drew, Longworth, Berks, staging the premier collection, which included fresh, full size blooms of La France, F. Michelon, H. Vernet, Papa Lambert, Duchess of Portland, Mrs. J. W. Grant, Countess of Annesley, and Dean Hole. The second prize was awarded for a balanced set of the Cotswold roses from Messrs. J. Jefferies and Son, Cirencester. Mr. W. H. Frettingham, Beeston, Notts, third.

The class for eighteen trebles was a full one, there being six competitors, Messrs. Alex. Dickson and Sons were first, and their blooms were excellent in both size and colour; very fine were the blooms of Mrs. John Bateman, Ulrich Brunner, Caroline Testout, C. J. Grahame, Lady Ashtown, Her Majesty, Duchess of Portland, Prince Arthur, and Mrs. John Laing; the King's Acre Nursery Company second, and Mr. J. Mattock third; Messrs. Jefferies and Son and Mr. W. H. Frettingham receiving special mention. For eighteen teas, there were half-a-dozen good boxes, Messrs. Alex. Dickson and Sons leading, having specially good blooms of Princess Mary (new), Eric (new), Mad. Vermorel, Mad. Cusin, and Muriel Grahame; Mr. H. Drew, second; Mr. J. Mattock third. For a dozen trebles, Messrs. A. Dickson and Sons and Mr. H. Drew shared the awards. For twelve dark roses, one variety, six boxes were staged, Messrs. Alex. Dickson and Sons were first with Horace Vernet; Mr. J. Mattock second with J. B. Clarke; and Mr. H. Drew third with Avoca. For twelve blooms of a light rose, nine boxes were staged, Messrs. Alex. Dickson and Sons and King's Acre Nursery Company having Mildred Grant, and Mr. A. Middlecote, Upton, St. Leonards, Frau Karl Druschki.

In the open amateurs' section, Mr. Conway Jones, Hucclecote, led in the classes for eighteen singles, eight triplets, twelve teas, and six treble teas (in vases); his blooms were generally finely developed; he had particularly good flowers of Dean Hole (premier bloom in the section, and awarded the N.R.S. silver medal), Countess of Caledon, F. K. Druschki, Mamie, Mad. J. Gravereaux, Mrs. J. Laing, Duchess of Portland, Lady Ashtown, Hugh Dickson, Ulrich Brunner, Mrs. T. Roosevelt, Dr. Felix Guyon, Mrs. E. Mawley, Molly S. Crawford, the two Cochets, and Auguste Comte; Mr. G. R. Bonnor, Barnwood, was second in the above classes, and first for nine teas. The twelve bouquets of garden roses formed a fine feature, Messrs. Fuller and Maylam, Cheltenham, Mr. W. H. Frettingham, and Messrs. J. Jefferies and Sons sharing the awards in the open division.

SWEET PEAS.

These appeared to overpower the roses, having the advantage of tiers in contrast to the flat surface of the side stages. Twenty-four classes were arranged, and each and all were admirably filled, and the best known varieties in white, crimson, scarlet, rose, carmine, yellow, buff, blue, blush, pink, cream, lavender, mauve, magenta, and maroon were represented. For twenty-four varieties, Mr. W. J. Thorpe, Hucclecote, secured the premier award for a grand collection, comprising the following varieties, viz., Zarina, Geo. Stark, Nora Unwin, Helio Paradise, The Marquis, Paradise, Lucy Hemus, Elsie Herbert, George Herbert, Queen Victoria Spencer, Prince Asturias, Ivory Paradise, Paradise Constance Oliver, Mr. Townsend, Othello Spencer, Paradise Beauty, Paradise Apple Blossom, Helen Lewis, Zephyr, and Mrs. C. W. Breadmore. For twelve vases, there were eleven exhibits, the first prize and silver medal going to W. Meath Baker, Esq., Hasfield Court (Mr. J. Aplin, gardener); for six varieties, to G. N. Walker, Esq., Woolten House; and for three, to A. V. Wright, Esq., Gloucester.

In the local classes for nine varieties, the premier award was secured by Sir H. Parry, Bart., Highnam Court; while for six there were ten exhibitors, Thos. Thorpe, Esq., Trocester, leading. In the class for a dozen vases (Messrs. Jefferies and Sons' prizes), W. Gordon Canning, Hartpury, was first in a good competition. In the single variety classes nearly one hundred vases were staged, and the first cards went to—white, Mrs. Sankey Spencer; yellow or buff, Paradise Beauty; blush or pink, Countess Spencer; orange, Helen Lewis; rose or carmine, Paradise Carmine; scarlet or crimson, The King; maroon, Bronze Paradise; lavender, Mrs. Chas. Foster; blue, Zephyr; picotee-edged, Elsie Herbert; and fancy, Mrs. A. Ireland. In the open amateur class for twelve varieties (Mr. R. Sydenham's prizes), the first prize was awarded to Mr. G. R. Bonnor; Mr. F. A. Mayo, Mitcheldean, leading for six vases. The tables arranged with sweet peas, etc., were very pretty, the cards going to Miss L. A. Nicholas, Miss E. E. Riddle, and Mrs. Harold Clark.

CARNATIONS.

There were three displays of carnations, arranged on a given space, Mr. A. Prentice, gardener to W. Gordon Canning, securing the premier award for a compact lot of flowers, very largely Malmaison; Messrs. J. Jefferies and Sons were second with an arrangement on light stands; Mr. A. Statham, gardener to Colin MacIver, Esq., Blaisdon Hall, third.

NON-COMPETITIVE.

Messrs. Wheeler and Sons, Gloucester, had a most effective pyramidal trophy of sweet peas on tiers and margined with cut roses; Messrs. A. G. Winfield and Sons, fifty vases of sweet peas; and Messrs. Young and Co., a collection of carnations, as extras; Messrs. Jefferies and Sons also arranged another display of carnations, etc., on bamboo stands.

Edgware Rose and Sweet Pea Show.

JULY 16.

Under highly favourable climatic conditions, the Edgware Horticultural Society held its annual exhibition of roses, sweet peas, and other products of the garden in the grounds of North Lodge, the residence of R. Thorne, Esq., and this was so great a success that all concerned with the management had good cause to be satisfied with the results. Excellent as was the exhibition last year, that of Saturday last was a marked advance, more especially in the case of roses and sweet peas, which constituted the two leading features. The five challenge cups that were offered in the classes for these flowers were keenly contested, and the whole of the collections staged were more or less good, many being of quite exceptional excellence.

SWEET PEAS.

There were five classes for sweet peas, and as the flowers had expanded in dry and moderately warm weather, and under the influence of subdued sunlight, they were remarkable for the splendid development of their colours, and for their freedom from markings, which are usually such serious defects in flowers that open in showery weather. There was a strong competition in the great class, open to nurserymen only, for twenty-four bunches, distinct, and at the head of the competitors was Mr. C. W. Breadmore, of Winchester, who was awarded the silver challenge cup and the cash prize offered as the premier award. The collection was one of the finest he has yet staged, and prominent among the varieties represented were Marjorie Linzee, Ivy Herbert, Senator Spencer, Dazzler—an effective variety with scarlet flowers, Mrs. H. Sykes, Mrs. R. Hallam, King Alfonso—a crimson variety that is said to bear the full exposure to brilliant sunlight without injury, Marquise, Earl Spencer, Mrs. A. Ireland, and Freda, pure white. Mr. W. J. Unwin was a capital second with a collection of much merit, the flowers being large, fresh, and bright. Messrs. E. W. King, Coggeshall, was third with flowers evincing cultural skill of a high order. The most important of the several classes open to amateurs only was that for twelve bunches, distinct, in which the Blair Challenge Cup was offered as the first prize. There was a considerable number of collections in competition, and the coveted award was made in favour of Mr. H. K. Judd, Glenberrie, Edgware, who had George Stark Improved, Evelyn Hemus, Prince of Asturias, Helen Lewis, Marquis, and Constance at their best; Mr. W. Fowler had a remarkably good collection for second place, the flowers a trifle under full size, but very clean and bright in colour; Mr. R. Blair, Hermitage, Edgware, was third, with flowers that were rather small, but of excellent colour, and tastefully set up. Mr. C. Wainright, the president, had admirably grown flowers, but they lost points in arrangement. For twelve bunches and nine bunches, in each case distinct, Mr. H. K. Judd obtained premier honours with flowers of excellent quality; Mr. Judd was first also in the class for a display of sweet peas; he had flowers of high quality, but overcrowded. The second prize collection was plainly yet tastefully arranged, but the flowers were of medium size. Two collections were disqualified in this class. The schedule stipulated that there should not be more than one vase of any one variety, and in striving after artistic effect, the exhibitors put two or more varieties in several vases, and thereby brought about duplication, and its consequent result. The cottage gardeners and allotment holders also exhibited these fragrant flowers largely and well. Mr. C. W. Breadmore exhibited a large and attractive collection not for competition.

ROSES.

These were not less satisfactory than were the sweet peas, for the entries were numerous, and the competitors included a considerable proportion of amateur and professional rosarians who usually occupy conspicuous positions on the prize lists of the National Rose Society. Five or six competitors contended for the prizes in the trade class for thirty-six roses, distinct, and the premier award was made in favour of Messrs. R. Harkness and Co., Hitchin, who had a stand of splendidly developed blooms, those of Dean Hole, Horace Vernet, and Exposition de Brie, being among the best; Messrs. B. Cant and Sons, Colchester, were second with excellent blooms, among which we noticed Marie Baumann in a high state of development; Messrs. F. Cant and Co., Colchester, followed closely for third place with blooms of good quality. In competition for the prizes for twelve teas, Messrs. B. Cant and Son occupied the post of honour with a highly meritorious stand, in which were exceptionally fine blooms of Mrs. Dudley Cross, Maman Cochet, Madame Jules Gravereaux, and Mrs. E. Mawley; Messrs. F. Cant and Co. and Messrs. D. Prior and Son showed well for second and third places.

The principal class for amateurs without restriction as to their place of residence was that for twenty-four roses, and in this there was a spirited contest. Here Mr. E. B. Lindsell, Bearton, Hitchin, scored, and won for the second time the Edgware Challenge Cup, staging, as is his wont, blooms distinguished by their large size and high finish. The varieties represented by especially good blooms included Mrs. Stewart Clark, Dupuy Jamain, Madame Melanie Soupert, Duchess of Bedford, Mrs. E. Mawley, Hugh Dickson, Her Majesty, and Frau Karl Druschki. Mr. G. Speight, Market Harborough, staged a meritorious box for second place. The same exhibitors were first and second also for twelve teas, both staging well for the relative positions.

Garden roses were splendidly shown, and in the trade class for twelve bunches Messrs. F. Cant and Co. were first with an exceptionally fine collection, in which the brilliant Ecarlate, the fine striped Rosa Mundi, the single pink Lady Curzon, and the pink rambler Debutante, were conspicuous; Lady Gay and Minnehaha and Rosette de Legion du Honneur were also well represented. Messrs. W. and J. Brown, Peterborough, were a good second, and Messrs. Harkness third. In the amateurs' class for six bunches, Mr. G. W. Cook, Miss B. Langton, and Mr. H. R. Darlington were the prize takers in the order of their names, all staging collections of a high order of merit.

At the head of the several exhibitors in the amateur class for twelve roses, open only to growers with less than 1,000 plants, was Mr. G. W. Cook, Radstock, Whetstone, who had finely developed blooms of The Lyon, Princess M. Mertchersky, a beautiful rose of the palest pink hue, Mrs. T. Roosevelt, Madame Paul Olivier, a deep, well-formed flower of good depth, and other varieties; Mr. A. C. Turner, Walton-on-Thames, was a good second, and Miss B. Langton followed closely for third place. In the classes for amateurs resident in the society's district there was a spirited competition. For twelve blooms, Mr. J. Hart, Potters Bar, and Mr. H. R. Darlington were first and second, both staging well; Mr. Hart had Hugh Dickson very fine, and in Mr. Darlington's stand was a splendidly finished bloom of Avoca. The successful competitors in other classes in this section were: Miss B. Langton, Mr. W. Fowler, Mr. J. Pavey, Mr. G. W. Cook, Mr. H. R. Darlington, Mr. H. K. Judd, and Mr. A. Merck. In the classes for bowls and baskets of roses, Miss B. Langton, Mrs. Howard Williams, and Mr. H. K. Judd were the most successful of the competitors. Mr. E. J. Hicks, Twyford, had a remarkably fine collection of roses, in which The Lyon was conspicuous, and roses not for competition were also shown by Messrs. W. Cutbush and Son, Highgate, and Messrs. Brown, of Peterborough.

Several classes were provided for vegetables, and the most important of these was for ten kinds, in which Mr. D. Dumbelton and Mr. C. Wainright were first and second with produce of a remarkably high quality. There were also numerous classes for cut flowers other than roses and sweet peas, and for plants, and we regret that space will not permit of their being referred to in detail.

Norfolk and Norwich Rose Show.

This fixture was held on Thursday, July 7, in the beautiful grounds of Carrow Abbey and Carrow House, Norwich, by kind permission of the Right Hon. James Stuart and the Misses Colman. Unfortunately from the time of opening until the close the weather was about as bad as it could be, rain falling more or less the whole time, with a chilly wind. As a result also of many days of heavy rain and hail, trade growers of roses could not send their blooms, and Mr. H. Morse, Eaton, Norwich, was the only nurseryman to make a display. He had some very good blooms of the newer kinds, including a large quantity of The Lyon, and these came in for much admiration. The medal for the best bloom was secured by Mr. T. Notley, gardener to E. G. Buxton, Esq., Catton, with a superb Frau Karl Druschki. The Rev. J. A. L. Fellowes won the challenge cup for the best thirty-six blooms, distinct, and also another challenge cup for twenty-four blooms grown by an amateur. Mr. R. Balls, gardener to Miss Penrice, Witton, gained first for twelve blooms, one variety, with fine examples of that good old variety La France. Garden or cluster roses were poorly represented. Sweet peas were a great feature; these seemed to have come through the weather much better than the roses. A keen contest was witnessed for the challenge cup presented by Messrs. Daniels Brothers, Lim., Norwich, for the best twenty-four bunches, distinct. Mr. T. Notley, last year's winner, again secured it. His blooms were massive, with extra stout long stems, and the arrangement was carried out to the best advantage.

Mr. Lewis Smith, gardener to Robert Fellowes, Esq., Shotesham Park, Norfolk, made a beautiful display of forty-eight bunches of distinct herbaceous flowers. He had some very choice subjects in the group, and they were arranged and set up as well as one could wish. This was considered the best exhibit in the show, and as such it received the silver-gilt medal of the R.H.S. Mr. Smith also secured first position with exotic flowers, his orchids, gloriosa, and other subjects being greatly admired. Mr. Quin, gardener to Lord Stafford, Cossey Hall, was a large exhibitor and prizewinner in the sweet pea classes, and he had also in the fruit section the best single bunch of black grapes.

Mr. W. Chettleburgh, gardener to Colonel Rous, Worstead, Norfolk, had some fine herbaceous flowers, especially deserving of notice being Chrysanthemum maximum Queen Alexandra. He was also the recipient of many prizes in the fruit and vegetable sections, special mention being due to his peaches and nectarines. Mr. W. Hilsdon, gardener to Sir Frederick Adair, Bart., Flixton Hall, Suffolk, won first place for thirty-six bunches hardy flowers, the colours of his early gladioli were very intense. Mr. Hilsdon had the best collection of fruit, grapes, figs, and peaches, his group being especially well finished. Mr. William Allan, Gunton Park Gardens, was in his best form in the carnation sections, his blooms of St. Cecilia being superb examples. He also exhibited several dishes of the Gunton-raised strawberries, and these were in every class winners of prizes.

Vegetables were well represented; the best collection came from Captain Jickling, Catfield Hall. Tomatoes and salads were well shown by Mr. William Laws, gardener to G. E. White, Esq., Eaton, Norwich. The best peas were staged by Mr. Wilby, gardener to F. A. Bainbridge, Esq., Hethersett. Lettuces were abundant, and had evidently profited by the wet weather. Onions, cauliflowers, turnips, and beans were all well shown.

The trade growers made some interesting displays. Messrs. Daniels Brothers, Lim., Norwich, made a fine feature of sweet peas. They also had a good array of carnations and roses, and a varied collection of greenhouse subjects in pots. Messrs. G. Stark and Son, Ryburgh, exhibited a fine collection of sweet peas; Messrs. Cutbush and Son, Highgate, N., contributed a display of herbaceous flowers and aquatic plants; Mr. G. W. Miller, Wisbech, made a pretty show of orchids; and Mr. Robert Holmes, Tuckswood Farm, Norwich, demonstrated the characteristics of the new loganberry, Phenomenal, from America. He exhibited sprays as cut from the plant, and these were covered with ripe fruits.

Finchley Horticultural Society.

The annual exhibition of this admirably-managed society attracted some five or six thousand visitors, who could not well have been otherwise than fully satisfied with the fine display of the products of the garden that had been provided for their entertainment. In addition to the flower show they had the privilege of free access to the beautiful gardens of the Manor House, the residence of A. W. Gamage, Esq., president of the society, and with an excellent display of fireworks with which the day's proceedings were brought to a close.

ROSES AND SWEET PEAS.

These fragrant and attractively-coloured flowers formed two distinct and remarkably fine features, for both classes were shown in large numbers, and in exceptionally good condition. There was a very spirited competition in the class for twelve roses, and Mr. E. R. Smith, Milford Lodge, Muswell Hill, occupied the premier position with splendidly-developed blooms, those of Mrs. Theodore Roosevelt, Duchess of Bedford, Melanie Soupert, Dr. Andry, and Frau Karl Druschki being especially noteworthy. Miss B. Langton, Raymead, Hendon, followed closely for second place with blooms of much merit. Mr. E. R. Smith was first also for twenty-four with grand blooms, and Mr. H. Whitnell, who occupied the second, had an exceptionally good stand, in which Marie Baumann, and Francois Michelon were seen at their best. Miss B. Langton had the best six teas and noisettes, and for six blooms Mr. E. R. Smith and Mr. H. A. Tubbs, Fairview, Torrington Park, were the most successful exhibitors. For six blooms of one variety Mr. J. Turk, Fairlawn, Totteridge, was first with La France, and Miss B. Langton and Mr. H. Whitnell were second and third with the popular Frau Karl Druschki.

The arrangements of roses were especially good. For a vase of rambler roses Mr. W. B. Tubbs scored with the brilliantly-coloured Crimson Rambler, and Mrs. Howard Williams obtained second place with Blush Rambler. In competition for the prizes for a bowl of roses Mrs. Howard Williams proved to demonstration the possibility of arranging roses of exhibition quality in an artistic manner. The bowl contained twenty-[illegible] blooms, and every one of them would have rendered good service on an exhibition board. Mr. W. B. Tubbs, who was second also had good blooms, tastefully arranged. In the vase class Mrs. Howard Williams had a beautiful arrangement of Killarney. For five blooms staged in a vase, Mr. J. Turk and Mr. E. R. Smith were first and second and for four trebles the prizes were shared by Miss B. Langton, and Mr. A. Laxton, Friern Park, Barnet.

Sweet peas had more liberal encouragement on this occasion than in the previous year, and the result was increased competition, and a very fine display. The most important of the numerous classes was that for twenty vases, distinct varieties, and the premier award was a magnificent challenge shield, of the value of twenty-five guineas, presented by the president. The competition was spirited, and in the result the winner of the shield was Mr. Hopkins, gardener to F. A. Wellesley, Esq., Woking, who on this occasion surpassed his previous efforts with one of the finest collections that has yet been exhibited. The flowers were of the largest size, finely-coloured, and without a blemish, and the stalks were of a great length, but not unduly stout. The varieties included George Stark, Marie Corelli, Florence Wright, Princess Juliana, Mrs. C. W. Breadmore, Constance Oliver, John Ingman, America Spencer, Mrs. Hugh Dickson, Elsie Herbert, Earl Spencer, and Etta Dyke. Mr. C. R. Lewis, Friern Park, Barnet, was second with an attractive set. In competition for the prizes for eighteen varieties Mr. W. B. Tubbs, Mr. T. Aley, and Mr. P. Highatt were the prizetakers in the order of their names, all staging well. There was a very strong competition in the class for nine varieties, the entries being numerous, and the quality high throughout. Mr. J. Turk was a capital first, his blooms being of large size and tastefully arranged. Mr. W. B. Tubbs and Mr. J. F. Catesby, Woodside Park, who were second and third, also staged excellent collections. In a second class for nine bunches Mr. E. P. Cooper, Muswell Hill, obtained premier honours.

PLANTS.

Ample provisions were made for plants available for exhibition at this season of the year, and the large marquee devoted to them was rich in interest and attractions. The outstanding feature of this section of the show was formed by the fuchsias, which are seldom shown round London in so high a state of development. In the group class Mr. Aley scored with an arrangement in which the plants were of high quality, and tastefully disposed. Mr. Grace, Finchley, and Mr. Gosling were the most successful exhibitors of gloxinias. Mr. Edginton, Field House, North Finchley, and Mr. Finch, Hampstead, had the finest fuchsias. Mr. J. Salter scored for hydrangeas. Mr. J. Turk and Mr. Aley had the best table plants, Mr. Finch was first for six stove and greenhouse plants with a fine set. Mr. W. Bryern had petunias of grand quality. Ferns were particularly good, as shown by Mr. J. Turk and Mr. Finch, who were first for four and six respectively. Mr. Gregory staged richly-coloured caladiums and finely-developed celosias. Mr. Gosling and Mr. G. W. Earp were very strong in the class for six begonias, and Mr. Touch contributed the winning collection of six orchids.

FRUIT AND VEGETABLES.

Fruit was not over plentiful, but that staged evinced cultural skill of a high order. For black grapes Mr. Gregory and Mr. J. Turk were first and second respectively, and in the corresponding class for white grapes Mr. Salter obtained premier honours, and Mr. Gregory was second. Mr. Gregory had the best peaches, and the finest strawberries were those from Mr. H. Saunders. In one of the two classes for collections of vegetables Mr. Laxton and Mr. Edginton were first and second, and in the other Mr. Aley and Mr. Gosling occupied the corresponding positions. The best salad was that shown by Mr. Salter. In competition for Messrs. Sutton and Sons' prizes for a collection of vegetables Mr. Edginton occupied the first place, and Mr. H. Saunders was second.

Cardiff, JULY 20.

Held, as usual, in the Sophia Gardens—than which there are few finer places for a show, the Cardiff Society was fortunate in securing a larger number of entries than in the year 1909, when it came of age. In the matter of trade displays the show fell rather below the standard of last year, but in all the competitive classes a higher excellence was obtained. Groups, hardy flowers, roses, sweet peas, table decorations, and vegetables were finely shown, and the cottagers' and children's exhibits were of great interest and large extent.

GROUPS AND PLANTS.

Messrs. J. Cypher and Sons, Cheltenham, secured the premier award for a group of plants arranged on a space of 100 square feet, culture and artistic arrangement being all taken into consideration. The Messrs. Cypher had a fine central palm, and they scored heavily with their highly-coloured crotons and liliums, while Humea elegans and Cocos Weddelliana added the needful elegance. Second prize fell to Mr. W. E. Pierce, gardener to Henry Oakley, Esq., Caldicot, whose crotons, Kalanchoe flammea, and liliums were used to full advantage. Mr. D. Macintyre, gardener to Lady Hill, Rookwood, was placed third for a light and pretty group, but the central arch of plants was not satisfactorily finished.

In the smaller group class Mr. W. Horne, gardener to Major-General Lee, Dinas Powis, led with a bright but rather solid mound of crotons, Clerodendron fallax, statice, and Francoa ramosa; Mr. G. Hill, gardener to F. L. Morgan, Esq., Llandaff, was a good second; and Mr. A. Brown was third.

Mr. A. Brown, gardener to the exors. of the late Hainwell, Esq., Grove House, led for three specimen ferns with a large gymnogramma, Davallia bullata, and Microlepia hirta cristata; Mr. J. W. Jones, gardener to Lady Morel, The Lindens, Penarth, second; and Mr. Collier, gardener to A. Parsons, Esq., The Elms, Cardiff, third. Mr. W. L. Melhuish, Clive Road, Cardiff, scored for half a dozen pelargoniums, with low, neatly-trained and freely-flowered examples, each about a yard across.

Some wonderfully fine fuchsias were shown, great tall pyramids, but they were not yet in full bloom; Mr. Macintyre led for six specimens, with Mr. Chas. Garrett, Llewellyn Street, second, and Mr. G. Nurse, Wellington Street, Cardiff, third.

ROSES.

There were five collections of roses, arranged with their own foliage on a space of 9ft. by 4ft. 6in., and here Mr. George Prince, Longworth, was awarded the first prize for a fine exhibit, in which Pharisaer, White Maman Cochet, Viscountess Folkestone, Lyon Rose, Mdme. Abel Chatenay, Souv. de Stella Gray, and Crimson Rambler were very much to the fore. The King's Acre Nursery Company, Hereford, came a capital second.

Messrs. J. Jefferies and Son, Cirencester, came to the front in the class for a dozen trebles of roses, and won with fine specimens of A. K. Williams, Mildred Grant, Lyon Rose, Caroline Testout, Frau Karl Druschki, Bessie Brown, and Muriel Grahame; Messrs. S. Treseder and Son second, and Mr. Prince third. Mr. George Prince led for a dozen trebles of tea roses, and his best sets here were of Mrs. E. Mawley, Madame H. Berger, Muriel Grahame, White Maman Cochet, and Comtesse de Nadaillac; Mr. H. Drew second, and the King's Acre Nursery Company third.

CARDIFF SHOW: PART OF MESSRS. JARMAN AND CO.'S EXHIBIT.
Showing Centaureas (Sweet Sultans).

In a close competition Mr. George Prince scored for twenty-four roses, distinct, with a box of brilliant blooms of Victor Hugo, Horace Vernet, Richmond, Lyon Rose, White Maman Cochet, Mrs. E. Mawley, Ben Cant, S. M. Rodocanachi, Dean Hole, etc.; Mr. H. Drew second, and Messrs. Stephen Treseder and Son, Cardiff, third. For eighteen tea roses Mr. George Prince took first place, and had lovely flowers of Comtesse de Nadaillac, Madame Constant Soupert, White Maman Cochet, Muriel Grahame, Golden Gate, and Myles Kennedy; Mr. Henry Drew second, and the King's Acre Nursery Company, third.

The King's Acre Nursery Company led for a dozen blooms of any tea rose with a fine box of Mrs. Edward Mawley; Mr. George Prince, Oxford, second, with White Maman Cochet; and Mr. H. Drew, Longworth, third, with White Maman Cochet. The premier set of twelve H.P.'s or H.T.'s came from Mr. W. Jarrett Thorpe, who had Hugh Dickson, Lyon Rose, and William Shean in fine form; Mr. G. R. Banner second, and Mr. Foley Hobbs, third.

Mr. W. Jarrett Thorpe, Hucclecote, Gloucester, had the first prize set of a dozen tea roses, and showed beau flowers of Maman Cochet, White Maman Cochet, Souv. de Pierre Notting, and Constant Soupert; Mr. T. Bircher, gardener to G. R. Banner, Esq., Barnwood, Gloucester, second; and Mr. R. Foley Hobbs, third. The King's Acre Nursery Company, Hereford, had the best dozen blooms of any H.P. or H.T. rose, and showed Mildred Grant; Mr. G. Prince second with Lyon Rose; and Mr. J. Crossling, Penarth, third with William Shean.

Mr. R. Foley Hobbs, Thorneloe, Worcester, came first for a bowl of roses, followed by Mr. Wheeler, gardener to Mrs. Jenner, Wenvoe Castle, second, and with Mrs. Mackintosh, of Mackintosh, Cottrell, third.

SWEET PEAS.

Sweet peas were splendidly shown, and, together with the table decorations, occupied one huge tent, and a second one of considerable dimensions. For eighteen bunches, distinct, Mr. Thomas Jones, Pen-y-lan, Ruabon, was a splendid first with superb blooms of Etta Dyke, Miriam Beaver, Audrey Crier, Mrs. C. W. Breadmore, Stirling Stent, Asta Ohn, Clara Curtis, Menie Christy, Dazzler, John Ingman, Zarina, Elsie Herbert, May Gerhold, Marjorie Linzee, and Wenvoe Castle; Mr. Vernon Hill, Mendip Nurseries, Langford, Bristol, was second; and Mr. W. J. Godfrey, Exmouth, third.

CARDIFF SHOW: FIRST PRIZE BASKETS OF FLOWERS.

Exhibited by Messrs. Hodge and Co. The carnations are Aristocrat and Mrs. H. Burnett.

Mr. T. Jones was also to the fore again in the class for six vases of sweet peas, winning the N.S.P.S. silver medal with Mrs. C. W. Breadmore, Elsie Herbert, Asta Ohn, Earl Spencer, John Ingman, and Mrs. Routzahn, all grandly represented; Mr. Pettifer, gardener to R. T. Raikes, Esq., Treherfydd, Brecon, second; and Mr. Taylor, gardener to Alan Gibb, Esq., The Croft, St. Andrews, third. Mr. Wheeler, Wenvoe Castle, led for six bunches of sweet peas in a local class, and here he had Wenvoe Castle, Clara Curtis, and Marjorie Willis in good form; Mr. S. H. Byass, Bridgend, second; and Mr. J. Jonathan, Chain Cottage, Abergavenny, third.

There was a fine competition in Messrs. Sydenham's class for a dozen bunches of sweet peas, distinct, and here Mr. Wheeler, Wenvoe Castle, scored a first with good bunches of America Spencer, Marjorie Willis, Paradise Ivory, Countess Spencer, etc.; Mr. Howard Young, Horsfield, Bristol, second; and Mr. E. Harvey, Dinas Powis, third. Mr. J. Rees, Dinas Powis, led for six bunches of sweet peas in a Cardiff class, followed in order by Mr. J. Buckland, Lavernock, and Mr. T. Pretty, Marshfield.

In the Eckford class for a dozen bunches of sweet peas Mr. Thomas Jones, Ruabon, was an easy first with grand bunches of Tennant Spencer, Helen Lewis, Othello Spencer, Dodwell F. Brown, Nora Unwin, Aurora Spencer, St. George, Countess Spencer, Constance Oliver, Florence Norton Spencer, Clara Curtis, and John Ingman; Mr. H. Baker, gardener to J. Cropper, Esq., M.D., Chepstow, second; Mr. J. Fanks, gardener to J. W. Waddell, Esq., Ravelstone, third.

Mr. Thomas Jones was an excellent first for eight bunches in Messrs. Webbs' class, and here he had Etta Dyke, Audrey Crier, Tennant Spencer, Elsie Herbert, John Ingman, Mrs. Routzahn, and Othello Spencer in grand condition; Mr. A. H. Cossam, gardener to R. T. England, Esq., Rumney Court, second; and Mr. A. W. Morris, Penarth, third.

CUT FLOWERS.

This section was especially good, and of much interest. In the class for a collection of hardy flowers it was unfortunate that Mr. W. Treseder, Cardiff, failed to properly interpret the schedule. Cut flowers were required, and he had the double gypsophila represented as a pot plant, and so had to be disqualified. Mr. W. J. Godfrey, Exmouth, secured the premier award with some fine bunches of scabious, violas, pentstemons, gladioli, gaillardias, coreopsis, antirrhinums, geums, etc.; Messrs. Rich and Co., Bath, came second with a bold exhibit, in which varieties of Chrysanthemum maximum were finely shown. In a class for a collection of annuals, Mr. H. Went, Llandaff, was to the front with salpiglossis, sweet sultans, Phlox Drummondi, double godetias, annual chrysanthemums, sweet peas, stocks, and celosias; Mr. Febrey, gardener to J. W. Caurtis, Esq., Fairwater, second; and Mr. Thomas, gardener to H. Webb, Esq., J.P., Castleton, third.

Mr. Went also annexed the first prize for a dozen bunches of herbaceous flowers, and here he showed finely and set up grand flowers of Campanula lactiflora, Lychnis chalcedonica, Coreopsis grandiflora, Gladiolus Colvillei alba, Chrysanthemum maximum Mrs. J. Fersteeg, Lilium speciosum, Lathyrus latifolius, gaillardias, Helenium pumilum, delphiniums, Galega Hartlandi, and Lythrum Rosy Queen; Mr. Frank Bouskell second, and Mr. W. Horne third.

Mr. Went scored for six bunches of hardy flowers with splendid sheaves of gladiolus, Lilium candidum, Galega Hartlandi, Sidalcea candida, Erigeron speciosum, and Chrysanthemum maximum Wm. Robinson; Mr. F. Bouskell, Market Bosworth, second; and Mr. W. Horne, third. Mr. C. Wall scored for a collection of border carnations and picotees, and Mr. C. F. Waters, Balcombe, Sussex, had the premier set of perpetual and Malmaison carnations, winning with a well set up lot of fine blooms of popular varieties.

FLORAL DECORATIONS.

These always form a prominent feature at the Cardiff show, and on this occasion there was a keen competition in all classes. In the open class for table decorations there were a dozen competitors, and nine entries in the class for sweet peas only.

Miss Dolly Gomer, Rouilly Road, Cardiff, scored in the class for a table decoration with a pretty design in white, cream, and mauve sweet sultans; Mr. J. T. Curtis, Stoke Bishop, Bristol, was second with orchids, etc.; and Mrs. Colston Hall, Warminster, third, with Gottfried Keller and Irish Elegance roses. Miss Muriel Burgess, Stow Park Avenue, Newport, won the first prize for a table decoration in sweet peas with a very pleasing design in pink varieties; Mr. J. T. Curtis, gardener to Sir W. Howell Davies, M.P., Stoke Bishop, Bristol, came second, with a daring but pretty table of cream, lavender, and orange tinted varieties; Mrs. H. A. Gerhold, Penarth, came third with a lovely blending of pink varieties, but she had used the foliage of Thalictrum adiantifolium too freely in the centre and base of her exhibit, otherwise her position would have been a higher one.

For two baskets of flowers, orchids excluded, Messrs. Hodge and Co., Albany Road, Cardiff, were placed first for beautifully arranged baskets of carnations, one filled with the scarlet variety, Aristocrat, and the other with the lovely pink Mrs. H. Burnett; Mr. W. Treseder was second with a basket of carnations and a basket of roses, a trifle heavy in each case; Mr. P. Thomas, Cardiff, third. The best epergne of flowers suitable for a table decoration was of Gloriosa superba, scarlet anthurium spathes, and tiny caladium leaves; this was arranged by Mr. Horne, gardener to Major-General Lee, Dinas Powis; Mr. Percy Phillips, Newport, came second with cream and orange sweet peas very prettily disposed. The best bride's bouquet was a pretty arrangement, composed chiefly of Odontoglossum crispum and Phalænopsis Rimestadiana, by Mr. W. Treseder; Mr. P. Thomas was placed second for a handsome but rather too large design in odontoglossums. For a basket of flowers arranged for effect, Mr. W. Treseder scored with a choice arrangement of bright-hued orchids.

Mr. P. Thomas scored for a hand bouquet, orchids excluded, with a charming design in Mrs. H. Burnett carnations; Mr. W. Treseder second, and Mr. J. Hodge third. Mr. W. Treseder scored for a bouquet of roses with a pleasing design of Madame Abel Chatenay; Mr. J. Crossling second, with Richmond; several of the unplaced bouquets in this class were not properly finished.

FRUIT AND VEGETABLES.

Fruit was not largely shown, but there was a fair competition, and, of course, it is full early to secure a large display in this division.

Mr. Wilkins, gardener to G. A. Gibbs, Esq., M.P., Tyntesfield, Flaxbourton, Bristol, led for two bunches of white grapes with neat, well-coloured clusters of Muscat of Alexandria. Mr. Parry, gardener to D. C. Lysaght, Esq., Portskemett, scored for a pair of bunches of black grapes with Madresfield Court, and he was also first prize winner in the class for one bunch of a black grape. Mr. Cooper, gardener to Captain B. Marling, Clanna, Llandovery, had the best bunch of a white grape, and won with Muscat of Alexandria.

KNIGHT, Royal Arcade, **LOWESTOFT.**

Mr. Horne had the best dish of strawberries.

The best decorated dessert table was the one arranged by Mr. W. Treseder, Cardiff, who showed excellent grapes, Pineapple nectarines, a pineapple, melon, and strawberries, and used cattleyas, oncidiums, and other choice flowers to decorate the table; second prize fell to Messrs. Hodge and Co., Albany Road, Cardiff; and third to Mr. C. J. Ellis, Weston-super-Mare.

Vegetables were very well represented, and in the majority of exhibits the produce was well arranged. Mr. A. R. Searle, gardener to the Marquis of Northampton, Castle Ashby, had a very fine collection of nine distinct kinds of vegetables; and Mr. Shackson, gardener to Mrs. Rees Jones, Porthkerry Road, who did well at Penarth the other day, was an excellent second. In the Messrs. Sutton's class for six kinds of vegetables Mr. Shackson was first, but in the Messrs. Webb's class he was second to Mr. Searle, while Mr. Cox, gardener to Mrs. Bernard, Oakfield, Bridgewater, was third prize winner.

NON-COMPETITIVE.

Trade displays were numerous, though scarcely so many in number or so extensive as in 1909, but they were sufficient to add greatly to the interest and attractiveness of the show.

Sweet peas were finely shown by Mr. Henry Eckford, Wem, Salop, who had a pretty exhibit of large bunches of Othello Spencer, Clara Curtis, Mrs. C. W. Breadmore, Countess Spencer, Dodwell Brown, etc. Messrs. G. Stark and Son, Great Ryburgh, contributed a bright display of sweet peas, and in this group George Stark Improved, Mrs. Duncan, and Mrs. C. W. Breadmore were well shown. Messrs. Toogood and Sons, Southampton, had a small temple of sweet peas over beautifully green grass. Messrs. J. C. Wheeler and Son, Gloucester, displayed sweet peas and well-grown carnations to great advantage.

The King's Acre Nursery Company, Hereford, brought a remarkably good exhibit of peaches, nectarines, gooseberries, and grapes, all growing in pots, and freely fruited; they also had a display of hardy flowers. Messrs. E. Webb and Sons' tall temple of sweet peas was a great attraction, and the base of the temple was furnished with gloxinias, sweet peas, melons, tomatoes, and other Wordsley specialities. Messrs. Young and Co., Hatherley, displayed well-grown perpetual carnations in very pleasing fashion. Messrs. W. H. Rogers and Son, Southampton, showed their bright scarlet pelargonium Jas. T. Hamilton. Messrs. Jarman and Co., Chard, put up roses, sweet peas, and pelargoniums, but the best part of their display consisted of sweet sultans (centaureas) The Bride, Bridesmaid, Bridegroom, and the golden-yellow Honeymoon, and these charming flowers were greatly admired. Mr. H. N. Ellison, West Bromwich, brought a group of choice ferns. Messrs. Clibrans, Altrincham, showed roses, and Messrs. Blackmore and Langdon, Twerton, had a few delphiniums and cut begonias. Mr. Evans, Llanishen, contributed hardy flowers and hardy plants liberally and well. Messrs. A. A. Walters and Son, Bath, showed hardy flowers, and Mr. Eames, Frome, also had good bunches of hardy flowers. Mr. Vincent Slade, Taunton, sent zonal pelargoniums and Mr. W. J. Godfrey brought up pelargoniums, gladioli, and Solanum Wendlandi, from Exmouth; while from Guernsey Mr. F. Lilley brought gladioli, and Mr. L. R. Russell, of Richmond, contributed a group of ornamental evergreen shrubs.

MEDALS.

Gold.—Mr. Henry Eckford, Wem, Salop, for sweet peas; Mr. Farmer, gardener to the Marquis of Bute, Cardiff Castle, for group of stove and greenhouse plants; King's Acre Nursery Company, Hereford, for fruit trees in pots and flowers; Messrs. E. Webb and Sons, Stourbridge, for sweet peas, fruits, and vegetables; Messrs. Young and Co., Hatherley, for carnations; Mr. L. R. Russell, Richmond, for hardy shrubs; and Messrs. W. and H. Evans, Llanishen, for hardy flowers.

Silver.—Messrs. J. Wheeler and Son, Gloucester, for sweet peas and carnations; Messrs. G. Stark and Son, Great Ryburgh, for sweet peas; Messrs. Toogood and Sons, Southampton, for sweet peas; Messrs. Jarman and Co., Chard, for sweet sultans, sweet peas, and roses; Mr. H. N. Ellison, West Bromwich, for ferns; Mr. F. Lilley, Guernsey, for gladioli; Mr. Evans, Frome, for hardy flowers; Mr. W. J. Godfrey, Exmouth, for greenhouse and hardy flowers.

Bronze.—Mr. V. Slade, Taunton, for zonal pelargoniums.

PANSIES AND VIOLAS.

These popular plants are being used more extensively every year for bedding out. When properly treated they continue to flower from spring till autumn; they are fairly hardy, do not take up much room when in their winter quarters, and are comparatively easy to grow. Plants that possess so many good points are bound to enjoy a high degree of popularity. They are not faultless, however. There is a tendency to degenerate rapidly if good culture be neglected. Named varieties should be very carefully propagated at this season.

A naturally sandy soil is very suitable. Where this does not obtain, road grit, or plenty of coarse sand should be mixed with the original. The border should face north, north-west, or north-east. A south border is not a good one for the cuttings. The soil should be dug up and the road grit mixed with it to a depth of quite nine inches, as these plants form roots freely. But after the digging, and when the soil has dried partially, it should be trodden down a little—if sandy.

Strong runner-like shoots make the best cuttings as they will continue to grow and not bloom. These shoots are found near the base of the plant, and are free from flower buds. Of course, cuttings may be taken from any part of the plant, but it is advisable to remove all flower buds found on them.

Having otherwise prepared the beds, scatter some sand on the surface so that some of it will be borne down by the dibber when the holes are made. The cuttings, resting on this sandy base, will soon form roots, and if all flower buds be pinched off as soon as seen, strong plants will be available before severe weather comes.

To make a cutting it is only necessary to sever the stem below a joint and to remove the two basal leaves. Keep a sharp look-out for earthworms, as they often draw in the leaves of the cuttings, loosening the latter in the soil, and thus preventing rapid root action.

G. B.

Lilium longiflorum Out of doors.—We are so accustomed to see this lily treated as a pot plant that its great beauty out of doors is apt to be overlooked. There are many forms of this lily in cultivation, and we obtain bulbs from many quarters of the globe — namely, from Holland, Bermuda, Japan, South Africa, and the Azores—but of them all for outdoor culture I prefer the Japanese bulbs, whether the variety be the dark-stemmed one known as grandiflorum, or that bold form with green stems that we used to call Wilsoni.—W. T.

Rhododendron Victorianum.—On page 486 your correspondent, Mr. W. A. Cook, takes exception to my reference regarding this rhododendron as a good garden plant. He does not, however, appear to have read the context, for at the commencement of the note I stated that it is one of the most striking of the tender garden forms. Thus it will be at once seen that I did not recommend it for outdoor culture, and I have yet to learn that a subject which needs protection in winter cannot be regarded as a good garden plant, there being, at least from my point of view, both indoor and outdoor gardening.—K.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

ŒNOTHERA YOUNGI.—W. W., Maidenhead: This beautiful golden-yellow flower is a fine garden plant, and will grow in almost any soil and situation, provided it has sunshine. It is a gay summer flower that is well worth growing because of its brilliance and continuity. Œ. Youngi is generally regarded as a variety of Œ. fruticosus. Planted among the bright and deep scarlet Paul Crampfer pelargonium, Œ. Youngi assists in the production of a gorgeous effect.

MIMULUS LUTEUS IN THE WATER GARDEN.—F. W. S., Newmarket: There are not many places in the garden where Mimulus luteus fails when once it is established. We have seen it flourishing on the rock garden, among stone steps, in herbaceous borders, and in window boxes, but we have never seen it so fine as when covering a low bank close to the edge of water, and in full sunlight. You will find no difficulty in establishing this mimulus.

INFESTED RASPBERRIES. — J. H., Lyndhurst: The infestation and consequent damage are due to the raspberry beetle (Byturus tomentosus), a little pest capable of doing a very great deal of damage. They chiefly attack the blossoms during the end of May and in June, but in recent years, probably owing to cold spring weather, they have continued to appear well into July. Bags soaked with paraffin placed under infested canes, and the latter shaken vigorously, will answer for the beetles that fall, but very much may be done to prevent further infestation by cutting out the fruiting canes as soon as the crop is gathered, and burning them. At the same time, thin out the new canes, remove all weeds and rubbish from the row, and burn every bit of this waste material. In the autumn, after the leaves have fallen, remove and burn the latter, and remove and burn or deeply dig as much of the surface soil as can be removed without injuring the raspberry roots, putting some thoroughly good soil mixed with manure in its place.

PROTECTION OF CERTIFICATED SWEET PEAS.—E. C. S., Weybridge: We understand that the National Sweet Pea Society has this matter under consideration, and will issue a copyright design to be affixed to each packet of sweet peas of a certificated variety sent out by the raiser during the year of introduction. Without this copyright label the seeds cannot genuinely represent the certified stock, and any infringement of the copyright will be proceeded against by the society. At least, that is how we understand the matter.

MEALY BUG IN GRAPES.—F. L. I., Byfleet: We sympathise with you, because there is no way of clearing mealy bug from bunches of grapes than that of washing, and it is a slow process, and spoils the appearance of the grapes. Do the best you can in this way, and do not admit plants of any kind into the vinery. After the grapes have been cut you may commence operations by forcible syringings with insecticide, and vaporising, but the great opportunity will come in the winter when the leaves have fallen. You must then deal with the pest thoroughly, and make no mistake about cleansing the house and rods in a most effective manner. If after the house is cleaned all the woodwork is painted and the walls washed with hot lime-wash, to which paraffin has been added, it will all help to eradicate the pest. Write us again in the autumn

ALPHA SPRAYING MACHINES.

Patent No. 24637/07.

Hydro-Pneumatic Sprayers for Orchard, Garden, Greenhouse, or Conservatory. Large or Small Plantations. Commercial or Private Growers.

The Simplest and most Perfect Sprayers yet introduced.

and we will advise you how to proceed. We are glad you like the GARDENERS' MAGAZINE. You will find our "Work for Week" columns of great value in your efforts to rehabilitate the garden you have now charge of.

FOSTER'S SEEDLING GRAPE.—S. E. R., Devizes: The late Dr. Hogg stated that Foster's White Seedling grape was raised about the year 1835 by Mr. Foster, gardener to Lord Downe, Beningborough Hall, York. This, and Lady Downe's Seedling, were both obtained at the same time from the same pot of seedlings, which were the result of a cross between Black Morocco and White Sweetwater.

NAMES OF PLANTS.

F. T., Carshalton.—Lilium Browni.

F. L. I., Byfleet.—Jacobinia cornea.

F. A. N., Surrey.—1, 2, and 3, are garden varieties of Iris Kæmpferi; No. 4, we do not recognise.

D. S., Gateshead.—1, Salvia sclavea; 2, Spiræa palmata; 3, Trachelium cæruleum; 4, Kalanchoe flammea.

G. S., Ryde.—1, a garden form of Veronica Andersoni; 4, Crassula coccinea; 3, Spiræa Douglasi; 4, Deutzia crenata fl. pl.

M. L. J., Blandford.—1, Campanula lactiflora; 2, Molucella lævis; 3, Passiflora Kermesina; 4, Mimulus luteus; 5, Galega Hartlandi.

NAMES OF FRUIT.

J. E. G., Amersham.—White Dutch.

F. L. I., Byfleet.—The fruits were so small that it was not possible to name them with any degree of certainty, because of their lack of character. We think 2 is Barrington; 3, Lord Napier; 4, Early York; and 5, Elruge. Send again next year, when we hope you will have been more successful. The strawberry is Louis Gauthier.

The Holiday Season.—We are now in the midst of the holiday season, and many of our readers are considering the question of when and where they will go for a short period of rest and change from the cares and anxieties inseparable from the management of gardens. Some may be contemplating a Continental holiday, but those who have the care and responsibility of large gardens can spare but a short time from home, and consequently avoid journeys extending beyond the boundaries of the United Kingdom. Happily there is no scarcity of interesting and enjoyable haunts in England where one may, if so inclined, improve one's knowledge of the British flora, or visit places that have played important parts in the history of this country. The Great Central Railway publishes an excellent little booklet, entitled "Strolls in Beechy Bucks," which shows what a delightful time may be spent in that tract of delightful country, with its old-world villages, breezy heights, peaceful vales, and beautiful woodlands. Students of history or lovers of poetry may visit within the limits of a fortnight the homes of Milton, Gray, Penn, Burke, Waller, Disraeli, and Hampden, and that with but little fatigue or expense. Further north the Great Central Railway affords remarkable facilities for visiting the "Dukeries," the most famous gardens of which were recently described in these pages; while those who prefer a holiday by the sea can travel by an excellent service of trains or steamboats to such admirable resorts as Scarborough, Whitby, Cleethorpes, Isle of Man, Southport, or Lytham. The company has just published a special programme of the arrangements they have made for the holiday season, and as this shows the facilities offered to over 300 towns and holiday resorts, we would advise those of our readers who are desirous of arranging an enjoyable holiday to obtain the programme and guides issued by this progressive company. Applications should be addressed to the Publicity Department, Great Central Railway Offices, 216, Marylebone Road, London, N.W.

OBITUARY.

MR. GEORGE TUBB.

We much regret having to record the death of Mr. G. Tubb, which recently occurred at Minley Manor, Hants, where for more than thirty-five years he was head gardener to three generations of the present owner's family (Laurence Currie, Esq.). During his long and faithful service many improvements and alterations in the gardens were carried out by Mr. Tubb, under the direction of his employers, whose confidence he enjoyed to the last. Mr. Tubb passed away from heart failure following paralysis. He was always a warm supporter of the Gardeners' Royal Benevolent, being connected with the Reading Auxiliary of that excellent institution.

Crassula coccinea.—Model little plants of this crassula are now to be seen in the florists' shops of London—and, in fact, sometimes on the costermongers' barrows. All of them are grown in the regulation 48-pot, that is to say, one 5in. in diameter There are several varieties, but the richest coloured forms seem, as a rule, to sell best.—W. T.

YOUNG MAN seeks SITUATION in private place, under Head Gardener; age 23; Inside and Out, or Inside. Apply Mr. PLATT, 21a, Grove Place, Hoylake.

Samples of the many Letters of Appreciation received from Advertisers.

"Your valuable paper has been the means of getting me a good situation, and I only had the advertisement in two weeks. I shall always have your paper for a valuable friend and circulate it amongst my fellow gardeners. You are at liberty to make what use you like of this letter."
(Signed) A. TICKNER.

"Please discontinue my advertisement in the 'Gardeners' Magazine' as through it I have secured a situation."

"I write to tell you my first advertisement has got me a situation and shall not want to go to any other paper next time. Wishing your paper every success."

THE BEST CABBAGES FOR AUGUST SOWING.
SUTTON'S APRIL,
Per packet, 1s., post free.

SUTTON'S FLOWER OF SPRING.
Per ounce, 1s., post free.

SUTTON'S FAVOURITE.
Per packet, 1s., post free.
"One of the earliest is Sutton's April, and this is a model Cabbage of very compact growth and quite free from bolting. It is remarkably early, and is rightly named, for I have had it the first week in April after a severe winter. Another very reliable early Cabbage is Sutton's Flower of Spring. This is a little larger than April, but equally valuable where quantities are required. It forms a compact head of a most beautiful shape, and is exceedingly delicate in flavour.—G. Wythes, "The Garden."

SUTTON AND SONS, THE ROYAL SEED
ESTABLISHMENT, READING.

KELWAY'S "COLOUR BORDERS"
(Regd.)

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

Colour in Garden Scenery.

Although the season in which alterations in the garden and planting operations can be the most successfully carried out is not yet with us, the question of colour in garden scenery is one that might with advantage be carefully considered. All the finest of the trees and shrubs that are of special value in the production of distinct and attractive colour contrasts are now at their best, and as there is ample moisture within reach of their roots, and the leaves have not had to bear the stress of brilliant sunlight, they may be expected to retain their distinctive leaf colouring until the summer season has become merged into that of autumn. This being the case abundant opportunities will be afforded during the next two months for studying, not only the leaf colouration of the several kinds, but also their habit of growth and suitability for the various positions that gardens and pleasure grounds usually afford. A knowledge of the leaf tints and other distinctive characteristics of trees and shrubs best suited to garden planting, as a large proportion of our many readers are aware, is essential to their successful use in the creation and improvement of gardens. Therefore we very strongly advise all who are engaged in garden management, or actively interested in the ornamental aspects of gardening, to take full advantage of the opportunities they may have for studying the various forms of arborescent and ligneous vegetation. Happily, much more attention is devoted to ornamental trees and shrubs at the present time than at any previous period in the history of gardening in this country, and, as the result, an immense improvement has been effected both in the making of selections and in the methods of arrangement. There is room for still further improvement, and with the continuance of the study of tree life that is so evident on all sides at the present time there is full justification for assuming that there will at no distant date be a material acceleration of the rate of progress. The question of the colour effects that may be produced by the use of hardy and other plants would be well within the scope of the heading to this note; but its consideration would open up a wide subject, and it therefore appears advisable to limit the consideration of colour in garden scenery to the effects that can be produced by the foliage of trees and shrubs. In suggesting that the kinds with golden, silvery, glaucous, purple, and bronze leafage should in many gardens be more freely planted than has yet been considered desirable, we are most anxious we should not be understood as advising their being planted in a lavish manner. We are anxious to make this quite clear because of our acquaintance with a number of gardens in which shrubs with golden leafage have been so liberally planted as to appreciably reduce the refreshing beauty characteristic of a garden that has a proper balance of colouring in the leafage of its occupants. It should be constantly borne in mind that the prevailing colour in nature is green, and that there is no colour so refreshing to the eye. If this be done it will be readily understood that golden and silvery hues should not be more liberally employed than is necessary to the production of distinct and pleasing contrasts in conjunction with green grass and leafage. While it is necessary there should be a proper balance between the green leafage and the golden, silvery and purple hues, it is essential to the maintenance of the garden in an attractive state throughout the year that both deciduous and evergreen trees and shrubs should be planted in due proportions. A considerable proportion of the deciduous kinds with richly-coloured foliage are so attractive in their summer garb that the planter might almost be excused for giving them an undue preference. Their summer charms should not, however, be allowed to exercise too great an influence when a selection is being made, for at no season of the year are bright hues more greatly appreciated in the garden than during November and the three following months, when the beds and borders are flowerless. The merits of such effectively-coloured subjects as golden cupressus, euonymus, retinosporas, thuias, and yews; golden and silver hollies; and glaucous abies and cedars for contributing to the charms of the garden during the late autumn and winter months should have full recognition, and these should be planted in due proportions where the conditions are favourable to a healthy growth and a full development of richly-coloured leafage. We refrain from specifying the names of the several kinds because we are anxious our readers should, if they are not already familiar with them, make their acquaintance while they can be seen at their best: it must be mentioned that while the hollies and euonymus will thrive in most gardens, the coniferous trees are only suitable for gardens that are beyond the influence of the atmospheric impurities incidental to large towns. The deciduous trees afford a considerable range in the making of a selection, but it will be found more satisfactory to select a few of the best kinds and to plant several examples of each than to make a large selection and to plant only one of each of the forms selected. The golden catalpa, elms, oaks, poplars, and Späth's golden dogwood; the silvery variegated acer, the Abele poplar, and the Aspen and the White Beam tree, both of which are remarkable for the silvery hue of the under-

MR. EDWARD WHITE.

side of their leaves; and the purple-leaved beech, birch, plum, and nut, are all of so high an order of merit that they should be included in a limited selection. The golden-leaved privet is the most useful of all the shrubs with golden leafage, but it enjoys so high a degree of popularity as not to require a word of comment other than to suggest that it is possible to plant it too freely.

Mr. Edward White, whose portrait we have the pleasure of giving herewith, has long occupied a foremost position among the leading landscape gardeners of this country, and the splendid work he has accomplished in the creation of new gardens and in adding to the charms of old ones fully justifies the high place that has been assigned him. Mr. White was for some years in partnership with the late Mr. H. E. Milner, V.M.H., and, on the death of that distinguished landscape gardener and garden architect, he succeeded to the business which he has since carried on with ever increasing success. The successful results that have been obtained in the conduct of the business are probably due to the fact that Mr. White does not belong to any particular school of garden design, but evidently believes that a landscape gardener should be able to do the best work in any style. His work, of which there are examples in every county of England, and in not a few of the counties in Ireland and Scotland, certainly suggests the holding of such beliefs. Whether that be the case or not, the examples of his work that have come under our notice prove to demonstration that he is equally happy in the carrying out of the various styles in garden design that now find favour in Great Britain, and, for the matter of that, on the Continent also. Mr. White, it should be mentioned, has not confined his activities to this country, but has worked in France, Spain, Germany, Austria, Sweden, and Poland. It would be interesting to give some account of the many examples of Mr. White's work at home and abroad, but, as that is not now possible, it should be mentioned that his most important complete works include Moulton Paddox, near Warwick, the residence of Mr. Robert Emmet; North Bovey Manor, Devonshire, the seat of the Hon. W. F. D. Smith; Joyce Grove, Oxon, the residence of Mr. Robert Fleming; Ardross Castle, Ross-shire, the seat of Mr. C. W. Dyson Perrins; Glenort Castle, co. Wicklow; a park at Chantilly for Baron E. de Rothschild; and Dr. Von Schwabach's gardens at Berlin. It is a point of some interest that Mr. White's firm arranged "garden cities" fifty years before the phrase was coined, and that the picturesque development of building estates forms at the present time an important part of Mr. White's work. We should add that Mr. E. White is the hon. secretary of the forthcoming International Horticultural Exhibition.

Vacant Land Rendered Profitable.—On Thursday, July 21, 1910, Lord Carrington, President of the Board of Agriculture, accompanied by Mr. Richard Winfrey, M.P., and Mr. E. J. Cheney, Small Holdings Commissioner, conducted by Mr. Joseph Fels and Mr. R. L. Castle, visited the grounds held by the Vacant Land Cultivation Society from the Gas Light and Coke Company at West Ham. Over an hour was spent in the inspection of the well-cropped plots, of which there are 266 on an area of 33 acres, and the visitors expressed much satisfaction with the results obtained by the men. Lord Carrington closely questioned several of the plotholders with regard to the value of their produce, used or sold, and the information elicited indicated an average of £8 to £10 per plot of 20 sq. rods. In every case, especial value was attached to the supplies of fresh vegetables for home use, the men, wives, and children thus benefited numbering over 1,200. As mementoes of the occasion, the visitors carried away fine bunches of brightly-coloured sweet peas.

Preservation of Cheddar Cliffs.—The National Trust has completed the purchase of the property in the centre of the Cheddar Cliffs, on which is situated the quarry that has caused much disfigurement to the gorge in recent years. The National Trust hopes that, by the purchase of this property, having regard to the position and the professed intentions of the owners of the rest of the gorge, the cliffs have been secured from all danger of further spoliation.

The National Sweet Pea Society's Provincial Cup has just been won, at Luton, for the third year in succession, by Mr. Thos. Stevenson, gardener to E. A. Mocatta, Esq., Woburn Place, Addlestone, and therefore becomes the property of the winner. Mr. Stevenson has had to travel with his flowers to Saltaire, Dublin, and Luton, but, notwithstanding the distance, he has beaten all comers, and worthily won the cup presented to the society a few years ago by Mr. Edwards, of Haydon Hall, near Harrow.

Meteorological Observations at Kew.—Frequent visitors to Kew and Richmond will know that the Kew Observatory is in the Old Deer Park, Richmond, and that a large amount of work done in it has been in connection with the National Physical Laboratory. In future, and as soon as the necessary arrangements can be made, the work of testing watches and other scientific instruments will be transferred to Teddington, and the observational and experimental work in meteorology and geophysics will be continued under the direction of the Meteorological Office by Dr. C. Chree, and thus the Observatory will be the central observatory of the office. The Eskdale Muir and Valencia Observatories have also been placed under the directorate of the Meteorological Office.

An Interesting Coincidence.—"The Leader," a Melbourne paper, is just to hand containing an account of the Malvern Chrysanthemum Show. It says: "All the leading awards were won by Mr. W. T. Pockett, son of Mr. T. W. Pockett, the great Australian seedling grower." Considering the rivalry that existed between Pockett's seedlings and those of the great French raiser, the late Mr. Ernest Calvat, it is interesting to read that the award for the best bloom in the show was made to Mr. W. T. Pockett, who won with Madame Carnot, one of Calvat's most famous varieties. This result, it is said, was not begrudged by chrysanthemum enthusiasts, who recognise the remarkable manner in which this old favourite has maintained its vigour.

Wheat Production.—In planning the programme for the meeting of the British Association, held in Canada in August of last year, it was felt that no more appropriate subject could be chosen for consideration than that afforded by wheat, Winnipeg being now the focus point of a great area devoted to the growth of the cereal. Arrangements were therefore made in advance to hold a joint meeting of the chemistry, botany, and agricultural sections, and to obtain communications from various gentlemen known to be specially conversant with the subject in one or other of its aspects. Several papers of far-reaching importance were read, and in order to bring to the knowledge the valuable information that is contained in them, the Board of Agriculture have, with the permission of the British Association, issued them as a supplement to the "Journal" for the current month. In doing this the Board of Agriculture have rendered the farming community a valuable service.

Roridula dentata.—At a recent meeting of the Royal Society of South Africa, held at Cape Town, Dr. R. Marloth made some interesting remarks on the biology of Roridula. The Fly-bush (Roridula dentata) is a distinct shrub attaining a height ranging from one to four feet, and grows on the mountains near Tulbagh and on the Cedar mountains. As the leaves are provided with many stalked glands, which secrete a very viscid fluid, numerous insects adhere to the leaves and perish there, hence the shrublet is universally considered to be an insectivorous plant. Experiments have, Dr. Marloth stated, shown that the fluid secreted by the glands does not possess any digestive properties, and that it is quite different from the fluid secreted by droseraceous plants. The fluid is a kind of balsam, and probably affords protection to the plant against the attacks of creeping animals, such as snails, caterpillars, earwigs, etc., and the capturing of other insects is merely accidental, and of no advantage to the plant. Roridula dentata and R. Gorgonias, the only two species of the genus, are consequently to be excluded from the list of insectivorous plants.

New Park at Friern Barnet.—It will be remembered that when Alderman Sir William Treloar, Bart., was Lord Mayor of London, he and the then Sheriff, Colonel and Alderman Sir William H. Dunn, M.P., attended at Okehampton, Devon, to open a park presented to that town by Mr. Sydney Simmons, J.P. The same gentleman, says the "City Press," has now most generously given a beautiful estate of about 22½ acres, known as Friary Park, Friern Barnet, to the public. It was to be opened by the Lord Mayor, but owing to the death of King Edward VII. the ceremony had to be abandoned. Sir William Treloar and Sir William Dunn attended, however, on Thursday, and addressed about 2,000 children, who had gathered there in connection with some sports that had been organised.

Trees and Shrubs for Town Gardens.—Mr. A. D. Webster, superintendent of Regent's Park, made a very interesting contribution to the Country in Town Exhibition at the Whitechapel Art Gallery. It included examples of trees, herbaceous and bedding plants that have been found suitable for smoky localities; a bed of ornamental-leaved plants; printed lists of trees, shrubs, etc., suited for London; lists of water-fowl from British birds that have been seen in Regent's Park; and a trophy of tools used in town gardens. The trees and shrubs recommended by Mr. Webster for town gardens are as under: Phillyrea la Osmanthus ilicifolius, Euonymus ra Euonymus japonicus, Euonymus albo-variegata, Euonymus aurea, Colutea arborescens (Bladder Senna), Olearia H

Olearia macrodonta, Clematis montana, Cupressus erecta viridis, Syringa vulgaris (Common Lilac), Skimmia fragrans, Cratægus pyracantha, Aucuba japonica, Ailanthus glandulosa, Ribes sanguineum, Ribes missouriense, Forsythia viridissima, Forsythia suspensa, Hibiscus celeste, Hibiscus totus albus, Juniperus tamariscifolia, Azalea procumbens, Cotoneaster microphylla, Cotoneaster buxifolia, Arctostaphylos uva ursi, Podocarpus andina, Liriodendron tulipifera, Vitis purpurea, Vitis variegata, Vitis Coignetæ, Vitis Veitchi, Ligustrum (Golden Privet), Aralia Sieboldi, Almond, Sumach, Corchorus japonicus, Andromeda japonica, Ilex crenata (Holly), Senecio elæagnifolius, Lycium chinense (Tea Plant), Ivy, Emerald Green, English Ivy, Potentilla fruticosa, Salisburia adiantifolia, Fig, Brown Turkey, and Cornus (Dogwood).

Saltaire Rose and Sweet Pea Show, held on Tuesday, July 19, was a great success, and the gate receipts amounted to £266 19s. The society's subscription list amounts to £150, and the total revenue to about £500—a very creditable achievement for a society only yet in its eighth year.

Hexham Fruit Show and Congress.—The arrangements for holding the fruit show and congress at Hexham on October 20 and two following days are making good progress, and there is full justification for anticipating an interesting exhibition and a conference of much value educationally. From an appendix to the schedule that has been recently issued we learn that the committee, "with a view to prevent the public being misled by a show of all sorts of apples, many totally unsuited for planting in the north," have placed the following restrictions on trade exhibits from growers outside the four northern counties (Cumberland, Durham, Northumberland, and Westmorland), (1) Varieties of fruit shown must have been supplied by the firms exhibiting to growers within the four northern counties, except varieties introduced since 1900; (2) any variety introduced since the year last named may be exhibited, but the older varieties are limited to the twelve apples and the two pears mentioned in the schedule.

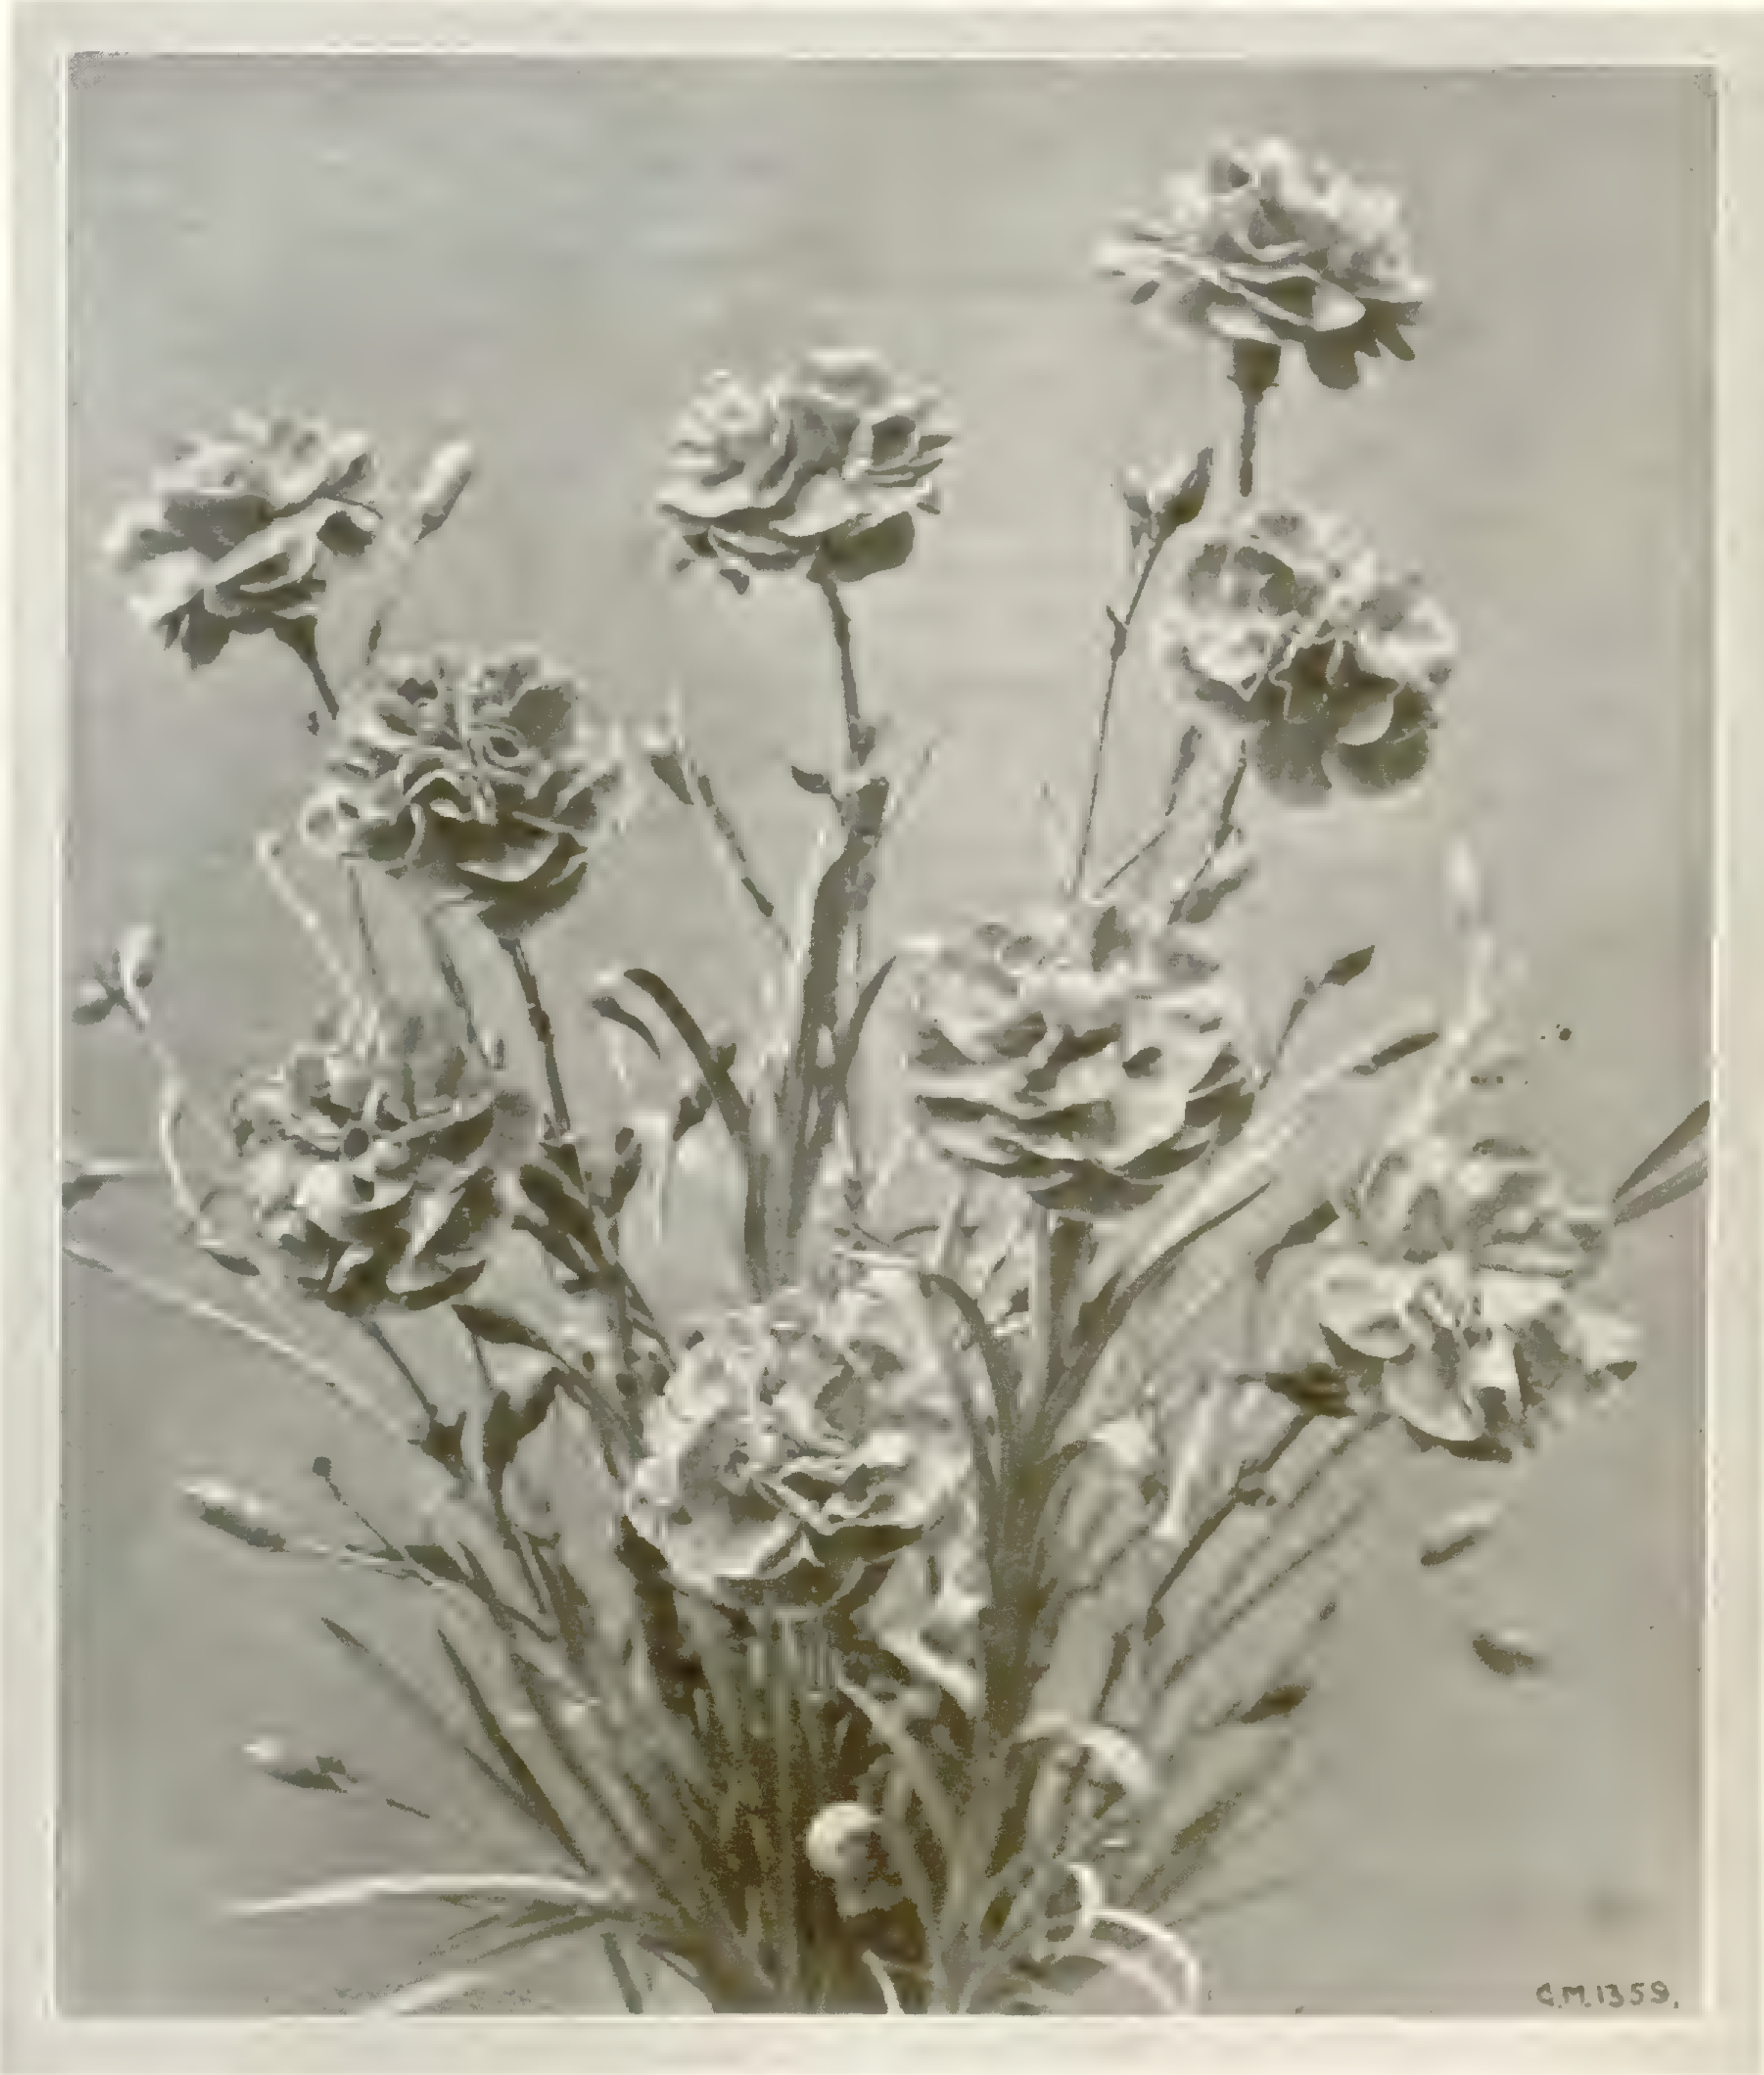
An Exhibition of Forced Shrubs will be held at Boskoop in April, 1911, under the auspices of the Boskoop Pomological Society, which will celebrate its jubilee next year.

Plant Remains in Peat Mosses.—The council of the Royal Society of Edinburgh has awarded the Neill Prize for the biennial period 1907-8, 1908-9, to Mr. F. J. Lewis for his papers in the society's "Transactions" on the "Plant Remains in the Scottish Peat Mosses."

Ruins and Vegetation.—An interpellation has, writes the Rome correspondent of "The Times" lately been made in the Italian Chamber of Deputies calling the attention of the responsible Minister to the danger of planting flowers and shrubs at the base of ancient ruins and, particularly, of the ruins in the Forum. The question seems to have been inspired by two well-known members of the archæological world, and sums up a good deal of loose criticism which has for some time past been levelled against the work of the Director of the Forum and Palatine, Commendatore Boni. The Forum has presented many very different aspects during the last half century, but never has it shown a more rare and exquisite beauty than it has this year. There was the first early period of neglect, when trees, grass, and wild creepers covered the high mounds which concealed its buried ruins—a period which was not without a certain picturesque quality of its own. Then, after much patient clearing and exploration came the time when the Forum resembled nothing so much as a stonemason's yard—a cold, naked waste of broken marble and stone, with no touch of green life to relieve its dreary and repellent ruins. Then came a period of judicious and careful planting, chiefly carried out by the present Director, during which the Forum grew in beauty every year. The claims of archæology were considered first; no tree or shrub was planted where it could interfere with present or future research, no creeper was allowed to threaten destruction to ancient walls, and no flower was admitted that could not show a classical origin of its own. But cypresses, laurels, and bays were planted, and now flourish in corners that were once bare and ugly, and give shade at the side of modern paths; ivy kindly curtains and conceals the new brick supports and buttresses which had to be erected here and there, and with the help of other creepers disguises restorations which, though necessary, are neither beautiful nor interesting in themselves; and all the intervals between, the bare spots left by exploration, the borders of the old buildings, and the summits of shapeless mounds of broken masonry, are clothed with green grass and made gay with the spring iris, the summer roses, and such flowers as the old Romans knew.

NATIONAL CARNATION SOCIETY.

This society held its thirty-fourth annual exhibition at the Royal Horticultural Hall, Vincent Square, Westminster, on Tuesday, July 26. The entries were numerous, more so than usual, but they were not sufficient to well fill the big hall, consequently the general effect was not good. There were some grand flowers in the leading classes, but there were also many poor ones in the smaller classes. The undressed flowers arranged in vases attracted most attention from the general public, but the specialists lingered lovingly around the flowers staged in paper collars on boards. The society, as it appears to us, does not enter with sufficient heartiness into the business of popularising the carnation: florists' flowers, bred to the florist's ideal, do not attract the general public nowadays—freedom, effect, colour, elegance are all needed, and rightly-grown and staged carnations can provide these.



YELLOW GROUND FANCY CARNATION PASQUIN.

First prize bunch exhibited by Mr. Jas. Douglas, Great Bookham, at the National Carnation Society's Show on Tuesday, July 26.

FIRST DIVISION.

Mr. James Douglas, Great Bookham, secured the premier award for eighteen bizarres and flakes in not less than a dozen varieties with beautiful blooms of Gordon Lewis, Master Fred, Recorder, J. D. Hedderley, Peter Pan, Admiral Curzon, Torchlight, G. Melville, Meteor, Sarah Payne, J. D. Hextall, Rowena, Arthur, and Sportsman; Mr. C. Blick, Hayes, was second with smaller, but very clean, bright flowers. First prize for eighteen selfs was also won by Mr. James Douglas, who scored with clean examples of Daffodil, Bob Acres, Seivewright, Caruso, Queenie, Miss Willmott, Kate Nickleby, Ruby, Mrs. Henwood, Cardinal, Mrs. R. Gorton, W. H. Parton, and Mrs. Griffith Jones; Mr. C. Blick second.

Some glorious flowers were shown in the class for eighteen fancy carnations, and here there were again only two entries; Mr. C. Blick led with big brilliant flowers of Donald McDonald, Bombadier, Medusa, The Marquis, Pasquin, Outlaw, Vandyck, Prince Albert, Prince Arthur, Skirmisher, Leslie (very fine), Arabella Stuart, Dauntless, Lieut. Shackleton, Victory, San Remo, and R. Morton; Mr. J. Douglas second. For eighteen white ground picotees Mr. J. Douglas led once more with an even set of J. Smith, Harry Kenyon, Mrs. Sharp, Miss Cartwright, Amy Robsart, Favourite, Amelia, Mrs. Twist, Thos. Williams, Lena, Brunette, Little Phil, Gannymede, Fortrose, and Clementine; Mr. C. Blick second with smaller flowers.

Eighteen yellow ground picotees brought out only two competitors, and here Mr. Douglas led the way again with Margaret Lennox, Cymbeline, Goblin, Onward, Togo, Lady Galton, Her Majesty, Styx, Ophir, Archie Brown, Lady Fremantle, and Exquisite; Mr. C. Blick again second.

In the section for undressed flowers Mr. James Douglas, Great Bookham, was a capital first for six self carnations, three blooms of each, staged in vases with carnation foliage; he showed Mrs. Robert Berkeley, Mrs. T. E. Henwood, Agnes Sorrell, Mrs. Griffith Jones, Daffodil, and a red seedling; Mr. C. Blick second. Mr. Douglas was first for six yellow ground fancies, shown in similar fashion, and here he staged big blooms of Alice Byron Stuart, Gloriosa, Lord Steyne, Liberté, Mrs. Penton, and Queen Eleanor; Mr. Blick a close second.

In the class for six yellow ground picotees, shown under similar conditions, Mr. James Douglas led with Exquisite, Togo, Ophir, Santa Claus, Onward, and Margaret Lennox; Mr. C. Blick second. Mr. Douglas also beat Mr. C. Blick for twelve trebles of selfs, fancies, and yellow ground picotees, showing a fine set of Lord Steyne, Gloriosa, Daffodil, Liberté, Ruby, Togo, Onward, Renown, Alice Byron Stuart, Margaret Lennox, Mrs. Robert Berkeley, and Kate Nickleby; Mr. Blick had a good set of slightly smaller flowers.

SECOND DIVISION.

Mr. H. R. Taylor, Cheam, was a capital first for a dozen flakes and bizarres, showing very brilliant flowers of Torchlight, Bedouin, Trio, Torchbearer, Gordon Lewis, and G. Morland; Messrs. Phillips and Taylor, Bracknell, second, and Mr. W. Sydenham, Melbourne, third. Mr. H. R. Taylor also secured a first for a dozen self carnations, and here he had Maud Allan, Ellen Gotswaltz, Carabas, and Cardinal in good form; there were seven competitors, and Mr. Hayward Mathias, Stubbington, was second, and Messrs. Phillips and Taylor third.

Premier award for a dozen yellow ground fancies was secured by Mr. Hayward Mathias, who had immense flowers of Mars, Daniel O'Connor, Linkman, Father O'Flynn, Hecla, N. Thurstan, Devonian, Highland Lass, Orlando Sport, Orlando, Mars, and Liberte; Mr. C. Wall, Bath, second, and Mr. W. Sydenham, third; seven entries. Mr. H. R. Taylor, annexed the first prize for a dozen white ground picotees, and he showed Queen of Spain, Pride of Leyton, John Smith, and Little Phil in fine form; Mr. W. Sydenham second, and Mr. H. Mathias third. The best set of a dozen yellow ground picotees came from Mr. H. Mathias, who had clean specimens of Gloria, Mrs. Heriot, Constance, Vera, Togo, Exquisite, and Goblin; Mr. W. Sydenham second, and Mr. C. Wall third; six competitors.

In the "undressed" section Mr. H. R. Taylor scored for four trebles, selfs, with Mr. H. Mathias second; five entries. For four trebles, fancies, Mr. R. Morton, Woodside Park, N., led among nine competitors, and was followed by Mr. H. R. Taylor, and Messrs. Philips and Taylor. For yellow ground picotees, four trebles, Mr. H. R. Taylor came to the front again, with Mr. H. Mathias second and Mr. W. Sydenham third.

The best set of nine varieties, three blooms of each, in vases, came from Mr. H. R. Taylor, and included Solomon and Ann Hathaway in first-rate condition; Mr. H. Mathias second, and Mr. R. Morton third.

THIRD DIVISION.

This division is for amateurs only, while in the two previous divisions the trade are admitted.

In this division Mr. G. D. Ford, Acocks Green, led for six bizarres and flakes, followed in order by Mr. C. A. Linzee, Alresford; and Mr. J. J. Sheldon, South Woodford. For six selfs, Mr. G. D. Ford was again the chief prize-winner, and he showed well; Mr. C. Alcock, Liverpool, second, and Mr C. A. Linzee third; ten competitors.

Mr. C. A. Linzee led for yellow ground fancies with R. Buchanan, Sam Weller, Orlando, Pasquin, Linkman, and Orlando Sport; Mr. C. Alcock second, and Mr. G. D. Ford third; ten entries. Mr. Ford was also to the front for six white ground picotees; Mr. E. J. Price, Bourneville, second, and Mr. J. A. Fort, Winchester, third. For yellow ground picotees, six blooms, Mr. J. J. Keen, Southampton, was first; Mr. C. A. Linzee second, and Mr. G. D. Ford third.

In the undressed section Mr. C. Alcock led for three pink or rose selfs with Lady Hermione; Mr. E. J. Price, Bourneville, second with Camilla. For three blooms of a white self Mr. Alcock scored with Sir Galahad, and Mr. E. Charrington, Limpsfield, second, with Mrs. Eric Hambro. Mr. E. J. Price scored for three crimson blooms with Ashantee, Mr. C. A. Linzee second with the same variety. Mr. C. Linzee led for three yellow selfs with Daffodil; Mr. F. E. Gray, Leyton, second with the same variety. Mr. D. Linzee scored for three scarlet flowers with Brigadier; Mr. D. Walker, Kilmarnock, second with Cardinal.

Mr. D. Walker scored in the terra-cotta class with Mrs. R. C. Cartwright, and Mr. E. J. Price was second with the same variety. Mr. Price led for a yellow ground picotee with Goblin; Mr. E. Charrington second with Togo. For a yellow ground fancy Mr. C. Alcock led with Lord Steyne and Mr. J. Fairlie, Acton, second with Ronny Buchanan. Mr. C. A. Linzee led for a light ground fancy with Sebright; Mr. J. Fairlie second with Millie. For a self of any other colour than previously mentioned Mr. C. Alcock scored with Duchess of Wellington, a silvery heliotrope; Mr. E. J. Price second with Cantor, purple-crimson. For six varieties of selfs or fancies Mr. J. Fairlie led the way, followed in order by Mr. C. Alcock and Mr. D. Walker.

In the fourth division, for small growers, there were many flowers that showed evidence of great skill and care, and suggested some strong competitors in the future. The chief prize-winners in this division were Mr. J. H. Linington, Newport; Mr. W. T. Ball, Chippenham; Mr. S. J. Payne, Woodford Park; Mr. C. A. L. Brown, Hatfield Peveril.

MARTIN SMITH CLASS.

In the Martin Smith Memorial Class for a dozen selfs, fancies, and yellow ground picotees, three flowers of each, undressed, there were four competitors, and here Mr. H. R. Taylor, Cheam, scored with fine flowers of H. Buchanan, Lord Steyne, Maud Allan, Ophir, Sultan, Cardinal, Duchess of Wellington, Miss Willmott, Togo, Carnival, Erl King, and Snowflight. Mr. R. Morton, Woodside Park, second, and Miss Schiffner, Lewis, third.

OPEN CLASSES.

In the open section for nine flowers of undressed blooms, one variety, Mr. J. Douglas did well again. For a pink or rose self Mr. Douglas was first with grand flowers of Miss Willmott; Mr. A. R. Brown, King's Norton, second with the same variety. Mr. Douglas led for white selfs with Mrs. T. E. Henwood; Mr. A. R. Brown second with Sir Galahad.

For a crimson variety Mr. Douglas scored with Agnes Sorrel in fine form; Mr. A R. Brown second with Ameer. For a yellow self Mr. Douglas led with lovely flowers of Daffodil, Messrs. Phillips and Taylor, Bracknell, second with Red Rover. The best nine flowers of a yellow picotee were of Ophir, from Mr. H. R. Taylor; Mr. Douglas second with Margaret Lennox. Mr. Douglas scored for a terracotta variety with a fine bunch of Mrs. Griffiths Jones; Mr. Lehmann, Thornton Heath, second with Elizabeth Shiffner. Mr. Douglas was first for yellow ground fancies with Pasquin (see illustration); Mr. H. R. Taylor second with Ronny Buchanan. For a white ground picotee Mr. Douglas scored with Delicia, and Mr. H. R. Taylor was second with Nizam.

FLORAL DECORATIONS.

Mrs. A. Robinson, Carshalton, won first prize for a table decoration of carnations with a pleasing exhibit of yellow flowers; there was, however, a rather too free use of greenery. Mrs. E. J. Price came second with a pretty table of Mrs. H. Burnett carnations.

NON-COMPETITIVE.

Herbaceous phloxes were the feature of a large group of hardy flowers put up at the end of the hall by Messrs. Barr and Sons, Covent Garden; Lady Hermione, Jung-frau, L'Aiglon, Pharaoh, Antonin Mercie, and Etna were conspicuously good varieties. Lythrums, lysimachias, senecios, heleniums, and coreopsis were also represented. Messrs. J. Peed and Son, West Norwood, put up a group of perpetual border and Malmaison carnations, these being chiefly represented by growing plants in pots; the crimson-scarlet Malmaison variety Mrs. J. Coles was largely shown.

Roses were exhibited by Messrs. Stuart Low and Co., Bush Hill Park, Enfield, the principal varieties on view being Liberty, Lyon Rose, Joseph Lowe, Betty, Frau Karl Druschki, Mrs. W. J. Grant, and Madame Abel Chatenay. A few ferns or rose foliage along the front of the group would have greatly improved it. Mr. H. Lakeman, Queensberry Nursery, Thornton Heath, displayed border and perpetual carnations in good style, and he showed yellow ground fancies and picotees in good condition and considerable variety. Messrs. H. B. May and Sons, Edmonton, submitted a fine lot of choice ferns, campanulas, etc. Messrs. G. and A. Clark, Dover, showed hardy flowers.

A large and attractive group of carnations, well arranged, was set up by Messrs. Wm. Cutbush and Son, Highgate, N. Here in large vases were staged some charming blooms of Lady C. Waring, Enchantress, Mrs. Burnett, Harlowarden, Mrs. W. T. Omwake, Mikado, Countess of Onslow, White Perfection, and Victory, and such Malmaisons as Soult, Blush, etc. Mr. A. F. Dutton, Iver, Bucks, showed a number of good bunches of well-grown carnations, and put these up in good style. From Mr. Charles Turner, Slough, came a group of carnations in pots, all sections being represented by bright flowers of leading varieties. Mr. Williams, Oxford Road, Ealing, submitted a table of rustic flower stands filled with carnations.

Strawberries.—There must now be no delay in preparing a compost for strawberries to be shifted into their fruiting pots. A suitable one consists of heavy moderately [illegible] loam at the rate of three barrowloads to [illegible] of pulverised dry horse manure, with the addition of a seven-inch potful of soot. The should be well mixed, and in a moderately dry condition when used. The pots should be clean, and in arranging the drainage place a piece of wire gauze beneath the crocks to exclude earthworms. In potting, which should be done as soon as the plants layered in small pots are well rooted, [illegible] the compost tolerably firmly, and leave sufficient space upon its surface for the convenience of watering. Arrange the pots closely together as the potting operations proceed, upon a firm bed of ashes [illegible] in an open sunny position, so that they [illegible] shade each other. In due time arrange them far enough apart to prevent crowding. Remove runners as they appear, attend to necessary watering, and in fine weather syringe overhead in the morning and evening.—COOMBER.

SIX GRAND SINGLE ROSES.

Among the numerous single roses, or those only slightly removed from being single, the following half a dozen are head and shoulders above the rest. Singles are more fugitive than doubles, but those named last longer than the majority, and have the additional charm of being thoroughly perpetual, and produced in such large trusses that a constant display is assured.

Irish Elegance cannot fail to please. It would be difficult to imagine a more decorative rose than this. It is a capital grower, and keeps in good shape. From the very first opening of its buds these are full of charm. Certainly few varieties are more suited for a vase. The colour is bronzy-orange in the bud, changing to various shades of apricot. Of branching habit, and the trusses well spread out. It needs a good single to gain the National Rose Society's gold medal, but this succeeded.

Maharajah has very large flowers, these being four and a-half to five inches in diameter. This is not nearly so handsome in the bud stage, but opens into a grand flower of the deepest velvety crimson. Very rich golden anthers heighten the effect, which is also helped by the exquisitely dark green foliage surrounding the flowers. The petals are of great substance. It generally has three buds to a truss, and these open in succession even when cut. It makes a useful decorative variety for the home, while as a pillar rose it has few equals in its class. It is an early bloomer, and produces a second display in the autumn. I find it better to prune less than in the case of most varieties.

Gottfried Keller appears to be a cross between the well known Austrian Copper Briar, but, unlike that variety, is a perpetual bloomer, although not equal in that respect to Irish Elegance. It is not quite single. The flowers are apricot with golden-yellow centre, and the outside of petals dark yellow. Very beautiful.

Irish Beauty is a pure white, and is one of the freest flowering and sweetest scented roses we have. The golden anthers are very prominent, and the large trusses make a grand display throughout the season. This is another capital grower.

Bardou Job is about as far removed from being single as Gottfried Keller. It has a large flower of bright glowing crimson, sometimes distinctly shaded with maroon-purple, and accompanied by handsome foliage. It is a good and free grower, but rather impatient of the knife, and often throwing out rather awkwardly placed shoots; is best trained to a pillar.

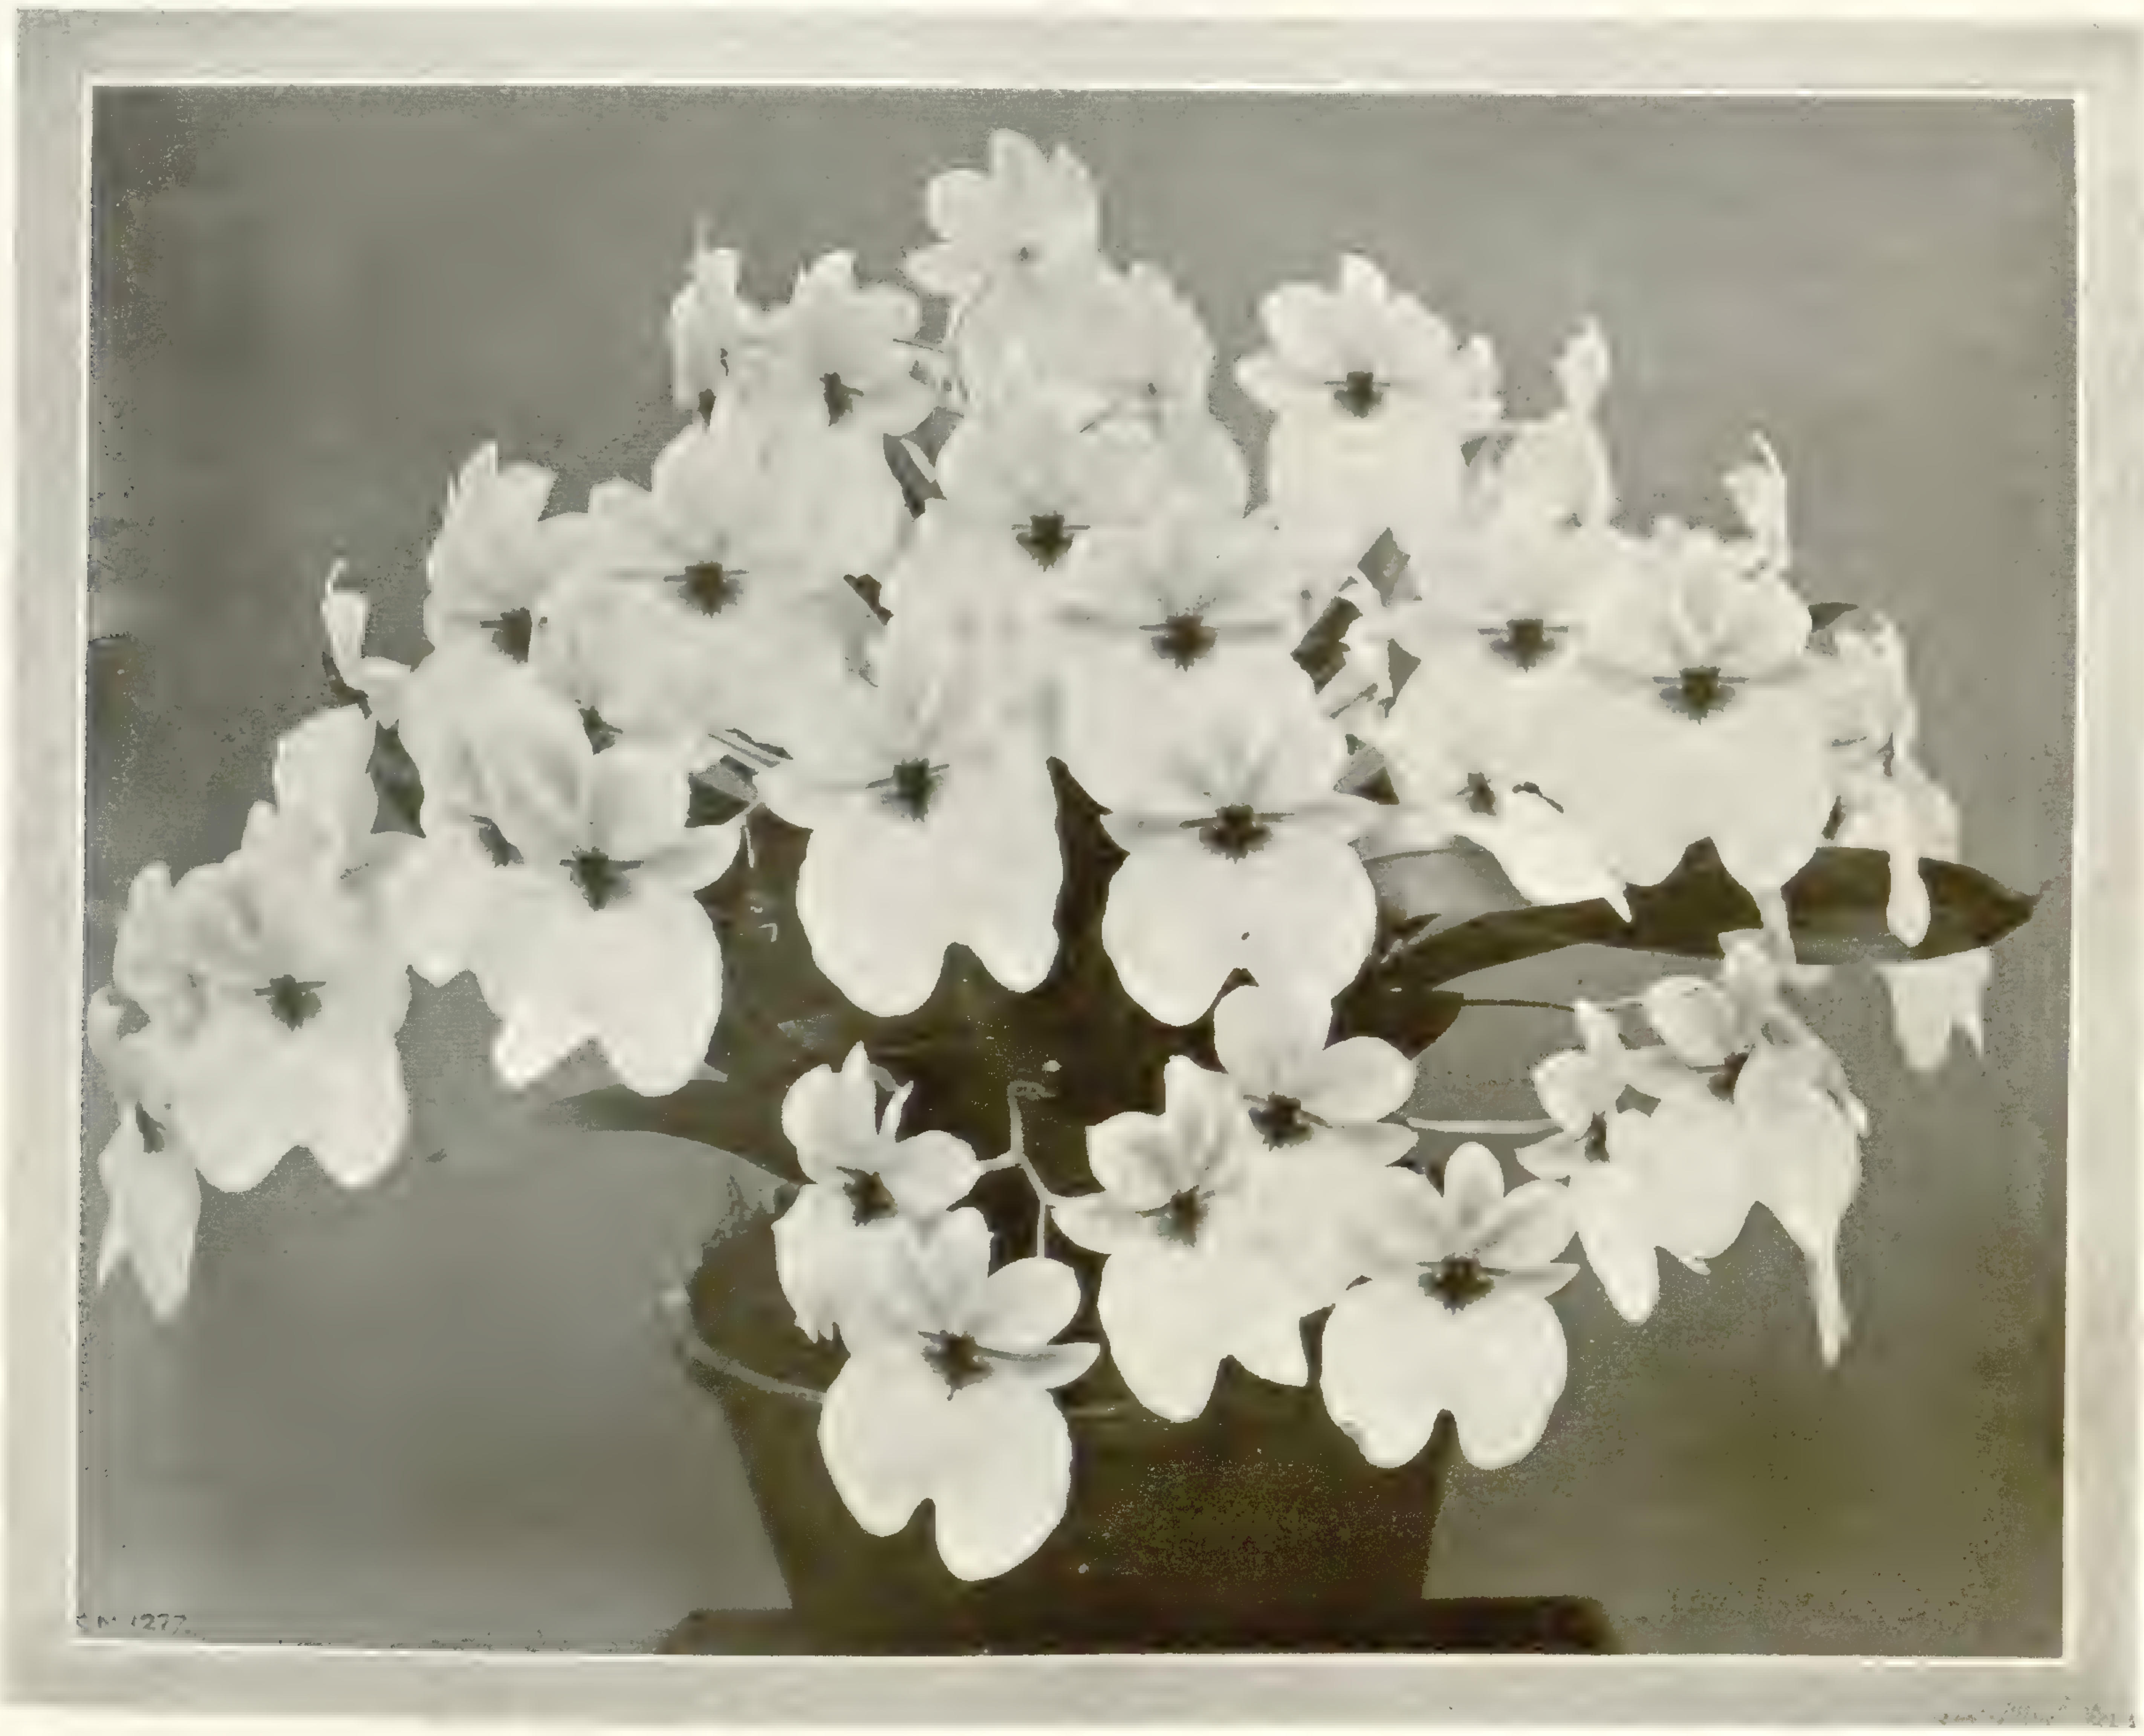
Simplicity. Of this variety I cannot speak so definitely as of the others, but so far as seen this new rose has shaped exceedingly well. The blooms are not quite a single, and they are pure white, of great size, and peculiarly cupped. It has an upright habit, and flowers on laterals. I think very highly of it, or I could not see my way to include so new a rose in this select list.

The above have one advantage over most singles because they are not merely summer bloomers as the majority, but give a lasting show of beauty. One point should not be lost sight of, and that is the way in which the blooms travel. Cut while in the bud stage, and packed firmly, they expand upon arrival, and appear almost as fresh as when upon the tree, and a very large number of buds can be packed into a small box. None of the above are wild, rampant growers like the Wichuraianas.

A. P.

MILTONIA VEXILLARIA VIRGINALE.

The effectiveness of good plants of Miltonia vexillaria when in full bloom is well known to all lovers of orchids, and the only regret in connection with the plants is that the flowers are not among the most suitable for cutting, as they show the effects of the smallest bruise quickly. To those who know only the rich rosy-flowered type of Miltonia vexillaria the distinct varieties found in the larger and more select collections of orchids come as a revelation. In some of these the size of the flower is greatly increased, and in others the colouring is intensified. In others again the marking at the base of the broad lip is altered, shortened or extended, lighter or darker. In a few of the varieties the whole flower is white or whitish, and these form a section of exceptional loveliness. One such variety is represented in the accompanying illustration; it is M. vexillaria virginale. In this the flowers are white, with the sepals and petals shaded with rosy-pink. The disc, or base of the lip, is yellow, with a reddish stain. The specimen shown is a fine one from Lieut.-Colonel Sir G. Holford's collection, at Westonbirt; it carried about a dozen spikes of bloom, and was greatly admired when exhibited by the clever grower, Mr. H. Alexander, before the Royal Horticultural Society.



A FINE SPECIMEN OF MILTONIA VEXILLARIA VIRGINALE.
Flowers white; sepals and petals shaded with rose-pink.

SOILS AND MANURES IN RELATION TO PLANT GROWTH.

In the growth of crops we know that some of the raw materials are taken from the atmosphere and that others are taken from the soil; we also know that the raw materials which are actually used in building up and constructing the plants are carbonic acid, a colourless gas, taken in by the apertures in the leaf from the atmosphere, and water taken up by the roots from the soil and transmitted to the leaf by the stem. We learn, further, that the sap of the plant is conveyed away from the leaf to certain minute bags, botanically termed cells, of which there are such a large number in the stem, and there stored up for future use in building up new shoots and roots. Further, we learn that the ultimate reserve which is stored up at the end of the period of growth is stored up for the purpose of constructing its flowers, fruit, and seed by means of which in the primitive state the plant propagated itself and perpetuated its species.

Constituents of Plant Food.

Besides carbonic acid, the colourless compound gas from the atmosphere, and water from the soil, the growing plant also requires nitrogenous compounds in the form of nitrates, as well as mineral substances—potash, lime, phosphates, etc.—and these are obtained in very weak solution from the soil. All these raw materials are absolutely necessary for the existence of all plants. Taking them as a whole we find that carbonic acid is obtained from the atmosphere, and that water, nitrogen compounds and mineral food are obtained from the soil.

Now the gardener looks at the growing plant from a somewhat different point of view from which the plant would regard itself. The gardener regards it as a factory for making flowers or fruit, or for the construction of green leaf tissue; it is, therefore, natural that he should aim at supplying these raw materials in the most favourable form, and in the maximum quantity, so far as it can be made use of for the purpose of turning out the maximum quantity of manufactured material that is required.

The gardener will ask in what way he can influence the supply of plant food. If he turns his attention to the atmosphere he will conclude that this is quite beyond his control; he cannot increase or modify the carbonic acid gas, neither can he increase the amount of sunlight, nor increase nor modify the temperature of the atmosphere. Consequently he will have to confine his attention entirely to the plant itself, and to the soil in which it lives. He will devote his attention to the former with a view to securing the most efficient and healthy kind, and also with a view to finding a variety which will produce the maximum crop of the desired product under favourable conditions. And when he has done that he will devote his attention to the soil. He will try and learn all that he can about the soil with a view to obtaining a maximum return. No apology is necessary to the gardener for suggesting a careful study of the soil he cultivates. We all know that large sums of money are spent annually in forking and ploughing and hoeing, and in other forms of tillage; also that the application of manure, whether natural or artificial, is exceedingly expensive; therefore it is necessary that we should understand the origin and composition, and methods of improving the soil.

Origin and Formation of Soils.

Soils are formed by the activity of certain natural agents upon rocks. These agents are the atmosphere, rainwater and flowing water, alternating heat and cold, the influence of vegetation upon primitive soil, and finally the activity of certain organisms in soil—"biological" activity, we call it—because it is the activity of living organisms that have their abode in the soil.

With regard to the action of the atmosphere upon rocks, the atmosphere consists of three gases—nitrogen, oxygen, and carbonic acid; and in 10,000 pints of air we will find approximately 7,906 pints of nitrogen, 2,090 pints of oxygen, and four pints of carbonic acid.

The importance of all this with regard to the formation of soils is that oxygen combines with certain ingredients found in rocks, particularly with iron, to form powdery "rusts" which crumble down and cause the mass of rock to drop into fragments, and these fragments constitute some of the most important constituents of soil.

Harpenden. J. J. Willis.

(To be continued.)

RED SPIDER AND PERPETUAL CARNATIONS.

It has been the wont of the inexperienced in times past to associate carnations with disease. If an attempt to grow the divine flower failed it was not the fault of the grower, but that of some disease. But now that the flower's simple requirements are becoming more generally known we hear less mention of disease. Why, even rust, which used to so unnerve quite experienced gardeners, has now lost its dread, not that the danger of it is less, but simply that we understand it more, and know how to cope with it in the right way.

In my opinion I believe that the common pest, red spider, is, without the slightest exaggeration, the most difficult of all pests to effectively fight, and conquer. Stigmonose and several similar diseases are nothing more nor less than the after effect of this little pernicious insect, which is capable of doing more harm than what it is generally credited with. The present is undoubtedly the best and easiest time of the year to fight it, because the growth is free, and in a sufficiently hard condition to allow of remedies being used with a minimum amount of ill effect upon the plant.

In my experience I have not found any vaporiser or fumigant that is able to exterminate red spider, and nearly all the effective remedies are used in a liquid form. To simply charge the atmosphere with moisture in a greenhouse will not destroy red spider, and does but little to check it. A well-directed force of water must strike and dislodge the insects, and so check their increase, and, no matter what liquid agency you use, the force with which it strikes the insect plays quite an important part, if, indeed, it is not the crux of the whole matter. Many of the best American carnation growers declare that clear water is the best remedy, with adequate pressure behind it, and our friends across the Atlantic have cause to know more about red spider than we.

However, the following are good preparations, of which I can speak with personal experience:

Dissolve 1oz. of common salt in a gallon of water. This should be sprayed in the early morning with a very fine spray, reaching every part of the plant, particularly the underside of the leaves, and a few hours after it should be washed off with the hose or syringe. This is not done with the idea of washing off the salt, because that would do no damage if it remained, but it is to wash off the red spider, many being then in a half-dead state.

Boil a half-pound cake of ivory or common yellow soap in a gallon of water until dissolved. When applying this liquid dilute with clear water one to ten. This should be applied early in the morning, and washed off later in the same way as recommended for salt water, except do not spray it on in the first place with quite so much pressure, the object being to coat the entire plant over with the soap solution in the first place.

Of course there are many other remedies, but the above are, perhaps, the best for this season of the year.

Montagu C. Allwood.

LAYERING STRAWBERRIES.

The time is once more here when the work of layering strawberries must receive attention. Layers intended for pot culture and for forcing should be dealt with first. The point to which I wish to specially refer now is the method of fastening the layer in the compost in the small pot. I know that some cultivators lift rooted layers and pot them. It is not a course I would take. Others use squares of turf, and duly pot the rooted layers; others, again, layer directly into the fruiting pots. This plan I cannot recommend because the compost must remain for such a long time before the pots are filled with roots, and is liable to become sour. The majority use small pots, and, in due course, shift into fruiting pots. This is the method I advise any inexperienced cultivator to adopt. With regard to the manner in which the layers are made secure in the soil in the small pots, I prefer flat stones. They are easily procured, readily applied, and keep the soil in the pots moist, thus hastening the formation of new roots, and so enabling the cultivator to have his young plants well forward. Pegs make the layers secure, but do not prevent the soil drying up, thus less labour is required in the matter of watering when stones are used. The first strong layers should be secured, and these are available while the fruits are ripening: some persons do not limit the number of layers from the different plants, but use as many as they can procure. Now, I think three are sufficient, as there is a big strain put upon the old plant just at this stage, and we want the young plants to be as strong as possible.

G. B.

Rhododendron Countess of Haddington.—Mr. W. A. Cook [illegible] 486) is quite in error in referring to [illegible] rhododendron as a Nuttalli cross, as [illegible] a hybrid between R. Dalhousiæ and R. [illegible] tum, which is, indeed, evident from [illegible] spection of the three when in flower. [illegible] only is this the recognised parentage [illegible] R. Countess of Haddington, but from [illegible] flower of R. Dalhousiæ fertilised with [illegible] pollen of R. ciliatum I obtained plants which, when they bloomed, proved to be identical with Countess of Haddington itself.—W [illegible]

Crotons and Dracænas that [illegible] intended to be grown into specimens, [illegible] have done well during the early part [illegible] summer, may require a further shift to [illegible] them through the winter. This should [illegible] done at once, so that they may become [illegible] established in the new soil before [illegible] begin to shorten to any appreciable [illegible] In most instances rather lighter soil may [illegible] used than when potting in the spring, and [illegible] roots taking to this more freely, and [illegible] is not the likelihood of their being [illegible] watered during the winter months.—[illegible]

NEW PLANTS, ETC.

CATTLEYA O'BRIENIANA ALBA.

Cattleya O'Brieniana is supposed to be a natural hybrid between C. Loddigesi and C. Walkeriana, and it has rosy-purple flowers, but the variety alba is a distinct albino, and its only colour is a little pale yellow stain in the throat of the lip. The rest of the shapely flower is pure white. F.C.C., R.H.S., July 19. Messrs. Stuart Low and Co., Bush Hill Park, Enfield.

CATTLEYA WARSCEWICZI LOW'S VAR.

A grand plant of this superb variety was shown, carrying fourteen splendid flowers. The flowers are large and of rich rosy-purple colour, while the lip is almost wholly deep crimson-purple, with a very small yellow mark on each side of the throat. F.C.C., R.H.S., July 19. Lieut.-Colonel Sir George Holford (grower, Mr. H. Alexander), Westonbirt Gloucester.

CATTLEYA ARTEMIS.

This very pretty hybrid, between Cattleya Iris and C. Gaskelliana, has pink sepals and petals, and a handsome crimson-purple lip that is edged with pale rose, and has an orange-shaded centre and white throat. A.M., R.H.S., July 19. Lieut.-Colonel Sir George Holford, Westonbirt, Gloucester.

ONCIDIUM SANDERÆ.

This new orchid resembles O. Kramerianum in many respects. The narrow upper sepals and petals are purplish brown; the lower and broad sepals are bright golden yellow, marked with red: and the handsome yellow lip has red marginal markings. A very showy species. A.M., R.H.S., July 19. Messrs. Sander and Sons. St. Albans.

PESCATOREA LAMELLOSA.

An interesting orchid, closely allied to P. cerina. It has creamy-yellow flowers with dark purple markings on the raised crest of the lip. A.M., R.H.S., July 19. Messrs. Charlesworth and Co., St. Albans.

MILTONIA VEXILLARIA LAMBEAUIANA.

This very beautiful variety has large pure white flowers with pale yellow disk at the base of the lip, and a few rosy lines around it. A.M., R.H.S., July 5. Messrs. Sander and Sons, St. Albans.

CALENDULA DOBBIES' STRAIN.

A grand strain of double calendulas with flowers four inches across, and varying in colour from pale yellow to richest orange. A.M., R.H.S., July 5. Messrs. Dobbie and Co., Edinburgh.

ASTILBE ARENDSI.

The above title has now been given to the useful race of hardy astilbes raised by crossing A. Davidi with A. floribunda and other kinds, but A. Davidi has in each case been the pollen parent, because, as a seed parent, A. Davidi produces strong-growing but shy-flowering progeny.

A. Arendsi Venus.—This has bright rosy-violet flowers, and has an excellent habit. A.M., R.H.S., July 19. Mr. Arends, Ronsdorf, Germany.

A. Arendsi Salmon Queen.—A charming variety with lovely plumes of salmon-pink flowers. A.M., R.H.S., July 19. Mr. Arends, Ronsdorf, Germany.

COSMOS ROSE QUEEN.

A beautiful and graceful garden flower with much divided foliage, and pretty single flowers three inches across, rich rose colour with yellow disc. Illustrated on p. 567 in our issue of July 23. A.M., R.H.S., July 19. Messrs. Dobbie and Co., Edinburgh.

RAMBLER ROSE FLAME.

A beautiful new rose of the rambler or multiflora type. It is said to grow about 9ft. high. The flowers are of a rich and bright shade of rosy pink with light centre; they are semi-double, and produced in large and effective clusters. A.M., R.H.S., July 19. Mr. Charles Turner, Slough.

CARNATION ROBERT BERKELEY.

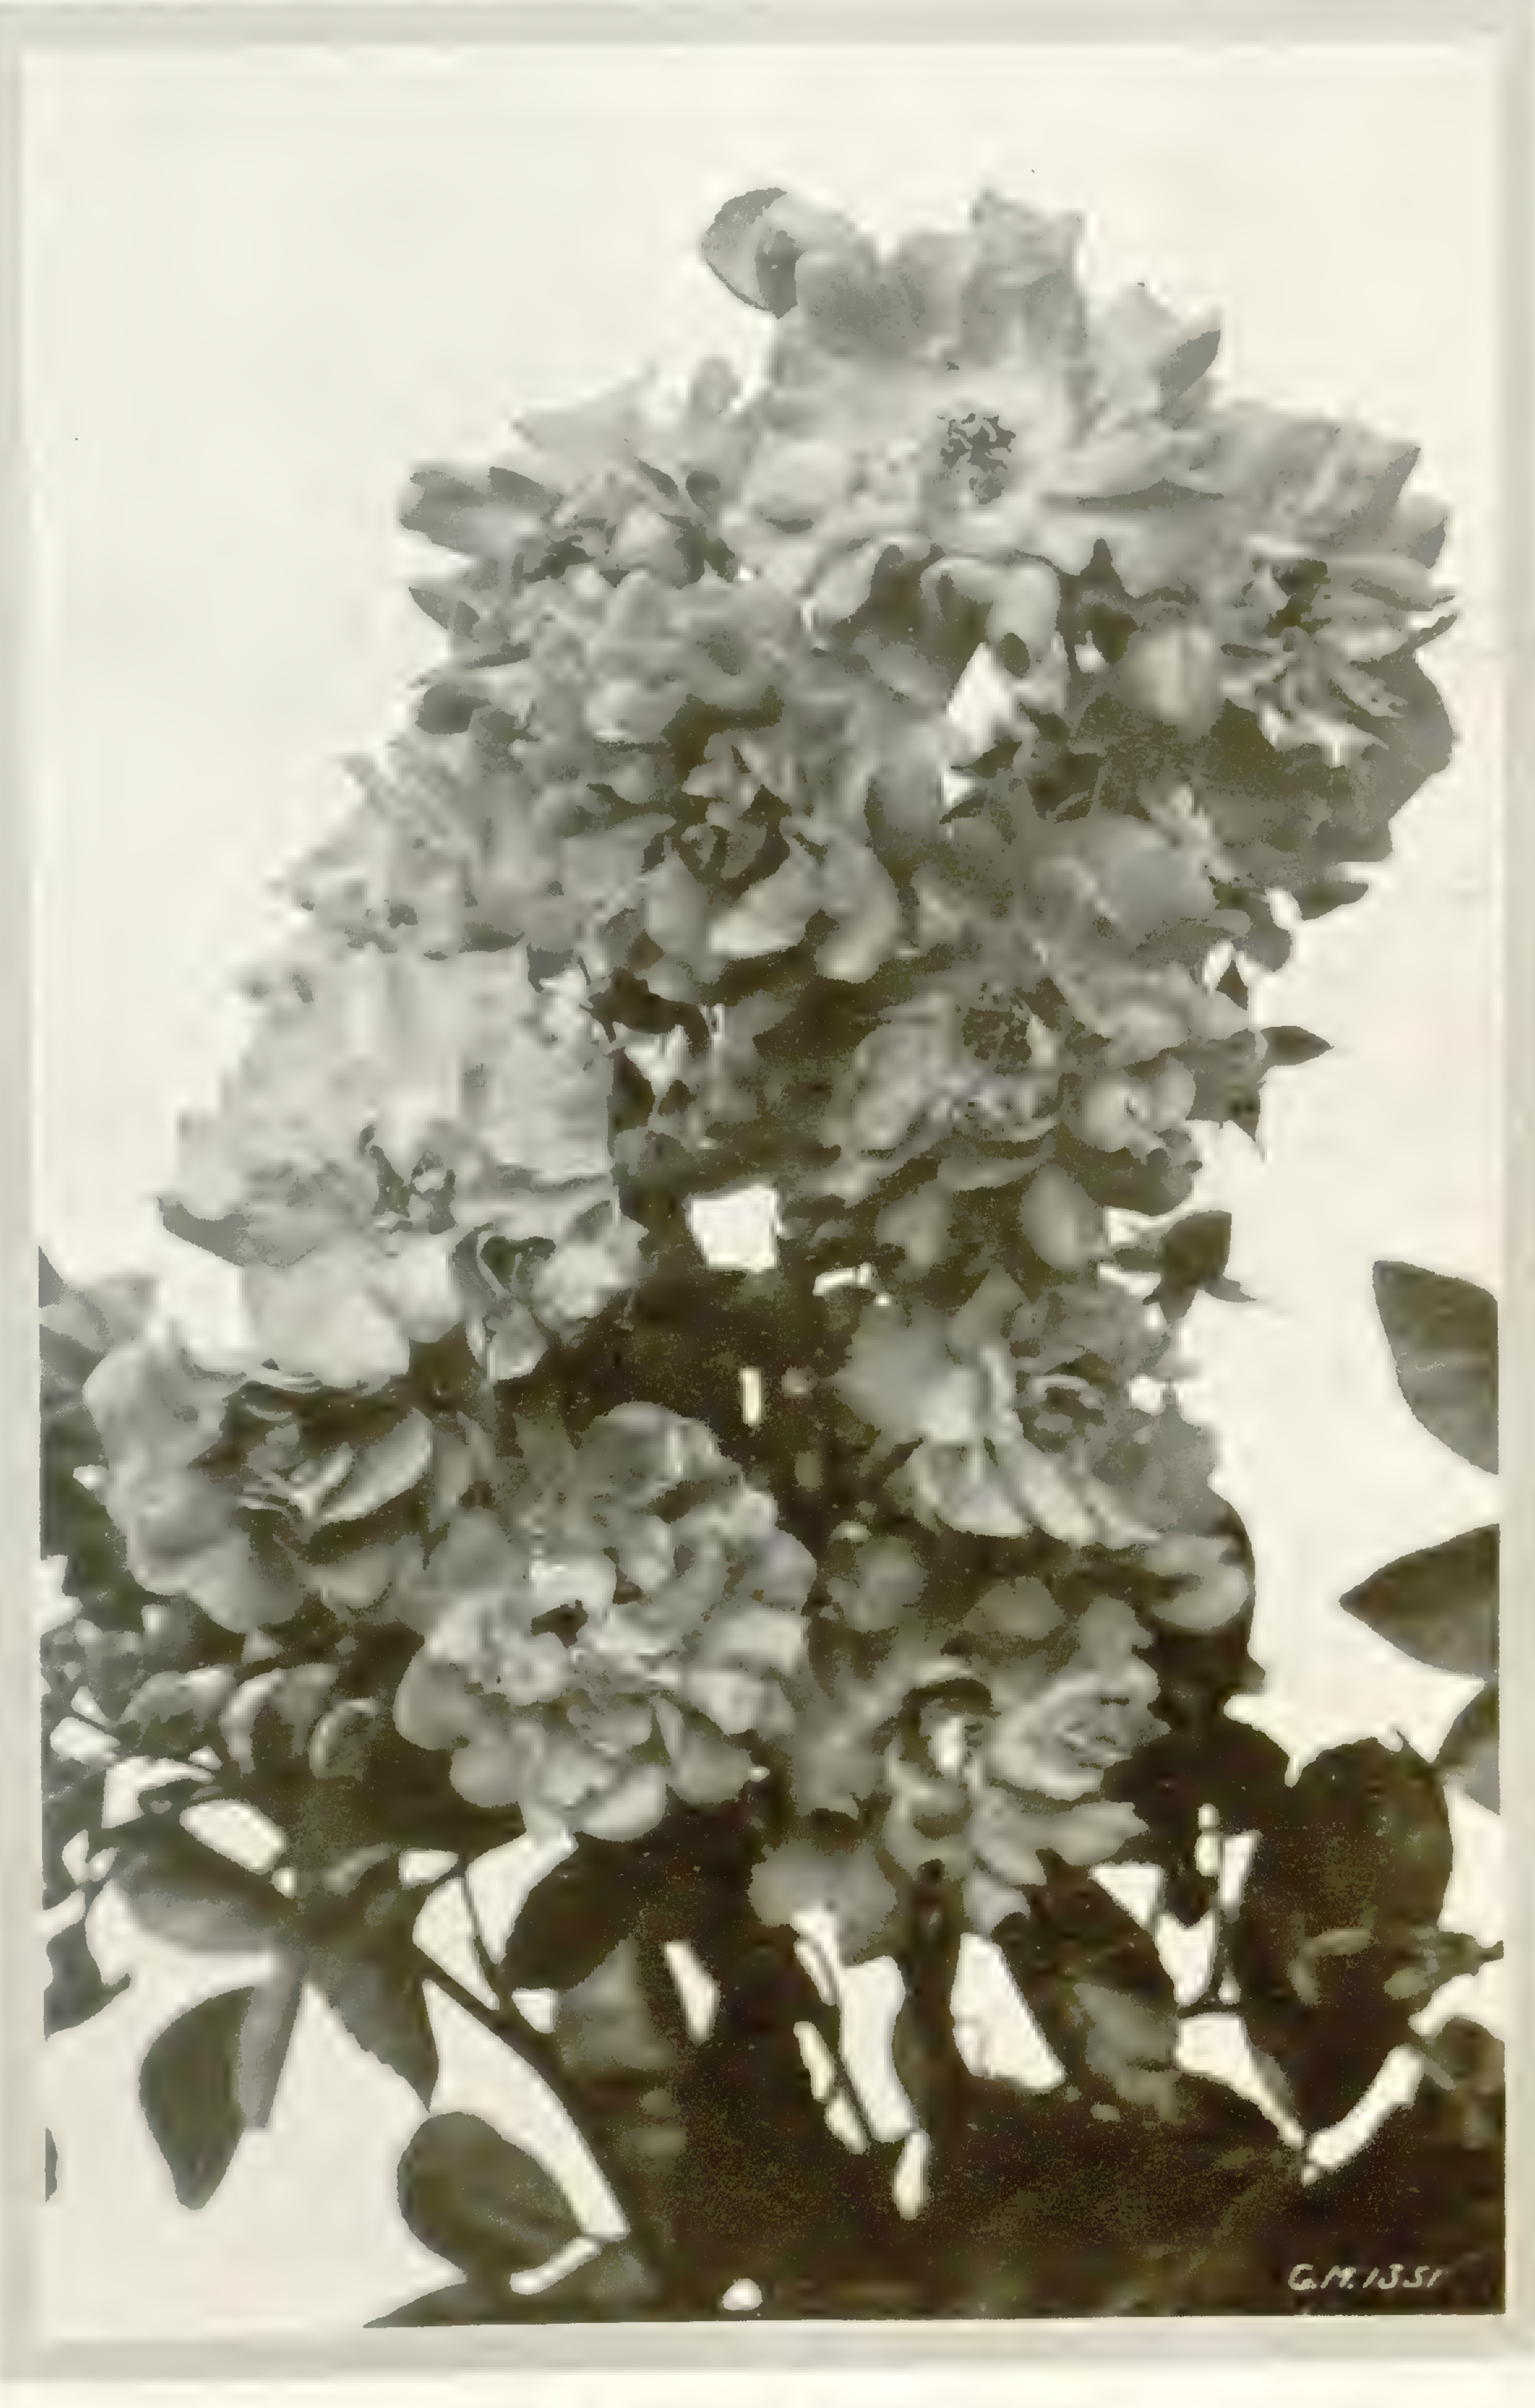
A refined border carnation of excellent form, and of a soft pink shade. A.M., R.H.S., July 19. Mr. Jas. Douglas, Great Bookham.

BOUVARDIAS.

Bouvardias generally bloom most profusely in the autumn and during the early part of winter; their lovely flowers are so useful that they are always much appreciated. During the first three months of the new year the plants, if properly cared for, will continue to bear flowers. As a rule amateurs are afraid to subject them to a cool temperature, and it is a mistake to keep them in a rather high temperature. Of course, the later blossoms are borne on the younger shoots, and these must not be unduly forced in a very warm house. Keep them well exposed to the light, and when the weather is mild enough air must be admitted freely, else the plants will be considerably weakened, both for growing on again and the production of cuttings. Old plants that are being grown on in pots should be supplied judiciously with some approved artificial manure. In this way the growth will be strengthened and flowers be freely produced.

Inexperienced cultivators are very often much puzzled to know what kinds of plants are the best for winter flowering in a temperature of about 55 deg. to 60 deg. The bouvardias are most suitable, especially where sprays and button-holes are in constant request; and, furthermore, they can be grown in the open during the summer months; either in pots or planted out. But I advise those who have not had any experience of the planting-out method to keep all the plants in pots and partially plunge them in a bed of ashes in an open position. A piece of slate or tile should be placed under each pot to ensure free drainage and prevent worms entering.

G. B.



NEW RAMBLER ROSE FLAME.

Flowers rich rose-pink, and produced in large clusters. A.M., R.H.S., July 19. Mr. Charles Turner.

DELPHINIUMS.

The delphinium is a power in the flower garden, and that power is increasing each year. What is it that makes the delphinium so popular? Surely its stateliness, its great beauty and effectiveness in the garden and the ease with which it can be cultivated. Some of its popularity is due to the raisers of new varieties, for undoubtedly a wide range of form and colour in any good garden flower ensures a large patronage, as so many tastes are provided for. Delphiniums will grow in almost any kind of soil and situation, but there is a marked difference in the results obtained when good culture and an open position are afforded, as compared with poor culture, over-crowding, and a position overshadowed by trees. Some amount of shelter from the prevailing winds is a great advantage to delphiniums, because their succulent stems are readily snapped by wind pressure unless there are several ties and a stake, and even these are not wholly successful when the clumps are large ones and a half-gale follows rain. Good soil, mulching, due thinning, and careful staking are the chief points to be remembered in delphinium culture.

DELPHINIUM BELLADONNA SEMI-PLENA.

A distinct and beautiful variety with semi-double light blue flowers. A.M., R.H.S., July 5. Mr. Amos Perry.

But good culture will not turn a poor and out of date variety into a good one, therefore every garden lover should add some new varieties to his collection each year. A visit to such a collection as that formed during the last few years by Mr. Amos Perry, of Enfield, would enable one to select a fine set of pleasing varieties, these ranging in colour from almost pure white up to intense blue-purple, through all shades of lavender and light and dark blue. There are single, semi-double, and double varieties, and there is some variation in the length, form, and density of the spike, so that every taste seems to have been provided for. Some delphiniums bloom earlier than others, therefore some care should be exercised in making a selection so as to secure as long a flowering season as possible.

For those unable to visit the collection at Enfield Mr. A. Perry provided a splendid opportunity at the recent fine exhibition at Holland Park, when he displayed hundreds of varieties, and some thousands of glorious spikes of bloom in great groups, quite filling one tent with a superb exhibit of these grand hardy flowers. It is safe to assert that never has there been such a magnificent exhibit of delphiniums as this one was. There were six great groups, and one of these is shown in part in the present issue.

It is not the purpose of this note to discuss varieties at any great length; but Mr. Amos Perry has a remarkable collection of all the finest varieties obtainable in addition to a large range of seedlings. Varieties of Delphinium belladonna have been brought very prominently to the front by him, and Lamartine is one of these, and its deep violet-purple flowers are very pleasing. The semi-plena variety, of which an illustration is given herewith, is another fine thing; it is not too double, but just double enough to enable the flowers to last longer than if they were single. Persimmon, Amos Perry, Carmen, Duke of Connaught, Lizzie, King of Delphiniums, Sir George Newnes, La France, Mdme. Violet Geslin, Blue Fendre, and Rev. E. Lascelles, are a few other varieties of surpassing loveliness, seen both at Holland Park and at Mr. Perry's nurseries at Enfield.

A FINE CORDON PEAR.

The variety Durondeau, is a very handsome pear, and when the trees are planted near walls and treated as cordons some excellent specimens may be obtained. A number of years ago, when I took charge of a large garden enclosed and sub-divided by very high walls, which were supported by strong buttresses, I planted a cordon fruit tree in the front of every buttress. Knowing how adaptable the variety Durondeau was to such treatment, I planted quite a large number of trees, and did not afterwards regret doing so. It was quite an easy matter to grow fruits equal to those seen in fruiterers' shop windows, and priced at sixpence and ninepence each. As the tree on the front of the buttress was very prominent it received the maximum amount of sunshine, air, and light, with the result that the wood and buds matured well and the fruits attained to a large size and were very highly coloured three-parts of the way round instead of, as in many instances, on one side only. The variety is a free grower and clean, and does best on the quince stock.

G. B.

Combretum purpureum.—As might be expected of a native of Madagascar, this needs the temperature of a stove for its successful culture. It is quite distinct from any other occupant of the same structure. It has a climbing habit, and is furnished with neat evergreen leaves and light scarlet flowers, several of which are [illegible] together to form a loose, somewhat [illegible] panicle. It flowers from now onwards for a considerable time. It was introduced as long ago as 1818, and is sometimes met with under the name of Poivrea coccinea.—W. T.

NOTES FROM KEW.

Posoqueria macropus.

Many members of the order Rubiaceæ, to which the posoqueria belongs, have blossoms with long tubes. Well known examples are to be found in the bouvardias, but in Posoqueria macropus this feature is greatly pronounced. The plant in question forms a rather upright branching shrub, clothed with oblong-shaped leathery leaves. The flowers, borne in good-sized corymbs, consist of a long slender tube nearly a foot in length, while the expanded mouth, like a five-pointed star, is 1½ inches or so across. The flowers are white, and very fragrant. From the great length of their tubes the flowers of this posoqueria are partially drooping, and present a most singular, yet striking appearance. The species under notice is a native of Brazil, from whence it was introduced in 1896. A specimen of it is just now in flower in the stove compartment of the T range.

Impatiens Hawkeri.

When this species of balsam was first introduced from the Sunda Isles, in 1886, comparatively few members of the genus were generally grown. Now, however, with later introductions, the case is altogether different, and numerous kinds of impatiens are to be met with in gardens. The well known Impatiens Sultani was distributed some three or four years before I. Hawkeri, and the appearance of this last, with its richly-coloured blossoms, aroused much interest. Unfortunately, however, I. Hawkeri proved to be very susceptible to the attacks of a small mite, such as often affects begonias, and so badly does the balsam suffer that it is now not often met with. In the intermediate portion of the T range a good example is, however, flowering freely. The flowers are larger than those of I. Sultani, and of a rich carmine-red shot with purple.

Gloriosa Carsoni.

This, which has been by some writers referred to as a less pronounced climber than some of the others, has mounted well up the roof of the stove portion of the T range, and is just now flowering freely. It belongs to that section with broad, smooth segments, and in shape recalls G. Planti, or virescens. The flowers are yellowish towards the centre, with the broader portion of the segments of a dull reddish tint. While some flourishing examples of the old and well known Gloriosa superba are in the same structure, the greenhouse (No. 4) furnishes an illustration of the fact that stove heat at this season is by no means necessary for this gloriosa, as under quite cool conditions it is growing freely, and, what is more, the flowers are particularly attractive by reason of their brightness of colouring.

Pelargonium echinatum.

Many of the visitors to Holland Park found a good deal to attract them in the splendid collection of species and scented-leaved varieties of pelargonium sent from the famous gardens at Aldenham. Anyone about to take up the culture of these plants must on no account overlook the claims of Pelargonium echinatum, a curious, yet at the same time beautiful species. The stems of this are stout and club-like, and furnished with rigid spine-like stipules. The lobed leaves present a greyish appearance from the profusion of silky hairs with which the upper surface is clothed. This species is very free flowering, the blossoms being borne in large branching umbels. They are not large, being individually from one-half to three-quarters of an inch across, the colour pure white, with a deep purple blotch on each of the two upper segments. It is flowering in the cool portion of the T range, and close by is P. Stapletoni, almost a counterpart of the other, but with bright rose-coloured flowers, the dark blotch still remaining. I cannot find the name of Stapletoni in any reference to hand, but it bears a great resemblance to some forms raised at Chilwell by Mr. Pearson, and given first class certificates by the Royal Horticultural Society in 1878. The varieties were named Ariel, Beauty, Pixie, and Spotted Gem. They were all a good deal in the same way. I have not met with these varieties now for some years, but was forcibly reminded of them by seeing P. Stapletoni in bloom.

Lilies.

Out of doors the lilies at Kew, as at other places, are scarcely up to their usual standard. Under glass, however, some good flowering examples are to be met with. A pretty effect is produced in the greenhouse by interspersing Lilium longiflorum with the comparatively new L. sutchunense. This last, at a first glance, suggests a slender-growing form of the Tiger lily, but closer inspection, and the appearance of the bulbs, points out a closer affinity to L. Maximowiczi, or L. pseudo-tigrinum. Dotted among the long white trumpets of L. longiflorum, and [illegible] over-

PORTION OF MR. A. PERRY'S DISPLAY OF DELPHINIUMS
At the Royal Horticultural Society's Show, Holland Park.

topping them, the bright red, gracefully reflexed flowers of L. sutchunense are particularly striking. Inside, the segments are dotted with dark brown. Under glass the flowers are decidedly paler than those which have developed in the open ground; indeed, some at the back of the Palm House, where they have been exposed to sun and air, might almost be regarded as bright scarlet in tint. This lily is a native of Western China, and first flowered at Kew in 1899 from bulbs sent by M. Vilmorin. After that it was, I believe, sent home in quantity by Mr. Wilson.

Lilium philippinense.

This pretty lily may be described as an attenuated form of Lilium longiflorum, the stem being more slender, the leaves quite grass-like, while the flower tube is very slight. It has also the pleasing fragrance of the longiflorum section. The blooms at Kew are mostly solitary, but I have seen the lily bearing three to five flowers on a stem. This lily was first collected by Gustave Wallis on the island of Luzon, in 1870, and has since been occasionally sent to this country.

Lonicera etrusca superba.

This honeysuckle, from Southern Europe, is hardy only in the more favoured parts of the country, but it has been long shown at Kew what a grand climber it is for a large structure from which frost is excluded. Both in the greenhouse and in the Temperate House it is very fine. It is an exceedingly vigorous grower, that bears immense clusters of yellow flowers, varying in depth of colour according to the time they have been expanded. They are also very sweetly scented.

K.

SILENE PENDULA COMPACTA

There are several forms of this useful annual, single and double, rose, pink, and white, none of which exceeds six inches in height under normal conditions. Its principal value is as a spring bedder, when, massed together, it produces a very fine effect, either by itself or in combination with other judiciously chosen plants of somewhat similar habit of growth. It is sometimes used for surfacing beds of spring bulbs, or taller plants, like wallflowers and doronicums, though most will agree that for many bulbs plants of a less compact habit are to be preferred. For an edging its compactness makes it eminently suitable, but the colour of the pink and rose varieties does not agree with the pink of hyacinths, the purple of aubrietia, or other similar colours.

By sowing at different times flowering plants may be obtained from spring to autumn, but we have little room for it in the summer, and it is best treated as a biennial by sowing it in the late summer for spring display. As soon as there is any spare ground in the kitchen garden in August this should be prepared as a seed bed, and the seed sown broadcast and raked in. When the seedlings get into the third or fourth leaf they should be roughly thinned to two or three inches apart, when, by October, they will make nice strong plants three or four inches across, ready to be planted in their flowering positions, and this is the best time to transplant them.

Though this cannot be regarded as a choice spring flower, or even as one of the prettiest, yet the ease with which an unlimited supply of good plants can be obtained, and a mass of colour produced, certainly give it a place in every gardener's mental list of kinds to be grown when occasion requires.

Alger Petts.

HOEING AND WATERING.

During the present season the chief work in the vegetable garden is that of hoeing, and the more time that can be devoted to this important operation the better. The Dutch hoe is an extremely useful implement for clearing soft, succulent weeds, which rapidly spring up between the rows of seedling vegetables before the latter have been thinned out. At a later stage, however, when thinning and planting out has been completed, and the ground has become consolidated by heavy rains, as they have been during the past few weeks, it is necessary to use some form of hoe that is capable of stirring the surface of the soil and breaking up hard caked surfaces, as if this is not done the plants will not grow freely.

In many cases, where the ground is hard, especially between the stronger-growing plants, such as green vegetables, and also in earthing up potatoes, it is preferable to use a fork, as the ground can be stirred to a greater depth, and any coarse lumps can be broken up as the work proceeds. Unfortunately there are many gardeners who—perhaps not through their own fault, but simply because they are denied the necessary labour—have to content themselves with the mere chopping down of weeds. This is only one of the good effects to be derived from hoeing, but it is by no means the most important one.

Considerable economy could be effected if farmers and gardeners were more certain as to the germinating capacity of the many varieties of seed which they purchase. This is why the testing of all seeds that are to be used on the farm or garden has been so much advocated from time to time. For example, in the present season I tested three varieties of mangold seed, and found that the germinating percentages were very irregular, due probably to the fact that old seed had been mixed with new. Whether this was actually the case one cannot definitely say. The same germination is, however, in evidence in the field, for since the recent heavy rains, a large percentage of the seed is germinating quite a fortnight to three weeks later than that considered to be the best-quality seed of the sample.

Again, in the garden we usually find that such crops as carrots are too thickly sown, and this is often the case with turnips, parsnips, beet, etc. Even the numerous varieties of green vegetables are frequently spoiled by thick seeding. If the thinning out, hoeing, or "singling" of these seedlings is taken in hand as soon as they are large enough to handle, all well and good; but unfortunately they are frequently left until they have become well established, when the result is often disastrous. Only the other day a friend of mine was thinning out a bed of carrots in which the plants were some eight inches or so in height. During the operation numerous carrot flies were flitting over the bed, with the probable result that they deposited their eggs by the sides of the remaining plants, especially if the soil had not been firmly replaced. In any case the risk was great, and one which should have been avoided as far as possible.

Moreover, in the case of cabbages and other green crops, if the seedlings are not soon transplanted the beds cannot be properly hoed or weeded, the plants become drawn and weak, with the result that they do not recover themselves sufficiently to make strong, sturdy growth. In planting out spring onions it is always found that tiny plants and those which have not been carefully grown on in boxes, can never make up this loss when planted in the permanent bed, however carefully they are attended to, and the same applies to most cultivated plants.

If the time devoted to watering in the garden was given to the work of hoeing or forking between the rows of plants, much better results would be secured. There are very few garden plants, and particularly vegetables, that require watering, with the exception of the following: Celery and leeks are often planted out of good soil in boxes into trenches, and afterwards allowed to suffer from want of water, whereas in order to ensure a steady and rapid growth during the growing season they should be kept continuously moist, and when thoroughly established the addition of liquid manure is highly beneficial. The same remarks apply to peas, runner beans, and onions, provided, of course, that they are not growing in soil that has been too liberally manured.

I have often seen peas growing in excessively rich soil, and making an excess of haulm instead of producing well-filled pods, and the same may be said of celery growing in moist situations and where heavy dressings of manure have been applied in the trenches. But during drought several good soakings of liquid manure undoubtedly stimulates the plants, and carries them on through the most critical period of their growth. Exhibition onions, for example, are benefited by weak solutions of liquid manure; or, if preferred, the plants may receive a dressing of finely-ground nitrate of soda at the rate of about two ounces to a square yard; but, being an active nitrogenous manure, this must not be overdone, or the growth will be so stimulated as to become rank and leafy. The time to withhold water from plants is in the autumn, as soon as they show signs of maturing; as, for example, as soon as peas and beans have set their pods, or where celery or leeks have become well developed, or onions begin to turn yellow. All liquid stimulants are then unnecessary and even harmful, as moisture in any form can no longer be of benefit.

Old Basing. J. C. Newsham.

Hydrangea arborescens grandiflora.—This hydrangea is a form of the North American Hydrangea arborescens, and differs from the type in the fact that the large, sterile blossoms, which are the showiest part of the inflorescence, are so numerous as to form a compact, rounded head. In the ordinary kind they are limited to a scattered few around the outside of the cluster. This newer variety has made considerable headway in popularity within the last few years, and promises to be even more extensively grown.—W. T.

Broccoli.—Broccoli is a crop calling for more than ordinary care in planting, more particularly with those varieties yielding their heads in winter and spring. The crucial point in cultivation is to secure a well-developed plant of short jointed growth. The ground should be in good heart, but not freshly loosened; that from which early turnip, carrot, or similar crops have been drawn will meet the case. Close planting should be avoided, and sufficient space allowed for the full development of each plant; towards autumn the lower leaves may be removed in order to admit the full measure of light and air, and thereby further the ripening of the crowns as far as possible before the approach of winter. Broccoli grown under field conditions are hardier than those grown upon rich garden quarters, and are often more profitable. Field culture gives more woody tissue in the plants; the leaves and stems are less succulent, the plants being dwarf and robust, and the curds are of a good table size, generally measuring from three to five inches in diameter.—Thomas Smith.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

SEEDLING CYPRIPEDIUMS.—Cypripediums of the winter flowering section that were raised from early sowings will, in many instances, be sufficiently advanced to produce roots. Providing the seed bed is in good order, it is not necessary to remove them, but I consider that the sooner the seedling cypripediums of this class can be given a separate receptacle the better the progress. Where potted separately they are treated individually, which is practically impossible where the plant providing the seed bed has to be cared for. The seedlings are liable to suffer from excess of moisture, which is practically the only quantity necessary to maintain them in health at the season in which they are developing their flowers. Where seedlings are pricked off at the present season they make considerable growth during the next two months, and they become so well established that they are enabled to withstand the trying winter months, and make considerable headway during the early spring.

COMPOST FOR SEEDLINGS.—The most suitable mixture for any of the plain-leaved section of cypripedium seedlings consists of about equal parts of fibrous loam, peat, and sphagnum moss, with sufficient rough sand or finely broken crocks to render the compost free and porous. The compost should be pressed moderately firm. For any of the tessellated leaved section we dispense with loam and use only peat and sphagnum, chopped fine, in about equal portions. The size of pots used should be governed by the strength of the seedlings. The pots should be clean, and filled to about one-half their depth with clean broken crocks. After the seedlings have been pricked off, water, using rain water, and also a can to which a fine rose is affixed. The plants should then be placed in a position within reasonable distance of the glass roof, either by raising the staging, suspending several together in a pan or basket, or, better still, if placed on a shelf with a thin layer of broken coke to ensure ample drainage. They must be protected from the direct rays of the sun, but otherwise they should have the benefit of all the obtainable light. Occasional spraying overhead will be found beneficial in hot, dry weather, and with careful attention to watering little difficulty will be found in their successful cultivation.

OLDER PLANTS.—Plants of one or two years' growth that have not sufficiently advanced to be likely to produce flowers this winter should, if they require more room, or the compost has become decomposed, be repotted at the present season. It will be found that in most cases root action has commenced, and when in this state, with favourable outside conditions, they quickly become established. The compost mentioned above, but of a coarser nature, is suitable for these also. It should be pressed moderately firm, and less drainage should be used as they gain strength. The more delicate constitutioned kinds, such as the hybrids of C. niveum, C. bellatulum, and their allies, also produce new roots at the present season, and where any repotting is necessary they should be attended to without delay. These should have ample drainage, and a liberal proportion of lime rubble intermixed with the potting compost will be beneficial.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

WINTER-FLOWERING BEGONIAS.—No time should now be lost in putting these into their flowering pots, especially those that were rooted early. A compost consisting of loam, leaf-soil, silver sand, with a fair amount of dried cow manure, well broken up, and a little charcoal, should suit all the winter-flowering sections, as they all require soil of about the same texture. The pots should in all cases be thoroughly cleaned and well crocked, and if this latter is done well water may be given quite freely after the pots are filled with roots. Potting should be moderately firm, using the rammer only to make sure of there being no vacant spaces at the side of the pot. For the largest and the earliest plants of Gloire de Lorraine and Gloire de Sceaux seven-inch pots will be quite large enough. In pots of this size huge specimens may be grown. For the smaller and later batches five and six-inch pots will be quite large enough, and the plants will be more convenient for use in decorations. After potting endeavour to have all this class of plants together in one house, or houses, where they may be treated properly. A melon or cucumber house just cleared of a crop is in every way suitable for them. Keep them as near the glass as possible, taking care with the watering for a time, but give morning and evening sprayings overhead, as well as among the pots. Keep the house shaded and close at least for a few weeks, as they grow away much more freely than if treated to a fair amount of sunlight and air. They must, of course, be inured to both as the season advances, and the young plants commence to show flower. After potting put one stake to each plant, and give a tie whenever necessary. This should carry them well into the time when they may be staked out if required, but for most purposes those trained or tied to the one stake have the best appearance.

PROPAGATION.—Continue the propagation of all classes of plants that are useful for decorative purposes, including coleus, panicums, tradescantias, and selaginellas in variety, also a batch of croton cuttings may be put in now, and these will be found very useful subjects for decoration in November if rooted in three-inch pots.

GLOXINIAS.—The main batches of these are now going out of bloom, and where this is the case they may be removed to a cooler house or frame. Do not withhold water too soon, but continue to give them supplies of liquid manure until the foliage begins to show signs of natural decay, when water may be gradually withheld, giving the plants or corms a chance of being thoroughly well ripened in the sun. This season's seedling plants will be well in flower, and these should be kept growing as long as possible, treating them as above as soon as they go out of flower.—Thomas Stevenson, Woburn Place Gardens, Addlestone.

FRUITS UNDER GLASS.

MIDSEASON PEACHES.—As soon as the trees are cleared of fruit leave the ventilators of the house fully opened, and daily syringe the trees in order to keep them clean, and relieve them of any red spider that may have effected a lodgment while the fruit was ripening. In cases where it is required give the borders enough water to moisten them through, and discreetly add liquid manure to the water, or give a light dressing of suitable soluble artificial manure in such cases where it is needed, the conditions of the trees as to vigour being taken as a guide in these matters. Carefully examine the trees and remove all useless wood, which will be chiefly found amongst the shoots that have this season carried fruit.

LATE PEACHES.—The fruits in late peach houses are now near the second swelling stage, and, with a view to improve the colour, means should be taken, if not already done, to expose them as much as possible to the light. The supply will, however, be lengthened if the fruits on the underside of the branches are left shaded. Continue up to the time the fruits begin to ripen to vigorously syringe the trees, and supply them with necessary water and manure, but at that period discontinue these practices until the fruit is gathered. In the case of outside borders, now that they have become warmed by the sun, they may, after dressing them with artificial manure, be mulched with partially decayed stable litter. Still avoid the crowding of wood by removing superfluous shoots, and secure the points of those left. Unless done in order to accelerate the ripening of the fruit no artificial heat should be used, and the house, on favourable occasions, should be freely ventilated.

CUCUMBERS.—At this season of the year, in order to keep cucumber plants in a satisfactory bearing condition, it is necessary to give the plants at frequent intervals top-dressings of fresh compost suitably mixed with manurial compounds. Plentiful supplies of diluted liquid manure should likewise be given, a moist atmosphere maintained, and the plants be well syringed morning and evening. Keep the shoots properly thinned and stopped at one leaf beyond the fruit; be careful not to overburden the plants, and cut the fruits before they become large and tough. Make new plantations as required. Carefully managed young plants produce fruits of the highest quality.—T. Coomber, The Hendre Gardens.

THE KITCHEN GARDEN.

SEAKALE.—This crop has made wonderful progress during the constant wet weather of the past two months. The bed should now be attended to, and the crowns be reduced to one to each plant. Take every care to promote the building up of strong, well-ripened crowns by the autumn by frequently stirring the soil with the Dutch hoe, and apply a good dressing of soot during showery weather.

ENDIVE will now need to be transplanted in ground previously occupied by potatoes, etc. Put the plants fifteen inches apart each way, and well water in. Also make good sowings of the Batavian varieties on similar ground, and plant out as soon as the seedlings are large enough.

LATE PEAS.—Pay close attention to these with a view to ensure a supply extending over as long a period as is possible. There are now many varieties with strong constitutions for the late supply, and if the necessary details are carried out they rarely fail to crop. The chief requirements are deeply dug soil, with plenty of moisture at the roots and overhead, and a nice mulching of manure that is partly decayed. To ward off mildew a few crystals of permanganate of potash is very beneficial, adding just enough crystals to colour the soft water to the shade of claret. Well spray weekly where mildew commonly pays visitations.

AUBERGINES AND CAPSICUMS that are nicely setting their fruits may have liberal waterings of farmyard manure, and regularly sprayed with tepid water. Keep a sharp look-out for red spider, but if the frame is closed early and thoroughly sprayed, and the roots prevented from getting dry, very little fear need be entertained on that point. As the ripening process advances employ more air and a drier atmosphere.

VEGETABLE MARROWS.—The dull weather so far experienced is not favourable to a good "set" of fruits; where this is the case the growths must be thinned out, the points stopped, and the flowers pollinated. Those in frames are still cropping freely, showing how necessary it is to have a few under glass at all seasons.

FRENCH BEANS.—It will be advisable to make a good sowing in frames, where later the lights can be placed therein, and so lengthen the season of this desirable vegetable.

TURNIPS.—Up to date these have been very fine. A good breadth can be sown where potatoes have been lifted. Sow in drills at twelve inches apart. Red Globe and Snowball are first-rate varieties for the present sowing.

COLEWORTS.—No cabbage is more useful than these for late autumn and winter use. The plants raised from the first sowing are now quite ready for planting. Ground previously occupied by early peas is very suitable. Make later plantings in quantity for succession, allowing a distance of one foot each way.—G. Ellwood, Swanmore Park Gardens.

EXHIBITIONS AND MEETINGS.

◆

Handsworth.

It was a good show that was held on Friday, July 22, in Handsworth Park, Birmingham, under the auspices of the Handsworth Horticultural Society. Unfortunately the weather was not so good as one wished, the frequent showers having the effect of keeping down the attendance. However, that is a matter beyond the control of the energetic committee and secretary, who are to be heartily congratulated on engineering a really interesting exhibition of high-class horticultural products. Handsworth Show deserves success, and there is every possibility, and indeed probability, of its attaining a very high position among provincial flower shows. The park is a beautiful spot for a show of this kind. Good prizes are offered, and there seems to be plenty of enthusiasm among the band of workers, who only need the support of the upper classes in the district to ensure further and rapid growth.

GROUPS.

The open class for a group of plants arranged for effect on 300 square feet of space, brought four entries, Messrs. J. Cypher and Sons, Cheltenham, winning easily and well. This firm always has something good to show, and the style is varied from time to time. On this occasion the central feature was a broad arch clothed with fuchsias, ferns, Begonia Gloire de Lorraine, etc., and surmounted by a noble kentia. The corners were picked out with Cocos Weddelliana on mounds of flowering plants and small, brightly coloured crotons. The groundwork included beautiful cattleyas, caladiums, and other effective plants, with Lilium longiflorum and tall specimen crotons admirably arranged in such a manner that whilst one could see right through the group there were no bare spots. Mr. J. V. Macdonald, gardener to Sir G. H. Kenrick, Edgbaston, was a close second, using some excellent crotons and other fine foliage plants to good purpose, but was somewhat lacking in flowering plants. Third prize went to Mr. Cryer, gardener to J. Arthur Kenrick, Esq., Berrow Court, Edgbaston, and fourth to Mr. W. Vause, Leamington.

Messrs. J. Cypher and Sons had the best twelve stove and greenhouse plants, and showed immense statices, ixoras, allamandas, Bougainvillea glabra, Rondeletia speciosa major, etc. Mr. W. Vause, Leamington, came second, and Mr. A. Cryer third. Mr. Cryer scored with six caladiums, showing beautiful plants, and he was followed by Mr. J. Winter, gardener to C. A. Palmer, Esq., Park Hill, and Mr. W. H. Kelland, gardener to A. Sanders, Esq., Hampstead Road, Handsworth. Mr. J. Winter was awarded first for a group of tuberous begonias, which were set off with selaginellas, caladiums, etc. Second prize went to Mr. W. H. Kelland. The same order was maintained in the class for six coleus.

Mr. H. N. Ellison, West Bromwich, gave prizes for twelve ferns, in pots between five and six and a-half inches in diameter. Two entries were forthcoming, and some good plants were staged in both collections, Mr. T. Perks, Ashley House, taking the lead, Mr. C. Thomas, Handsworth, being awarded second prize.

ROSES, ETC.

Roses were shown freely, and were of good quality. There were seven entries for twenty-four distinct varieties, Messrs. Perkins and Sons, Lim., Coventry, securing leading honours with a stand of really good flowers, Mildred Grant, Margaret, and Lyon Rose being well shown. The King's Acre Nurseries, Lim., Hereford, came second. Mr. John Mattock, Oxford, third, and Mr. W. T. Mattock, Headington, was allowed an extra prize. Messrs. Perkins and Sons again scored with twelve distinct varieties, the best blooms being William Shean, Her Majesty, and Mildred Grant. The King's Acre Nurseries, Lim., had Maman Cochet, Frau Karl Druschki, and Bessie Brown among their second-prize dozen. Mr. John Mattock was awarded equal third with Mr. W. T. Mattock.

For twelve teas Mr. W. T. Mattock led, his Mrs. E. Mawley, White Cochet, and Maman Cochet being good blooms; the King's Acre Nurseries, Lim., were again second, and Mr. John Mattock third. A good display was made by the garden roses, staged in twelve bunches, and Mr. J. Mattock's first-prize lot included Sulphurea, Madame Ravary, Betty Berkeley, and other very pretty things. Second prize was awarded Mr. W. T. Mattock, and third to Messrs. Townsend and Sons, Worcester.

Border carnations are always strong in the Midlands, and good things are expected in the Birmingham district. We were not disappointed so far as concerns the winning exhibits in both the twenty-four blooms and twelve blooms. Mr. A. R. Brown, Wychall Nurseries, King's Norton, was winner in both classes, and showed beautiful flowers of choice and up-to-date varieties, including Ajax, Alcestris, Aleppo, Otway, and Charles Edmonds, all of which are of Mr. Brown's introduction. Mr. F. Oldnall, gardener to F. Hawkes, Esq., Devonshire Road, Handsworth, came second in the twenty-four's, spoiling his exhibit by putting six varieties in each of four vases, instead of setting up each bloom separately. Mrs. Joseph Jester, West Bromwich, came second in the twelves, showing some good clean white grounds and a white self and crimson self.

A capital class was that for twelve bunches of violas, distinct varieties. It brought half a dozen strong entries, and not only were the flowers of high quality but the staging was well done. Mr. William Chipman, New Oscott, was awarded premier place, his Agnes Kay, Mrs. Chichester, Nancy Marsh, and Lady Grant being very choice. Messrs. Bastock and Sons, Moseley, were a very close second, their bunch of Moseley Perfection being as near the standard its name suggests as anything we have seen. Messrs. W. Pemberton and Sons, Bloxwich, came third, their earthenware bowls detracting from the effect of the flowers. Mr. H. Allen, Headingley Road, Handsworth, an amateur, made so good a show that he was worthily awarded an extra prize.

Hardy herbaceous flowers were catered for in a class for twenty-four bunches, and Mr. William Chipman, New Oscott, was the successful exhibitor, followed by Messrs. Bastock and Sons, Moseley, and Messrs. W. Pemberton and Sons, Bloxwich. Chrysanthemum maximum, Coreopsis grandiflora, Aconitum napellus, and other seasonable flowers were staged in both exhibits.

The best twenty-four bunches of sweet peas came from Mr. William Marples, Penkridge, whose flowers were clean, fresh, and well put up; Helen Lewis, America Spencer, Syeira Lee, and Evelyn Hemus were included in the collection, also one or two good seedlings. Mr. A. Langston, Wychbold, Droitwich, was second, and Mr. J. R. Burd, Penkridge, third. Messrs. Robert Sydenham, Lim., Birmingham, offered special prizes for sweet peas grown from their seeds, the principal winners being Mr. Delbridge, Penkridge; Mr. E. Deakin, Hay Mills; and Mr. W. Clarke, Lower Hagley. In Messrs. Webb's class Mr. R. Dawes, Dorridge, and Mr. H. Davis, Stourbridge, were winners.

TABLE DECORATIONS.

These were a very strong feature, and the fourteen tables made a very pleasing display down the centre of the tent. In the class confined to lady exhibitors the first prize went to Miss C. Williams, 91, Holyhead Road, Handsworth, who carried out a most delightful arrangement of yellow and copper

FIRST PRIZE COLLECTION OF BORDER CARNATIONS AT HANDSWORTH SHOW.
Exhibited by Mr. A. R. Brown, King's Norton.

roses with trails of selaginella and adiantum. Miss A. Faulkner, 33, Station Road, Handsworth, came second with Mrs. Burnett carnation, set off with fern and gypsophila. Mrs. Holder, New Oscott, came third. In the open class Mr. W. T. Mattock scored with a beautiful arrangement of single roses, second prize going to another tasteful display carried out in orange-tinted roses by Miss Townsend, Broadheath, Worcester. Mr. J. Winter came third.

VEGETABLES AND FRUITS.

The first-prize collection of nine dishes of vegetables came from Mr. E. Deakin, Hay Mills. The peas, onions, and cauliflowers were good samples, and the collection was staged in an attractive manner. Mr. A. T. Rainbow, Northfield, came second, and Mr. R. Davis, gardener to H. Watson Smith, Esq., Stourbridge, third.

LOCAL CLASSES.

A number of classes were provided for gentlemen's gardeners and amateurs within a radius of five miles of Handsworth Park, and the exhibits filled a large tent with good plants and flowers.

For a group of stove and greenhouse plants occupying 12ft. by 8ft., Mr. J. Winter, gardener to C. A Palmer, Esq., Park Hill, was awarded first. Fuchsia triphylla was freely used with crotons, caladiums, and a variety of other good plants. Mr. C. Thomas, gardener to W. Lister, Esq., Handsworth, was placed second, his group being rather overdone with white flowers and white leaved plants.

Mr. T. Perks, gardener to J. Boston, Esq., J.P., Ashley House, Handsworth, received first in the smaller, semi-circular groups. Mr. W. Pearl, gardener to A. J. Rabone, Esq., Hampstead Hall, scored for three exotic ferns, Mr. T. Perks coming second, and Mr. H. Kelland third. Mr. A. Cryer led for six exotic ferns with some fine specimens, while for the six British ferns, first honours were accorded Mr. J. Innis, gardener to Mrs. [illegible], Church Lane, Handsworth, Mr. W. Pearl being second.

Fuchsias were well shown by Mr. C. Thomas, gardener to W. Lister, Esq., who won first for six good pyramidal plants, his followers being Mr. Cryer and Mr. Kelland. Mr. J. Winter had a dozen double zonals, for which he was awarded first in the class for twelve flowering plants of one kind, Mr. T. Perks securing second, using fuchsias. Some good specimen stove plants were shown by private gardeners, Mr. A. Cryer securing first for six. Mr. J. Winter was second. A number of cut flower classes in the gentlemen's gardeners section were well filled, the exhibitors already mentioned accounting for most of the prizes. Handsworth cottagers are evidently very enthusiastic gardeners, otherwise they would not have mustered so strong an array of exhibits as were placed before the judges. Flowers and plants, as well as vegetables were staged in quantity, and many of the exhibits were of a high order of merit. The children's wild flower classes were also the source of much interest and enthusiasm.

NON-COMPETITIVE.

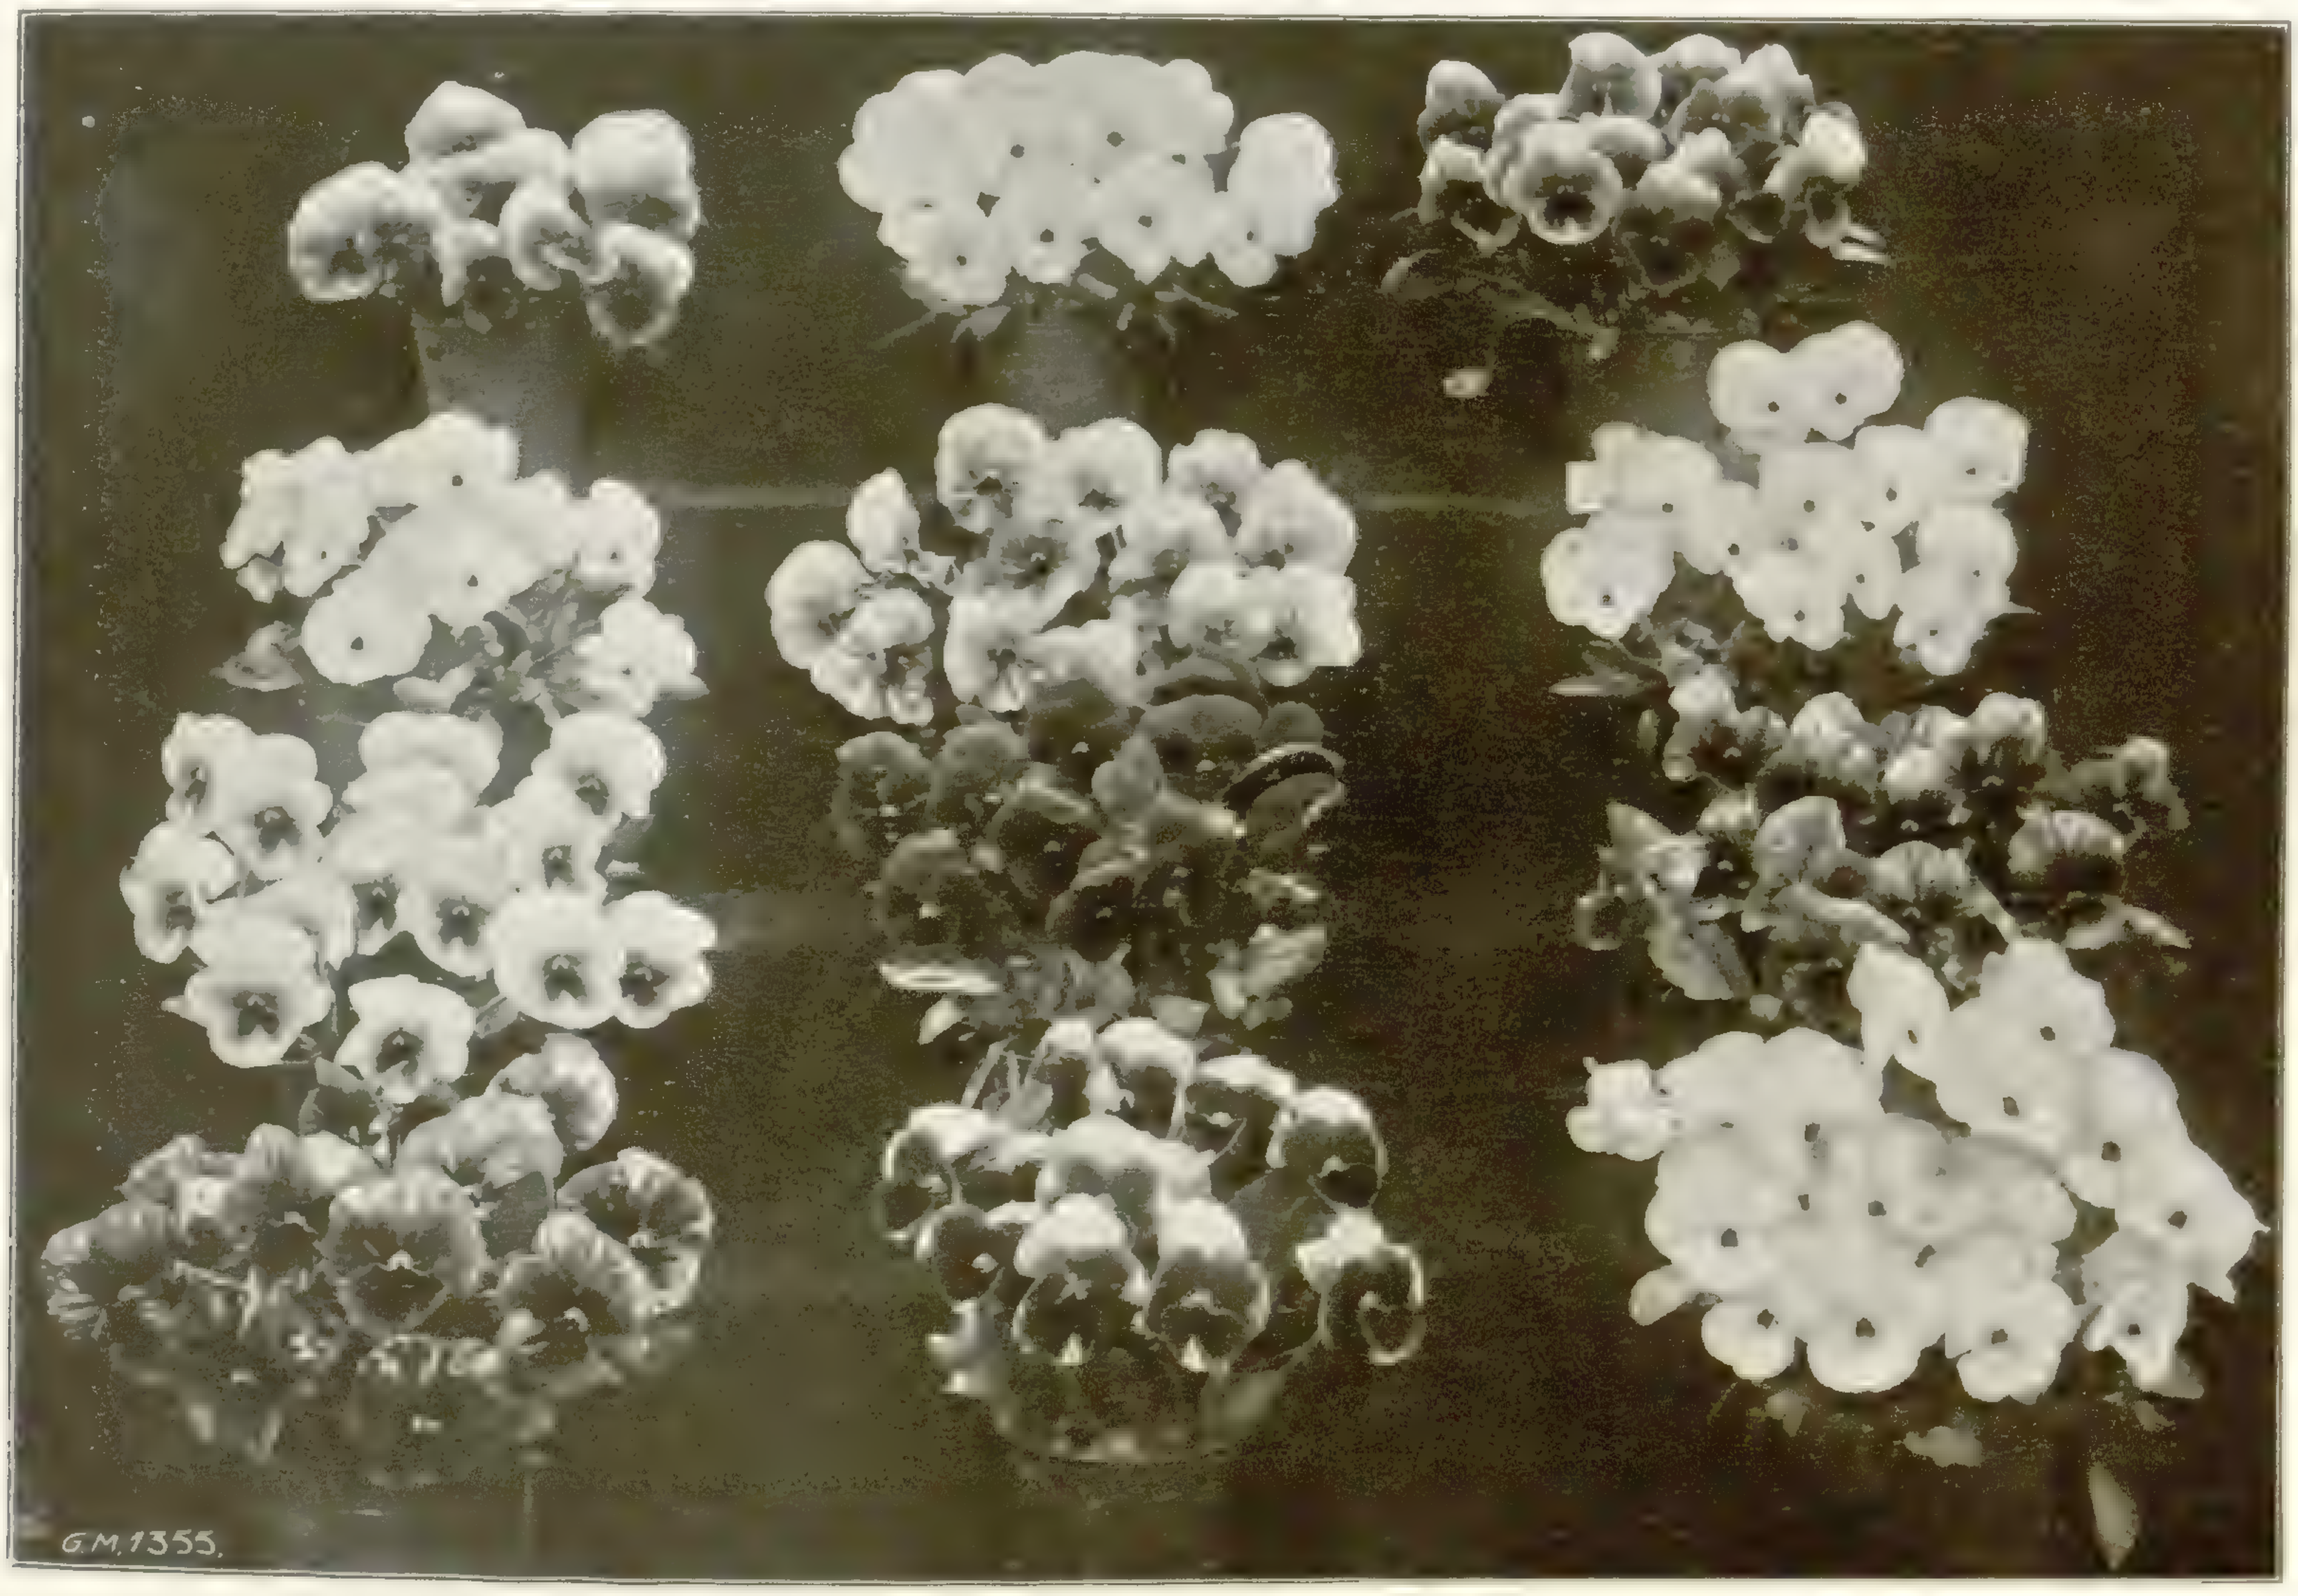
A large silver cup and medals were offered for the best trade or non-competitive exhibits, and some good displays were forthcoming.

Hardy herbaceous flowers were well staged by Messrs. T. B. Groves and Son, Wyndley Nursery, Sutton Coldfield; Funkia undulata variegata marginata, Meconopsis aurantiaca fl.-pl., and Sidalcea Listeri were among many other beautiful subjects shown. A silver medal was awarded. In an extensive and varied collection of violas staged by Messrs. W. Artindale and Son, Sheffield, we noted Immortalite, a fine lilac; Chocolate, of rich velvety colour, indicated by its name; and Mrs. H. Pearce, a large broad-petalled white. Messrs. Artindale also staged hardy perennials in choice variety. The silver cup for the best trade exhibit was awarded to this firm.

The ferns set up in a tasteful manner by Mr. H. N. Ellison, West Bromwich, were representative of practically all species suitable for greenhouse or room cultivation. The variegated Dracæna Bruanti Souv. de Francois Buyse was also shown in shapely plants. Silver medal. Messrs. Hewitt and Co., Solihull, Birmingham, made a bold and effective display with all the choicest hardy flowers of the season. Liliums, spiræas, and a host of other herbaceous flowers were supported by a nice selection of roses, sweet peas, and carnations. Silver medal. Cactus dahlias of good varieties and quality (considering their earliness) were shown by Mr. J. E. Knight, Wolverhampton. Upwards of 50 varieties were exhibited.

A special silver cup was offered for the best display of roses, the varieties and method of staging being left to the exhibitor. Mr. John Mattock, of Oxford, put up a choice selection of the newest and best varieties in cultivation, being specially strong with large masses of Lyon Rose, Hugh Dickson, Madame Melanie Soupert, Frau Karl Druschki, and the best of the ramblers. The silver cup was awarded for this group, Messrs. W. and J. Brown, Stamford, being the runners up.

Quite a collection of well-designed and useful spraying machines was exhibited by Alpha Extinguisher, Lim., Ross, Herefordshire. Their horizontal knapsack, and conical hand sprayers were the source of much favourable comment. The variety of nozzles, jets, and other fittings, which are all interchangeable, add greatly to the value of these excellent machines. The exhibit gained a silver medal.



FIRST PRIZE COLLECTION OF VIOLAS AT HANDSWORTH SHOW.
Exhibited by Mr. William Chipman, New Oscott.

Newcastle-on-Tyne Flower Show.

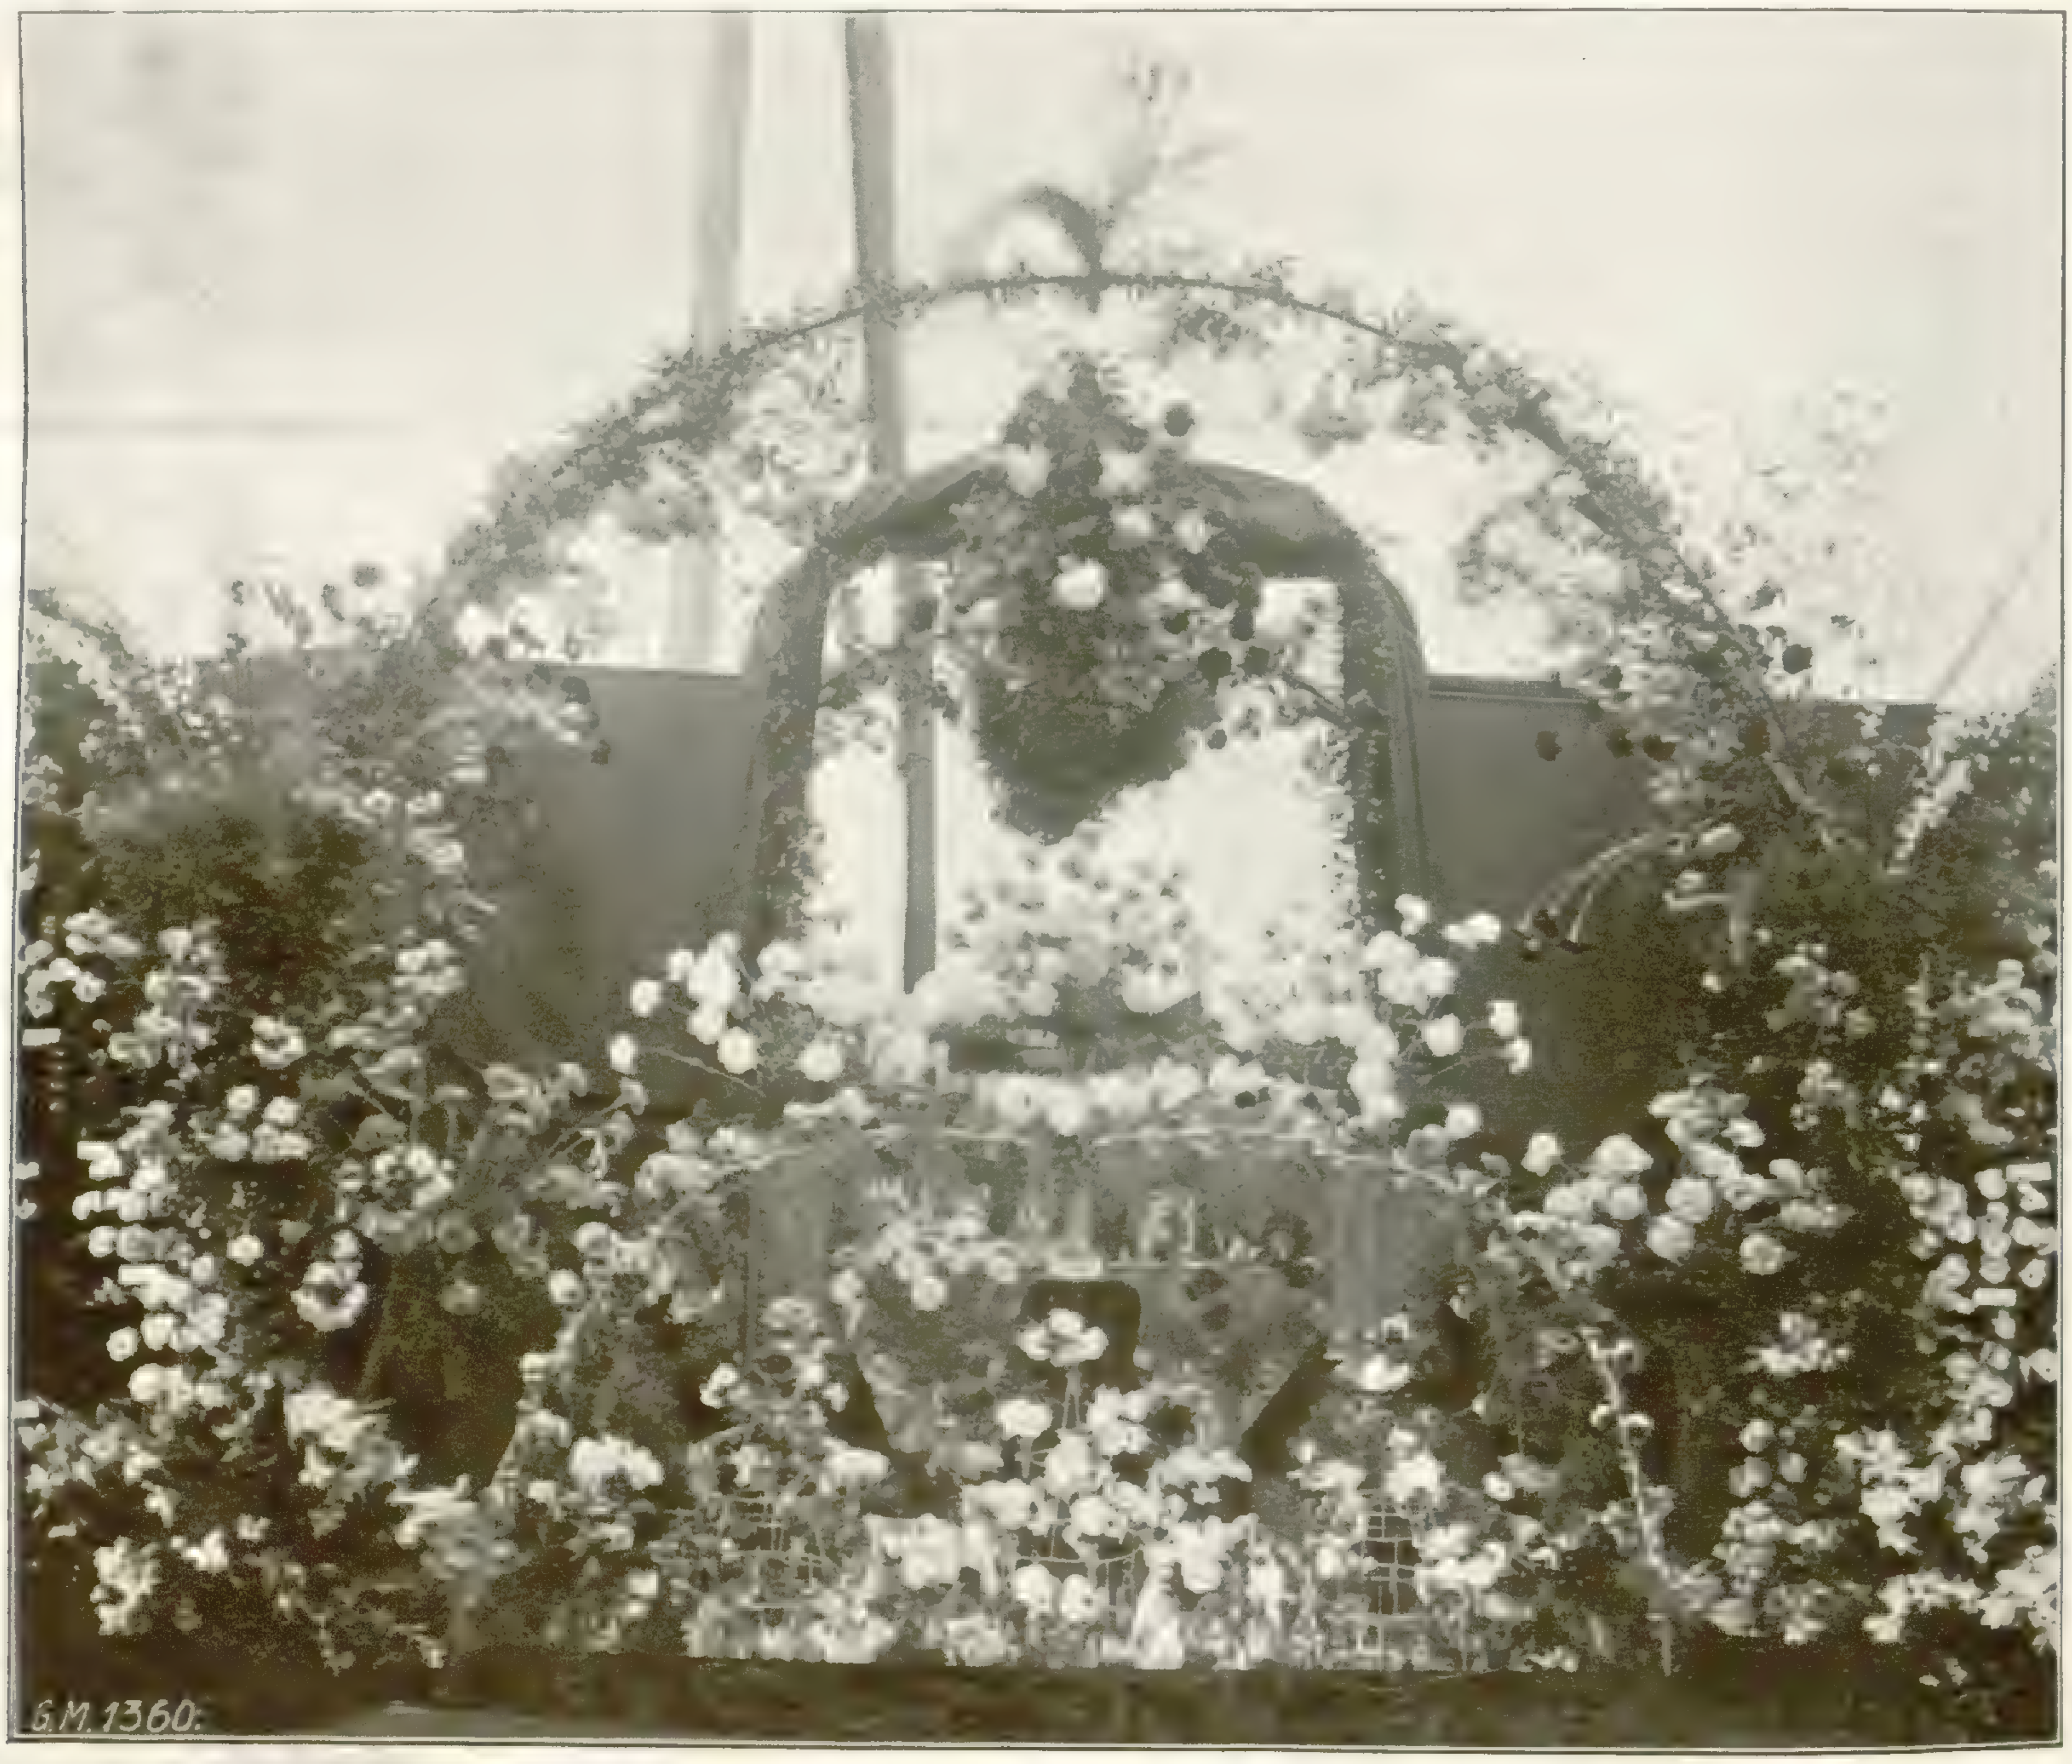
This exhibition was held at Newcastle-on-Tyne on Wednesday, July 20, and two following days. The first day was most unfortunate, rain falling during the greater part of the afternoon, and the strike of the railway employees not only prevented a number of exhibits reaching their destination, but the irregular train service kept many visitors away. The show on the whole was one of the best we have seen at this centre, the quality of the products being of a very high standard. We were particularly impressed by the finely arranged group set up by Mr. T. Bell, from the gardens of A. E. Bainbridge, Esq., Lynwood Jesmond, the sweet peas shown by Mr. Keith, from Sir G. O. Trevelyan's garden at Wallington, and the specimen plants grown and shown by the pitmen.

The class for a group 25ft. by 12ft. brought seven competitors. Mr. Bell's first prize group contained finely coloured crotons, foliage, and flowering plants, among the latter being several spikes of Odontoglossum crispum; the whole of the plants showed high culture, and the group was tastefully arranged; Mr. H. H. Hilliar, Green Park Gardens, Darlington, was second, with a group that compared favourably with the former, the roses and other flowering plants giving brightness, and the arrangement was tasteful; Messrs. Carnagie and Co., Newcastle, were third; and Mr. G. W. Pinkney, Brookfield Gardens, Stockton-on-Tees, fourth. In the class for a group of carnations, to be shown in pots as grown, Mr. W. Lawrenson, Newcastle, was first, and Mr. D. Marshall, Yarm, second. In the class for six plants in bloom, huge specimens of bougainvilleas, rondeletias, stephanotis, allamandas, clerodendrons, statice, etc., were shown, and Mr. J. Ellison, Crumlington, was first, Messrs. R. Arthur and J. Harrison were second; and in the class for four specimen plants in bloom, these exhibitors were placed in the same order, the specimens being remarkably good.

For eighteen bunches of sweet peas, Mr. E. Keith was a splendid first, showing, among others, St. George, Queen Alexandra, Elsie Herbert, Tom Bolton, Apple Blossom, John Ingman, and Mrs. Hardcastle Sykes. Mr. T. Bell, Whitley Bay, second. Mr. Keith was first in all the other classes for sweet peas. For twelve bunches of flowers of herbaceous plants, Messrs. Harkness and Co., Bedale, were first, Messrs. Gibson and Co., second, Messrs. Longster third. There was a very fine display in these groups. For a group of cut carnations, arranged for effect, Mr. W. Lawrenson was the only exhibitor, and deservedly received the premier prize. In the class for 48 roses, distinct, Mr. Hugh Dickson, Belfast, was first with beautifully finished flowers of the finest of the hybrid teas and hybrid perpetuals; and Messrs. G. Gibson and Co., Bedale, were second. In the class for twenty-four, distinct, Mr. Hugh Dickson was again first, and Mr. Walter Lacey, Gosforth, second. For twelve distinct varieties, Mr. H. Dickson obtained premier honours, Messrs. G. Gibson and Co. were second, and Mr. Lacey third. For twelve blooms of any one variety, Mr. H. Dickson occupied the first place with Mrs. E. Mawley; and Mr. T. Park, Askew Mill, was second with Mrs. J. Laing.

The fruit classes were well filled, and the exhibits fairly good in quality. In the class for eight dishes, distinct kinds, Mr. J. Brennand, gardener to J. E. Hathaway, Esq., Baldersby Park, was a capital first; Mr. W. Nicholls, gardener to Lady Beaumont, Charlton Towers, York, was second. For four dishes, distinct kinds, Mr. Brennand was first, Mr. Nicholls second, and Mr. G. Shotton, gardener to Mrs. Swan, Prudhoe Hall, third. For four bunches of grapes, Mr. Nicholls was first with good average bunches of Madresfield Court and Muscat of Alexandria; Mr. Ferguson, gardener to H. B. Watson, Esq., Long Benton, was second, and Mr. Mark, gardener to Miss Muschamp, Farnley Hall, Corbridge, third. For two bunches of white grapes, Mr. T. Bell, Mr. Nicholls, and Mr. Shotton were the prize winners. In the class for two bunches of Black Hamburgh, Mr. Shotton was first, Mr. W. Lambert, gardener to Earl Grey, Howick, second, and Mr. Brennand third. For two bunches of black grapes, any other kind, the winners were Mr. J. R. Gardiner, Mr. Nicholls, and Mr. Ferguson. Peaches were well shown by Mr. Shotton, and Mr. G. Hillier, Darlington. For a dish of nectarines Mr. Brennand, Mr. Hilliar, and Mr. Nicholls secured the awards. In the limited class for four dishes of fruit, Mr. Mark and Mr. Shotton were first and second.

There were some remarkable trade displays. Messrs. Sutton and Sons exhibited a fine table of flowers, fruit, and vegetables in variety (gold medal); Messrs. J. Forbes, Lim., showed phloxes in very remarkable variety, pentstemons, carnations, violas, etc. (gold medal); Mr. W. Lawrenson, Newcastle and Yarm, had a grand bank of ferns, roses, herbaceous and other cut flowers (gold medal); Mr. Hugh Dickson, Belfast, staged roses, etc. (silver medal); Messrs. Gibson and Co. had ro and herbaceous cut flowers in variety (silve medal); Messrs. Stuart and Mein, Kelso, contributed perpetual flowering carnations, etc.; Mr. F. J. Bell, Whitley Bay, violas, sweet peas, etc.; Mr. H. Inness, Croft Spa, Darlington, had a miscellaneous collection of orchids, which was much appreciated; Messrs. Ord Bros., North Shields, ferns, palms, and foliage plants; Mr. O. R. Lamb, Gosforth, foliage, flowering plants, and shrubs in ornamental tubs and baskets.



CENTRAL PORTION OF MESSRS. W. ARTINDALE AND SONS' EXHIBIT AT LEAMINGTON SHOW.

Leamington, JULY 27 and 28.

The second show held by the Leamington and County Horticultural Society was a remarkably fine one, and that a society can in its second year fill six large marquees with exhibits from all parts of the country speaks well for the energy and enthusiasm of its officers. Rarely do we see the horticultural trade in greater force or better form than on Wednesday last, and if the Leamington show continues to grow year by year it will soon leave many an older show far behind.

GROUPS.

Three groups of plants were staged for the £50 offered as total prizes, and, as usual, these exhibits constituted one of the best and most attractive features of the show. Arranged on a space 20ft. by 12ft., with a front both ways, the exhibit made a grand display. First prize was secured by Messrs. J. Cypher and Sons, Cheltenham. A low arch was the central feature, composed of Origanum hybridum, and surmounted by a kentia. Bright crotons and caladiums were freely used, and also a number of choice orchids. Mr. Macdonald, gardener to Sir G. H. Kenrick, Whetstone, Edgbaston, was placed second, and his was certainly a very fine group; the centre was carried to a good height, the arch being taller than in Messrs. Cypher's display. The crotons used to mark the corners, and others to give relief in the body of the group, were richly coloured, while ixoras, Fuchsia triphylla, and francoas were well used among other flowering plants. Mr. W. Vause, Leamington, came third, and he had a conical centre and mounded corners, with crotons freely used between.

Messrs. J. Cypher and Sons came first with a dozen stove and greenhouse plants, Mr. Vause being second. For three coleus, Mr. Finch, gardener to Alfred Holt, Esq., Oaklands, Leamington, scored, and for fuchsias the lead was taken by Mr. W. G. Jones, gardener to Mrs. Rayson, Newstead House, Leamington, Mr. S. Bradshaw following. Mr. H. J. Finch, gardener to J. H. Burley, Esq., The Grange, Leamington, won for three ferns, Mr. Thos. Parry, Warwick, being second, and Dr. Elkington, Fenny Compton, third. Mr. Parry also came to the fore for six table plants, his followers being Mr. W. Vause and Mr. S. Foster. The best three zonal pelargoniums were those staged by Mr. W. J. Jones, Mr. A. J. Friend following. Mr. W. Ellis Masters, Paradise Street, Warwick, scored for six begonias, and Mr. W. J. Jones won with gloxinias.

CUT FLOWERS.

Roses made a magnificent show, the big collection, for which a 25-guinea cup was offered, bringing one of the strongest competitions we have seen. Mr. George Prince, Longworth, was the winner, his stand being beautifully arranged. Lyon Rose was freely used on tall bamboo stands, and columns of lighter varieties threw up the rich colouring of that telling variety. Ramblers were used as a background, and vases of choice hybrid teas filled up the base. Messrs. Gunn and Sons, Olton, had beautiful Frau Karl Druschkis, Lady Chesterton, Killarney, and other good things in their second prize group. Mr. John Mattock, Oxford, filled third place with a massive arrangement of fine flowers, his central feature being a great shield-like stand of Lyon Rose and Frau Karl Druschki. The King's Acre Nurseries, Lim., won the prize for twenty-four varieties with shapely blooms, well staged; Messrs. Perkins and Sons, Coventry, coming second, and F. Dennison, Esq., Cranford, Leamington, third. Messrs. Perkins and Sons scored with twelve H.P.'s, showing Gustave Piganeau Duke of Edinburgh, and other favourites; the King's Acre Nurseries, Lim., followed, and Mr. Geo. Prince brought up the rear. For twelve teas Mr. Geo. Prince led the way, his Comtesse de Nadaillac and Muriel Grahame being fine. Mr. W. T. Mattock took second place. Mr. Prince also won for six teas, Mr. Henry Drew, Longworth, Farringdon, taking second place, and Mr. W. T. Mattock third. In the six bloom class the King's Acre Nurseries, Lim., won with Frau Karl Druschki, Messrs. Perkins and Sons coming second with A. K. Williams.

A good class was that provided for twenty-five distinct kinds of herbaceous flowers, and a challenge cup, value 25 guineas, was offered as chief prize. Unfortunately three competitors misread the schedule, or understood "kinds" to be "varieties." This error led to their disqualification. It cannot be too plainly stated that two varieties of a species do not constitute

WOOD GARDEN HUTS

for use as Tool-sheds, Workshops, Potting Sheds, Play-rooms, Cycle Houses, Motor-car Houses, etc., etc. Strongly built of selected materials by skilled workmen. Made in sections for easy erection and removal by local workmen. Painted and finished throughout in a superior manner.

WM. WOOD & SON, LTD.,
WOOD GREEN, LONDON, N.

two kinds. The exhibits were grand, and it is unfortunate that three should have been outclassed. The two remaining exhibits were awarded first and second prizes, the former going to Mr. Frank Bouskell, Market Bosworth, Leicestershire, the latter to Mr. J. H. Marsden, Malvern Link.

For twelve bunches of hardy herbaceous flowers the first prize went to Mr. C. H. Herbert, Smallwood Nursery, Acocks Green, who showed his new white galega among other good things; Mr. Frank Bouskell, Market Bosworth, was a good second; third prize went to Messrs. Kimberleys, Queen's Road Nursery, Kenilworth.

The best twelve bunches of sweet peas came from Mr. Thomas Jones, Bryn Pen-y-lan, Ruabon, who staged remarkably fine flowers of Tom Bolton, Audrey Crier, Dazzler, and other up-to-date varieties. Mr. W. Hicks, gardener to F. Twist, Esq., Dalicote, Coventry, came second with Zephyr, Queen Alexandra, Mrs. Hugh Dickson, etc.; Mr. W. Marple, Penkridge, took third place. Many prizes were offered by Messrs. R. Sydenham, Lim., and other firms, for sweet peas, and good flowers were shown in all these classes.

Mr. W. Harper, florist, Leamington, scored for twelve bunches of stove and greenhouse flowers; Mr. W. Vause being second.

FRUITS AND VEGETABLES.

In the open class for eight dishes of fruit the 25-guinea challenge cup was won by Mr. Gibson, gardener to the Duke of Portland, Welbeck Abbey. His Crimson Galande peaches and James Grieve apples were excellent. Mr. Gibson was also awarded first prize for the floral decoration of his exhibit. Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, took second place, showing good Triomphe de Vienne pears, Kirk's plums, and some fine grapes. Mr. Goodacre scored for four dishes of fruit, Mr. Gibson having to take second place. Mr. J. Lloyd, gardener to Lord Willoughby de Broke, led for two bunches of black grapes; Mr. C. Harding, second; and Mr. James M. Bush, Banbury, third. Mr. Bush came out on top in the white grape class; Mr. S. Foster, Hockley Heath, being second; and Mr. Gibson, third, but Mr. Gibson led with peaches, and also with nectarines.

Quite a number of prizes were offered by seed firms for produce grown from their seeds, and the competition in these classes was very keen. Messrs. Dickson and Robinson, Manchester, offered prizes for six kinds of vegetables, Mr. S. Foster, gardener to F. E. Muntz, Esq., Umberslade, Hockley Heath, winning first prize with good cauliflowers, peas, carrots, and potatoes; Moneymaker tomato was also well shown. Mr. J. Lloyd, gardener to Lord Willoughby de Broke, Compton Verney, Kineton, was a very close second, and Mr. G. P. Blackman, gardener to Captain W. H. Starkey, Bericote House, Leamington, third. In Messrs. Sutton's class, Mr. John Hudson, Gunson Road, Leicester, scored with splendid peas, tomatoes, etc. Mr. Edward Deakin, Hay Hall, Hay Mills, Birmingham, came second, his carrots being beautiful models of Sutton's New Intermediate; Mr. G. F. Hallett, gardener to Sir Thos. Hesketh, Bart., Easton Neston, Towcester, third.

In Messrs. E. Webb and Sons' class the lead was taken by Mr. E. Beckett, Aldenham House Gardens, Elstree: his Stourbridge Marrow peas, New Bountiful potatoes, and White Tripoli onions were very fine. Mr. J. Hudson, Leicester, followed with good cauliflowers, Market Favourite carrots, and other capital vegetables; Mr. Thos. Wright, Charles Street, Warwick, was placed third, and Mr. E. Deakin fourth.

AMATEURS' AND GENTLEMEN'S GARDENERS.

In the group class confined to amateurs and gentlemen's gardeners, Mr. H. J. Finch, gardener to J. H. Burley, Esq., The Grange, Leamington, scored with a tasteful group, containing liliums, orchids, and crotons, interspersed with small ferns, caladiums, and other useful plants. Mr. A. J. Friend, gardener to the Misses Robinson, The Newlands, Leamington, was second, and Mr. E. M. Garlick, gardener to R. M. Griffin, Esq., Quorn House, Milverton, third. F. Denison, Esq., Cranford, Leamington, had the best dozen roses, and also won for six teas and six blooms of any one variety, staging Dean Hole in good form. Mr. W. Ellis Masters, Paradise Street, Warwick, scored for six cactus dahlias, followed by Mr. Chas. Taylor, 23, Leam Street, Leamington, and Mr. F. E. Dawes, Hockley Heath, Birmingham.

Among amateurs not employing a regular gardener Chas. Hanson Sale, Esq., Arden Hill, Atherstone, Leicester, scored for twelve roses, followed by Mr. W. Nash, 60, Newcome Road, Coventry. In the class for six blooms this order was reversed.

Mr. W. Nicholls, gardener to the Rev. — Hodgson, Clopton House, Stratford-on-Avon, put up the winning four dishes of fruit; his Muscat grapes, melon, Bellegarde peaches, and Rivers's Orange nectarines were all good. Mr. C. Harding, gardener to the Marquis of Hertford, Ragley Hall, Alcester, was second, and third prize went to Mr. C. L. Blackburn, gardener to Capt. W. H. Starkey, Leamington. The winner for two bunches of black grapes was Mr. J. Lloyd, Mr. W. Kean, gardener to C. T. Garland, Esq., Moreton House, Moreton Morrell, winning for white grapes.

Mr. J. Lloyd scored for six kinds of vegetables, followed by Mr. Thos. Parry, gardener to Mrs. Chappell, Wellesbourne Hall, Warwick, and Mr. S. Foster, gardener to F. E. Muntz, Esq., Umberslade, Hockley Heath. Mr. Lloyd won first place both for kidney and round potatoes, and Mr. Thos. Parry scored with long-pod beans and turnips.

NON-COMPETITIVE.

The non-competitive displays made up a grand show by themselves, and thoroughly deserve a much more detailed report than time and space permit. A capital display of cut begonias, mostly double, came from Messrs. T. S. Ware, Lim., Feltham. Messrs. Wm. Artindale and Son, Sheffield, were in fine form, and their large collection of violas was artistically arranged and set off by arches of rambling roses and smilax; herbaceous flowers, roses, carnations, and gladioli were also shown by them. Mr. H. N. Ellison, West Bromwich, brought ferns, which were shown in his usual tasteful manner. A large and choice group of spiræas and other bog plants came from Mr. Amos Perry, Enfield; the group was arranged in a very pleasing style, and among the choicer subjects were Spiræa venusta magnifica, S. gigantea carnea, and S. venusta elegans. A choice selection of floral designs was exhibited by Miss Ada Brandstone, 34, Bedford Street, Leamington; orchids, carnations, asters, and sweet peas were deftly worked into very pleasing bouquets and other devices.

Sweet peas in the choicest varieties were put up by Mr. H. Eckford, Wem, and Othello Spencer stood out conspicuously among the others, being a capital contrast to the paler colours. Messrs. W. H. Simpson and Sons, Birmingham, also showed sweet peas. Violas came from Mr. W. L. Pattison, Shrewsbury, and a variety of hardy flowers from Messrs. J. H. White and Co., Worcester, contained several really good things. Mr. G. Lange, Hampton, had a very fine lot of perpetual flowering carnations, and his blooms of the best varieties were well grown, and displayed in tall glass vases. The early flowering gladioli from Mr. Frank Lilley, Guernsey, were very brilliant and beautiful; King Edward VII. was one of the newest and finest varieties. Messrs. Bakers, Wolverhampton, arranged a model water garden, suitably furnished with nymphæas, and backed up by spiræas, bamboos, etc.; border flowers were also shown.

Messrs. Hewitt and Co., Solihull, made a bold display of hardy border flowers, roses, and sweet peas, while tritomas, liliums, and some new lythrums were among the more noticeable of their other subjects. Very bright and effective were Mr. Vincent Slade's zonal pelargoniums. Staplegrove Nursery, Taunton, has turned out good flowers for several years, and these were among the best. Liliums, alstrœmerias, and Romneya Coulteri were prominent on Messrs. Dickson's stand; the Chester firm is always strong in choice perennials.

The temple of sweet peas put up by Messrs. E. Webb and Sons, Wordsley, was beautifully furnished. On the table beneath were good melons and vegetables

Messrs. Webb were awarded the 25 guinea challenge cup for the best non-competitive exhibit in the show.

A very choice group of dracænas, alocasias, and other foliage plants, came from Mr. L. R. Russell, Richmond. Messrs. Jarman and Co., Chard, once more effectively displayed their charming sweet sultans, and their new sweet pea Mrs. Townsend. Among the vegetables which were skilfully staged by Messrs. Clibrans, Altrincham, were Chilian beet, Seakale beet, various types of tomatoes, and other uncommon things that ought to be more widely grown. Messrs. Young and Co., Hatherley, Cheltenham, had perpetual carnations of splendid quality. The Messrs. Young have capital taste in arrangement, their flowers being so put up that every bloom could be seen to advantage.

Messrs. R. Sydenham, Lim., Tenby Street, Birmingham, arranged choice sweet peas in admirable fashion, using their well-known rustic table decorations, which lend themselves so well to artistic arrangement of these lovely flowers. A group of well-grown caladiums was exhibited by Messrs. John Peed and Son, West Norwood, London, S.E.

A group of hollies, conifers, and other choice shrubs was arranged in the open by Messrs. John Waterer and Sons, Lim., Bagshot; the weeping forms of variegated hollies were particularly fine, and Abies nobilis was well represented, while Spiræa Anthony Waterer added a fine touch of colour.

Liverpool Horticultural Association.

JULY 20 and 21.

This society held its second rose and sweet pea show in the Corn Exchange, and secured an entry more than double that of last year. The sweet peas were the predominant feature, although they are almost a failure in the neighbourhood of Liverpool. The roses were only moderate, lacking in size and freshness. The herbaceous cut flowers were well shown, excellent bunches being staged.

For eighteen hybrid tea roses Mr. E. Jones, gardener to G. H. F. Robertson, Esq., Gresford, was first, having good blooms of Mildred Grant, Killarney, Caroline Testout, etc. For eighteen blooms Mr. Jones again led, having good blooms of Dean Hole, Frau Karl Druschki, etc.; Mr. G. Nisbet, gardener to Miss Robinson, second. For twelve varieties, Mr. W. Bourhall, gardener to A. E. Gunson, Esq., Freshfield, was first, and also scored for six distinct varieties.

In the class for twenty distinct varieties of sweet peas Mr. W. Davies, gardener to Dr G. E. Phillips, Malpas, secured the silver vase presented by Mr. H. Middlehurst, his best flowers being Dazzler, Tom Bolton, Sunproof Crimson, and Asta Ohn. Mr. E. Jones was a strong second. For twelve distinct varieties Mr. E. Jones took the lead, with Mr. W. H. Shaw second. For twelve distinct varieties with waved standards, Mr. W. Davies was to the fore, and Mr. E. Jones followed. For one bunch of Sutton's Queen Mr. E. Jones took the lead, with Mr. W. E. Ward second.

In the amateurs' class for twelve distinct varieties Mr. W. Bindloss, Formby, and Mr. E. M. Allen, Formby, were placed as named; while for six varieties Mr. Bindloss again led; second, Mr. G. Faulkner.

For twelve vases of hardy herbaceous cut flowers Mr. W. J. Shaw won with a highly creditable collection, with Mr. G. Nisbet second; for six vases Mr. Shaw was again to the fore, with Mr. C. Bradshaw second. Mr. Jos. Bather led in the amateurs' section, and also had the best six trusses of single begonias and of double begonias.

Six varieties of carnations or picotees, three

blooms of each, found Mr. Smith, gardener to Percy Cornelius, Esq., to the front with a good set, including Dido, Agnes Sorrel, Hesperia, etc.; Mr. Charles Russell, gardener to Charles Alcock, Esq., second. For twelve blooms Mr. Smith was again the winner, followed by Mr. C. Russell. For six blooms Mr. Smith and Mr. G. A. Turner were placed as named. For six blooms (amateurs) the prizemen were Messrs. G. A. Turner and E. M. Allen.

For a dinner table decoration of sweet peas Mr. E. Jones and Mrs. F. Allen were first and second; and for the ladies' table, sweet peas excluded, Mrs. E. Jones and Mrs. McFall were placed as named, both using carnations.

As usual, a number of non-competitive exhibts were staged. The following received gold medals: Messrs. Alex. Dickson and Sons, W. Rowlands, and R. Manson for roses; Messrs. Dicksons, Chester, and W. Conway and Sons, Halifax, for herbaceous cut flowers; Messrs. Young, West Derby, carnations; Mr. C. W. Breadmore, Winchester; and Mr. H. Middlehurst, Liverpool, sweet peas. Messrs. R. P. Ker and Sons, Liverpool, plants, vegetables, and fruits; Mr. W. L. Pattison, Shrewsbury, pansies. Silver medals to Messrs. Thomas Davies and Co., Liverpool, for cut flowers, and to Messrs. Bees, Lim., Liverpool, for roses, etc.

Birmingham Horticultural Society.

JULY 20.

The second summer show of roses and hardy garden flowers was held on the 20th inst., in the Botanical Gardens, Edgbaston, and was a record over any of a similar character. Notwithstanding the rainy afternoon, there was a good attendance of visitors, and it may be interesting to remark that the visitors were augmented by a goodly proportion of members of the Bath Gardeners' Debating Society, who came after an early visit to Highbury, the seat of the Right Hon. Joseph Chamberlain. After partaking of a welcome tea in the large marquee in the Botanical Gardens, the visitors from Bath made a hurried inspection of the Nettlefold alpine rock garden, and other chief features in the grounds, and then proceeded to the exhibition held in the enlarged orchestra hall and annexes. The visitors were much gratified by being conducted by the courteous curator, Mr. Humphreys, over the gardens.

Prizes were offered for roses and hardy garden flowers, and the members of the trade were invited to send non-competitive exhibits, and the result was a large and attractive display.

Messrs. Gunn and Sons, of Olton, made a large display of roses, chiefly in masses, also one of herbaceous phloxes. A gold medal was worthily awarded to the combined display. Messrs. Bakers', Wolverhampton, set up a splendid display of sweet peas (silver-gilt medal); Messrs. Robert Sydenham, Lim., contributed a choice assortment of sweet peas, effectively arranged in the centre of the exhibition hall in their artistic "rustic" stands (bronze medal); Mr. H. N. Ellison, West Bromwich, contributed one of his well-known and attractive displays of ferns (silver medal); and Mr. C. H. Herbert, Acock's Green, near Birmingham, set up representative collections of hardy flowers, including also several bunches of his popular pink Progress, and many other seedlings of promise, notably Queen Mary, a sweetly-scented flower with richly laced broad petals (silver medal). Mr. A. R. Brown, King's Norton and Moseley, contributed a nice collection of roses (bronze medal). Mr. F. Lilley, Guernsey, sent a charming collection of early-flowering gladioli (bronze medal). Messrs. Bastock and Sons, Moseley, set up a most artistic arrangement of violas (bronze medal), and gained an award of merit for their rich yellow viola Moseley Perfection. Mr. W. P. Wilcox, Moseley, had a pleasing collection of begonias, gloxinias etc. (bronze medal).

COMPETITIVE EXHIBITS.

These were an advance upon the corresponding exhibits of last year, but hardly equal to the extent that might have been expected, considering the resources of the district. In the class for six varieties of roses, Mr. F. Jefferson, Lapworth; Mr. F. W. Blood, Edgbaston; and Mr. H. Anderson, Shirley, were the winners, with fairly good blooms. For three varieties, Mr. T. E. Weatherlogg, Yardley, was first, and Mr. C. Holden, New Oscott, third. For nine varieties of sweet peas, Mr. G. Deakin, Hay Mills; Mr. H. Anderson, and Mr. S. Smith, Bournville, were placed as in the order named. For six varieties of hardy border flowers, Mr. J. W. Mee, Harborne Tenants' Garden City, was placed first for a choice lot; Mr. H. Anderson was second, and Mr. E. Tilt, New Oscott, third.

There was only one collection of begonias, but what a grand display of begonias might have been, had some of the principal growers in the Birmingham district exhibited examples of their cultural prowess.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, July 19.

Present: Mr. E. A. Bowles, M.A., F.E.S., F.L.S. (in the chair); Messrs. J. T. Bennett-Poe, M.A., E. M. Holmes, F.L.S., W. Hales, J. Fraser, F.L.S., A. Worsley, J. Douglas, V.M.H., W. Fawcett, F.L.S., and F. J. Chittenden, F.L.S. (hon. sec.).

SAXIFRAGA TELLIMOIDES.—Mr. Fraser showed a plant of S. tellimoides, and commented upon its peculiarities. It is a native of Japan, and has affinities with the American S. peltata and with S. Jamesii, which is also American, but it agrees with none of the recognised sections completely. It is, perhaps, nearest the section Isomena, but differs in the peltate leaves. This species was discovered by Maries in 1880, first flowered in this country in 1885, fertile seeds being produced in 1892. It was put into commerce by Messrs. Vilmorin in 1897.

SEMINAL VARIATION IN CAMPANULA LACTIFLORA.—Mr. Bowles showed seedlings of Campanula lactiflora, having abnormally narrow leaves and very narrow petals, the corolla being cut almost to the base. One had blue flowers, and had been derived from a blue-flowering plant, the other bore white flowers, and had occurred near a clump of the white form. The variation was in the same direction as that seen in the variety of C. rotundifolia, known as soldanellioides.

SPIRÆA ARUNCUS.—Mr. Bowles also showed a specimen of Spiræa Aruncus, bearing both staminate and hermaphrodite flowers. Up to the present only the staminate form had been known in his garden.

East Anglian Horticultural Society.

At the July meeting of this flourishing society Mr. F. Endersby, gardener to J. H. Gurney, Esq., Keswick Hall, Norwich, read a very practical and lucid paper upon "Cyclamen Culture." He ably dealt with all details, from seed sowing to blooming, and the growing on again of the old corms if so desired. The essay was listened to with marked attention, and brought forth a lengthy discussion in which the prominent local growers of the flower took part. The exhibition was a very fine one of herbaceous flowers, sweet peas, and roses.

The day following the meeting about 100 members and friends journeyed to Flixton Hall, the seat of Sir Frederick Adair, Bart., for their annual summer excursion. Mr. W. L. Walks, the secretary, had made capital arrangements for the transit and feeding of the party. Mr. W. Hilsdon, the head gardener at Flixton, met the party at the gate and piloted them through all the glass-houses, shrubberies, rockeries, herbaceous borders, etc., of this well-kept place. Mr. Lewis Smith, who acted as president, accorded a most hearty vote of thanks to Sir F. Adair for his permission to visit the beautiful gardens, and to Mr. Hilsdon for the trouble he had taken to make the visit both pleasurable and educational.

ANSWERS TO CORRESPONDENTS.

PHOTOGRAPHS.—R. S., Beverley: Clear, bright photographs, silver prints preferably, are necessary for good reproduction. The background is often at fault when specimens are taken, as a garden mat or piece of tiffany is made to do service; and every line of bast in the former, and every crease and dirty mark on the latter comes out distinctly in the photograph, and spoils the picture. A specimen plant should be stood quite clear of any other plant, and be placed before a background that will not intrude in the picture or detract from the merit of the specimen. Good lighting is also important, as the photograph loses half its value if the base or one side of the specimen is merely a black mass. The book to which you refer is published by Messrs. Simpkin, Marshall, Hamilton, Kent, and Co., Paternoster Row, at 5s.

WIREWORMS IN KITCHEN GARDEN.—F. T., Torquay: Wireworms are difficult to eradicate from a vegetable garden, and are often a very great nuisance in gardens newly made from pasture land. In the autumn as fast as crops are removed dress the infested plots with fresh gas-lime at the rate of 56lbs. to the rod, spread this evenly and allow it to remain for four or five weeks. Then dig or trench the ground. The gas-lime will kill all insect and vegetable life it reaches, and cleanse the soil excellently. It is essential that the gas-lime be used early in the autumn so that it will not harm crops sown or planted the following spring. Wireworms may be trapped by placing hollowed halves of potatoes or turnips in the ground a few inches below the surface; a stick should be stuck in each trap, so that the latter may be readily found, removed, and examined.

MUMMY PEA.—J. J., Croydon: The specimen sent is a fasciated growth of the common Pisum elatius, a rosy or blush flowered species found in the Mediterranean region. The frequent assertion that the seeds of this species were found originally in a mummy case is not founded on fact.

FERN WALL IN CONSERVATORY.—Homebird, Streatham Hill: To have the wall built up with tufa in rockwork fashion will cost a considerable sum and probably would not be the success you anticipate. We think it would serve your purpose better to have the wall built of bricks and mortar, both of first quality. On the inside, at the foot of the wall provide a narrow border, well drained, to receive Pteris tremula, P. serrulata major, P. Wimsetti, P. Victoriæ, Nephrodium molle corymbiferum, Cyrtomium falcatum, and other good growers, with a few of the stronger forms of Begonia Rex. Here also should be planted a few pots of the small-leaved Ficus repens, which will soon attach itself to the wall, and cover the brick-work. One close clipping each year, and the cutting back of any strong growths that break away from the wall will keep this green covering quite tidy. At regular intervals along the wall suspend ferns and Rex begonias planted in the earthenware pockets provided by any of the pottery firms advertising in our columns. These are made flat at the back, and have one or two eyes so that they may be hung close to the wall on spikes driven into it. These pockets should be hung so that the frondage of the ferns in one row hides the pockets above, while the ferns in the border hide the lowest row. Selaginella Kraussiana, green or variegated tradescantia, and Helxine Solieroli will serve also to screen the earthenware if planted near the front edge of each pocket.

SPARROWS IN INDIA-RUBBER TREE.—W. T. F., Ibrahimieh: As the use of a gun is illegal, and the hose has not proved efficacious, we suggest that you obtain the services of three or four healthy, active native lads, and give them a reasonable lump sum to clear the tree of nests—payment to follow the clearance. Give these same lads the opportunity of capturing all the sparrows they are able to secure once a week in the tree, and destroying new nests, and if they are like most other lads they will contrive their own traps and methods of procedure. But see that they despatch all the birds they capture. By such methods as this the tree will be made distasteful to the sparrows, and those that escape will move on to a tree in some other garden.

SPLIT PEACH STONES.—G. B., Dublin: When a peach tree makes gross growth as a consequence of coarse downward roots the stones of the peaches often split badly. Another cause of stone-splitting is heavy watering just as the peaches begin to ripen; plenty of water is needed while the fruits are swelling, and if well supplied up to the time swelling ceases little will be needed during the ripening process. A good soaking should follow the removal of the fruits.

NAMES OF PLANTS.

W. C., Datchet.—Lychnis Flos-jovis.

A. J. P., Sidmouth.—Spiræa Bumalda.

G. F., Albury.—Very shrivelled when received; probably Lobelia elatior.

G. S., Ryde.—We have not received any specimens from you during the past week. Those to which you refer are probably those named in our issue of July 23; these arrived too late to be dealt with in our issue of July 16.

FORTHCOMING ENGAGEMENTS.

MONDAY, August 1.—Bank Holiday.
Swanage Horticultural Society.
Hackbridge and Carshalton Show.
TUESDAY, August 2.—Royal Horticultural Society; Committees meet at 12 o'clock; lecture at 3 p.m. on "The Planning and Planting of Small
Gardens," by Mr. A. Clutton-Brock;
Committee at 4 o'clock.
Leicester Summer Show; two days.
Scottish Horticultural Association.
WEDNESDAY, August 3.—Northampton Horticultural Society; two days.
Burwash Horticultural Society.
THURSDAY, August 4.—Midland Carnation Show at Birmingham; two days.
Madresfield Horticultural Society.
SATURDAY, August 6.—French Horticultural Society of London.

Situations Wanted.

HER GRACE THE DUCHESS of DEVONSHIRE wishes to recommend J. THOMPSON to any Lady or Gentleman requiring the services of a HEAD GARDENER, where several are kept; 20 years' experience in all branches. Holker Gardens, Cark-in-Cartmel, Lancs.

MR. TAYLOR, Head Gardener to Sir James Mackay, Chesterford Park, Essex, can highly recommend J. WREN as HEAD GARDENER, where two or more are kept; thoroughly experienced in all branches, Inside and Out; good references; age 31; married, three children; leaving when suited. J. WREN, Meesden, Buntingford, Herts.

W. J. CLITHEROW, Esq., highly recommends his Foreman to any Lady or Gentleman requiring thorough practical Man as HEAD WORKING GARDENER; five years here as foreman; age 32; married. STEVENS, The Lodge, Boston House, Brentford, Middlesex.

CERTIFICATED GARDENER, highly recommended, as Head Working of four or more, where there is a good amount of glass; good practical experience Inside and Out; Table Decorations, Fruit, Flowers, and Vegetables; recommended for producing good effects in borders, beds, etc.; age 30; married, two boys; please state wages and particulars; interview if necessary. H. CHURCHMAN, Sawston, Cambs.

GARDENER (Head-Working where two or more are kept); German, age 39; married, wife English, no family; 25 years' practical experience in all branches Inside and Out, including House and Table Decoration. 12 years in some of the best establishments in England; present situation five years; excellent references. Highly recommended by C. F. BAUSE, Morland Nursery, South Norwood, to whom apply in first instance.

GARDENER (Head); life experience in growing all kinds of fruit and plants, including orchids; also kitchen and flower garden; can be highly recommended. W. LAMBERT, The Common, Kenilworth, Warwickshire.

GARDENER (Head, where one or more are kept); life experience in all branches; age 35; married, no family. WELLS, 40, Malden Road, Boreham Wood Herts.

GARDENER (Head, where two or more are kept); life experience in all branches; age 30; married, no family; excellent references. ARCHER, Eastcote Lodge Cottage, Pinner, Middlesex.

GARDENER (Head Working); experienced in the cultivation of Fruit, Plants, Flowers under Glass, Flower and Kitchen Garden, Forcing, etc.; also Hardy Fruit culture; good references; married, no family. W. S., 16, Warwick Place, Maidstone, Kent.

GARDENER (Head Working), age 45; 28 years' experience; 12 years as head in last place. REEVES, Paddock Road, Bexley Heath, Kent.

GARDENER (Head Working, where two or more are kept); good all-round; can be well recommended; married when suited; age 36. PEARCE, Ridley, near Wrotham, Kent.

GARDENER (Head Working or good Single-handed); life experience in all branches; good references from present and previous employers as to ability and trustworthiness; no family. GARDENER, 28, Martell Road West, Dulwich, S.E.

GARDENER (Head Working), age 31; 16 years' experience fruit and plants, Inside and Out; vegetable and flower garden, decorating, etc.; good references; last two years head of five. W. TALBOYS, Frampton-on-Severn, Stonehouse, Gloucestershire.

GARDENER (Head Working, where one or two more kept, or good Single-handed); experienced Inside and Out; good references, and recommended; age 27; married when suited. W. CROUCHER, 11, North Terrace, Hythe, Kent.

GARDENER (Head Working, or a good Single-handed), where a garden can be kept up well; life experience in lawns, flowers, vegetables, fruits, and plants under glass; good rose grower; can show excellent references; married, age 30. TYLER, Fair Oak, Bishopstoke, Hants.

SITUATION WANTED.—Gardener (Head Working, where two or three are kept); well up in Vines, Melons, Figs, Cucumbers, Tomatoes, and Flowers; early and late forcing; age 41; life experience; abstainer; married, 1 child; good refs. W. E. S., 52, Corporation Road, Gillingham, Kent.

MRS. BUSK wishes to thoroughly recommend her GARDENER, age 32, as SINGLE-HANDED or with help; married, one child; leaving through giving up; good references. Apply, C. BOULT, Manor Cottage, Fritwell, near Banbury.

GARDENER (good Single-handed where help is given or Head of two); good all round experience, both inside and out; 8 years and 10 months' reference; eldest boy of three 14 years old; life experience; wife willing to help in house or laundry; good ironer. HARRY GOOD, Ivinghoe, near Tring, Bucks.

GARDENER (Single-handed); married; age 27, seeks SITUATION; experienced Inside and Out; 5½ years' excellent reference last situation. Apply W. G. CONN, 7, Coombe Road, Sydenham.

GARDENER (Single-handed or otherwise); good all-round man in all branches, or handy man on gentleman's estate; good at either; willing to be useful; active and reliable; good character; age 45; married, one child. OSBORNE, 48, Bradshaw Road, Watford,

GARDENER (Single-handed) seeks SITUATION; 12 years' good experience; good reference. Address, A. DODD, 64, Northfield End, Henley-on-Thames.

GARDENER (Inside and Out); good single-handed, or where help is given; 16 years' good character; married, no children. H. FINCH, Dovedale Cottage, Chelmsford.

MR. HODGSON, Hesley Hall Gardens, Tickhill, Rotherham, highly recommends G. ELY as FOREMAN (Inside); age 28; good experience in Fruit, Plants, House and Table Decorations; three years here; leave when suited.

GARDENER, Second, where four or five are kept; 9 years' experience; 5 years' good reference; single. Apply, GOWER, Scaynes Hill, Haywards Heath.

MR. WESTON, Eastwell Gardens, Ashford, Kent, will be pleased to recommend JOURNEYMAN, been with him over 3 years; Fruit or Plants; 5½ years' experience; age 20; tall; Bothy. G. ROBINSON, Oxton, Exeter, Devon.

JOURNEYMAN (First or Second); age 21; 8 years' experience all branches, Inside and Out; Bothy preferred; abstainer. G. GREGORY, Scrooby, Bawtry, Yorks.

JOURNEYMAN-IMPROVER, age 20, seeks SITUATION, inside, or inside and out; well recommended; 3 years' good experience, inside and out at The Moot, Downton. S. FURNELL, Morgan's Vale, Downton, near Salisbury.

MR. J. SHELTON, Wildernesse Gardens, Sevenoaks, Kent, will be pleased to recommend A. BOOKER as JOURNEYMAN (Inside); age 21; 4 years' experience. Apply as above.

GARDENER (Under), age 25, seeks SITUATION; Inside or Inside and Out; eight years' experience; three years present place; good references. W. COPPIN, Upper Shirley, near Croydon.

GENTLEMAN wishes to recommend Young Man as GARDENER (Under) in Kitchen Garden, or Kitchen Garden and Pleasure Grounds; age 21; abstainer; good references. BARRELL, Frating, Colchester, Essex.

MR. W. HUMPHREYS, Buckden Towers, wishes to highly recommend a respectable Young Man as GARDENER (Under); over five years' experience, Inside and Out; age 20; Bothy preferred, G. WORLEY, Buckden, Huntingdon.

GARDENER.—Young Man, age 18, asks SITUATION as IMPROVER, where several are kept; tall, strong, healthy. Apply CAMPLIN, Ormsby Hall, Alford, Lincs.

YOUNG MAN, age 21, seeks SITUATION as Gardener; Inside or Inside and Out; experienced; strong and willing; good references. W. BALDWIN, Fox-Pitts Gardens, West Farleigh, near Maidstone, Kent.

HON. FRANCES WOLSELEY can highly recommend a YOUNG LADY as Under Gardener, with Head Lady Gardener; two years' experience. GLYNDE, near Lewes, Sussex.

THE BEST CABBAGES FOR AUGUST SOWING.
SUTTON'S APRIL,
Per packet, 1s., post free.

SUTTON'S FLOWER OF SPRING,
Per ounce, 1s., post free.

SUTTON'S FAVOURITE,
Per packet, 1s., post free.
"One of the earliest is Sutton's April, and this is a model Cabbage of very compact growth and quite free from bolting. It is remarkably early, and is rightly named, for I have had it the first week in April after a severe winter. Another very reliable early Cabbage is Sutton's Flower of Spring. This is a little larger than April, but equally valuable where quantities are required. It forms a compact head of a most beautiful shape, and is exceedingly delicate in flavour. — G. Wythes, "The Garden."

SUTTON AND SONS, THE ROYAL SEED ESTABLISHMENT, READING.

KELWAY'S "COLOUR BORDERS"
(Regd.)
Artistic and permanent—arranged for continuous bloom and colour effect.
These Borders can be purchased BY THE SQUARE YARD for any position all ready arranged for planting.
"I am thinking of planting a few borders with perennials. I am tired of continually planting bedding plants. Mrs. ——."
Write now stating your area, position, soil, etc., for planting in the Autumn, to
KELWAY AND SON, The Royal Horticulturists, LANGPORT.

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

Bulbils.

Although it is not practicable to draw a hard-and-fast line between bulbils and buds, there is a difference between a bulbil and such buds as are so common in flowering plants, the great majority of which bear buds at the point where the leaf is attached to the twig, and from their position are termed axillary buds. It is by virtue of such buds that trees, shrubs, and other vegetation of large growth build up, in course of time, the labyrinthine masses of their foliar system. Such a bud is, in fact, a potential branch, fitted to carry other buds, and so branch again; and as each season of growth adds a ring of wood to the previous season's twig, as it does to the entire tree system of trunk and branches, we can easily see how in course of time a ramification of graded growth results. The fern bulbil, however, differs from such buds by not forming a mere branch destined to extend the permanent structure of the plant, but is an excrescence destined to form a separate and complete plant with roots and fronds, which only require to be brought into contact with the soil to root into it, and thus become entirely independent of the parent. Nature herself brings this about by various means. Many fronds, when they have fulfilled their spore-bearing mission and grown old, develop a weak spot a few inches from the caudex or root-stock, and as a result, though still attached, fall outward, and thus bring any bulbil growths in contact with the soil, thus facilitating development. Other bulbils, like those of Woodwardia orientalis, are produced on the frond surfaces, where they develop two or three rounded fronds admirably adapted to form a parachute, and as they are very slightly attached, a gust of wind may detach them and bear them, more or less gently, with the root downward, to the adjacent soil. Cystopteris bulbifera bears fat, berry-like bulbils, in which the bud proper is embedded in the cleft of an oval mass of nourishment, and such "berries" drop off at a touch, and produce young ferns in profusion around the parent plant. Some ferns produce terminal bulbils at or near the frond tips, and as these develop the resulting plant weighs down the slender top, and in this way reaches the soil and enables the fern to take a stride, as it were, into fresh woods and pastures new. Woodwardia radicans and Camptosorus rhyzophyllus (the American Walking Fern) are types on a large and small scale of this form of bulbil propagation. In the Gleichenias the fronds increase in extension by axillary buds on non-independent lines; but even here the result is never the formation of permanent ramifications as with trees, since the fern tribe has no provision for any annual ring of woody material to strengthen an increasing structure. Curiously enough, although proliferous or bulbil-bearing species of ferns are not rare, we do not number one amongst our forty odd native species—that is, in their normal form. Nevertheless they make up for this by a large number of instances among the abnormal "sports" and their progeny. Thus our native Maidenhair, Adiantum capillus veneris, in its forms of imbricatum, and daphnites, produces marginal bulbils where the spores should be; and Polypodium vulgare var. Cornubiense, sometimes does the same on its finest divided fronds. Quite a number of the Lady Ferns bear bulbils on the frond backs, and one at least on the crests. Lastrea montana has yielded bulbils on the frond stalks; and the Hart's-tongue and Shield Ferns have contributed quite a host of proliferous varieties belonging to many very distinct sections of these variable ferns. In the varieties we have in view for the moment, this proliferous character cannot be clearly imputed to any known diversion of energy involved in the varietal form, since it appears in connection both with very foliose forms and very slender ones, but we are inclined to think that fine cutting and slender subdivision favour bulbil development; and certainly in the Polystichums the most proliferous forms are all of such slender, acutely pointed dissection that the section has been termed acutilobum in lieu of proliferum by the experts, owing mainly to the fact that other forms are proliferous as well, but on sparser lines. Apart from these spontaneously - produced bulbils there are others latent, and to a certain extent patent, with which nature has endowed ferns as an additional security from total destruction by trampling animals or other destructive factors. Thus a section of the base of a frond of the common Male Fern at its thickest part reveals an incipient internal bud, which will assert itself if the main crown be damaged or destroyed, and frequently does so without such impulse, and so forms a lateral offset. Here the presence of a latent bud can be detected by dissection, but inasmuch as many bulbil plants can be induced to appear on caudices of Shield Ferns, Lady Ferns, and others by the destruction of the central axis of growth and careful close treatment, it is clear that such natural provision must involve the faculty of the vital energy left in the still living cells, enabling these to form entirely new centres of growth, and force these to the surface. The now well-recognised fact that the old frond bases of any form of Hart's-tongue—in which base dissection displays nothing beyond the normal cellular structure—will form buds profusely, both on wounded and unwounded surfaces, is another proof of such unseen and often unsuspected provision for the preservation of the species. Curiously enough, numerous experiments

MR. C. R. FIELDER.

which have been made with sections of the far fleshier rhizomes of Polypodium vulgare, taken intentionally without a growing point, have all failed to produce such bulbils, but we would strongly advise further experiments. The best plan, as with the Hart's-tongue bases, is to lay them on damp sand in a glass jar or tumbler, and keep them quite close in a fairly lighted place. With the Hart's-tongue the result is invariably that in a few weeks little white pimples appear and develop into young plants, with roots and fronds, much more rapidly than is the case with spores. So much success has attended experiments in this connection with British ferns, that we are forced to believe that many rare exotics otherwise difficult to propagate might yield similar results on similar lines of culture.

Mr. C. R. Fielder, head gardener to Mrs. Burns, North Mymms Park, Hatfield, occupies a prominent position among the foremost of skilful and up-to-date horticulturists. He is eminently practical, but he understands, and is able to tell in a pleasing manner, "the reason why" of all he does in the garden, and that is saying a good deal. He is no rule-of-thumb practitioner, but a skilful and well-educated exponent of the gentle art of gardening. He has had a varied experience, and after spending a short time in a garden near his home in the New Forest he went to Hampton Court Gardens, where he stayed four years. His next move was to the propagating department at Mr. William Bull's nursery, King's Road, Chelsea, where he had ample practice in the multiplication of a wide range of plants. At twenty-two years of age Mr. Fielder became foreman under the late Mr. W. Denning at Lord Londesborough's garden at Coombe Wood; and afterwards he filled a similar position at Haversham Grange, Twickenham; and Mote Park, Maidstone, when the last-named establishment was held by the late Dowager Lady Howard de Walden. His first charge was Arbury Priory, where he became head gardener and steward to the late Sir Edward Newdigate, and, after four years there, he returned to take charge of the gardens at Mote Park, where he remained until Lady Howard de Walden's lease expired, and then went with her ladyship to her new place at West Malvern, Worcestershire, where for five years he was busily engaged in laying out and planting the gardens and pleasure grounds and superintending the erection of glass-houses. The Dowager Lady Howard de Walden died in 1899, and a few days after her decease Mr. Fielder was engaged by Mrs. Burns at North Mymms, where he has seen the small garden extend under his own supervision and design until it occupies something like forty acres. Mr. Fielder has raised the whitest of white amaryllis, and he has made his mark as a fruit grower, plantsman, and landscape gardener. He is an admirable teacher, and his services as examiner in horticulture have been secured on a number of occasions by the Royal Horticultural Society—sufficient proof, if more were needed, of his unusual capabilities.

Botany at the British Association.—The general arrangements for the meeting of the British Association at Sheffield have been completed, and the provisional programme of the work of each section has been set out. Most of the sections commence proceedings on Thursday, September 1. In the case of Section K., Botany, proceedings will begin with a joint discussion between the Botanical, Chemical, and Physiological Sections, on the bio-chemistry of respiration, Dr. F. F. Blackman and others to take part; a new method of estimating the opening of stomata, Dr. F. Darwin; the paths of translocation of sugars from green leaves, S. Mangham; (1) two synthetic genera of Filicales, (2) note on Ophioglossum palmatum, Professor Bower; the pollen chambers of fossil and recent seeds, Professor F. W. Oliver; the morphology of the ovules in Gnetum and Welwitschia, Mrs. Thoday; further observations on the fossil flower, Dr. M. C. Stopes; chromosome reduction in the Hymenomycetes, Harold Wager; the sexuality of Polystigma rubrum, Professor V. H. Blackman; telophases and prophases in Galtonia, Professor Farmer and Miss Digby; a cytological paper, Dr. H. C. J. Fraser; the zoospores and trumpet-hyphæ of the Laminariaceæ, Dr. Lloyd Williams; plant distribution in the woods of north-east Kent, M. Wilson; the absorption of water by leguminous seeds, A. S. Horne. Professor F. E. Weiss and others are expected to read papers, and the semi-popular lecture this year will be on "Sand Dunes and Golf Links," by Professor F. O. Bower.

August Bank Holiday was favoured by weather exceptionally well adapted to the enjoyment of outdoor life, and dwellers in towns appear to have taken full advantage of their opportunities for participating in the pleasures which parks and gardens are so well able to afford. In London and in the great provincial centres of industrial activity, the public parks and gardens were thronged throughout the day, and the "beauty spots" within a comparatively easy distance were visited by large numbers who appreciate the charms of Nature. The Royal Gardens, Kew, continue to increase in popularity among the masses, and on Monday there were 129,000 visitors.

The Kew Bulletin, just issued, is of considerable interest, as it contains useful garden notes on new trees and shrubs, chiefly Chinese, recently presented to Kew. There is an account of the formation and conduct of the herbarium at the Hong Kong Botanic Gardens; descriptions of African and other plants; an account of a botanical trip in the Malay States of Kedah, Perlis, and Setut; and several notes referring to rubber and rubber cultivation.

Undesirable Water Plants.—Of all the undesirable water plants planted in ponds Villarsia nymphæoides is the worst known to the writer of one of the "Commonplace Notes" in the "R.H.S. Journal." Its pretty neat yellow blossom and bronzy leaf are most attractive, and it would be a welcome plant for the water garden if it would keep in bounds; but it grows and spreads so rapidly that it will quickly cover a large sheet of water and smother all the other aquatic plants in the place. We have tried to eradicate it by thoroughly cleaning out the pond, taking out every root that could be found, and leaving the pond perfectly dry for a month or more. Yet the following year it was as bad as ever. It is a very curious fact that in some ponds and lakes Aponogeton distachyon absolutely refuses to live, in spite of the most careful attempts to establish it, while in others it grows so rampantly as to crowd out everything else. But the pleasant scent of its flowers compensates largely for its other drawbacks. Bullrushes, if kept within bounds, give a pleasing appearance to the margin of a lake, but one ought to be very careful how they are introduced, because they will grow well into deepish water and spread far out, making it very difficult to get them out by the root, and unless they are kept in bounds by pulling them out roots and all they soon diminish the size of the lake, and become a nuisance. Some of the rushes are as bad, and Acorus Calamus is apt to spread too much. With such a host of beautiful aquatic plants to choose from that give little trouble, it is scarcely worth while to plant those of doubtful character.

Awards to Early Peas.—A sub-committee of the Fruit and Vegetable Committee, consisting of Messrs. Alex. Dean, V.M.H., W. Bates, E. Beckett, V.M.H., J. Jacques, G. Hobday, J. Davis, and Owen Thomas, V.M.H., visited Wisley on June 30 to examine early peas, when the following varieties were recommended for an Award of Merit. These were placed before the full committee on July 5, when the awards were approved, the Council confirming them at their meeting on July 19: Hundredfold, sent by Messrs. Sutton and Sons; Laxtonian (re-selected), and Early Duke, sent by Messrs. J. Carter and Co.; and Victor, sent by Messrs. J. Veitch and Sons.

Advantages of Co-operation in Marketing Produce.—The current issue of the official publication of the Agricultural Organisation Society gives two examples of the saving effected in marketing produce by the co-operation of the growers. In one case the members of an affiliated society sent their produce to market individually in half-ton lots at the 9s. 2d. per ton rate, or 4s. 7d. per half-ton lot. The matter was investigated by the central society, and it was found that the growers could by combination market their produce in four ton lots at the rate of 6s. 3d. per ton. This reduction in the rate is stated to be equivalent to an annual saving of £17 per member. The other instance was at Worthing. A local body known as the Worthing and District Market Gardeners' Association, was formed for the purpose of enabling the growers to send their produce to London at the lower rate. The local and central societies and the railway company had a conference, and, as the result of the arrangements that were made, the members of the Worthing society will effect a saving of between £600 and £700 for carriage.

Red Tuberoses.—It was stated in the United States a short time ago that red-flowered tuberoses were grown at Tientsin, China, and, as a consequence, an enterprising florist asked the Consul-General to procure bulbs of this treasure for him. After considerable trouble it was discovered that the red colouring was obtained by placing the newly cut flower stems in aniline dye. But, as uncut flowers of red hue were found, a further search was necessary, and, says the "Weekly Florists' Review," finally a native gardener admitted that these were bulbs of the ordinary white tuberose, reared in ordinary flower pots, in this way: The opening in the bottom of the pot is closed with a cork; the pot is filled with earth mixed to a mud with water in which the colouring matter has been dissolved; the bulbs are planted in this after a number of small incisions have been made in the lower half of the bulb above the roots; a thin covering of uncoloured earth is placed over the earth in the pot to conceal the coloured portion below; and the plant is supplied with water in which the colouring matter has been dissolved. The resulting flowers have the tint of the colouring matter used.

LEICESTER FLOWER SHOW.

AUGUST 2 and 3.

Nearly a quarter of a century has elapsed since the first flower show was held in the Abbey Park, and those who have been associated with the annual gatherings that have done so much to stimulate an interest in horticulture among the residents of Leicester have good cause to be well satisfied with the results. Commenced in a comparatively small way, the Leicester flower shows have steadily grown until they have become so extensive and good as to give them a prominent position among the leading horticultural gatherings in the United Kingdom. This year there were 277 exhibitors and 1,728 entries, and it was satisfactory to observe that the cottagers and allotment-holders contributed liberally of their products. The Abbey Park is one of the most beautiful of Leicester's open spaces, and is admirably adapted to the purposes of a flower show, for it is so spacious as to provide ample accommodation for 30,000 visitors, and so admirably kept and liberally embellished as to afford abundant entertainment to the visitors, and reflect credit upon the Parks Committee, of which Mr. Councillor Collier is the chairman, and upon Mr. J. Burton, the able superintendent of the open spaces belonging to the Leicester Corporation. The great feature of the show held on Tuesday and Wednesday last were the groups of plants arranged for effect, the roses, the decorated tables of fruit, the vegetables, the sweet peas, and the hardy flowers.

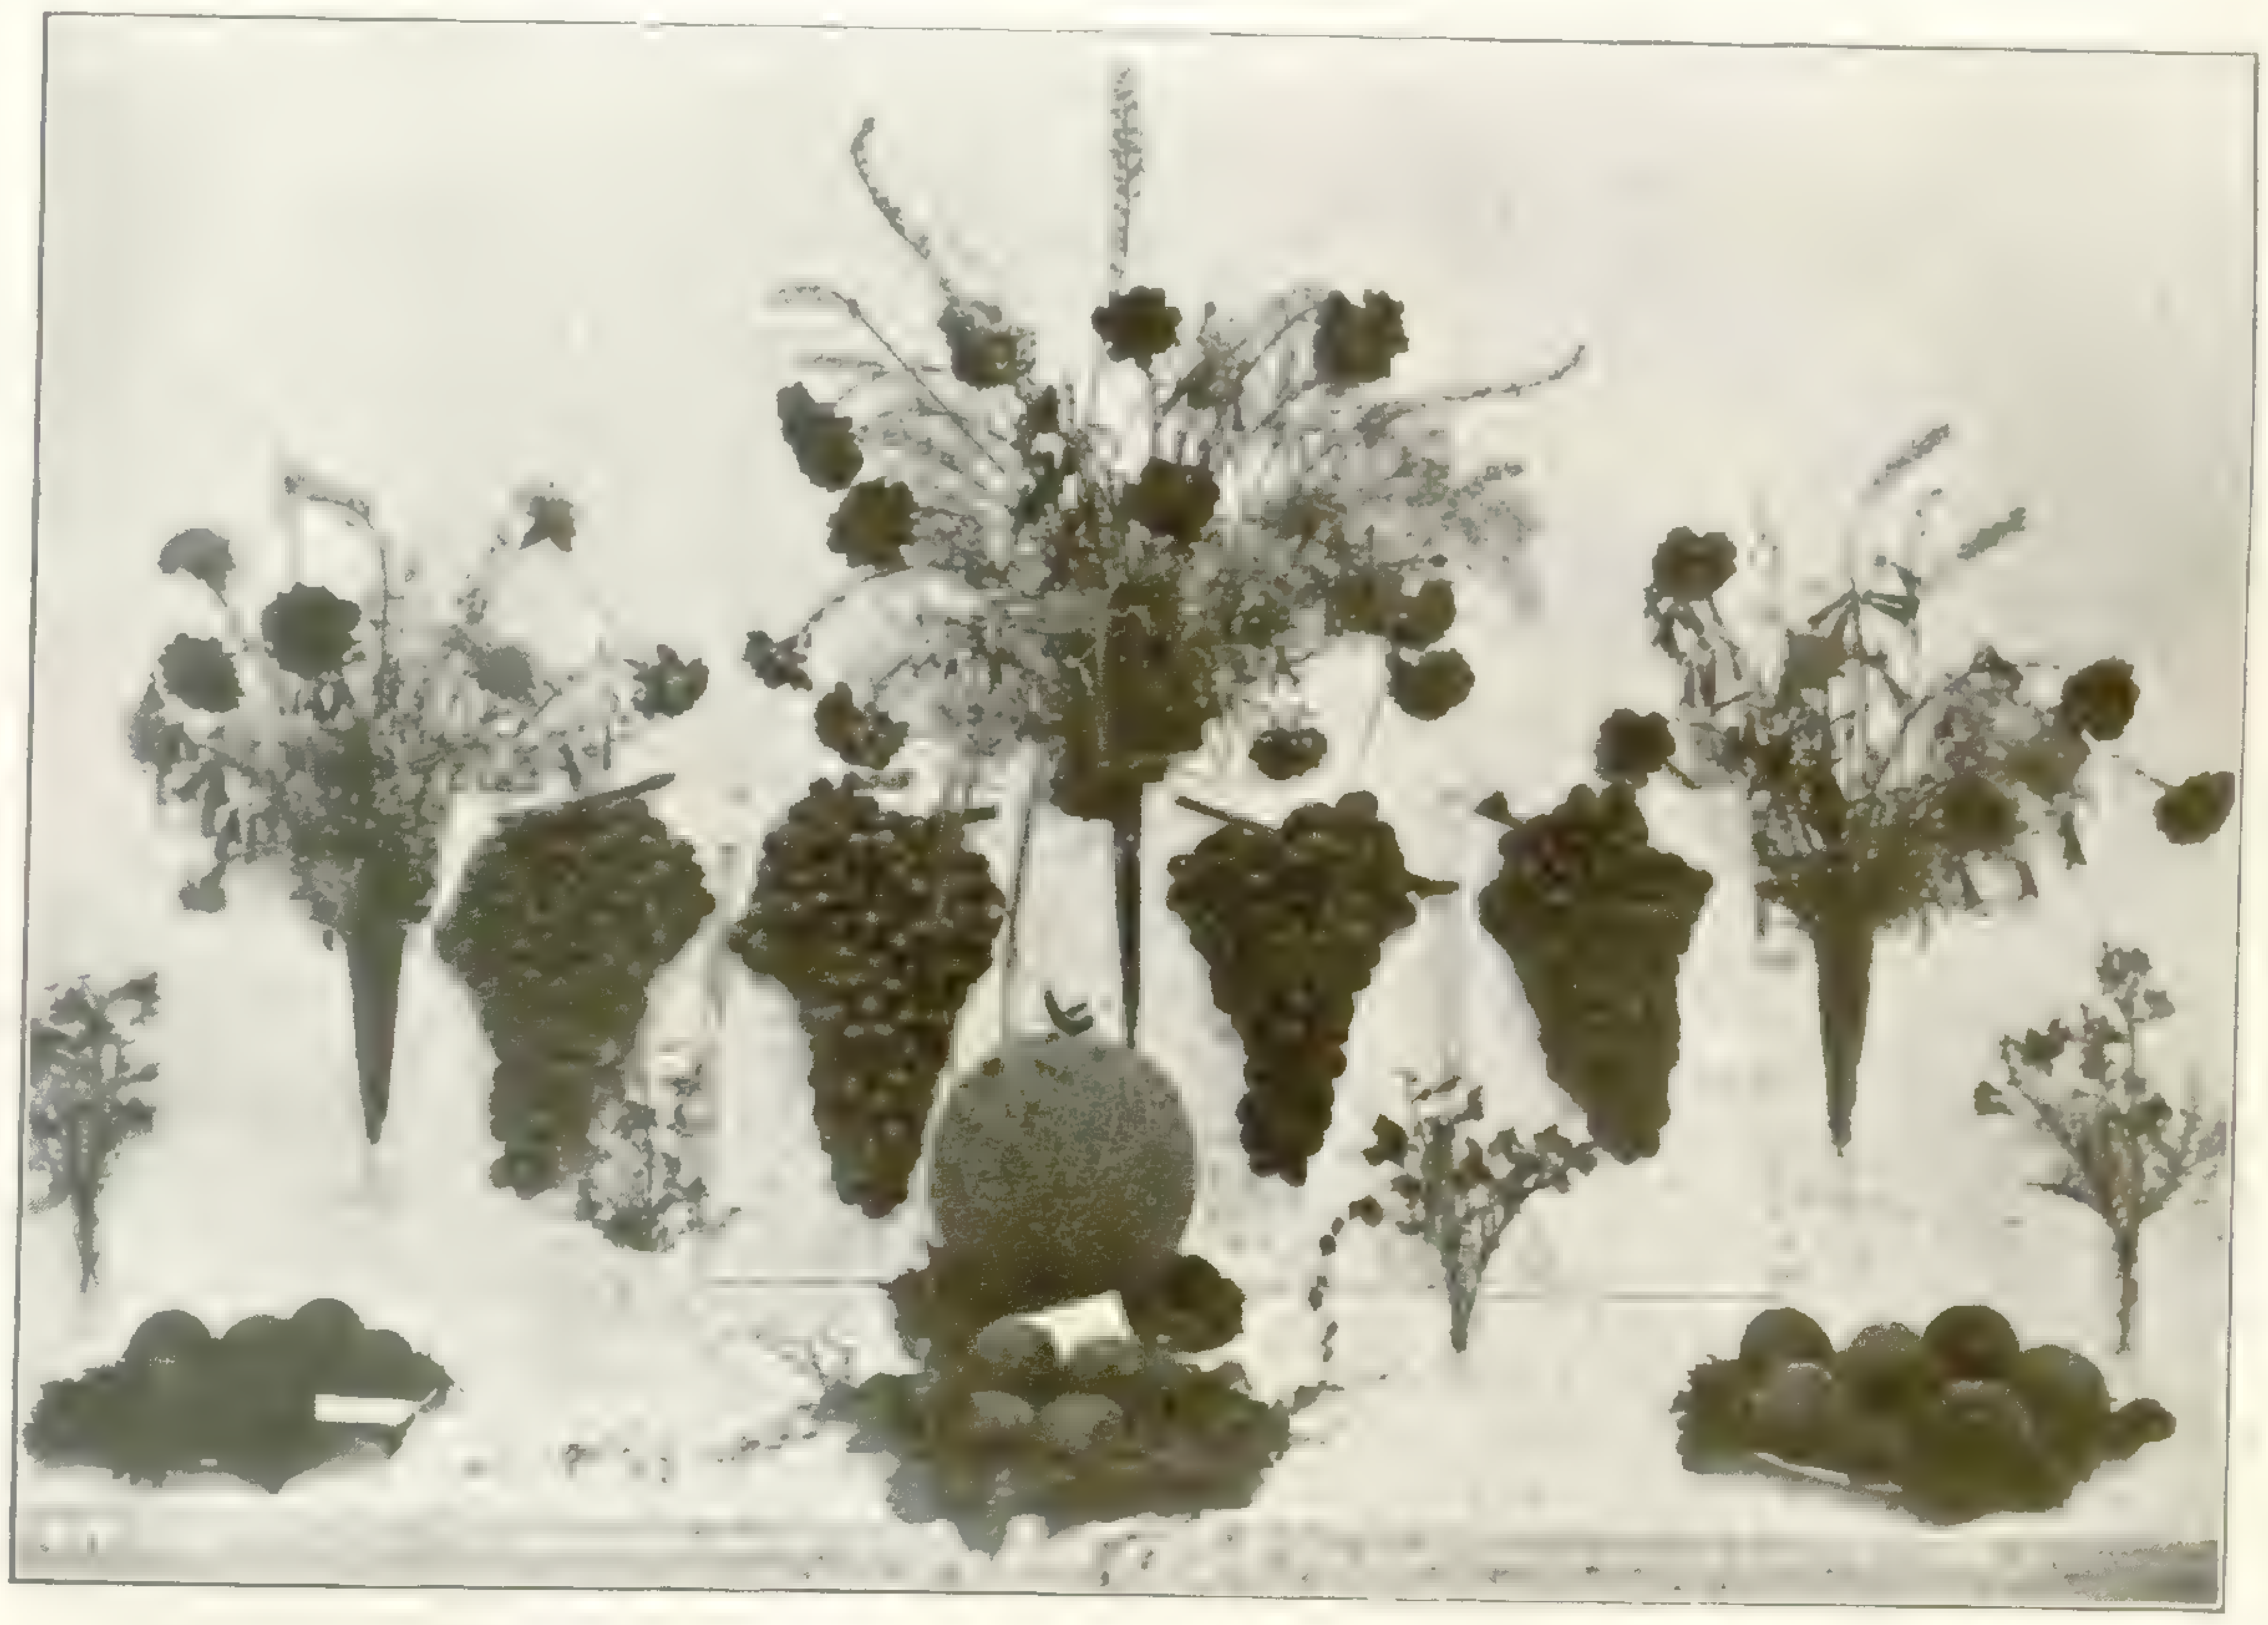
PLANTS.

The outstanding feature of the plant classes was formed by the groups arranged for effect, which, meritorious as they have been in previous years, have not been quite equal to those shown this year. They sufficed to fill a marquee several hundred feet in length, and, as for several years past, Messrs. Cypher and Sons, Cheltenham, occupied the post of honour with an arrangement that materially enhanced their reputation as exponents of the art of plant grouping. To describe the style of arrangement adopted on this occasion with sufficient fulness to convey a clear idea of its characteristic features would require much space. The group, as near as may be, was oblong, and the centre was not formed, as is usually the case, by a pyramidal group of plants, but the graceful palm that formed the centre-piece was stood upon a light arch, and had a few light plants arranged around it. As the arch was high enough to allow the portion of the group beyond to be seen through it, the effect was light and very pleasing. At each corner was a low mound surmounted by a well-coloured croton, and midway between these on either side was a mound surmounted by a finely-developed specimen of the graceful Cocos Weddelliana. Between these, various orchids, Kalanchoe flammea, and fine foliage plants in variety were tastefully arranged. Mr. W. A. Holmes, Chesterfield, was second with a highly effective and tasteful arrangement. It contained rather too many crotons, and as these were all finely grown and richly coloured, the yellow colouring was a trifle too strong. The third prize group, arranged by Mr. H. Rogers, was very light and beautiful, and Mr. Vause, Leamington, who was fourth, had an arrangement deserving of much praise. In the limited class for groups arranged on a space of eighty feet, superficial, Mr. C. F. Oliver, Leicester, and Mr. W. Buckler, Thurmaston, were first and second respectively with arrangements that were a trifle heavy.

Exotic ferns were well shown, and for six Mr. W. Buckler, Mr. C. F. Oliver, and Mr. H. Rogers were the prize-takers in the order of their names. Mr. W. Buckler had the best plant in bloom, and Mr. W. R. Manning, Hadley, the second best. Of great excellence were the fuchsias shown by Messrs. J. Wright and Sons, Mr. H. Rogers, and Mr. C. Ward. Especially meritorious were the zonal pelargoniums contributed to the class for four specimens by Mr. H. Rogers, Mr. C. Ward, and Messrs. J. Wright and Sons, all of whom had large and finely-flowered bushes. Messrs. J. Wright and Sons and Mr. W. H. Allen were first and second for double begonias, and Mr. W. Clanachan and Mr. W. Holmes occupied the first and second places in the class for six table plants. Mr. H. Keeling scored for eight miscellaneous plants, and Mr. W. H. Allen and Mr. W. J. Moore were second and third.

ROSES AND SWEET PEAS.

Roses, if not quite so largely shown as in some previous years, were staged in immense numbers, and produced so glorious a display as to constitute one of the most attractive of the many good features. There was a keen competition in the open class for thirty-six blooms, distinct varieties, and at the head of the several competitors were Messrs. Perkins and Sons, Coventry, who had finely-developed blooms of Madame Chedane Guinoisseau, Lyon Rose, Charles Lefebvre, Mildred Grant, Duke of Connaught, Victor Hugo, Gustave Piganeau, Dr. Odone Browne, Captain Hayward, and other of the leading varieties. The King's Acre Nursery Company, Hereford, were a close second with blooms of great excellence. Especially noteworthy was the fine bloom of Dean Hole, which only missed by a point or two being selected as the premier bloom in the open classes. Mr. W. H. Frettingham, Beeston Nursery, Nottingham, was third with blooms of much merit. Very spirited also was the competition for the prizes for twenty-four roses, distinct, and here Messrs. Perkins and Sons were again first, staging blooms large in size, brightly coloured, and highly finished. Mr. W. Frettingham followed closely for second place with a collection containing a magnificent bloom of William Shean, which was adjudged the best bloom shown in the open division. The King's Acre Nursery Company third. The first and second prizes for twelve teas or noisettes were awarded respectively to the King's Acre Nursery Company and Mr. W. H. Frettingham. The best box of twelve blooms of any one variety was shown by Messrs. Perkins and Sons, who staged the Lyon Rose in grand style. Mr. W. H. Frettingham was a capital second with large, finely-coloured blooms of William Shean, and Mr. W. Bentley, Belgrave, Leicester, was third with medium-sized fresh blooms of Frau Karl Druschki. The King's Acre Nursery Company obtained premier honours in the class for twelve blooms of any one variety with Mrs. E. Mawley.



FIRST PRIZE TABLE OF SIX KINDS OF FRUIT AT LEICESTER.
Shown by Mr. W. Parker, gardener to J. Drakes, Esq., Market Rasen.

The classes for roses in which the competition was limited to amateurs were especially well filled, and for this advanced period of the rose season the blooms were high in quality. Mr. F. Dennison, Leamington, was successful in obtaining premier honours for thirty-six blooms, distinct, these being large in size, bright in colour, and superb in finish. Mr. E. B. Lindsell, Bearton, Hitchin, and the Rev. J. H. Pemberton, Havering, followed closely for second and third places with finely-developed blooms. For the prizes in the class for eighteen roses there was a smart competition between Mr. F. Dennison and the Rev. J. H. Pemberton, and in the result the first and second awards were made in the order of the names; Mr. E. B. Lindsell was a good third. For twelve roses Mr. F. Dennison was again first with a fine box, and Mr. E. B. Lindsell and the Rev. J. H. Pemberton were second and third. Mr. F. Dennison had the best box of six teas or noisettes, and Mr. Upton and Mr. Whittle followed for the second and third places.

The class for twelve blooms, to consist of four varieties, each variety to be arranged in a separate row, was a good one. Mr. F. Dennison occupied the first place with a splendidly-developed set of blooms; the Rev. J. H. Pemberton followed closely for second place, and Mr. W. Boyes, Middleton-on-the-Wold, Yorkshire, who was third, had a splendid box of blooms.

The classes set apart for amateurs and gardeners resident in Leicestershire, were admirably filled. For eighteen blooms Mr. G. Speight, Market Harborough, scored, and Mr. M. Whittle and Mr. Upton were second and third. The successful competitors in the class for twelve were Mr. Upton, Mr. Whittle, and Mr. Speight.

Sweet peas were staged in immense numbers, and produced a great and beautiful display. There was a very strong competition in the class for twelve varieties, in which the whole of the liberal prizes were given by Messrs. Robert Sydenham, Lim. At the head of the numerous competitors was Mr. Hallam, Radcliffe-on-Trent, with a collection evincing cultural skill of a high order, and much taste and judgment in staging. The remaining prizes were awarded as follows: Mr. F. Landsell, Dasford, second; Mr. H. Brown, Stoney Stanton, third; Mr. C. Robinson, Ivanhoe Street, Leicester, fourth; and Mr. G. E. Lewis, fifth. Messrs. R. Sydenham, Lim., also provided prizes for six varieties of sweet peas, and for these also the competition was of the keenest. In the result the premier award was made in favour of Mr. Morris, who had a collection of rare excellence. Mr. E. Sandle, Knighton, was a close second, and Mr. Illston, Barkby, a good third. Some seven or eight other prizes were awarded, but space will not admit of the names of the whole of the winners being given. In the class in which the prizes were given by Messrs. Lamb and Sons, Mr. Hallam was first, Mr. G. E. Lewis second, and Mr. Sandle third. Messrs. E. Webb and Sons gave liberal prizes for six vases of sweet peas, and the entries in the class were very numerous, and the blooms very fine. The principal awards were made to Mr. R. Hallam, Mr. G. E. Lewis, Mr. E. Sandle, Mr. O. Hartshorn, and Mr. F. H. Wagstaff. The varieties throughout showed much judgment in selection.

MISCELLANEOUS CUT FLOWERS.

In the miscellaneous classes for cut flowers Messrs. James Wright and Sons, 69, Market Place, Leicester, were first for twenty-four blooms of double begonias with an excellent stand. In the class for twenty-four blooms of show carnations, Mr. A. R. Brown, King's Norton, Mr. W. Pemberton, Bloxwich, and Mr. W. Barsby, were the prizetakers in the order of their names with excellent stands. For twelve self carnations Mr. A. R. Brown was again first, and Mr. P. Hocart, Melton Mowbray, and Mr. W. Barsby, were second and third. Fancy carnations were well staged by Mr. A. R. Brown, Mr. W. Pemberton, and Mr. W. Barsby. The last-named exhibitors were also the prizewinners in the class for white ground picotees, the blooms being throughout highly meritorious.

FIRST PRIZE COLLECTION OF VEGETABLES (TWELVE KINDS) AT LEICESTER.
Shown by Mr. J. Hudson, Gimson Road, Leicester.

Hardy flowers, in collections without limit as to numbers, were numerous, and produced an attractive display of colour. Mr. W. Weston, gardener to C. F. Oliver, Esq., Knighton Park Road, Leicester, scored with thirty-six vases, in which the finest of the herbaceous phloxes, veronicas, rudbeckias, day lilies, coreopsis, heleniums, and campanulas were well represented. Messrs. J. Wright and Sons were a close second with a collection remarkable for the taste evinced in the arrangement.

Violas were contributed in large numbers, and staged naturally in broad, shallow vases, they produced a highly attractive display. Mr. W. Pemberton was successful in taking premier honours with large and otherwise meritorious blooms. The varieties were Agnes Kay, Minnie J. Ollar, Mrs. J. H. Rolland, Annie Frater, Mrs. Chichester, G. C. Murray, Mary Burnie, Admiral of the Blues, Willie Farmer, George Dunn, and Meteor: Mr. Barsby was second with good blooms.

FRUIT AND VEGETABLES.

There was a manifest improvement in the fruit section as compared with some previous years, and the large array of decorated fruit tables proved so attractive to the visitors as to render it extremely difficult to obtain a glance of them from within a short time of the tents being open to the public. The larger of the two classes for tables of fruit was for nine dishes, distinct, three dishes of grapes, one pine, and one melon being allowed on each table. In addition to the prizes for fruit, a set of prizes was offered for decorations, flowering and fine foliage plants, also cut flowers and foliage arranged in glass, or ware, or loose being allowed at the discretion of the exhibitors. There were five tables in competition, and the premier award for fruit was made in favour of Mr. T. Ireland, gardener to Miss Webb, Newstead Abbey, Nottingham, who had large finely finished clusters of Black Hamburgh, Madresfield Court, and Muscat of Alexandria grapes, splendidly coloured Dymond peaches, Pine Apple and Spencer nectarines, and well-ripened Hero of Lockinge melon. Mr. Ireland was rather weak in his decorations, and was placed third for them. Mr. Parker, gardener to J. Drakes, Esq., Market Rasen, had finely-finished fruit for second place, and was successful in obtaining premier honours for decorations. In the latter he used pink Malmaison carnations with good effect. Mr. J. H. Goodacre, Elvaston Castle, Derby, was third for fruit, and second for decorations. The conditions were the same in the class for six dishes as in that for nine, and in this Mr. Parker was a splendid first for fruit and third for decorations. His clusters of Madresfield Court and Muscat of Alexandria grapes were magnificent, being of immense proportions and perfect in colour and finish. Of high quality also were the melon, peaches, nectarines, and figs. The decorations consisted of bold vases of carnations as a background, and small vases of schizanthus flowers interspersed among the fruit. Mr. J. H. Goodacre was second for fruit and first for decorations, the arrangement of schizanthus sprays being especially tasteful.

Mr. J. H. Goodacre obtained premier honours in the class for four varieties of grapes with large, well-finished bunches of well-known varieties. Mr. W. Parker followed closely for second place, and Mr. T. Ireland was a good third. Mr. T. Sims, Thorpe Satchville, was first for a single dish of black grapes, and in the corresponding class for white grapes Mr. J. H. Goodacre obtained premier honours. Mr. J. H. Goodacre had the best dish of peaches, and Mr. W. Parker staged the finest dish of nectarines.

The display of vegetables was very large, and throughout the quality was fully equal to the quantity. The competition for the prizes offered in the classes for collections was very keen, and in one of those for six kinds there were over a dozen entries. Mr. J. Hudson, Gimson Road, Leicester, again distinguished himself by winning the whole of the first prizes for collections, and in each of his contributions he had produce of which any cultivator might well feel proud. The society provided a class for twelve kinds, and here Mr. Hudson was at the head of the competitors with a tastefully arranged collection, in which the potatoes, onions, cauliflowers, runner beans, and peas were especially noteworthy. Mr. E. Jackson was a good second, and Mr. N. Buxton third. In Messrs. Harrison and Son's class for eight kinds Mr. J. Hudson obtained premier honours with Mr. J. Cauk second. Mr. Hudson was at the head of the large body of competitors in Messrs. Sutton and Sons' class for six kinds, followed by Messrs. F. Dakin, E. Jackson, and Mr. P. Hocart, who were awarded the remaining prizes in the order of their names. Very keen was the contest for the prizes offered by Messrs. E. Webb and Sons for six kinds, and the successful competitors were Messrs. J. Hudson, Mr. Owen Hartshorn, and Mr. N. Buxton.

NON-COMPETITIVE COLLECTIONS.

Contributions to the non-competitive class were numerous and good, and contributed liberally to the interest and attractions of the exhibition. Mr. Walter Bentley, Leicester, exhibited a large and tastefully-arranged collection of roses, and was awarded the silver cup offered for the best non-competitive exhibit. Mr. J. Barrow, Oadby, contributed roses in variety, and of high quality, and was awarded a gold medal.

The end of one of the large rose tents was occupied by a magnificent collection of cut flowers of hardy herbaceous plants, contributed by Mr. F. Bouskill, Market Bosworth, who was awarded a gold medal. The flowers were arranged in large vases on the ground, and produced a surprisingly beautiful effect. Very fine were the gaillardias, phloxes, eryngiums, coreopsis, geums, alstromerias, and chrysanthemums.

Messrs. J. Wright and Son, Leicester, arranged a collection of flowering and fine foliage plants, which filled the end of one of the large tents and produced a rich effect; the award of a gold medal was made. A similar medal was awarded to Mr. C. Warner, Abbey Nurseries, Leicester, for decorative plants in great variety. Messrs. Simpkin and James, Leicester, also exhibited remarkably well, and received the distinction of a gold medal.

Especially attractive and interesting was the remarkably fine collection of sweet peas shown by Mr. W. J. Unwin, Histon, Cambridge. The finest of the varieties, new and old, were represented, and the beautiful novelties attracted much attention. Hardy flowers and sweet peas were splendidly shown by Messrs. Harrison and Sons, Leicester, the firm having among the sweet peas a fine vase of the brilliantly-coloured Stirling Stent.

To this section of the show Messrs. Robert Pringle and Co., Leicester, contributed a large and attractive display of hardy flowers. The same firm also exhibited a fine set of vases of sweet peas. Mr. J. Wilkins, of Syston, arranged a small rockery, which he tastefully planted with alpine plants. Messrs. Macrimmon and Fulton, Leicester, exhibited, not for competition, a large collection of violas, but the style of arrangement was too stiff and formal to show the well-developed blooms to advantage. Mr. G. Underwood, Aylestone Park, Leicester, exhibited sweet peas in variety, arranged in small vases. A remarkably fine collection of these flowers was also shown by Messrs. J. Lamb and Sons, Bingham, Notts, and from Messrs. Jarman and Co., Chard, came a large gathering of the flowers of their fine strain of sweet sultans (centaureas), and a fine lot of cut flowers of zonal pelargoniums.

NATURAL SHADE IN THE GARDEN.

That the position of shade shifts with the passing of the months is a fact not sufficiently recognised and allowed for in garden planning and planting; the bed or border that was sunless during winter becomes visited by genial rays from May to November, and so is fit for the numerous bedding plants that do not need tropical heat, though many perennials would fail there owing to the damp cold of the soil from November back to May. The seat believed to be always in shadow proves to need an awning erected over it to make a rest there enjoyable during summer. The line of shade cast by a row of tall trees is of far less consequence than was supposed. All such details are interesting to the earnest gardener, and well worth putting down in his note book.

One of the most enjoyable kinds of shade is that cast by a fine weeping willow, but we do not plant these trees as frequently as did our ancestors, probably because we seek after more rapid returns for our labour. In one old garden a weeping hawthorn was a delight, beautiful both in blossom and fruit time, with its branches held up by hop poles, and even so almost touching the grass, except where an arch-shaped entrance and exit had been cut. Another feature of the same garden was a shaded parlour made by hollowing out the centre of a majestic variegated holly on a lawn. For dense shade, easy to obtain speedily, the common laurel should be planted on a bank six feet high; if this bank is of semicircular shape so much the better, as the period during which shadow will be cast will be much longer, and a plain rustic bench seat looks so well in the alcove. The sides of the bank should be turfed to within two feet of the top, then harebells, crocuses, and single daffodils may dot the grass, and the soil can be carpeted with pansies on the shady side, violas on the sunny one, among clumps of heather, St. John's wort, London pride, columbines, and tall snapdragons, all hardy enough to dwell comfortably where winds blow.

It should be noticed, and recollected, however, that light, or partial shade, is preferable to dense shadow on many occasions, when a chilly wind tempers sun heat, for instance. Silver birches are seldom planted on lawns, but their exquisite grace and beauty of tint entitle them to such a position. If the ground space permits three birches in a group are as lovely an ornament as can be invented. The colour and elegance of young larches should also be remembered; they can be used in the same fashion, yet look best, perhaps, set in gravel, where their green hue can be fully appreciated by contrast.

A fine way of creating natural shade is one but little practised. Any tall wall that is climbed by ivy or ampelopsis can be made the foundation of a fair arbour by training out the climbers from the top to form a roof, fastening their ends to several hop poles placed a yard or two in front of the wall. The roofing can, of course, be continued all the distance if desired, in which case it forms a kind of leafy colonnade; the effect is more quickly gained by planting a similar climber against each pole.

Wherever an avenue of tall deciduous trees exists the shade should be utilised by setting circular seats round some of the trunks, clearing away a portion of the shrubbery for the purpose; these plain wood benches cost little to construct, and have a better appearance if made of old grey wood and left unpainted. There can scarcely be too many seats with different views and aspects in a garden. Then there is the summer shade that the tallest perennials, hollyhocks, sunflowers, etc., will yield during a few months of the year; why should not a low bench be placed on the north side of a bold group of one of these giant plants? Raised but a foot and a-half from the ground the seat will be comfortable, and protected from the sun's rays.

M. H.

HYDRANGEAS FOR DECORATIONS.

The popularity of Hydrangea hortensia for decorative purposes is a sufficient proof that its merits are fully appreciated by those who have to provide a liberal stock of plants for beautifying the home and the conservatory during the spring and the early months of the summer season. Consequently, there is no occasion to refer to its usefulness, but it may be desirable to briefly refer to the cultural requirements of plants intended for indoor decoration, and to give an illustration of a well-developed example. The plant illustrated was about twenty-eight months' old at the time the photograph was taken, and each of the two heads of bloom was about twelve inches in diameter.

A WELL-GROWN HYDRANGEA.

The propagation of this hydrangea is a very simple matter, as young shoots when they have produced two pairs of leaves form excellent cuttings, which will root nearly, if not quite, as readily as those of a fuchsia. The cuttings should be taken off immediately below the second joint from the top, and have the lower leaves removed. When this has been done insert them singly in small pots, and place them in a pit or house where they can be kept rather close, and screened from sunlight until such time as they begin to make new roots. Need it be said that, when the plants are required to produce good flower heads in the year following strong shoots should be used for propagation, or that where bottom heat is available, the cuttings should have its assistance.

The young plants should be shifted into five-inch pots as soon as the small sixties are filled with roots. A suitable compost is one consisting of fibrous loam four parts, leaf-mould one part, and silver sand half a part. It is not necessary to add decayed manure to the compost, as the plants can be readily assisted with top-dressings of some approved fertiliser, or with liquid manure, as may be the most convenient. They should be kept in a pit or frame throughout the summer months, and if the pots can be partly plunged in a spent hotbed it will be an advantage. Ventilate freely to ensure a firm short-jointed growth, supply liberally with water, and occasionally top-dress with some approved fertiliser, sufficient being applied to thinly cover the surface of the soil.

When the flower buds are formed, remove them from the frame, and place in a sunny position out of doors, the usual precaution being taken to stand the pots on a hard surface to prevent worms entering them. A month or so in the open will ensure the thorough ripening of the wood, and they may then be removed to a frame or cool house, where they will enjoy complete rest. They will not require very liberal supplies of water, but they must have sufficient to maintain the soil in a moderately moist state. Sometimes hydrangeas are kept dry at the roots throughout the season of rest, but this is a mistake, as, in the case of other shrubs, they suffer when kept dry for any considerable period. They may be started in a mild heat in February or March, and when new growth commences shift into six-inch pots, using a compost similar to that advised above.

W.

Everyone interested in a garden should obtain a copy of the Alphabet of Gardening, by T. W. Sanders. Thoroughly practical information is given as to soils, manures, seed sowing, planting, potting, budding, pruning, grafting, forcing, hybridising, etc., with explanatory diagrams. Price, bound in cloth, 1s. 6d. net, post 1s. 9d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

HIMALAYAN RHODODENDRONS.

The majority of the Himalayan rhododendrons are too tender for general outdoor culture in the British Isles, but in the parts which are not visited by severe frosts a number of species give most satisfactory results. There are, however, one or two kinds which are hardier than the remainder, and of these R. campanulatum is perhaps the hardiest. It may be seen out of doors in many parts of the country, and good-sized examples have been noted in Yorkshire and Northumberland. The parts most suitable for the culture of these plants are, however, to be found in the south-west counties of England, Wales, Ireland, particularly the south and west counties, and the west coast of Scotland, while in sheltered parts of Kent, Surrey, Sussex, and Hampshire some kinds grow well.

The conditions most favourable to rhododendrons are well drained ground with plenty of moisture, a moist atmosphere, and fairly equable temperature. The mist-laden valleys in the vicinity of Falmouth offer ideal homes for these plants, as is instanced by the many fine examples found in the gardens there. In some of these gardens very large collections may be noted, species being well represented, in addition to numbers of the showy hybrids which have been raised from the more or less semi-tender species and those kinds which are suitable for culture in colder parts of the country. The season of bloom in some of these gardens is a long one, and sometimes extends over a period of from seven to eight months.

Although essentially plants for light soil, with a partiality for peaty ground, they may be grown successfully in fairly heavy loamy soil, providing that it is well drained and tolerably free from lime. In the vicinity of Falmouth rhododendrons thrive amazingly in disintegrated granite, which at first sight would hardly strike one as being a suitable rooting medium. This is in the form of stony soil, while granite is present from the tiniest particles to pieces several inches across, much of it, however, being in pieces from a quarter to half an inch across.

Though the flowering period is an extended one, it is probable that the best display in Cornish and South Wales gardens is made during March and early April, for during this time several of the most showy species and their progeny are in bloom.

One of the most common kinds is R. arboreum, which may be met with as a bush ten or twelve feet high, or assuming tree-like proportions, as is instanced in the gardens at Tregothnan and Carclew, near Falmouth, where specimens between thirty and forty feet high may be noted with trunks a foot or more in diameter. R. arboreum is noted for its neat and compact trusses of flowers. The colour varies considerably, for, while the most esteemed forms have blossoms of a rich crimson hue, there are others with rose and white blooms. It has naturally been used as a parent by the hybridist, and some very beautiful hybrids have been obtained, notably by Mr. R. Gill, Penryn. The best forms have usually a silvery under-surface to the leaves.

Another species with rich red flowers and compact trusses is R. barbatum. This forms a large bush, with large green leaves, which are characterised by two rows of stiff hairs on the upper side of the leaf stalk. As a rule mature bushes are from twelve to fifteen feet high.

R. Thomsoni is usually of dwarfer stature than the last-mentioned, though in exceptional instances it grows more than twelve feet in height. Its formal oval leaves stamp it as distinct from other species, whilst its long, tubular, fleshy blossoms, of a rich crimson colour, which are borne in loose trusses, are very showy. Between it and the last-named a very useful hybrid has been raised, which is known as R. Shilsoni. This has the compact trusses of R. barbatum, with the larger blossoms and rich colour of R. Thomsoni. It may be noted that the two species are hardy in the vicinity of London, though the hybrid has been injured by severe frost.

A further rich red-flowered species, which is hardy about London is R. fulgens. This is noted for its compact trusses and its oval foliage, which is covered on the under-surface with a rusty tomentum. Two forms are known, one of which is conspicuous by good-sized blooms, and the other by having flowers which are of a somewhat puny character. R. Falconeri is an eagerly sought after plant, for it is ornamental alike for its flowers or foliage. When mature it forms a large, shapely bush and blossoms freely. At Tregothnan a large bush existed a few years ago, which in a single season carried upwards of 800 trusses of flowers. The flowers are cream coloured and large, and they are borne in shapely trusses six to eight inches deep, and almost as far through at the base. On young, vigorous plants the leaves may be anything up to fifteen inches in length and six inches across, while on older examples they are somewhat smaller. Their principal feature lies in the dense brown felty pubescence which covers the under-surface of the leaves. It is without doubt one of the noblest members of a genus composed almost entirely of showy species, and ought to be in every collection in the milder parts of the country.

In many ways quite as striking a plant is R. grande, for the cream-coloured flowers are borne in even larger trusses, while the leaves are large and handsome. They are, however, quite distinct from those of the last-mentioned species, and are silvery on the under-surface. Mature specimens form very large bushes, and one at Tregothnan has carried 1,200 trusses of bloom in a single season.

Another large-leaved species is R. Hodgsoni. It is remarkable for its strong growth and imposing presence; the flowers are, however, less showy than those of the two last-mentioned kinds, for they are borne in smaller trusses and are purplish in colour.

R. Griffithianum, or R. Aucklandi, as it is frequently called, is another magnificent plant, the blossoms being glistening white and four or more inches across. They are borne in loose trusses, and with great freedom. It has been largely used by the hybridist, and numerous fine hybrids from it, such as Gill's Triumph, Glory of Penjerrick, Dawn, Beauty of Tremough, Kewense, etc., are in commerce.

R. campanulatum approaches R. fulgens most closely in foliage, for the leaves are very similar in shape, while they have the undersides covered with a dense tomentum. The flowers are, however, lilac in colour. A form with white flowers is known, which is exceedingly beautiful.

R. campylocarpum is a comparatively rare species, but one which is eagerly sought after, for it is unique amongst the large-flowered Himalayan species by reason of its yellow flowers. As a rule, it is met with three or four feet high, but larger examples may be noted occasionally. R. cinnabarinum is distinct by reason of its narrow tubular flowers, which may be orange, orange and scarlet, or reddish in colour. The plant is of upright habit, with medium-sized leaves.

R. siliatum differs from the previously-mentioned sorts by being of dense habit, with comparatively short and weak branchlets. The flowers are similar in shape to those of the Indian azalea group of the genus, and are white in colour. It flowers with great freedom and is a most useful plant.

In addition to those already mentioned there are several others of lesser value which may be obtained where a fuller selection of species is required, but those described include the most showy and useful, and would form a good collection for any garden in the southern counties. Further north it would be necessary to set apart a cold house for their culture, and such a house would form a valuable asset to the garden.

Kew. W. Dallimore.

THE MADONNA LILY.

Lilium candidum always imparts a degree of beauty and refinement to a garden when in flower, and in none is its presence more welcome than in that of the cottager, where, under the fostering care of its owner, it generally enjoys a degree of vigour that is painfully lacking in the garden of his more princely neighbour. One of the commonest of lilies, and among the least exacting, it is, however, capricious to the degree that no amount of labour and material will ever obtain from it a favour. Its type of purity is familiar, from its symbolic use in painting and sculpture; its material beauty is known to and enjoyed by a wider circle of admirers than can readily be instanced as the case with any other exotic. The flowers are of the purest white, and bell shaped, the lower ones drooping; they are carried upon stiff, erect, graceful stems, each stem bearing from a dozen to twenty flowers, and are in season during June and July.

This species belongs to the group of lilies producing roots from the base of the bulb only. No stem roots are made. It is a lily that resents disturbance at the root, so that once established, and the bulbs flowering freely, no light inducement should necessitate their removal. It succeeds with a large amount of sunshine, but is generally best in half shade, and will bear the utmost exposure. It flowers year after year at the foot of cottage walls, beside boundary hedges, and in the arid borders of neglected gardens. The soil of the garden appears of less moment to this lily than immunity from disturbance. A good sandy loam, inclined to heaviness, will generally meet its requirements, drainage in winter being an essential.

Planting is best performed early in autumn, as soon as the flower stems ripen being a suitable time; the bulbs are all but buried in planting, and the ground must be made tolerably firm. Early planting favours the development of the radical leaves, which remain evergreen throughout winter, so that the subsequent flowering of the plants is largely influenced by their strength. As a rule, the planting should be done immediately the flower stems have died down. Thomas Smith.

Walmsgate Gardens.

Lonicera sempervirens minor.—This variety of the Trumpet Honeysuckle is one of the best of climbers for the greenhouse, as from spring onwards a succession of its delightful blossoms is maintained. In their scarlet and yellow tints they are brighter than those of most honeysuckles.—W. T.

SEED SAVING.

If it be asked Is seed saving worth while? the answer will in some cases be, Yes; and in others, No. This question is asked, and a partly affirmative answer given, not in a spirit of parsimony, that is, with the idea of saving a few shillings a year, but, rather, assuming one is prepared to spend a certain sum annually on seeds, with the idea of considering how to spend that sum to the best advantage. Most of us have had disappointing experience at one time or another with cheap seeds, on account not only of their poor germinating power, but of their falsity to name. If one were to visit the seed grounds of a third-rate seed grower, what will he see? Beds of pansies, for instance, three parts of which may be more or less fine sorts, but the remainder quite ordinary, or even poor, and as the latter seed much more freely than the former the seed saved from the whole bed will be as to seven-eighths of it or more the produce of varieties of poor quality, even allowing for no deterioration in the seed from the good flowers when grown in such proximity to poor ones. Yet the seed will be dispersed as a fine strain of show, or fancy pansy, to be a disappointment to all buyers of it who know a good pansy when they see it. Or to take another instance, in a bed of French marigolds he will see flowers of various sizes, shades, and markings, and plants of various heights and habits. But if he visits the seed grounds of a good firm he will not fail to notice the remarkably high quality of every flower in a bed of choice pansies. Any plant which is not considered good enough to represent the firm's best strain being at once pulled up; and, the same principle being applied to every seed bed, not only will all the seeds come from plants of varieties of the best strain, but the chances of cross-fertilisation with blooms of others not so good will be reduced to a minimum. When visiting a seed farm some time ago I saw a bed of an antirrhinum in full bloom and producing a beautiful display of colour, but on looking at it closely I noticed there were spikes of various shades of pink, and some difference in the habit of the plants, and I was told that no seed would be saved from the bed. From the above illustrations it is obvious that it does not pay to buy seeds of choice flowers from any but good firms, especially where we want collections of good varieties, and that seed so obtained will often produce better results than any we are likely to get from seed saved by ourselves.

Most of us have at some time or other saved seed from nasturtiums, petunias, marigolds (both calendula and tagetes), wallflowers, primroses, antirrhinums, etc., and we know how, after a year or two, our strain has deteriorated so that little of the original seems left. With florists' varieties, which sport very much—Tom Thumb nasturtiums and Shirley poppies are perhaps two of the most notorious instances—it does not pay to save seed at home for we cannot afford to pull up every plant which is not of the required standard as soon as it comes into flower, and in no other way can we keep a fairly true strain, even if we save seed from selected plants only.

At the other extreme there are flowers which vary so little that we are not likely to get any marked deterioration of strain if we save our seed for two or three years in succession, and many homely flowers might be mentioned as instances of these, such as the old yellow and orange Eschscholtzia californica, cornflowers, canary creeper, sweet sultan, Chrysanthemum coronarium and segetum, Collinsia bicolor, honesty, malope, common mignonette, etc., many of which are almost true species, while others, such as the evening primroses, some of the columbines, sweet rockets, foxgloves, perennial lupins, Myosotis sylvatica, and a host of others, more or less peculiar to certain soils, may be trusted to seed themselves. All we need to do is to pull up occasionally any plant which we see is reverting to a poor ancestor.

Between these two extremes there are some flowers of which we do not want many varieties—as we usually do in the case of pansies, petunias, antirrhinums, Shirley poppies, primroses, etc.—perhaps only one variety, and, moreover, there are some which may be trusted to come fairly true from seed, even when the parent plants have others not so true growing around them. In these cases not only is it economy to save our seed, but we may obtain as good results as from bought seed, possibly better in some cases. With perennial gaillardias, for instance, many like only one kind, the deep crimson with a yellow margin, combined with a not too rambling habit of growth, and we often experience difficulty in getting this by itself when buying seed. But if the first two or three good flowers that come out are marked, and seed saved from them alone, we shall get as many plants as we want of the strain we like best. Similarly with love-in-a-mist, one or two selected flowers will give us as much seed as we want, and that of the best strain procurable, supposing we have got it to start with. In Iceland poppies we are generally satisfied with four or five shades if the flowers are large; and by carefully selecting the seed parents in a good stock we can get as good seed as can be bought. In these two last-mentioned flowers I have obtained a very good strain after several years' careful selection, though the stock was rather indifferent to start with. Pentstemons are another instance in which it will pay to save seed, as we only want the various shades of pink, red, and scarlet, while a packet of mixed seed of florists' varieties often produce too many of the purplish and maroon tints, all, or most, of which we can do without, and many seedsmen do not sell the colours separately. Some years ago I bought a packet of pentstemon seed of large-flowered florists' varieties, the best a leading nurseryman could sell me. The result was a large proportion of Pentstemon barbatus and other small-flowered kinds, and on taking a bunch of flower spikes to the shop where I bought the seed I was assured that they were the result of my bad soil or cultivation!

The above are a few illustrations to show when it is best to buy seed, and that only from a reliable seedsman, and when we may not only economically, but sometimes with advantage, save seed ourselves; when, added to other advantages there is always the possibility that our selection may eventually procure us a strain which cannot be bought because we have originated it ourselves. Many of our choicest florists' flowers have originated in this way.

To revert to the statement at the opening of this article as to spending to the best advantage what we are prepared to spend upon flower seeds, it will be pretty obvious from what has been said that what we have husbanded by saving some of the seeds may be spent with much better results in buying the best seed procurable of those flowers of which it is not advisable for the average amateur to collect the seed for himself, not fighting shy of a half-crown packet if it is necessary to have the best strain, for "we needs must love the highest when we see it." Alger Petts.

CHRYSANTHEMUMS.

Some Seasonable Notes.

Only a part of the season, so far, has been really ideal for these plants. I am quite prepared to learn that many varieties that are naturally early will give cultivators a little surprise this year. Owing to the very cold weather that prevailed during March, April, and May, many varieties did not make their natural breaks in good time--especially the very early sorts. But curiously enough, that grand variety Hon. Mrs. Lopes made the natural breaks with me in very good time. A few of the plants, however, were dilatory in this matter, and so I was enabled to pinch them at will, and thus have specimens which appear to promise crown buds for about August 5 and 12, such buds should, if all goes well with them, develop into fine blooms. Master David was in a hurry to show the first bud, or break, but here again three or four plants were backward, one only, however, being stopped. Master James (a glorious flower) was troublesome in its early stages of growth; persistent bud-formation retarded growth; then the plants made steady progress, and, in due time, about nine were stopped for second crowns; then several more specimens were similarly treated. One, rather early, made a natural break, and this was allowed to grow on, but at the present, by July 16, the shoots were not much more forward than those stopped a week or two after they appeared. Leslie Morrison was very backward, and so all had to be stopped for first crowns. Mrs. Q. Thorne was also stopped for first crowns. Purity, a grand white, made natural breaks, and promises well. That popular variety Mrs. A. T. Miller, was very late in producing the first break. I allowed six plants to break naturally, and pinched twelve others. All are growing very satisfactorily now. The cold winds and rains chilled both soil and plants just before the final potting was done, and Shanklin, Lady Talbot, Reginald Vallis, F. S. Vallis, and Mrs. Q. Thorne lost a few basal leaves.

Feeding.

Some cultivators do not believe in feeding the plants before the buds are "taken," but I think they are few in number. I have always fed the plants judiciously the moment they appeared to require stimulating. It is much better to have a strong plant at the time when the buds show than a weak one. We cannot make weakly plants strong as if by magic. The best specimens are those that are steadily built up, and every cultivator must thoroughly know his plants before he can benefit them by feeding. Some varieties, such as Leslie Morrison, for instance, carry a greater weight of foliage than others, and they need more moisture because of the greater amount of evaporation; and more stimulating food may be given.

A week before, and a similar period after the buds are taken, artificial manures should not be given, but weak doses of liquid manure may be supplied with advantage. Directly the buds begin to swell feed again and continue to do so until the blooms are half developed.

As it is possible that buds will show irregularly in many collections this season, cultivators —- those not much experienced in the growing of blooms for exhibition—must be prepared to hasten and retard their development; and the best way is to begin early enough, and so do it very gradually, as the best results follow.

Bournemouth. G. Garner.

CAMPANULA PUSILLA.

There are several bell flowers of moderate growth that possess much beauty, and are highly attractive when placed under the conditions favourable to their full development, but there are few, if any, that surpass the Small Bellflower (Campanula pusilla) and its varieties. The species is a native of Switzerland, and thrives in the mountain pastures where the herbage is dwarf and scanty, and where the roots can have ready access to liberal supplies of moisture. It may be seen spreading over broad ledges of rock; but invariably low down where the roots have sufficient soil in which to run freely, and have an abundance of water within reach. The Small Bellflower has long been in cultivation in this country, but exactly how long would be difficulty to determine. It was figured in the "Botanical Magazine" (t. 512), as far back as 1801, and in his description of the species, Dr. Sims, the then editor, states that he had "seen this campanula in the Botanic Garden, both at Lambeth Marsh and Brompton, for many years," and he further observes that "it had always preserved its distinguishing features."

Like so many of the plants that have been in cultivation for a considerable period, the Small Bellflower has borne a number of names. By Linnaeus it was considered a variety of Campanula rotundifolia, and is entered in Aiton's Hortus Kewensis as C. rotundifolius var. By Bauhin it was described as C. minor rotundifolia alpina, and by Jacquin it was named C. pusilla, the name under which it is now generally known, and in the "Botanical Magazine," it was figured as C. pumila, the name "by which it has been long known," according to Dr. Sims, "in the botanic garden."

There are two distinct varieties of C. pusilla, one of which is known as pallida, and has pale lavender-blue flowers, and alba, which, as indicated by its name, are white. The flowers of the specific form are deep blue. All the forms are grown with remarkable success by Mr. Constance Elliott, of Six Hills Nursery, Stevenage, as indicated by the fine example of pallida herewith illustrated. A position on the lower ledges in the rock garden is best suited to the display of the charms of the Small Bellflower and its varieties, but the ledge must be large enough to provide ample soil, and so placed that the moisture will be fully equal to the needs of the plants. The best rooting medium is loam, to which a liberal proportion of coarse sand or broken stone has been added.

CAMPANULA PUSILLA PALLIDA.
A charming variety of the Small Bellflower with pale blue flowers, as grown by Mr. Constance Elliott, of Stevenage.

Tricuspidaria lanceolata.—In the West of England this is a delightful outdoor shrub, while in many other parts it needs greenhouse protection. It is a native of the low valleys of Chili and Valdivia, and forms a good-sized evergreen bush whose leaves are peculiarly harsh in texture. The most striking feature, however, is the flowers, which are bell-shaped when expanded, of a bright coral-red colour, and hang suspended by unusually long stalks. The segments are of a very wax-like texture, and before expansion they much suggest ripe cherries. Unfortunately, there is a deal of confusion over the name of this pretty shrub, for it was first known as Crinodendron Hookerianum, then as Tricuspidaria hexapetala. The next change was to Tricuspidaria dependens, a most appropriate name from the drooping character of the blossoms; and, lastly, that at the head of this note. The name of "dependens" is now bestowed upon a white-flowered species whose blooms are really not drooping.—W. T.

MUSHROOMS.

I know it to be a fact that many inexperienced young gardeners are afraid to make an attempt to grow mushrooms except in structures artificially heated. It is certainly a much easier matter to grow them in such places, but elaborately-built houses are not absolutely essential to success, as I have proved during a period of twenty-five years. In that time I have had at my disposal properly-constructed mushroom houses, and in some instances only cool sheds. In these, and in the open air, with the aid of good hotbed material, and, in several cases, only tree leaves, I have grown mushrooms without experiencing a single failure except one partial failure when attempting to grow them in practically all peat moss litter from stables. I will briefly explain how a beginner should work so as to attain success

The hotbed material and the way it should be prepared are very important essentials. Of course, stable manure is the best to use, and with it a small proportion of tree leaves, as the latter induce a steady and lasting heat. Many persons fail because they spawn an ill-prepared bed too soon—while the heat is too high—and then the spawn is destroyed.

The manure must be gathered fresh every morning and spread out thinly in an open shed to partially dry and sweeten. If turned over every morning the rank gases escape, and in this way the manure is sweetened. When sufficient material has been prepared, the bed should be built. But prior to making up the hotbed, throw up the whole of the stable manure into a conical-shaped heap and allow it to remain so for one day and one night, then spread out the material again thinly. Much steam will escape, and so the manure will be finally sweetened.

Having decided upon the position, proceed to make up the bed. Beds may be of any size, but the smallest should measure 4ft. by 3ft., and the largest 12ft. long by 4ft. in width. A very suitable size, however, is an 8ft. long and a 4ft.wide bed. In nearly all cases, where the beds are constructed on floors of sheds, the beds should be flat-topped and 15in. deep at the back, with a depth of 1ft. in front. Where leaves are used they should be added when the bed is being formed. It is a great mistake to remove all the strawy litter from the manure; long straw may be taken out, but the short litter should be left in. Add one barrowload of leaves to three of manure, and thoroughly mix the parts. Shake the manure and leaves lightly over the place where the bed is to be made, and as layer after layer is so put down well tread all so that when all the material is used up the bed will be a very firm one.

When the heat has reached the maximum, and stands at about 85 degrees on the decline, insert the spawn nearly 2in. below the surface of the manure, and 9in. apart each way. The lumps of spawn should be nearly 2in. square. Beat down the manure again when the spawn is inserted, and follow with a coating of sifted maiden loam 1in. thick. Finally cover with clean straw 1ft. deep. No watering will be required; keep the shed darkened and exclude draughts. In about six weeks' time the first mushrooms will appear. When in full bearing, I like to remove the straw covering in the case of beds in sheds and replace it with sheets of brown paper, as the mushrooms always come pure white under the paper whereas the damp straw stains them. Only water the beds with tepid water if they become dry, but syringe the floor and walls of the shed every day. When the beds have been in bearing for about six to eight weeks, the growth of mushrooms may be stimulated by giving the bed a good watering with tepid liquid manure—from stables, and about the colour of pale brandy—and some salt; the latter being used at the rate of one ounce to a gallon of the liquid manure water.

Beds in the open air may now be constructed. The preparation of the manure and its manner of use should be the same as in the case of beds in sheds; only the beds should be in the form of ridges 4ft wide at the base, and 3ft. high at the ridge. In this case, both a coating of litter and a thatch of straw—and in severe weather, mats—will be necessary.

For beds made of leaves only beech and oak leaves should be used; they must be just slightly damped when the bed is constructed, and I have found it a good plan to put on a layer of maiden loam 3in. deep and insert the lumps of spawn in the centre. Usually, I have noticed that a period of about eight to ten weeks pass before mushrooms appear. Protect these beds in the same way as the others. Outside beds are best made up on the west or north-west sides of walls or fences, but never make them under the branches of trees. G. B.

A CHARMING JAPANESE GARDEN.

In our issue for July 9 we fully described the two Japanese gardens which form such an important and attractive feature of the Japan-British Exhibition at Shepherd's Bush, and in conjunction therewith we gave two illustrations, one of each of the two gardens. As supplementary to these we now give an illustration of another view in the "Garden of Peace," which, as we have already stated, we regard as the most successful of the two examples of the accomplishments of Mr. H. Izawa in the art of garden making in this country. The previous illustration of this garden portrayed Mr. Izawa's skill in the use of running water as a means of scenic effect, and, with the aid of the one given herewith, our readers will have no difficulty in obtaining a clear idea of the characteristic features of a garden designed and constructed in accordance with Japanese ideas, or of appreciating the taste evinced in converting the area into a beautiful garden and the skill shown in the adaptation of the environment to the general design of the enclosure. It is not advisable to repeat the general description of the "Garden of Peace," and we therefore refer our readers to the issue of the date mentioned for information on the characteristics of this delightful example of the landscapists' art as practised in Japan.

GENERAL VIEW OF THE JAPANESE GARDEN, JAPAN-BRITISH EXHIBITION.

Popularly known as the "Garden of Peace."

AMONG THE ALPINE FLOWERS.

"A garden is a lovesome thing, God wot!
Rose plot,
Fringed pool,
Ferned grot——
The veriest school
Of peace . . . ."

Thomas Edward Brown.

"Lovesome," indeed, is the garden, and among the flowers we have in the course of years come to cherish so highly we take much real pleasure in the denizens of the mountains and valleys which, for convenience sake, we call "alpines." These have now, when summer is at its height, no poor task laid upon them. In face of the consummate beauties of the rose, and the many tall flowers of the border at this season, they have to endeavour to hold their own and to continue to give us pleasure. We must all bow to the claims of the Queen of Flowers, and we must all, surely, take inspiration and delight from her perfect charms; but there is no reason why we should not retain a warm corner in our hearts for the quiet beauties which reveal themselves to us in the graceful and ofttimes unassuming alpine flowers. Viewed singly in comparison with the beauties of the rose, their attractions seem few indeed, but in the mass they assume a beauty which appeals ever more to the lover of flowers. The garden without the rose is destitute indeed, but the garden which has plenty of roses and plenty of alpine flowers is more perfect still, as these all give the little pleasaunce features of enjoyment for many months of the year. While bowing then to the claims of the rose, let us see for a few moments what these alpines can give us now.

The Fragile St. John's Wort.

It was not this plant, Hypericum fragile, of which Cowper wrote in his familiar lines:—

"Hypericum, all bloom, so thick a swarm
Of flowers, like flies clothing her slender rods
That scarce a leaf appears."

But at times this little alpine covers itself with bloom as profusely as our native St. John's Worts, and very beautiful is it with its little trailing growth, hardly rising more than a couple of inches above the earth, and making a neat carpet of deep green leaves, of that glaucous hue we see in so many of the hypericums. This carpet is dotted, and at times covered, with handsome flowers more than an inch across and resplendent in yellow, seeming like miniature suns looking upwards instead of shining down upon us. It is a very beautiful little hypericum, and one which seems to be hardy in our climate. It grows in a wall garden well, and shows its beauties to advantage under such conditions; and it is also very beautiful indeed on the ordinary rockery, with its roots well behind the rocks or in a flat pocket of soil, and spreading its neat leaves and showy flowers over the stones, clothing them with Flora's attractions. It appears to be careless of its conditions, but will probably like a soil not too rich, but somewhat hard and dry in summer. A native of Greece, it has not yet come into general cultivation. I do not venture to assert that the treatment I give it is the best, but it is flourishing on a rock garden well up to the sun, in a dryish soil, and facing almost due west. It can be propagated by cuttings or raised from seeds if the latter can be procured.

The Top-shaped Bellflower.

Little apology is required, one thinks, in mentioning again and again such a good campanula for the rock garden as Campanula turbinata, classed by many as a form of C. carpathica, but differing in its dwarfer habit, its neater growth, and in the fact that it has seldom more than one flower on each stem.

The true plant is not so plentiful as it ought to be, and it is always greatly appreciated by those who own it, as we have no little alpine bellflower with upright, open flowers which can surpass it in brightness and beauty, or which is more easily cultivated. It is only a few inches high, and when in full bloom hardly a leaf can be seen for the mass of bright blue flowers. (By the way, the foliage is more hairy than that of C. carpathica). There is, in addition to the blue one, a white variety, which, although not pure white, but tinged with a suspicion of blue, is remarkably pleasing to those who wish a variation from the ordinary colour of the top-shaped bellflower. There is no difficulty to be encountered in cultivating this lovely little campanula, and I have grown it for many years either in the front of the border or on a flat part of the rockeries. In loam, or loam, sand, and leaf-soil, it will flourish perfectly, all it requires being an occasional top-dressing in autumn and spring. It is increased by division, and from seeds. If the plants are in near proximity to other bellflowers hybrid offspring may appear, and I have at present two or three such among self-sown seedlings.

Erica cinerea coccinea.

The ashy-grey heath possesses a considerable number of varieties, and there is hardly one of these which is not of the highest type of the beauty inherent in the ericas. Whatever colour, or shade of colour, they may own all are characterised by beauty, and all are of the greatest service in the furnishing of the garden of alpine flowers. I am selecting for special notice just now, mainly because it seems to have dropped a little out of cultivation and to be undergoing a kind of undeserved obscurity, the pretty variety of Erica cinerea called coccinea. It makes a charming little bush, only a few inches high, of greyish leaves all bedecked with crimson blossoms of high beauty and of a colour distinct from those of its sister-flowers. For brightening up a rockery, these summer and autumn heaths are invaluable, and among them should be included this scarlet-flowered heath, which will grow in loam and does not require the peat so often said to be necessary for these plants.

Other Flowers.

Although there is necessarily some reduction in the mass of floral beauty apparent earlier in the year, there is yet no dullness evident to our eyes as we look over the garden to see its delights. There are masses of sedums, or stonecrops, white, and pink, and yellow, and crimson; there are curious sempervivums, or houseleeks, with clusters of flowers like jewelled stars set at the top of their succulent stems; there are masses of dwarf bellflowers, glowing in the sun of the time; there are yet many helianthemums, or sun roses, bright and effective on the rockwork; there are potentillas, of white and yellow and orange, and brown and scarlet; there are gay erodiums, and geraniums, lithospermums, violas, thymes, thrifts, veronicas, with many other flowers of more or less worth and more or less delight-giving properties to our eyes.

S. Arnott.

For pretty gardens and lovely flowers read The Flower Garden, by T. W. Sanders, F.L.S. An up-to-date work on the formation, planting, and management of the garden, with description and cultivation of flowers and plants adapted for outdoor culture. Price 7s. 6d. net, by post, in box, 8s., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

SEEDLING ORCHIDS.—Seedling cattleyas of one year and upwards will in many cases have completed their first bulb of the season, and the new roots will be produced from the last-made or developing pseudobulb. At this stage, and more especially at this season of the year, it is desirable that any of the plants requiring more pit room, or where the potting compost needs replenishing, should be attended to without delay. See that ample drainage is given. The potting compost should be of a good lasting nature, especially for the larger plants that are reaching the flowering stage; this will avoid the necessity of disturbing the roots much in the final potting, as they may be transferred to large pots undisturbed if the material is in a good state of preservation. Avoid using much moss. I prefer peat and osmunda fibre in about equal parts with sufficient finely broken crocks intermixed to render the compost porous for the larger sizes. In dealing with smaller plants up to about the second year we find that there is considerable advantage derived by intermixing a liberal proportion of broken leaves and finely-chopped sphagnum moss. These composts should be pressed firm. Carefully shade all freshly-potted plants for a few days from the direct sun and strong light, or the leaves may probably turn yellow and give the plants an unhealthy appearance.

SEEDLING CYPRIPEDIUMS raised from seeds sown during the winter and early spring, particularly those derived from crosses with C. insigne as one parent, will now be developing the second leaf. The young plants may be pricked out several together, or singly in small pots as desired. In raising seedlings the question of housing space quickly arises, and it is well to consider this question at an early stage. There is not much encouragement to raise seedlings if space cannot be afforded for growing them afterwards. Those with any experience will have observed that even from the very best crosses that can be made there are only a very small percentage of desirable varieties, even where large numbers are raised, so that to limit the pricking off of the seedlings to a small proportion narrows down the prospects of getting those which are worth having. Now that orchids can be supplied at the prices of zonal pelargoniums, it is time to look into these matters from a broader basis than the limits of the past. The compost we use for seedling cypripediums are equal portions of fibrous peat, turfy loam, and chopped sphagnum, with sufficient silver sand added to render the compost porous.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

PERPETUAL FLOWERING CARNATIONS.—It will be necessary to secure the shoots to stakes as required. Discontinue the pinching out of the points of the shoots of plants that are required to flower in winter. The best stakes for supporting carnations are thin bamboo points. They are easily obtainable from the sundriesman, and last a considerable time. Syringe the plants occasionally with weak soot water, as this is beneficial to them, and helps to keep down insect pests. Ventilate freely at this season of the year.

MALMAISON CARNATIONS.—One-year-old plants should have a shift into larger pots, those 8 or 9 inches in diameter being a suitable size. Make the soil very firm. After the repotting place the plants in a well-ventilated house or frame, or out of doors in a sheltered position. On no account allow the soil to become saturated with water.

SALVIA SPLENDENS.—The earliest batch may have a shift into their flowering pots, using good turfy loam. Do not allow them to become dry at the roots. Syringe overhead twice daily to prevent thrips or red spider becoming established on the foliage. Free ventilation is essential to the production of robust plants. Pinch back the shoots when the new roots are running freely in the new soil.

CHRYSANTHEMUMS.—These will now have filled their pots with roots and should not be allowed to become dry, and a light top-dressing of some approved artificial manure will be beneficial. The necessary tying of the shoots, taking the buds of the more forward varieties, and the removal of side growths must be attended to. Superfluous shoots must be removed early, and not at the stage when a removal will cause a check. If greenfly be troublesome a dusting of tobacco powder will effect their riddance. Earwigs will now be troublesome, and these must be hunted down, pieces of brown paper crumpled up make useful traps; these should be examined every evening, and the earwigs drooped into a pail of hot water.

SCHIZANTHUSES.—Seeds should now be sown for the purpose of raising plants to bloom in spring, sow in pans filled with light sandy soil, and place the pans in a warm house and shade from bright sunshine. As soon as the seedlings appear, gradually give more light and air to prevent their becoming drawn. When of a suitable size put them into thumb pots, using a rich sandy soil.

REHMANNIA ANGULATA.—A sowing of the seed of this species should be made now for the production of plants for flowering in May next. When shifting the plants into their flowering pots do not use too rich a soil, but pot firmly, so that they will produce compact flower spikes.

CINERARIAS.—Seedlings pricked off into boxes will now require to be put into pots, those 4½ inches in diameter being large enough. When they have filled the soil with roots shift into pots 6 or 7 inches in diameter; use loam, leaf-soil, and sand. After repotting place in cool frame with the pots on a layer of ashes. Keep the ashes well soaked with water, syringe twice daily, and keep a sharp look-out for greenfly; when this is noticed fumigate at once.

CALCEOLARIAS.—A sowing of seed of these attractive flowers should be made at once. When the seedlings are large enough put them singly in thumb pots or boxes, using a rather heavy soil, but one that is quite porous. Good turfy loam and peat well mixed in equal parts makes a good compost.—W. **STAWARD**, Belford Hall Gardens.

THE FLOWER GARDEN.

HERBACEOUS FLOWERING PLANTS still need constant care and attention in the way of needful support to the extra strong growths made during the present season. The heavy rainfall has caused many to make abnormal growths, so that extra care and judgment must be exercised in dealing with them. Hollyhocks should have special care when being secured to the stakes, as they will be injured if secured too tightly at the start. Michaelmas daisies, too, should not be so tied as to present a heavy bunched-up appearance, and nothing tends to destroy the beauty of the herbaceous border more than a stiff. formal manner of staking; all should be done as inconspicuously as possible if a natural appearance is desired.

DWARF ROSES are, in many instances, making very strong growths and showing a second crop of flowers. These should be encouraged as much as possible, and any thin flowerless shoots should be removed. Remove all spent or decaying flowers, and, if needs be, shorten back the growths of H.P.'s that have finished their flowering. On light soils, or when dealing with old-established beds, it is advisable, just at this time, to give the plants extra support in the way of suitable manure—and especially so if no former mulching has been given, or the beds are carpeted with dwarf-growing plants. Climbing and Rambler roses should have their growth loosely secured so as to prevent the young shoots being injured by the wind.

DAHLIAS are now making more satisfactory progress, and regular and constant attention to these will be necessary. If grown for exhibition several stakes will be required for each plant, carefully tying out all growths to the required number, for only by doing this can satisfactory flowers be obtained. During dry weather the soil should be heavily mulched, and liquid manure of some kind be occasionally given. This is a matter, however, requiring a little judgment on the part of the grower, as some varieties do not so readily respond to, or benefit by, feeding so much as others, but the knowledge of this can only be gained by experience when dealing with a multitude of varieties.

THE AUTUMN PROPAGATION of pelargoniums and other bedding plants must soon be taken in hand—in favoured localities the best results are obtained by striking these in boxes placed in the full sun out of doors; in less favoured spots the protection of a cold frame or light, airy greenhouse becomes necessary. It is yet full early to take cuttings of alternantheras, coleus, iresines, and similar plants used for carpet bedding, but for these a warm house, or bottom heat is necessary during the process of striking. Pentstemons and antirrhinums propagate freely in perfectly cold frames; in fact, heat is decidedly injurious. The cuttings of these should be secured as soon as ready, placing them in sandy soil, in deep pans or boxes, or a bed of soil made up in a cold frame or shelter.

IVY EDGINGS to beds or shrubbery borders should have the growths pegged down or shortened back, at the same time taking care to remove all dead or decaying growths; use a knife for this purpose, and so avoid displacing or disfiguring the edgings more than is absolutely necessary. Newly-sown grass plots should be lightly mown with a scythe before any attempt is made to use the mowing machine.—W. **HEDLEY WARREN**, Aston Clinton Gardens.

HARDY FRUITS.

WALL TREES.—Most varieties of fruit trees grown against walls will be swelling their fruits freely now, and these will be greatly benefited by frequent waterings with liquid farmyard manure, alternating it with an occasional application of some approved chemical fertiliser. Fig trees that are carrying heavy crops should receive copious supplies of water to mature and accelerate the swelling of their fruits. Earwigs will become a source of trouble amongst peaches, apricots, etc., as the fruit begins to ripen, and means should be adopted for their eradication. Hollow, dry stalks of the broad bean, or hollow bamboo canes, will be found excellent traps if cut into short lengths and placed amongst the branches of the trees; the traps must be frequently examined, when the earwigs can be shaken or blown out into a paraffin solution or boiling water. All fruits should be exposed to the sun and light as much as possible to assist in the development of high colour and rich flavour. Continue, and finish as soon as possible, summer pruning on all wall trees; these remarks also apply to trees grown in the open quarters. Now is a good time to make careful note of trees that are growing too strongly and form few or no fruit buds, so that root-pruning can be undertaken early in the autumn before the leaves have fallen. Young trees that are bearing heavy crops should have their branches supported with good strong stakes, or if this is not done in all probability many branches will be broken off by the weight of fruit.

RASPBERRIES AND LOGANBERRIES.—Immediately all the fruits have been gathered the old canes should be cut away and the young growths tied loosely and securely to the wires, or whatever supports are used. If the current year's growth appears weak, frequent watering with liquid manure should be given without delay to mature good strong fruiting canes for next season.

ORCHARD TREES.—The turf should not be allowed to grow to within several feet of the main stems, and where it has encroached it should be severely kept back. Trees that are carrying heavy crops of fruit should be given a good dressing of decayed farmyard manure upon the surface soil; this operation will be of the greatest possible benefit both to apple, pear, and damson trees. The grass should be also kept fairly short, either by cutting or grazing. Hedges should be trimmed, and the whole place should be kept as neat as possible. The present is a good time to examine the tree guards, and if any require attention they should be repaired without delay; this is of the utmost importance where cattle and sheep are allowed the free run of the orchard.

FILBERTS AND COB NUTS.—There is every indication that good crops will be general here, although, strictly speaking, this is not an ideal locality for the production of good nuts. The trees or bushes should be examined, and all suckers removed; a good dressing of farmyard manure or decayed vegetable refuse, and liquid stimulants applied to the roots is essential to the production of good fruits. — **HENRY R. FARMER**, Cardiff Castle Gardens.

PHYTEUMAS.

Among the hardy plants deserving extended appreciation are the phyteumas, a genus included within the natural order Campanulaceæ, but whose general character scarcely betrays this affinity.

Of Phyteuma orbiculare Nicholson says, "It is found in pastures and by roadsides on a chalky soil," a statement that virtually contains the key to the genus, as all the species appear to find their requirements supplied when grown in chalk or limestone soil. The flowers are collected into either rounded or spherical heads, and are carried upon slender unbranched stems.

Of the taller species P. betonicæfolium has ovoid spikes of blue flowers, carried upon twelve-inch stems. P. Micheli grows to a height of eighteen inches: the flowers are blue, in ovate spikes. P. orbiculare has blue flowers in close, round heads, on stiff stems, some twelve inches high. P. Scheuchzeri produces deep blue flowers in spherical heads. P. comosa is a dwarf species, and generally regarded as capricious, as it is sometimes difficult to establish: it is both pretty and interesting, and worth almost any effort to secure its well being. Success is most readily secured from strong seedlings if planted out late in spring; the flowers are blue and tube-like, and are borne in umbel-like heads supported by loose stems. P. Halleri has dark violet flowers in oblong heads, and P. Sieberi has flowers of a deep blue in heads of spherical form; both are dwarf in habit.

The flowering season of phyteumas extends from May till August: on the commoner kinds belated blossoms may be found much later. Considerable variety is noticeable in the foliage of the different species, and, being deciduous, is always most refreshing in spring when the new growth is developing: the radical leaves form dainty mounds through which the flowering stems emerge. Phyteumas readily fall a prey to slugs and mice, unless early measures be taken to prevent their attacks. The latter, in particular, are most destructive. The best means of increasing phyteumas is by seed, which germinates freely, the seedlings soon forming good plants, and are suitable for planting on rock gardens, employing the taller kinds on the bolder parts, and yielding positions near the eye-level to the dwarf kinds. They succeed in good garden soil freely mixed with sand, and the position should be well drained and open to the sun.

THOMAS SMITH,
Walmsgate Gardens.

EXHIBITIONS AND MEETINGS.

◆

Leeds, JULY 26-28.

It is apparently becoming the general thing for agricultural societies to introduce horticulture as a separate branch of their shows, and certainly such an addition is by no means out of place. The Yorkshire Agricultural Society tried the experiment for the first time this week, and having placed the management of the section in the hands of Mr. Peter Blair, who, as usual, worked hard and enthusiastically, the first flower show of the society was distinctly successful. Roundhay Park was the venue of the show, and the exhibits were accommodated in three big tents, in one of which were the big groups, roses, sweet peas, etc., and in the second the cut-flower classes and trade exhibits. The third tent was occupied by the great array of wild flowers exhibited by the school children of the district.

GOLD MEDAL COLLECTION OF ORCHIDS.
Exhibited by Messrs Mansell and Hatcher, Lim., Rawdon, Yorks, at the Leeds Show.

GROUPS.

Five magnificent groups proved the centre of the largest tent, and were of course the great attraction to everybody who visited the show. 350 square feet space had to be covered, which means a big group. The winners of the first prize were Messrs. J. Cypher and Sons, Cheltenham, who had a beautiful arrangement of choice foliage plants, among which were placed orchids of many kinds, liliums, Clerodendron fallax, some small ericas, etc. Over a wide arch in the background was a splendid Kentia, supported on either side by crotons. The sides and corners of the group were furnished with particularly good crotons, while variety of foliage was supplied by alocasias, caladiums, ferns, and a few Cocos Weddelliana. Mr. J. Donoghue, gardener to M. Pickersgill, Esq., Garden Hill, Leeds, secured second prize, his group taking the form of a bed of richly-coloured foliage, out of which rose taller crotons, etc., and flowering plants. Begonia Rex was freely and well used, and over the carpet of verdure the sprays of odontoglossum, oncidium, and other orchids showed up to good advantage. Hiawatha rose rambling round the stems of a fine palm made the central background, good dracænas and silver maples being also used. Third prize went to Mr. Curtis, gardener to James Blacker, Esq., Selby. Here one felt the need of a few larger plants to break away from the rather uniform, although very nice arrangement.

Messrs. Cypher scored for twelve stove plants, showing their huge bougainvilleas, ericas, allamandas, etc., in their usual good style. Mr. J. S. Sharp, Huddersfield, secured second place. Messrs. Stuart Low and Co., Bush Hill Park, Middlesex, were the only competitors in the class for a collection of orchids occupying 100 square feet. They had nice examples of Odontoglossum Pescatorei, O. Williamsianum, Cattleya Gaskelliana, and a number of choice oncidiums.

ROSES.

Messrs. Alex. Dickson and Sons, Lim., Newtownards, won for twenty-four distinct roses with a stand of very large blooms. Messrs. G. Gibson and Co., Leeming Bar, received second, and the third place was taken by Mr. T. Park, Bedale. Messrs. Dickson again led for twelve varieties, showing William Shean, Lady Barham, and other popular varieties. Mr. T. Park secured second in this class, Messrs. Gibson and Co. being the followers.

In the class for twenty-four varieties, from which the trade were excluded, the premier place was allotted Mr. Park. His blooms were a level and clean lot, the varieties being of the best. Mr. B. Mawson, Roundhay, Leeds, was second. For twelve blooms Mr. Park still led, this time being followed by W. S. Heslington, Esq., Ripon.

SWEET PEAS.

Mr. Robert Bolton, Warton, Carnforth, staged a first-rate collection of sweet peas, which was easily first in the class for a collection arranged on 20ft. by 5ft. tabling. Nancy Perkins, Tom Bolton, King Edward Spencer, and Mrs. C. Foster were among the best, and were shown in imposing masses.

Messrs. Aldis and Rowntree, 3, Albion Street, Leeds, followed Mr. Bolton, their peas being also good, but there was room for improvement in the style of staging.

A class was provided for eighteen vases of sweet peas, and the winning exhibit was that of Mr. W. S. Heslington, Yore Gath, Littlethorpe, Ripon. Among his best varieties were Mrs. Hugh Dickson, Mrs. Hardcastle Sykes, The Marquis, and Paradise Ivory. Second prize was awarded Messrs. G. Longster and Son, The Nurseries, Malton, who also had some of the most popular peas in cultivation. Mr. Heslington again scored in the class for twelve bunches, showing Elsie Herbert, Maggie Stark, Evelyn Hemus, and a good vase of Violet Heslington. Mr. G. F. Brotherston, gardener to W. F. Samuelson, Esq., Brockenbrough Hall, Thirsk, was second in this class, the arrangement falling short of that in the winning group. Similar classes to the foregoing were provided for private growers only, and for 18 vases Mr. Brotherston came in for chief honours. His spikes of Constance Oliver, Helen Lewis, Marjorie Linzee, Mrs. H. Bell, and others were fine examples of good cultivation. The second award was made in favour of Mr. S. Shackleton, Keighley, Mr. W. S. Heslington taking third place. Mr. J. B. Harper, York, scored first with the twelve varieties, showing capital flowers, nicely arranged. Mr. S. Shackleton secured second, and was followed by W. S. Heslington for third place.

Mr. C. F. Waters, Balcombe, Sussex, was worthily awarded first in the class for a collection of cut carnations occupying a space of 12ft. by 5ft. His flowers of Winsor, Aurora, Victory, and other popular perpetuals were very fine, and a number of good borders finished off the front. Messrs. Blackmore and Langdon, Bath, came second, good border varieties predominating on their stand, although a good centre was made with Mary Vilven, a cherry-carmine perpetual. Mr. A. F. Dutton, Iver, Bucks, was awarded third prize. In the smaller class Mr. J. Barker, gardener to the Duke of Newcastle, won, showing some Malmaisons of capital quality.

Messrs. Blackmore and Langdon, Bath, scored well in the class for begonias, their group containing some exceedingly fine examples of the flowers they grow so well.

A gorgeous bank of hardy flowers was formed by the entries to the class for a collection of hardy perennials occupying 15ft. by 5ft. Messrs. Harkness and Sons, Bedale, led off with great bunches of salmon poppies,

SANDY (BEDFORDSHIRE).
42nd ANNUAL SHOW, AUGUST 25, 1910.
PLANTS, FLOWERS, FRUIT, VEGETABLES, Etc.
DOGS, POULTRY, PIGEONS, RABBITS, and CATS.
PRIZES VALUE £1,000.
Ten Stove and Greenhouse Plants, £8, £7.
Groups, £10, £9, £8.
Entries close August 18.
Schedules and particulars of W. GREEN,
Secretary, Sandy.

SHEFFIELD CHRYSANTHEMUM
SOCIETY'S SHOWS
Will be held in the CORN EXCHANGE,
FRIDAY and SATURDAY, September 16 and 17;
FRIDAY and SATURDAY, November 11 and 12.
OVER £300 OFFERED IN PRIZES.
Schedules and all particulars on application from
C. COOK, Secretary, City Road, Sheffield.

THE FOUR NORTHERN COUNTIES, FRUIT CONGRESS and SHOW, HEXHAM, 20-22 October, 1910. Particulars of space for Trade Exhibits from the General Secretary, Rev. J. BERNARD HALL, Hon. F.R.H.S., Dalston, Cumberland.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

early gladioli, several fine verbascums, and choice liliums. Messrs. G. Gibson and Co., Leeming Bar, were second, their group including Malva moschata, good gaillardias, and a few late delphiniums.

FRUIT.

Mr. J. H. Goodacre, gardener to the Right Hon. Earl of Harrington, Elvaston Castle, secured first prize for a collection of twelve varieties of fruit. His peaches and nectarines were good, as also his dish of Lady Sudeley apple. Mr. J. Barker, gardener to the Duke of Newcastle, was second, James Grieve apple and Madresfield Court grape being good dishes. Mr. Barker also led in the class for black grapes, and Mr. Goodacre scored for peaches, green-fleshed melon, and nectarines.

THE NON-COMPETITIVE SECTION

was strong, and did much toward making the show. Messrs. Mansell and Hatcher, Lim., Rawdon, Leeds, put up a big and very beautiful group of orchids; vandas, odontoglossums, and oncidiums were conspicuous, and some good sprays of Renanthera Imschootiana, and Epidendrum vitellinum majus made distinct notes of colour. The arrangement of the whole group was very tasteful. Messrs. Stuart Low and Co., Bush Hill Park, staged a small group of choice perpetual carnations, also Lyon and a few others of the newer roses. Good vegetables, hardy flowers, and sweet peas were staged by Messrs. Geo. Massey and Sons, Spalding, who also put up a capital batch of Lilium testaceum, the colour and form of which were very good.

Messrs. Alex. Dickson and Sons' extensive display of roses received a full share of attention from the visitors. The table was occupied by specimen blooms representative of the best of the H.P. and H.T. sections, whilst bamboo stands of choice garden roses made up the background. Messrs. H. B. May and Sons, Edmonton, brought a group of choice ferns, Nephrolepis Marshalli and Polypodium Mayi being among them. Messrs. Aldis and Rowntree, 3, Albion Street, Leeds, put up a big group of hydrangeas, liliums, heliotropes, and other greenhouse subjects. Mr. F. J. Bell, Crescent Nursery, Whitley Bay, showed violas and sweet peas in considerable quantity and variety.

Messrs. Wm. Conway and Sons, Halifax, staged herbaceous flowers, and Messrs. R. H. Bath, Lim., Wisbech, had a big stand of sweet peas, phloxes, roses, and carnations. Mr. H. N. Ellison, West Bromwich, put up nephrolepis, Polypodium glaucum crispum, Cyrtomium Rochfordi, and a host of other choice ferns. Mr. Chas. W. Breadmore, Winchester, brought up a very attractive lot of sweet peas.

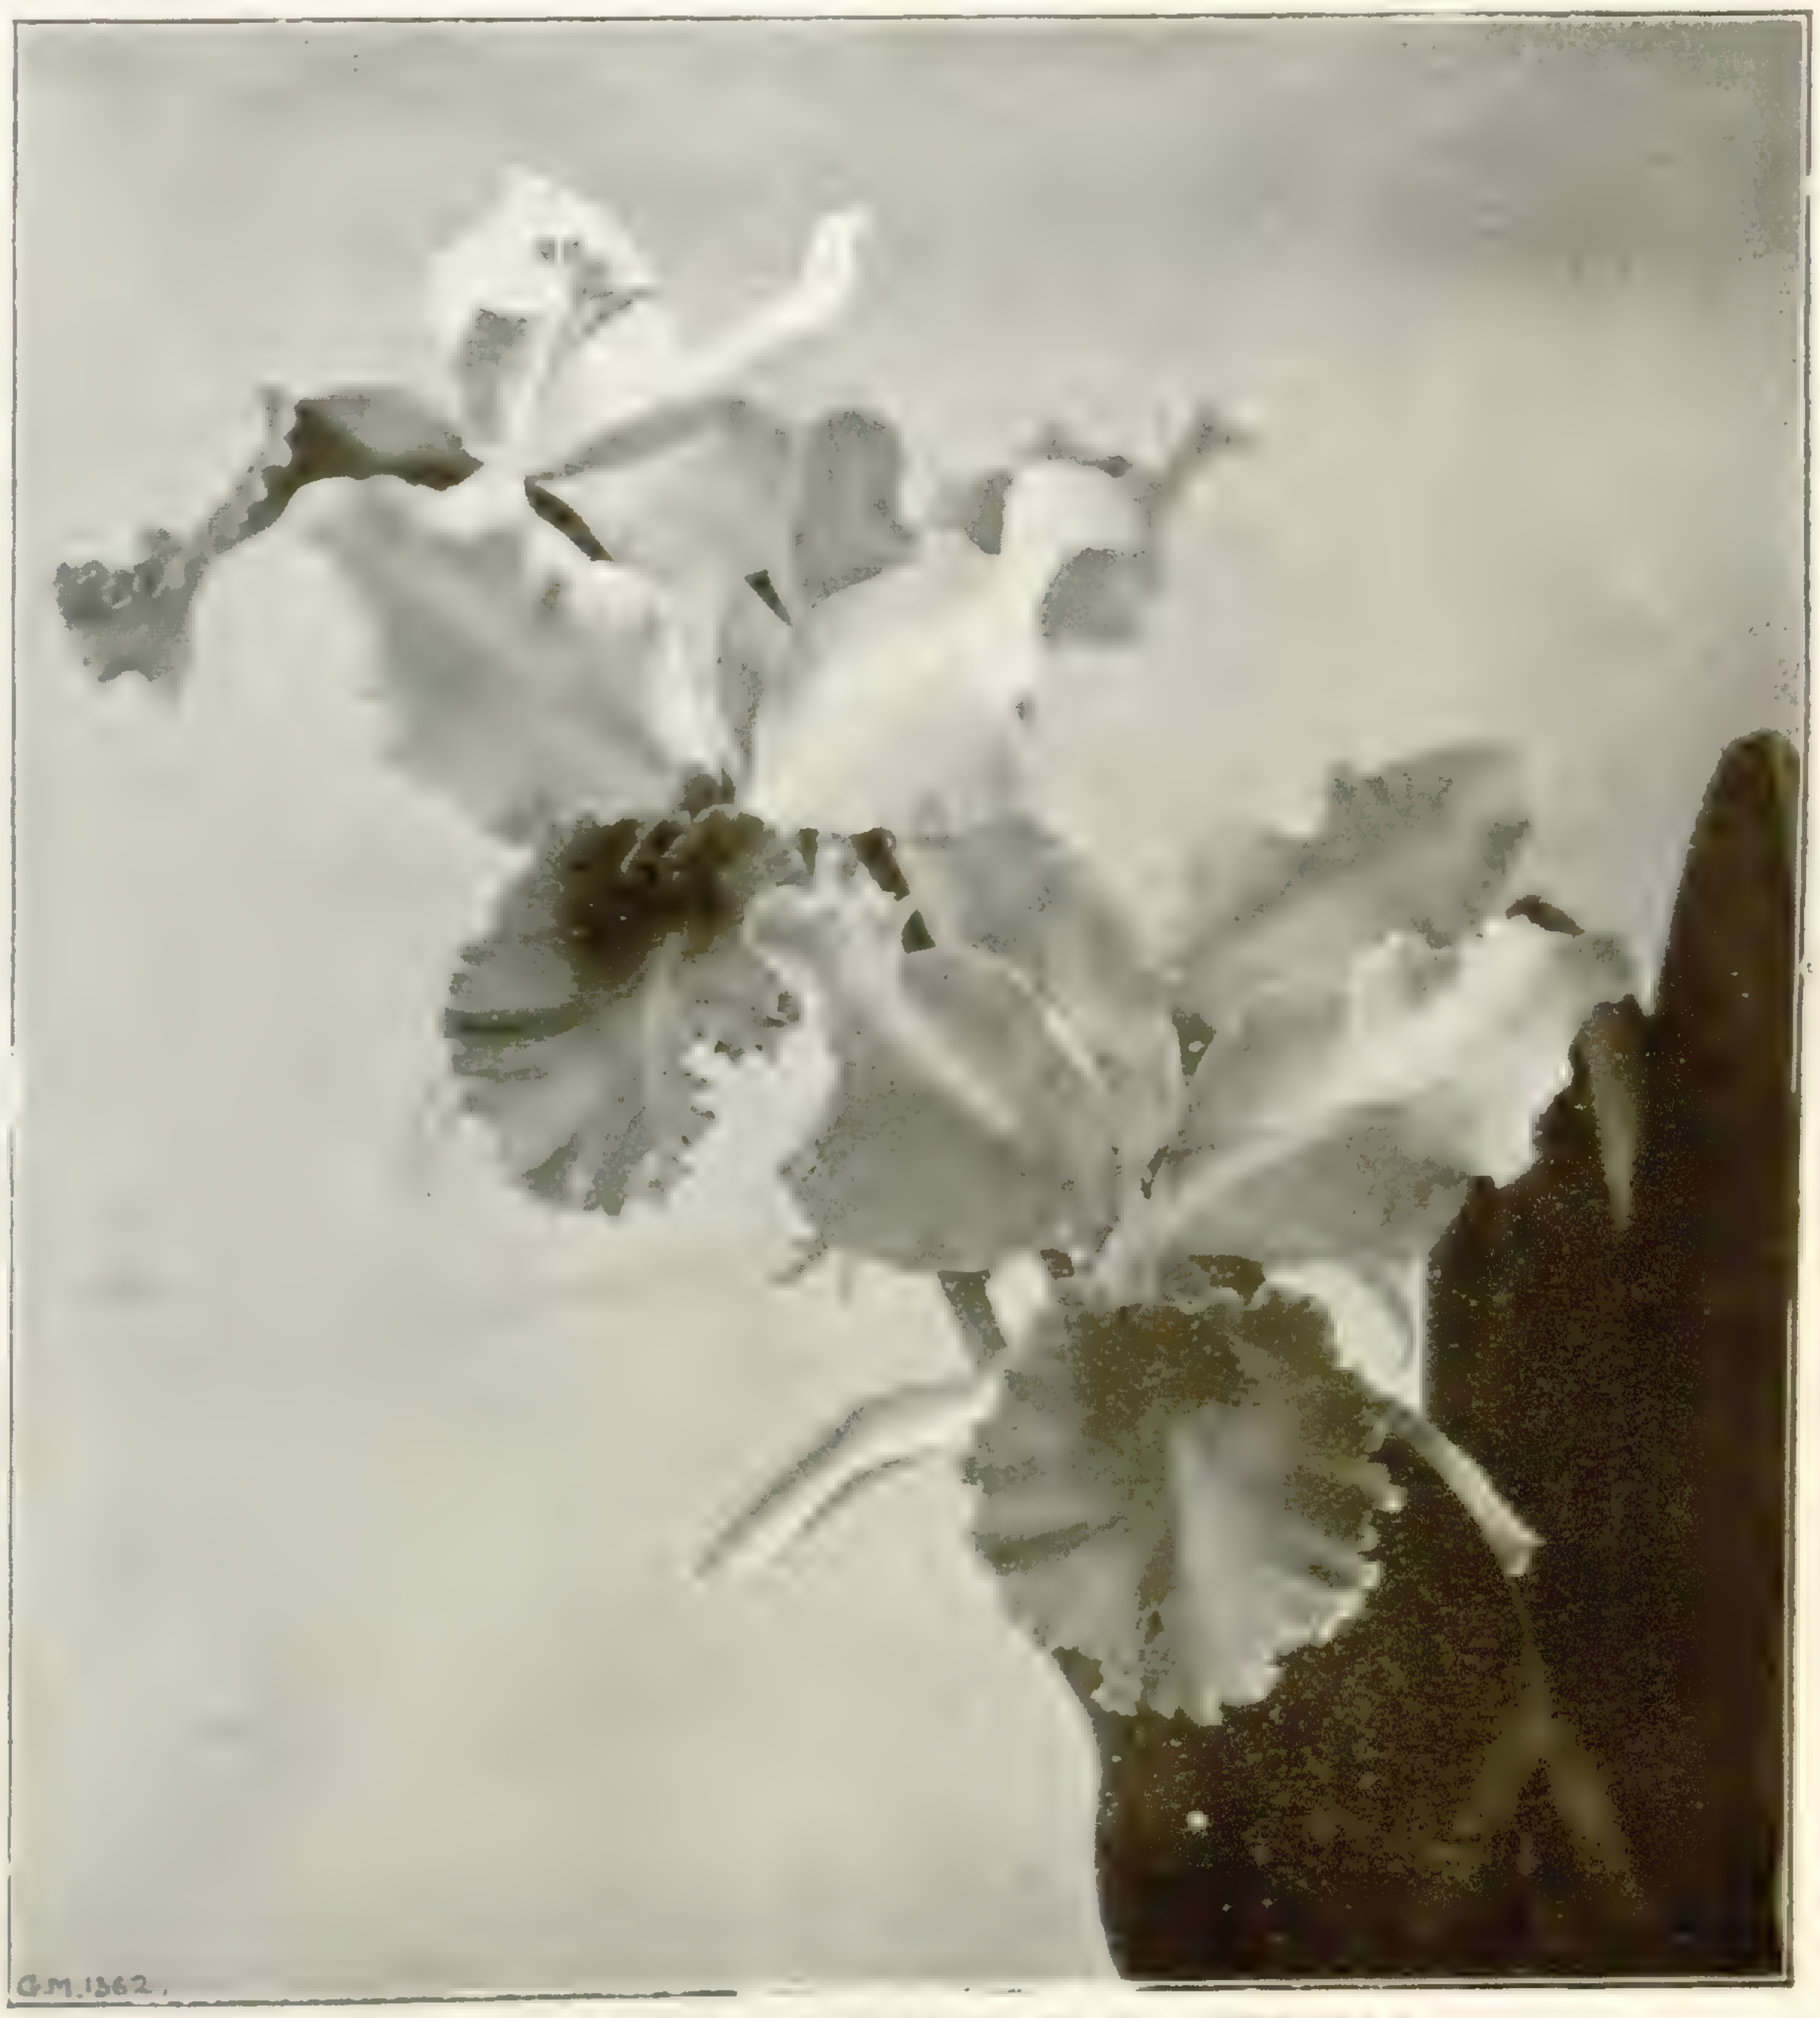
A large and excellent collection of pot fruit trees was staged by King's Acre Nurseries, Lim., Hereford. In addition to peaches and apples there were canes of the loganberry, cordon currants, and gooseberries, and some grapes. A varied collection of herbaceous flowers was staged by Messrs. W. and J. Brown, Stamford, and a new scarlet zonal, named Rising Sun, was exhibited by Messrs. J. Firth and Sons, Avenue Nursery, East Keswick. It looks like being a good bedder, having a habit similar to the old F. V. Raspail. Garden roses came from Messrs. Clibrans, Manchester. The group of all the newer crested nephrolepis, arranged by Messrs. E. J. Batchelor and Sons, Harrogate, was made up of large, well-developed specimens, which showed the full beauty of these elegant ferns. Some nice roses were shown by Mr. Arthur H. Rigg, Shipley Glen, Baildon, Yorks. Baby Dorothy, Dorothy Perkins, and other of the new polyanthas were shown, and a vase of Madame Ravary was very good. A group of carnations in pots was arranged across the end of a tent by Messrs. Kent and Brydon, Darlington. A few palms and ferns were used to set off the flowers, the varieties exhibited being of the best. Messrs. G. Gibson and Co., Leeming Bar, put up a group of herbaceous flowers, among which delphiniums were very strong for so late in the season.

MEDALS.

Gold.—Messrs. Alex. Dickson and Sons, Lim., Newtownards, for collection of new roses; Messrs. Mansell and Hatcher, Lim., Rawdon, Leeds, for orchids; King's Acre Nurseries, Lim., Hereford, for fruit trees; Messrs. H. B. May and Sons, Edmonton, for ferns.

Small Gold.—Messrs. R. H. Bath, Lim., Wisbech, for miscellaneous cut flowers; Mr. C. W. Breadmore, Winchester, for sweet peas.

Silver.—Messrs. George Massey and Sons, Spalding, for cut flowers; Mr. F. J. Bell, Crescent Nurseries, Whitley Bay, for violas and sweet peas; Messrs. G. Gibson and Co., Leeming Bar, Bedale, for hardy flowers; Messrs. W. Conway and Sons, Lim., Halifax, for herbaceous flowers; Messrs. Clibrans, Altrincham, for roses; Mr. H. N. Ellison, West Bromwich, for ferns; Messrs. Stuart Low and Co., Bush Hill Park, Middlesex, for roses and carnations; Messrs. W. and J. Brown, Stamford, for herbaceous flowers; Messrs. E. J. Batchelor and Sons, Harrogate, for nephrolepis; Mr. Arthur H. Rigg, Ardyrig Nurseries, Baildon, Yorks, for roses; Messrs. Kent and Brydon, Darlington, for group of carnations, etc., in pots.



CATTLEYA WARSCEWICZI VAR. OTHELLO.

Flowers rich purple, crimson purple and gold; A.M., R.H.S., August 2; from Lieut.-Colonel Sir George Holford, Westonbirt, Gloucester.

Royal Horticultural Society.

AUGUST 2.

We have on previous and similar occasions pointed out the undesirability of holding an exhibition of the Royal Horticultural Society on the day following August Bank Holiday. We need not labour the point, for if the poor display of August 2 is not sufficient condemnation nothing ever will be. It was a small show, and a poor one, and some of the exhibits were distinctly unsatisfactory. Visitors were few, and many of the regular attendants wished they had stayed away. Instead of the usual half-crown, the admission price was reduced to 6d.

FLORAL COMMITTEE.

Verbascum Caledonia and the golden-yellow Verbascum Harkness' Hybrid Yellow were both splendidly shown by Messrs. Harkness and Sons, Bedale, each variety being represented by a dozen vases of finely-developed spikes; some good gaillardias were also included in the exhibit. Mr. Frank Lilley, Guernsey, contributed a few choice gladioli, and a mound of spikes of the graceful Sparaxis pulcherrima.

The new Cosmos Rose Queen was once

again exhibited by Messrs. Dobbie and Co., Edinburgh, and with this were some very brilliant pot marigolds, their Orange King and Sulphur Queen being unusually fine. The scabious and the flowers of Dimorphotheca aurantiaca, and the rosy and apricot-coloured snapdragons from the same firm were highly meritorious. Mr. W. Wells, Merstham, staged phloxes in great variety, including the white Frau Antonin Buchner (A.M.), lupins, delphiniums, gaillardias, and violas. Messrs. Jas. Veitch and Sons, Chelsea, had a quite small exhibit of annual chrysanthemums, marigolds, candytuft, lupins, and the brilliant Newbury Gem pentstemon. Scarlet Perfection, a deep red border carnation, was shown by Mr. Walter Easlea, Eastwood, Essex. The display of border carnations made by Mr. Chas. Blick, Hayes, Kent, was greatly admired; the flowers were of fine size and well staged in vases. Doris, Jas. Quin, Father O'Flynn, Silvia, Prince Arthur, Grand Duke, Thais, Pasquin, Ronny Buchanan, Sidney Carton, and Captain Scott were yellow ground varieties, all finely represented in this handsome group. Mr. Jas. Douglas, Great Bookham, Surrey, showed several new carnations, the chief of those being Mrs. J. A. Reynolds (A.M.), a bright golden apricot self; and Forester (A.M.), a yellow-ground fancy, very bright, with light scarlet flakings.

In the group of phloxes and varieties of Chrysanthemum maximum, shown by Messrs. Paul and Son, Cheshunt, the latter were very conspicuous. C. m. The Speaker was the largest form, and is of immense size; C. m. G. Sage, C. m. Duchess of Abercorne, C. m. M. Prichard, C. m. King Edward, and C. m. Mrs. J. Fersturg made up a very fine set of these useful flowers. Messrs. Jas. Kelway and Son, Langport, displayed a tableful of gladioli, in a great range of colouring; Kipling, Cornishman, Earl Compton, Walpole, Sir Horace Plunkett, Orby, and Conway Seymour were a few of the most striking varieties in this handsome set. The same firm had a few pyrethrums and gaillardias, and also some delphiniums. Mr. G. Reuthe, Keston, and the Guildford Hardy Plant Company, Guildford, exhibited hardy flowers freely, the former including Campanula Moerheimi, Stenanthemum robustum, Isatis glauca, and Veronica longiflora subsessilis. Campanula isophylla, C. i. pallida, C. i. Mayi, C. i. alba, and C. i. superba were all shown prettily by Messrs. H. B. May and Sons, Edmonton, as pot plants, growing both pendulously and staked erect; with these were choice ferns, and a few ixoras.

FIRST PRIZE GROUP AT NORTHAMPTON FLOWER SHOW.

Exhibited by Mr. J. W. Macdonald, gardener to Sir H. Kenrick, Whetstone, Edgbaston, Birmingham.

ORCHID COMMITTEE.

Mr. E. V. Low, Vale Bridge, Hayward's Heath, presented a small group of select orchids that included Cattleya Pittiana, but nearly all the plants were packed up and had disappeared by 2.30. Mr. Maurice Mertens brought over a few choice odontoglossums from Ghent, but evidently thought it not worth while to keep them on view, and these had also disappeared at the above hour. A splendid specimen of Oncidium incurvum, carrying two dozen spikes of its small and elegant flowers, was brought up by Mr. W. H. White, orchid grower to Sir Trevor Lawrence, Bart., Burford Lodge, Dorking, and most deservedly secured for its grower a cultural commendation.

Mr. G. Day, gardener to H. S. Goodson, Esq., Fairlawn, Putney, showed Odontioda Goodsoniæ var. Herberti, of good colour, and Odontoglossum crispum Herberti. Mr. Stables, gardener to De Barri Crawshay, Esq., Rosefield, Sevenoaks, brought up a pale yellow form of Odontoglossum ardentissimum, the handsome O. Astarte, and O. Nerissa, the latter a cross between O. nævium and O. crispum, and something like O. Phœbe in general appearance. Mr. H. Alexander, orchid grower to Lieut.-Colonel Sir George Holford, Westonbirt, Gloucester, showed Cattleya Warscewiczi var. Othello (A.M.), a splendid variety with deep-hued lip and sepals and petals of unusually rich purple colour.

FRUIT AND VEGETABLE COMMITTEE.

From the society's garden at Wisley a number of vegetables that had been on trial there were brought up, and Awards of Merit granted at Wisley were here confirmed, as follows: A.M. to cabbage lettuce Supreme, Messrs. Sutton and Sons; cabbage lettuce Icehead, Messrs. Barr and Sons; cabbage lettuce Heartwell, Messrs. Sutton and Sons; cabbage lettuce Green's Favourite, Messrs. Barr and Sons; and cabbage lettuce, White Favourite, Messrs. Barr and Sons; kidney potato Faithlie, Messrs. W. Smith and Sons, Aberdeen; potato Selected Ashleaf, Messrs. Barr and Sons; potato Walker's Seedling, Messrs. Brewer; potato Den's Favourite, Messrs. Den; pea Prince of Peas, Messrs. Sutton and Sons; pea Prestige, Messrs. Jas. Veitch and Sons; and pea Moneymaker. (?)

Improved Winningstadt cabbage was famously shown by Messrs. Dobbie and Co., and is a splendid summer variety of handsome appearance; the beautifully curled Victoria kale was also submitted. Messrs. S. Spooner and Sons, Hounslow, showed a box of picked fruits of Early Red Margaret apple.

AWARDS OF MERIT.

To Cattleya Warscewiczi var. Othello, from Lieut.-Colonel Sir George Holford (grower, Mr. H. Alexander), Westonbirt, Gloucester; to Carnations Mrs. J. A. Reynolds and Forester, from Mr. Jas. Douglas, Great Bookham; to Phlox Frau Antonin Buchner, from Messrs. W. Wells and Co., Merstham; and the vegetable awards above noted.

MEDALS.

Neither the Orchid or the Fruit and Vegetable Committee granted any medal awards.

Silver-Gilt Banksian.—To Mr. Chas. Blick, Hayes, Kent, for carnations.

Silver Flora.—To Messrs. J. Kelway and Son, Langport, for gladioli; to Messrs. H. B. May and Sons, Edmonton, for campanulas and ferns.

Silver Banksian.—To Messrs. Dobbie and Co., Edinburgh, for annuals; to Messrs. Paul and Son, Cheshunt, for phloxes and herbaceous chrysanthemums.

Bronze Flora.—To Mr. G. Reuthe, Keston, for hardy flowers; to Messrs. W. Wells and Co., Merstham, for phloxes.

Bronze Banksian. — To Guildford Hardy Plant Company, Guildford, for hardy flowers.

Northampton, AUGUST 3 and 4.

The second exhibition held by the Northampton Municipal Horticultural Society in Abington Park, on the above dates, was a far more extensive one than the first; indeed, so extensive was it, and so few of the entrants fell out that the committee had much difficulty in providing sufficient space for the exhibits. This caused a great deal of delay, and instead of having the tents cleared for judging by eleven o'clock, judging could not begin until twenty minutes to one, and there always seemed to be many persons present in the tents besides the officials.

Ten tents were filled with horticultural produce, one with honey, and one with poultry and birds. The cottagers' exhibits quite overran the space provided, and many of the vegetables had to be laid out on the grass outside the tents. The prospects for a great show at Northampton are particularly rosy, therefore we hope that another year Mr. Palmer, the secretary, and the committee and stewards will be able to provide more tent room, and insist that the virtue of punctuality is practised.

A schedule of 176 classes, and about £300 in prize money were provided. The weather on the opening day was not of the best, heavy showers and wind storms being interspersed with bursts of hot sunshine.

A FINE GROUP OF DAHLIAS AND SWEET PEAS.
Staged by Mr. S. Mortimer at the Northampton Flower Show.

GROUPS AND PLANTS.

In the large open class for a group arranged on 160 square feet, there were three competitors for the prizes of £15, £10, and £5 respectively. Premier award fell to Mr. J. H. Macdonald, gardener to Sir H. Kenrick, Bart., Whetstone, Edgbaston, Birmingham, who put up a charming group in which a low arch was the central feature; this was surmounted by a Kentia, and clothed with Selaginella, crotons, Francoa ramosa, and Fuchsia triphylla. The latter plant, so well grown by Mr. Macdonald, figured in the lower part of the display, being associated with crotons, francoa, and liliums in the corner mounds. Crotons, Rex begonias, aralias, a central colony of dwarf ixoras, and Oncidium flexuosum formed the base of this attractive design. Mr. W. Vause, Leamington, was awarded second prize for a good exhibit that lacked the lightness of Mr. Macdonald's. Lilium speciosum, crotons, Strobilanthes Dyerianus, and dracænas were the principal plants used. Messrs. Thos. Perkins and Sons, The Drapery, Northampton, was placed third.

In the smaller group class Mr. J. H. Macdonald was again first, and here he had a lower and more formal arrangement, with Fuchsia triphylla, Oncidium flexuosum, begonias, caladiums, and brilliant crotons tastefully disposed around a spreading central Phœnix. Mr. G. Hallett, gardener to Sir Thos. Hesketh, Bart., Easton Neston, Towcester, second; and Mr. J. Holland, gardener to F. Bostock, Esq., Springfield, third.

Mr. G. Clark, gardener to Miss Waterton, Billing Hall, secured first place for six exotic ferns with fine examples of Nephrolepis exaltata, N. Piersoni, Adiantum Farleyense, A. Mariesi, and A. decorum; Mr. J. Sherman, gardener to Lord Annesley, Holdenby House, second, and Mr. J. Holland third. Mr. David Hollowell, Whiston, scored for three fuchsias with low spreading bushes full of flower; Mr. J. Barkway, Lower Ilwift Street, second. Mr. Holland led for double begonias with medium-sized specimens. Mr. W. T. Rollings, St. John's Hospital, Weston Favell, had the best three pelargoniums, and was very closely followed by Mr. J. Sherman. The latter was placed first for three caladiums, but was second to Mr. G. Clark for three coleuses, the latter showing big, well-furnished, and brightly-coloured specimens.

CUT FLOWERS.

Messrs. Harkness and Co., Hitchin, scored for two dozen roses, distinct, with very clean blooms of Caroline Testout, Comte. de Raimbaud, Lyon Rose, Bessie Brown, Dean Hole. Mildred Grant, etc.; Messrs. G. and W. H. Burch came second; and Mr. Henry Drew, Longworth, third. For a dozen blooms, Mr. F. M. Bradley, Peterborough, scored with fine flowers of Lyon Rose, Comte. de Raimbaud, Queen of Spain, Florence Pemberton, Mildred Grant, Dean Hole, Hugh Dickson, etc.; Mr. Henry Drew, second, and Messrs. Harkness and Co., third.

Mr. W. T. Mattock, Headington, Oxford, scored for a dozen tea roses, and, for the time of year, he had a fine box that contained Boadicea, Muriel Grahame, Golden Gate, Media, Perle des Jardins, Mrs. E. Mawley, Mrs. Myles Kennedy, Bridesmaid, and White Maman Cochet; Mr. H. Drew, second.

In the amateurs' section for roses Mr. G. Speight, Market Harborough, scored for six tea roses: Mr. E. B. Lindsell, Bearton, Hitchin, for four trebles, and for twelve blooms, distinct; and Mr. Speight for eighteen blooms. Mr. J. Holland and Mr. W. T. Rollings won prizes of a lower order of merit.

Premier award for a dozen vases of carnations was won by Mr. C. F. Waters, Balcombe, with good flowers of Aurora, Rose Pink Enchantress, Red Lawson, Enchantress, Edith Waters, Harry Fenn, White Enchantress, Mrs. T. W. Lawson, Winsor, Ceres, Mrs. H. Burnett, and Victory; Mr. A. R. Searle, gardener to the Marquis of Northampton, Castle Ashby, second.

Mr. Hallett led the way in the class for two dozen bunches of sweet peas with a beautiful clean set of America Spencer, Helen Lewis, Senator Spencer, Elsie Herbert, Constance Oliver, The King, Paradise Ivory, Clara Curtis, Marjory Willis, etc.; Mr. A. R. Searle, second, and Mr. S. Cole, gardener to Earl Spencer, Althorpe Park, third. For a dozen bunches of sweet peas, Mr. Silas Cole was to the fore with clean, bright flowers of Mabel Cole, Constance Oliver, Earl Spencer, Gladys Cole, Miriam Beaver, Althorp White, Silas Cole, John Ingman, and Seafoam; Mr. G. Hallett, a close second; and Mr. A. R. Searle, third.

Mr. Searle had the finest set of a dozen bunches of hardy flowers, his best examples being gaillardias, Helenium pumilum, Lilium speciosum, Galtonia candicans, phloxes, and campanulas; Mr. E. Palmer, King Street, Kettering, second.

FLORAL ARRANGEMENTS.

The best wreath was a design worked out in Lilium longiflorum, lily of the valley, roses, carnations and a few cattleya blooms by the Messrs. T. Perkins and Sons, The Drapery; Messrs. Yarde and Co., Wellingborough Road, second; and the Messrs. James, 35, York Road, third. The Messrs. James had the best cross of flowers, arranged with a base of liliums and croton leaves; in the same class Messrs. Yarde and Co. came second with a large design of "The Gates Ajar" style, worked chiefly in stocks, asters, and liliums.

Miss W. Timms, Aylesbury Street, Fenny Stratford, had the best bridal bouquet; Messrs. T. Perkins and Sons, second, and Messrs. Yarde and Co. third. The Messrs James led for a hand bouquet with a design in Mdme. Abel Chatenay roses. Mr. J. W. Timms coming second with cattleyas and odontoglossums, and Messrs. W. and J. Brown, Peterborough, third with yellow roses.

Mr. S. J. Cole, Green Lane, Wolverton, was placed first for a table decoration with a pleasing design in Constance Oliver and Evelyn Hemus sweet peas and trails of selaginella; Mr. H. Law second. In another class Mr. Hallett gained the first place with pink sweet peas, Mr. H. Law second, and Mr. W. T. Mattock third, the latter having a very pretty table of roses.

FRUIT.

Mr. A. R. Searle was to the front in the class for six dishes of fruit, with black and white grapes, peaches, nectarines, figs, and a melon; Mr. S. Cole second. Mr. Searle had the best pair of bunches of black grapes, Mr. Hallett coming second. Mr. Searle also led for white grapes, followed by Mr. E. Cox, gardener to Lady Knightley, Fawsley. Mr. Searle scored for six peaches with Mr. Cole a good second. Mr. Hyland led for nectarines, with Mr. Searle second. Mr. Searle scored for figs, for gooseberries, and for cherries, and Mr. Hallett scored for apples.

In the local classes Mr. A. Childs, gardener to H. A. Attenborough, Esq., J.P., Catesby House, had the best black grapes, and also the best white grapes, showing grand bunches of Buckland Sweetwater in the latter class; Mr. Searle, Mr. S. Cole, and Mr. Hyland were prominent prize-winners in the single dish classes.

The best decorated table of dessert fruit was the one set out by Mr. A. R. Searle, Castle Ashby Gardens, who won with good clusters of Muscat of Alexandria and Madresfield Court grapes, a melon, peaches, figs, cherries, plums, nectarines, and gooseberries, the table being decorated with schizanthus sprays—Mr. Searle had not labelled any of his dishes of fruit. Mr. G. T. Hyland, gardener to Major Hibbert, Ashby St. Ledgers, was second, and his best dishes were of Stanwick Elruge nectarines, Latest of All strawberries, Muscat and Muscat Hamburgh grapes, and Stirling Castle peaches.

VEGETABLES.

In the open class for a collection of nine kinds of vegetables Mr. A. R. Searle, gardener to the Marquis of Northampton, Castle Ashby, won first place among four competitors with fine celery, onions, cauliflowers, potatoes, marrows, carrots, tomatoes, peas, and runner beans, none being labelled; Mr. S. Cole, gardener to Earl Spencer, Althorpe Park, second; and Mr. Hallett, gardener to Sir Thomas Hesketh, Bart., Easton Neston, third; and in neither case was the produce labelled. For Messrs. Yarde and Co.'s prize Mr. Hallett was an easy first with fine onions, celery, tomatoes, carrots, and peas; Mr. A. R. Searle second; and Mr. S. Cole third. Mr. Searle, Mr. Law, Mr. G. Clark, Mr. Hallett, and Mr. Hyland won numerous prizes in the single dish classes.

NON-COMPETITIVE.

As usual, the non-competitive exhibits added materially to the extent and interest of the display. Messrs. Sutton and Sons, Reading, contributed a splendid exhibit of choice fruits and vegetables, the whole being decorated with sweet peas, phloxes, godetias, annual chrysanthemums, and other of the firm's specialities in flowers. Melons were a prominent feature, notably the varieties Superlative, Ringleader, and Sutton's Perfection; Centenary peas and New Red intermediate carrots were also superbly staged. Messrs. Thos. Perkins and Sons, Northampton, showed a large collection of cut flowers, chiefly border flowers, carnations, violas, and sweet peas. Mr. C. F. Waters, Balcombe, Sussex, brought up a lovely lot of carnations, and showed Mikado, Britannia, Rose Pink Perfection, Enchantress, and Edith Waters in grand style. Messrs. R. Harkness and Co., Hitchin, were represented by a display of roses, in which the Lyon Rose, Mdme. Abel Chatenay, and Frau Karl Druschki figured prominently. Messrs. Yarde and Co., Northampton, had a display of useful spraying machines; this firm had also a large exhibit of cut flowers, but the display would have been improved had the bunches been fewer and larger.

Mr. S. Mortimer, Rowledge, Farnham, put up a fine lot of show and cactus dahlias, backed by tall stands of Aurora Spencer, Evelyn Hemus, Mrs. Townsend, Prince of Asturias, Mrs. Duncan, and other good sweet peas. In front were good bunches of popular sweet peas, and a new and distinct orange-tinted salmon variety named Mrs. Henry Bury—a very pretty colour, and flowers of good size and form. Between the tall stands at the back Mr. Mortimer displayed vases of the best forms of the useful Chrysanthemum maximum.

Messrs. E. Webb and Sons, Wordsley, Stourbridge, put up a large and attractive exhibit of finely-grown vegetables, their Nonsuch, Ailsa Craig, Improved Banbury, and Masterpiece onions, Emperor tomatoes, and Stourbridge Marrow peas standing out well among other good things. Sweet peas were prettily associated with maidenhair ferns in pots, and formed an effective setting for the vegetables and melons. Messrs. John Perkins and Son, Billing Road Nurseries, Northampton, displayed pentstemons, border carnations, pelargoniums, begonias, etc., in considerable numbers, but their arrangement was rather flat.

Horticultural Club.

On Thursday, July 28, at the kind invitation of N. N. Sherwood, Esq., V.M.H., the members of this club spent a most enjoyable day at Prested Hall, Kelvedon, Essex, a party of about forty, including a considerable number of ladies, being most hospitably and pleasantly entertained. Leaving Liverpool Street Station by special saloon at 10.55, Prested Hall was reached about one o'clock, after a short drive from Kelvedon Station. The pretty grounds, diversified by streams and tastefully laid out, were first inspected, and then lunch was partaken of to the accompaniment of a military string band provided for the occasion, a gifted local elocutionist subsequently giving some recitations with great effect in the Essex dialect by way of local colour.

After lunch, brakes being provided for the

purpose, the party divided, the majority being driven some five miles or so to Merle, where a splendid mansion of the Tudor period was visited, and an old church inspected, the latter containing some quaint tombs surmounted by recumbent statues of its founders: the Rector kindly gave a most interesting summary of the history of the building. The rest of the party devoted their attention to the trial grounds (Messrs. Hurst and Sons'), in the vicinity, where a very large area of land is devoted to seed raising and experimental studies. On the return of the two parties tea was provided, and a return was then made to Kelvedon Station to await the saloon carriage of the down journey. Fortunately, the Clerk of the Weather was benevolently disposed, and interpolated a typical summer's day in his hitherto mixed programme, the result being by general consent one of the pleasantest outings the club had enjoyed, and a most cordial vote of thanks to the host was passed to that effect.

ILLUSTRATIONS.

Portrait of Mr. C. R. Fielder, 605; First Prize Table of six kinds of Fruit at Leicester, 607; First Prize Collection of Vegetables at Leicester, 608; A well-grown Hydrangea, 609; Campanula pusilla pallida, 612; General view of the Japanese Garden, Japan-British Exhibition, 613; Gold Medal Collection of Orchids at the Leeds Show, 616; Cattleya Warscewiczi var. Othello, 617; First Prize Group at Northampton Flower Show, 618; A Fine Group of Dahlias and Sweet Peas at Northampton Flower Show, 619.

ANSWERS TO CORRESPONDENTS.

GREENGROCER'S JOURNAL.—H. J. P., London: You will find the "Journal of Greengrocery" the sort of paper you need; it is, we believe, still published by Biggs and Co., 139, 140, Salisbury Court, Fleet Street, E.C.

CRASSULA COCCINEA.—H. G. C., Hampstead: In the spring, about March, select shoots of Crassula coccinea, about four inches long, and, after trimming the leaves from the lower half of each one, insert the cuttings in pots or pans of sand, and place in a temperature of 55 to 60 degrees. Here they will make roots in a few weeks, and may then be potted singly in three-inch pots in a sandy mixture of fine turfy loam and old manure. When they have taken possession of the new soil remove to a warm, airy greenhouse, and afford them a light position. As soon as growth is made remove the growing point to induce the plant to make several branches. In June a further shift will be necessary into six-inch pots, and after they have become re-established the plants are best set out of doors on ashes in an open sunny position. Bring into the greenhouse in early autumn and afford a minimum winter temperature of 40 deg. If cuttings are not stopped at all they will flower the second year, but the method indicated is the best for securing fine specimens.

FLOWERS AT COVENT GARDEN.—C. E., Durham: We should have thought Newcastle would have been handier as a flower market than Covent Garden. However, if you write to the Superintendent, Covent Garden Market, London, W.C., he will send you a list of flower salesmen with whom you can communicate.

VOLES IN THE GARDEN.—J. C. N., Southampton: The voles are closely related to the mice, and the kinds found in this country are Arvicola amphibius—the Water Rat, and Arvicola agrestis—the Field Vole or Short-tailed Field Mouse, and Arvicola pratensis or Bank Vole. The one that is proving something of a plague in your garden is the Short-Tailed Field Mouse or Meadow Vole. Bait traps with fruit and corn, and endeavour to find and destroy the nests.

SPOTTED CUCUMBER LEAVES.—G. H., Westerhope: The leaves are affected with the cucumber or melon spot disease (Cercospora Melonis). This disease frequently follows dull cold weather, especially when the plants and house have been kept too moist during such a period. Remove the diseased leaves and spray the plants with weak Bordeaux mixture. Very glad to hear from you again, and to know you are succeeding.

PEACH TREES.—J. C. N., Southampton: The trees are making excessive growth, and you evidently keep the borders too wet during the winter. Soon after the few fruits have been gathered, carefully lift, root prune, and replant the trees, adding a good quantity of crushed lime rubble to the soil. Heavily shade the house during the work, and also for several days afterwards, and syringe the trees two or three times a day according to the weather. If the work is carried out expeditiously and well the trees will not suffer nor lose their leaves prematurely.

IRIS FULVALA.—Mr. W. R. Dykes, Charterhouse, Godalming, writes to point out that the pollen parent of his new Iris fulvala (not fulvata), was I. hexagona Lamaurei, and the seed parent I. alata.

SHANKED GRAPES.—C. S., Blackburn: The grapes are badly shanked, but what is the cause of the trouble we cannot say. It may be due to overcropping, bad root action, wet borders, or other cultural error.

DISEASED LOGANBERRIES.—R. E. S., Wellington: Remove and burn all the fruiting canes at once, as they are useless. Fill up and spray the new canes with weak Bordeaux mixture, and in the early winter, when the canes are practically leafless, spray with sulphate of iron at the rate of 2lb. of sulphate to five gallons of water. The disease appears to be closely allied to the Raspberry Spot. Purchase a few young plants, and plant them in another part of the garden.

NAMES OF PLANTS.

G. E. W., Leicester.—1, Delphinium Belladonna; 2, Senecio Clivorum; 3, Vitis Henryi; 4, Chrysanthemum maximum.

M. M., Loudwater.—1, Eryngium alpinum; 2, Romneya Coulteri; 3, Pelargonium denticulatum; 4, Isatis glauca; 5, Euonymus latifolius; 6, Cedrus Deodara.

H. W., Hungerford.—1, Viburnum Lantana; 2, Viburnum Opulis; 3, Cornus sanguinea; 4, see next issue; 5, Bryonia dioica; 6, Lycium barbara. In a collection of wild fruits only those from native plants may be included: covert plants are by no means all native subjects.

FORTHCOMING ENGAGEMENTS.

MONDAY, August 8.—United Horticultural Benefit and Provident Society.

TUESDAY, August 9.—Sevenoaks Horticultural Society; two days.

WEDNESDAY, August 10.—Exmouth Horticultural Society; two days.

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

Memorial Parks.

A short time since the Prime Minister stated, in a letter addressed to the Lord Mayor of London, that the Government had carefully considered the various proposals that had been made for raising a memorial to the late King Edward VII., and had arrived at the conclusion that it would be in every way preferable such memorials should be of a local character. The conclusion at which the Government arrived on this question appears to have met with the approval of all who are taking an active interest in the matter, and it is generally felt that it would be far better to provide a memorial in each town, district, or county, as the case may be, that would do honour to the memory of the late King, and be of benefit to the residents, than to combine for the purpose of raising a memorial in some central place. There are many reasons why a number of memorials of a local character should have the preference, but for our present purpose it will suffice to mention but two. A memorial associated with some particular town will appeal more strongly to the residents therein for support, and, as it will, in all probability, take some useful form, it will be ever present in the minds of the residents, and keep green the memory of the greatest King who has ruled over the British Empire. Within a short period of Mr. Asquith's letter being made public, attention was directed by the leading men in a considerable number of the more important centres to the consideration of the question of providing a memorial worthy of the occasion, and adapted to the needs of the respective districts. In some cases the erection of a new hospital, or the improvement of an existing establishment, has been suggested as suitable; in others the provision of a new public park or garden has been recommended. Memorials of other kinds have had their advocates, but the trend of public opinion has been largely in favour of hospital extension and the increase of public parks and gardens, and it is gratifying it should be so, for, as so well known, King Edward VII. gave a large share of his attention to the various institutions that administer to the needs cf the sick and suffering, and evinced the warmest sympathy with the efforts of those engaged in increasing the parks and gardens for public use. The proposed increase of the latter should be a source of much gratification to those who appreciate the importance of open spaces, and we trust that as one result of the movement now on foot there will be a considerable augmentation in their number throughout the United Kingdom. Much has been accomplished within the past quarter of a century to increase the breathing spaces in and near towns, but much has yet to be done before they will equal the needs of the people. It may, perhaps, be considered an overstatement of the case to suggest that every town, however small, should have its open space, but we feel assured our readers will agree with the suggestion that towns of moderate proportions should have an open space wherein the inhabitants can enjoy the refreshing green velvety turf, and bright flowers, and beautiful trees and shrubs. The question is really one that more immediately concerns the older towns of moderate size that are rapidly extending their boundaries, and the new districts that have sprung up in various parts of the country, than it does the cities and great towns, which are provided with numerous and well-kept parks. It is, therefore, much to be desired that in such populous centres the necessity of open spaces for the people should receive attention when the question of raising a memorial to the late King is considered. Parks elaborate in design and costly in keeping are not so much required as open spaces, and good breadths of green turf, and tastefully planted with hardy flowers and beautiful trees and shrubs that can be depended upon to make a satisfactory growth under the soil and climatic conditions that obtain in the district. They should be places where the residents, and especially mothers of families, can spend any spare time they may have when the weather is favourable to outdoor life, free from the rougher elements of human nature, and, it may be, obtain a few lessons in making beautiful any garden they may have at a small cost. The garden should not, as is frequently the case, be planted with the commonest of the trees and shrubs in cultivation, but with beautiful kinds of a distinct character, and of these, happily, there are large numbers which can be purchased at a comparatively small cost. Then there should be beds and borders of hardy flowers that are attractive and require but little skill to maintain them in a thrifty state. There are more than sufficient of these to produce an attractive display throughout the summer and autumn months, without the aid of choice tender plants, to which, of course, there is no objection, provided the park is under the management of a skilled horticulturist. Any open space that is created as a memorial to the late King Edward should be a place for rest and the refreshment of the mind for all classes, and not a place for sports in which alone the strong can engage. Moreover, the societies which exist for the purpose of encouraging cricket, football, and such games, can usually provide grounds in which their members can display their skill. Although we have particularly in view the creation of open spaces as memorials to Edward VII., the question of providing additional parks and gardens of a simple character especially adapted as places of recreation for women and children, is one that immediately concerns Urban and District Councils, for open spaces have an immense influence upon the prosperity of a town or district. We are well acquainted with more than one district in which there is no park or garden, and some hundreds of pounds are lost annually because the more respectable residents move

MR. W. HEDLEY WARREN.

as soon as they are able to other districts where they and their families can have ready access to a pleasant open space.

Mr. W. Hedley Warren has during the past sixteen years occupied the important position of head gardener to Lady A. de Rothschild at Aston Clinton, and during that period he has achieved so high a degree of success as to obtain for himself a prominent position among practical horticulturists of the highest rank. It is interesting to recall the fact that Mr. Warren commenced his gardening career under the late Mr. John Keynes, and that his engagement at the Salisbury nurseries was followed by several years' experience in market nurseries in the South of England. Subsequently he obtained the position of foreman—indoor and out—in the gardens of Terrace House, Southampton, under Mr. William Phelps, who was exceptionally successful as a cultivator of vegetables. Then, having filled an appointment at Netley Castle, Mr. Warren was engaged as foreman at Hamble Cliff, Netley, the residence of the Honourable Mrs. E. Yorke daughter of Lady A. de Rothschild where he remained several years. Sixteen years ago, as already intimated, Mr. Warren was appointed to the charge of the Aston Clinton Gardens, and during that period he has afforded unquestionable proofs of his skill as a cultivator and ability as an administrator. With the sanction, or rather co-operation, of Lady A. de Rothschild, he has endeavoured to improve bothy life in the gardens under his charge. This Mr. Warren considers, and rightly so, is the duty of every gardener where possible, so that the young men under him may be happy and comfortable. The cultivation of choice fruits under glass, the production of cut flowers, and the raising of decorative and bedding plants are carried out on a large scale and on market lines, and vegetable culture is also regarded as a matter of much importance. Exacting as are the duties involved in the management of a garden of the highest class, Mr. Warren has found time for devoting some attention to other matters. Accordingly, we find that for three years he was horticultural lecturer for the county of Bucks under the old régime, and has acted on three occasions as a steward of the Gardeners' Royal Benevolent Institution anniversary festival. He is now, and has for many years been, the secretary and treasurer for the local horticultural society, and secretary for the Higher Education Committee for Aston Clinton. Mr. Warren evidently believes a man, however actively engaged in his ordinary avocations, should have one or more hobbies, for he has two, and these are photography and microscopic work.

Aberrations in Antirrhinums.—Mr. W. Hales contributed to the recent meeting of the R.H.S. Scientific Committee a variety of aberrations in the common antirrhinum, consisting mostly of flowers tending to become regular. In one case the terminal flower had become completely peloric, and on the same shoot the normal corolla had at its base an anterior outgrowth very like the palate in form and colouring.

July in the North.—During the month of July, writes our Aberdeen correspondent, the rainfall has been about three inches, most of which fell towards the end of the month, the first three weeks being decidedly dry. For the whole month we have only had five or six really sunny days, the last half of the month being excessively cloudy. July is the month in which, in these northern regions, thunderstorms most frequently occur, and we had a rather sharp one on the 21st. It did not last long, however, but on the following day we had a repetition on a smaller scale. Strange to say, along the coast of this county we experience the coldest summer in Britain—I mean for parts at a like elevation. There can be little doubt that this is owing to the seaboard of Aberdeenshire projecting so far into the cold waters of the North Sea. Much more rain falls on the West Coast of Scotland, but the air there is milder owing to the influence of the Gulf Stream, as well as to the heat resulting from the condensation of so much atmospheric moisture. The direction of the wind during the month has been mostly south-east, or north-west. We have had very little south-westerly winds. In force, it was light or quiet on twenty-four days; breezy or blowy on other seven, but no strong gale. June and most of July were too dry for the strawberries, hence there are many small ones, and owing to the want of sun the crop, where ripe, lacks sweetness. The turnip and potato crops are both doing well. The showery May made a fair crop of hay, but the weather has been very unfavourable for securing it. Throughout the month the temperature has been low, especially during the cloudy weather, but then July is often a cloudy month here.

Landslide in the Kew Rock Garden.—The tremendously heavy rainstorm that broke over Kew on Friday morning, August 5, flooded the lower part of the rock garden at Kew for some time. A great deal of water also soaked through the bank near the Dripping Well, and brought down a good deal of soil and stones at that interesting point. No very serious damage was done, however, and probably by the time these lines appear, there will be little evidence of the "slide," as prompt measures were taken to repair the bank.

Employees in London Squares.—At Bow Street, on the 3rd inst., before Mr. Marsham, the Duke of Bedford was summoned by the London County Council for employing five male servants without licences. Mr. Pickford, who appeared in support of the summons, submitted that the five men were employed to carry out the ordinary duties of gardeners at Bedford Square gardens and other ornamental enclosures, for the maintenance of which the Duke of Bedford was responsible. Their duties were the laying out and planting flower beds, pruning shrubs, etc., which, in his opinion, brought them within the legal definition of gardeners, and were therefore liable to taxation. An officer in the Taxation Department of the London County Council gave evidence in support of the summons, but he was unable to say whether licences were taken out in respect of the men who are employed in the open spaces under the control of the London County Council. Mr. G. Beck, the foreman of the five men referred to in the summons, was called for the defence, and, in the course of his evidence, stated that their duties were chiefly to mow the grass, roll the paths, cut hedges, and keep the gardens tidy. They had nothing to do with the propagation of plants, as those used in filling the beds were purchased from nurserymen, and they were paid labourers' wages. He received £2, and the other men 30s. a week each. Mr. Bodkin, who appeared for the defence, said the question was of importance, not only to the Duke of Bedford, but to owners of property and parochial authorities who were responsible for the maintenance of open spaces. The work of the men, except for the little planting out they did, was to maintain the enclosures in a state of tidiness, which was not skilled gardening work within the meaning of the Act. Mr. Marsham adjourned the summons to enable him to consider his decision.

Gall on Willow.—Examples of galls on willow (Salix alba) were shown at the meeting of the R.H.S. Scientific Committee by Mr. Bowles. The galls had been obtained from Enfield, and were similar to those shown from the neighbourhood of Buckhurst Hill by Mr. Chittenden in October, 1906. The galls are apparently formed through the irritation set up by a mite (Eriophyes salicis), causing the repeated branching of a shoot which produces small and narrow, rather soft leaves, so that the whole mass measures up to a foot in length and nine inches in diameter. The growth turns bright red in autumn.

Peter Barr Memorial and Gardeners' Orphan Fund.—The Peter Barr Memorial Fund is progressing steadily, but the executive committee are anxious that all who desire to honour the memory of the late Mr. Peter Barr should have ample opportunity of doing so. The general idea is the provision of a sufficient sum of money to always maintain one child through the medium of the Royal Gardeners' Orphan Fund, and also a medal to be awarded annually for special work in connection with daffodils. Mr. Peter Barr's work in the improvement and introduction of daffodils, and among hardy flowers, and his devotion to the Royal Gardeners' Orphan Fund, are well known, consequently the aims of the executive committee should find favour with those who knew Peter Barr and his work, and who desire to keep his memory green in connection with the charity he helped to found. Subscriptions should be sent to Mr. H. B. May, Chingford, the treasurer of the fund. Full particulars will be gladly furnished by Mr. Wm. Marshall, V.M.H., Bexley (chairman), or Mr. Chas. H. Curtis, Adelaide Road, Brentford (hon. sec.) Those who have contributed to the fund since previous publication are Messrs. W. Robinson, H. Backhouse, J. Pope, Dorrien Smith, E. G. A. Nix, the Glamorgan Daffodil Society, Haage and Schmidt, Hurst and Son, Harvey Clarke, W. Welchman, Byvoet Brothers, Guldemonde and Sons, R. and G. Cuthbert, B. Ruys, E. Kerston, Vilmorin and Co., Robert Veitch, Bellis and Meek, G. Forbes, C. Lemeslie Adams, Ant. Roozen and Sons, J. H. Stroud, G. Monro, N. Naylor, Jas. Hunter, Lowe and Shawyer, Dobbie and Co., Mrs. Penton, W. Mauger, C. W. Cowan, Foster and Robins, G. Monro, Jun., Boyd Barrow, — Beamish, W. H. Cranfield, W. Waemar, W. Goldring, Watkins and Simpson, Wheadon and Sons, J. S. Brunton, W. A. Watts, T. H. Lincoln, T. Kime, J. Bunting, J. H. Kerston, Otto Mann, V. van Zanten, P. van der Neer, Van Meerbeck and Co., W. H. Page, Van Hartman, Van der Eest, H. de Graaff and Sons, Chas. Smith and Sons, Arnold Weiss, and Protheroe and Morris.

Prospects of the Potato Crop.—The Board of Agriculture state in their report dated August 8 that potatoes have improved considerably during the month, and that they now appear to be relatively the most promising of all crops. Little disease has been reported.

Spraying Fruit Trees.—In the course of a paper read before the Ontario Fruit Growers' Association on the Spraying of fruit trees, Mr. Max Smith, of Burlington, who is a large and successful grower of fruit, referred to the success he had achieved in renovating an old orchard. With reference thereto, he said: "I do not want to take up your time, but I might just instance one particular orchard of forty acres which had never been sprayed nor pruned nor ploughed nor fertilised in twenty years, so you can all figure about the shape that orchard was in. I got possession of that in March, and I sent about six men there to prune it, and I put on 10lbs. of strong commercial fertiliser around each tree; and I sprayed it very thoroughly according to the directions I have given you, and with the materials of which I have told you. I ploughed that orchard and tried to keep it cultivated throughout the season, and I harvested over 2,000 barrels of beautiful apples. I have known that orchard for the last 20 years, and for the last ten years particularly, and the apples in that orchard have been perfect rubbish; in fact, a year ago I refused the orchard for the picking of it. I controlled the fungus, and I controlled the codling moth to the extent of about 80 per cent."

Plants in the Swansea Parks.—Mr. Daniel Bliss, the Swansea Parks Superintendent, has compiled a catalogue of the trees, shrubs, herbaceous and other plants to be found growing in the Cwmdonkin Park, Swansea. The nomenclature adopted is that of Kew, and the country of origin is given as well as the English name where this is known. The number of species grown in the botanical beds is about 1,000, and in the first part of the catalogue these are listed in their respective natural orders as grown. About 700 species of herbaceous and alpine plants cultivated in the rock garden are given in alphabetical order, and the same method is followed with the shrubs, the herbaceous plants in borders, trees, bamboos, and moisture-loving plants. The latter part of the catalogue is arranged so that a visitor may know what plants to look for in certain parts of the park. If the natural order could be added in future issues in the case of species grown outside the botanical collection proper, this would add to the interest and usefulness of the catalogue. It is, however, a very useful list of plants, somewhat overloaded with advertisements, and sold to visitors for the remarkably low price of one penny.

Local Coloration of Cell Walls.—Professor H. Molisch has published an interesting communication on local coloration of the cell wall in certain water plants induced by manganese compounds. The introduction of manganese salts into cultures of Elodea produces, after a few days' exposure to light, a deposition of brown matter in the outer walls of the epidermis which, on continued exposure tends to mask the green pigment in the leaf. The author notes that the deposition takes place only when the plant is exposed to light, and that a similar result was obtained in leaves of vallisneria, Ranunculus aquatilis, and myriophyllum. As observed by "Nature," the chief point of interest lies in the fact that it furnishes a definite instance of localised action produced by the absorption of a specific element.

A New Italian Orchid.—Reference to what is supposed to be a quite new terrestrial orchid is made in the columns of "Nature" by Mr. W. Herbert Cox, together with an illustration of the plant found by him, and showing the prominent trilobate lip. Mr. Cox writes: M. H. Correvon, who is, I suppose, the greatest living authority on the European orchids observes it "seems to be out of the way of species known." When first I found it. I believed it to be Serapias triloba, but, having studied various authorities, I have since come to the conclusion that I was wrong. They all agree that the lip of triloba is crenulated, but in my specimen there is no sign of that. Triloba is considered to be a hybrid between Serapias lingua and Orchis papilionacea; although the ground was covered with the former, I could not find a vestige of the latter in the whole of that district. Also, the authorities only give the Riviera as the habitat of triloba, whilst I found my plant in mid-Italy, near Florence. In my plant the sepals and petals are each very distinct and separate, not joined into a cap, as in all the other varieties of serapias. It may possibly be a cross between S. lingua and O. laxifolia, but, even so, it differs much from that pictured in Barla's book. It is a somewhat striking plant, as the flowers are very large in comparison to the rest, both the labellum sepals and petals being a very vivid shade of colour between pink and purple, the former a little darker.

THE FRUIT CROPS IN SCOTLAND.

The somewhat doleful accounts of the crops of hardy fruits in many parts of the kingdom that have recently appeared in the pages of the horticultural journals happily do not justly represent the conditions existing in some other parts, to wit, the southern portion of Scotland, where in general the quantity and quality of most kinds may be considered very satisfactory.

Strawberries.

The weather, too, though very erratic at times, was favourable to the strawberry crop, as for a fortnight, when the bulk of the maincrop varieties were ripe, or ripening, no rain fell, and with bright sunshine daily this important crop was secured in excellent condition, and almost free from loss owing to damp and its usual accompaniments. The season for this fruit has been a fairly long one, the first gathering being made from plants of Royal Sovereign growing upon a border having a southern aspect on June 16, while at present, August 5th, Givon's Prolific and Laxton's Latest still provide daily supplies, and promise to do so until the middle of the month at least.

Bush Fruits.

Currants of all kinds are bearing well, the black variety especially so, and the bushes being immune from insects, though measures to attain this end have this year been unnecessary, the fruit is large in size and clean. Gooseberries appear not to have been at all exhausted by the heavy crop of last year, when the fruit was abundant, while at present it is sufficient for all purposes. Raspberries are likewise fruiting well, and seem to revel in the changed weather conditions—wind, mist, and occasional heavy rains—which ushered in the present month.

Cherries.

The sweet varieties were very scanty, many of the fruits falling from the trees after attaining considerable size. Morellos are not heavily cropped, but still fairly plentiful on most of the trees, the individual fruits giving promise of full size, and are colouring well.

Peaches and Nectarines.

These are very partial, some kinds bearing freely, while others are fruitless. Of the former Hales' Early is the most prolific, as well as being the earliest to ripen, which, judging from present appearances, should take place about the middle of the month. Early Crawford, Dymond, and Stirling Castle are the next best in regard to fruitfulness. For several years past Rivers' Orange nectarine has proved the best among the several varieties of this somewhat fickle fruit for outside culture, and the present season is no exception, as it is again ahead, both in respect to crop and healthiness, of all others cultivated here.

Figs.

These in the open are a complete failure owing, probably, to the early and very severe frosts in the autumn of last year, which destroyed the foliage while yet in the flush of vigour, and greatly damaged the young shoots as well. Formerly figs did remarkably well in this part, but for several years past the crops have not repaid the work and expense put upon them. More than any other fruit the fig requires a bright warm period in autumn to ripen both fruit and wood, to ensure rich lusciousness in the one, and thorough maturity of the embryo fruits in the other.

Plums.

These are variable, some kinds bearing full crops while others are quite the reverse. As bush trees in the open Rivers' Prolific, The Czar, and Victoria are carrying far more fruits than are the same varieties against walls. Trained trees of Jefferson, Early Orleans, Belle de Louvain, Lawson's Golden Gage, and Coe's Golden Drop, are all good, but many other kinds are poorly cropped.

Apples and Pears.

The first, though not a full crop, except in the case of a few sorts, are very fair, taken all round, and deficiency in numbers may possibly be compensated for by size and quality, as at the present time the fruits are larger than usual, are growing freely, and the foliage is healthy, and free from insect pests.

Of pears the more popular varieties, as Jargonelle, Williams' Bon Chretien, Louise Bonne of Jersey, Pitmaston Duchess, Jersey Gratioli, and Beurre Diel, are bearing good crops, and the same may be said of many of the newer introductions too numerous to mention specially, further than that, at a fair estimate, the majority are fruitful, more or less, which, considering the very sunless weather last autumn and early winter, and the unripened state of the shoots and fruit buds owing to this, is here considered very satisfactory.

Galloway House, JAMES DAY.
Garlieston, Wigtownshire.

LESPEDEZA SIEBOLDI.

This is one of the latest of our flowering shrubs, for its blossoms do not expand until the latter half of September and October. Although a warm, sunny season suits it best it flowers very satisfactorily even when the weather is not particularly favourable during the summer months. A native of China and Japan, it is under cultivation of subshrubby character, and usually dies each winter to within a few inches of the ground. As this is the case, it is good policy to cut it hard back to the root-stock each spring. This allows of strong shoots three to four feet in length being formed, which bear a profusion of rosy-purple flowers in large panicles, which compose the upper half of the shoot. Like other leguminous plants, it thrives in light, loamy soil. Seeds, which are usually imported, form the best means of increase, whilst little attention other than the annual cutting over is required. D.

THE POPULARITY OF SWEET PEAS.

The experience of another season has enhanced the popularity of the sweet pea; there is nothing like it, and it is quite right to say that no flower of the garden has succeeded in capturing the hearts and affections of so many people. The sweet pea is cosmopolitan to a degree; go into any aristocratic garden you like, and you will be sure to find a selection of up-to-date varieties of sweet peas, and you may pass on from there to the garden of some enthusiastic cottager, and you will find flourishing therein the same varieties. grown just as well, flowering just as freely, and looking equally effective and in place. What other annual have we which adorns all sorts and conditions of gardens alike, which lends itself to varying circumstances so well, and fascinates the public to the same extent?

Have you ever noticed how the man who grows and loves sweet peas—and who doesn't in these days?—likes to go abroad with a few of his favourite flowers in his coat. Men who never wear a buttonhole at any other time of the year break the rule when their sweet peas begin to bloom, and if two men meet, each having a buttonhole of sweet peas, the characteristic reserve of the average Briton vanishes at once, there is no need for formal introduction, and they become chummy without the slightest hesitation or reserve.

Let me just give you an instance. A short time ago I stepped into a third-class railway carriage, having a couple of blooms of Evelyn Hemus in my coat; in the corner on one side was a man with a nice buttonhole of Countess Spencer, and before the train started a third traveller took his seat, and he boasted some four-flowered stalks of John Ingman. There was no need for any introduction, though we were all three total strangers to each other, everything else was taken for granted, for we met on common ground, as we were all sweet pea growers, without being experts, cranks, exhibitors, or anything of the kind. Newspapers lay unheeded on the seat, for there was something else to talk about. Before the train started conversation began in comparing the merits of the several buttonholes, and from that we went on describing our various methods of culture, offering mutual sympathy in cases of difficulty, and chatting over the good or bad qualities of this or that variety, speaking of them as sweet pea growers do in a personal sense, as we might have done if we had been talking about absent friends and acquaintances. It was with genuine regret that we parted, and possibly I shall never meet either of the two travellers again, but if I do the mention of sweet peas will be quite sufficient to renew the acquaintanceship.

Have you ever noticed that sweet peas have an influence in making gardeners of men? I do not mean professional gardeners, of course, but men who grow fond of their gardens, lured to the love by the fascinations of the sweet pea. Let me give you a case in point. I know a man, a townsman to his finger ends, who never had an inch of garden in his life until this year, and when he got it he looked upon his strip of border as a burden and a responsibility. Having some sweet pea seeds left over in the spring I asked the man if he would like to have them, but he wasn't particularly keen about it, and took them because he had to put something in his border, and thought he might as well grow sweet peas as anything else. That man is a different individual to-day, and the change came when his sweet peas began to bloom. The members of our local bowling club complain that they see so little of the man, and the fact is that he spends most of his time in his garden tending his sweet peas, and when not thus engaged he is out and about inspecting the flowers of his friends and neighbours. This is no instance of fiction, but a true fact, and it goes to show what may be done by giving away a few spare seeds rather than leaving them to shrivel up in the bottom of the packets.

The sweet pea is the flower in the garden which above all others teaches the virtue of unselfishness, and men who were positively stingy before become suddenly generous when they commence growing sweet peas. Perhaps one cannot attribute so much credit to them for this change of character as to the sweet pea itself, the cutting of which is an essential item in its culture. I know men who specialise in roses, carnations, and other flowers, and are always pleased to see their friends, and show them round, but the privilege of the latter is to look, and not handle, as the flowers are not intended to be cut and carried away. There is a different feeling altogether with sweet peas, for the grower knows that if he allows the flowers to fade on the plants and form seed pods the display will soon be over, so it becomes the most natural thing in the world for him to cut you a bunch of flowers to bring away with you, after they have undergone a critical inspection on the plants. The grower may affect an air of generosity as he hands you the bouquet, which would lead you to think that the gift comes from the fulness of his heart, but you can come to what conclusion you like about this, and give credit to the flower itself, which makes a law of its own that it should be cut. There are people about who are more than a little selfish in respect of their gardens, and would never dream of giving away a bunch of flowers, but let us hope that all such may become sweet pea growers, and learn the lesson of unselfishness which the flower teaches.

As an exhibition flower the sweet pea is justly popular, and it is doing a good deal to improve the method of staging flowers at exhibitions. I am speaking here more particularly of village shows than big exhibitions, and am thankful to say that, so far as I know, no one has ever yet insulted the sweet pea by exhibiting it on an ugly green show board. In respect of this point I was very much struck the other day by the contrasts at a village flower show. The exhibitors, bound and fettered by the law of habit and custom, had shown their asters, stocks, zinnias, and carnations on the bare flat surfaces of ugly boards, than which nothing could look more unnatural, but they had learnt better things in respect of the sweet peas. It is true one exhibitor showed his flowers in disused Day and Martin's blacking bottles, and another cottager had commandeered every glass and china vase that his wife possessed, but what mattered that, the blooms were standing upright, they were set out in an artistic and tasteful manner, such as is characteristic of sweet peas at shows, and it is hoped that this departure from the beaten track of custom will lead to better things in the methods of exhibiting other flowers at shows.

It is very much to be regretted that so many new sweet peas are sent out before they are fixed, and if this sort of thing continues I am afraid it will affect the popularity of the flower; but I wonder how many people there are who in a quiet way aspire to the raising of a new sweet pea. The world knows a great deal more of Mendel's laws than it would ever have done if the sweet pea had remained the commonplace flower that it once was, and several of my friends have told me in confidence than they have effected some crosses, founded on the principles of the above law, and they hope to get a good thing or two as the result of the same.

In conclusion, the queenly rose may be still our national flower; I don't argue to the contrary, and comparisons are odious, but how far is the sweet pea behind in the affections of the people? This thought occurred to me the other day when I visited an old-established rose show at which classes for sweet peas were introduced a few years ago. There was no overlooking the fact that in point of number the sweet peas overshadowed the roses, and it would be difficult to say which flower came in for the greater share of attention at the hands of the visitors. But there, I have said enough in support of the popularity of sweet peas, and my excuse for writing this article at all is the desire to call attention to phases of sweet pea growing other than those which are strictly practical.

G. H. H.

NEW PLANTS, ETC.

CARNATIONS.

Forester. — A handsome fancy carnation with light, bright yellow ground, and bright red markings. A.M., R.H.S., August 2; Mr. Jas. Douglas, Great Bookham.

Mrs. J. A. Reynolds.—A deep golden-buff self carnation, free-flowering, and of excellent constitution. It should prove a fine border variety. A.M., R.H.S., August 2; Mr. Jas. Douglas, Great Bookham.

PHLOX FRAU ANTONIN BUCHNER.

A fine white phlox with large trusses of big circular blooms. It is very sweetly scented, and apparently grows and flowers freely. A.M., R.H.S., August 2. Messrs. W. Wells and Co., Merstham.

CATTLEYA WARSCEWICZI OTHELLO.

Some varieties of Cattleya Warscewiczi are remarkable for the colouring displayed in the labellum, but in C. W. Othello the sepals and petals are more richly-coloured than usual, being of bright rose-purple hue. The lip is also very handsome, deep crimson-purple, with a small yellow mark on each side of the throat. See illustration on p. 617. A.M., R.H.S., August 2; Lieut.-Colonel Sir George Holford (grower, Mr. H. Alexander), Westonbirt, Tetbury, Gloucester.

PROTECTING SEEDS FROM BIRDS.

Experiments have been conducted by the Imperial Biological Institute, Germany, with a view to ascertain the degree to which seed can be protected from the attacks of birds, particularly rooks or crows, by dressing it so as to give it an unusual colour or an objectionable taste or smell. The colours used were blue, red, and green, in the following proportions.—For every 100 parts of seed 0.2 parts of glue dissolved in 8 parts of water, with 2.0 parts of red colour, or from 0.5 to 1.0 parts of Prussian blue, or 0.4 parts of aniline green. Experiments with starving rooks showed that when let loose on the sown beds they ate 3 grammes of seed prepared with Prussian blue, 35 of that treated with red colour, 8 of that treated with green, and 68 grammes of undressed seed. Dressing with blue was shown to be most effective, and the experiments proved that rooks are influenced in their search for food by colour, smell, and taste. For the two latter experiments powdered aloes 0.6 parts with 8 parts of water to 100 parts seed, and creolin—a 3 per cent. solution in 8 parts of water per 100lb. of seed were used. The birds shunned the creolin and aloes.

YELLOW-GROUND FANCY CARNATIONS.

If only our specialists could be persuaded to show the habit of growth of the gorgeous yellow-ground fancy carnations then the popularity of a fine race of garden flowers would be assured. At the recent carnation exhibitions nothing has attracted more attention from the general public than this particular class, and the big and brilliant blooms, arranged regularly on boards, have excited a great deal of wonder. The question often asked has been, "Do these grow as well as ordinary border carnations?" The answer is in the affirmative, but the raisers and trade growers, if they are wise in their generation, will not be content with a verbal answer, but will exhibit growing plants in flower to show the public the capabilities of yellow-ground fancies. Readers of these pages who have scanned the reports will have become familiar with such names as Lord Steyne, Rony Buchanan, Pasquin, Hidalgo, Father O'Flynn, Orlando, Sam Weller, King Solomon, Voltaire, Cardinal Wolsey, Liberté, Molly Maguire, Mandara, Erl King, and Linkman. These all represent splendid varieties, raised chiefly by the late Mr. Martin R. Smith, by Mr. Charles Blick, and Mr. James Douglas. Linkman is as fine in its way as Pasquin, recently figured in these columns; it was shown well by Mr. C. Blick, Hayes, Kent, at the London Carnation Show, and is yellow, heavily marked with scarlet. We may add that Mr. Blick has a fine new yellow-ground fancy that is certain to attain a high position; it is brilliantly marked with orange-scarlet on a yellow ground, and has been named Donald Macdonald.

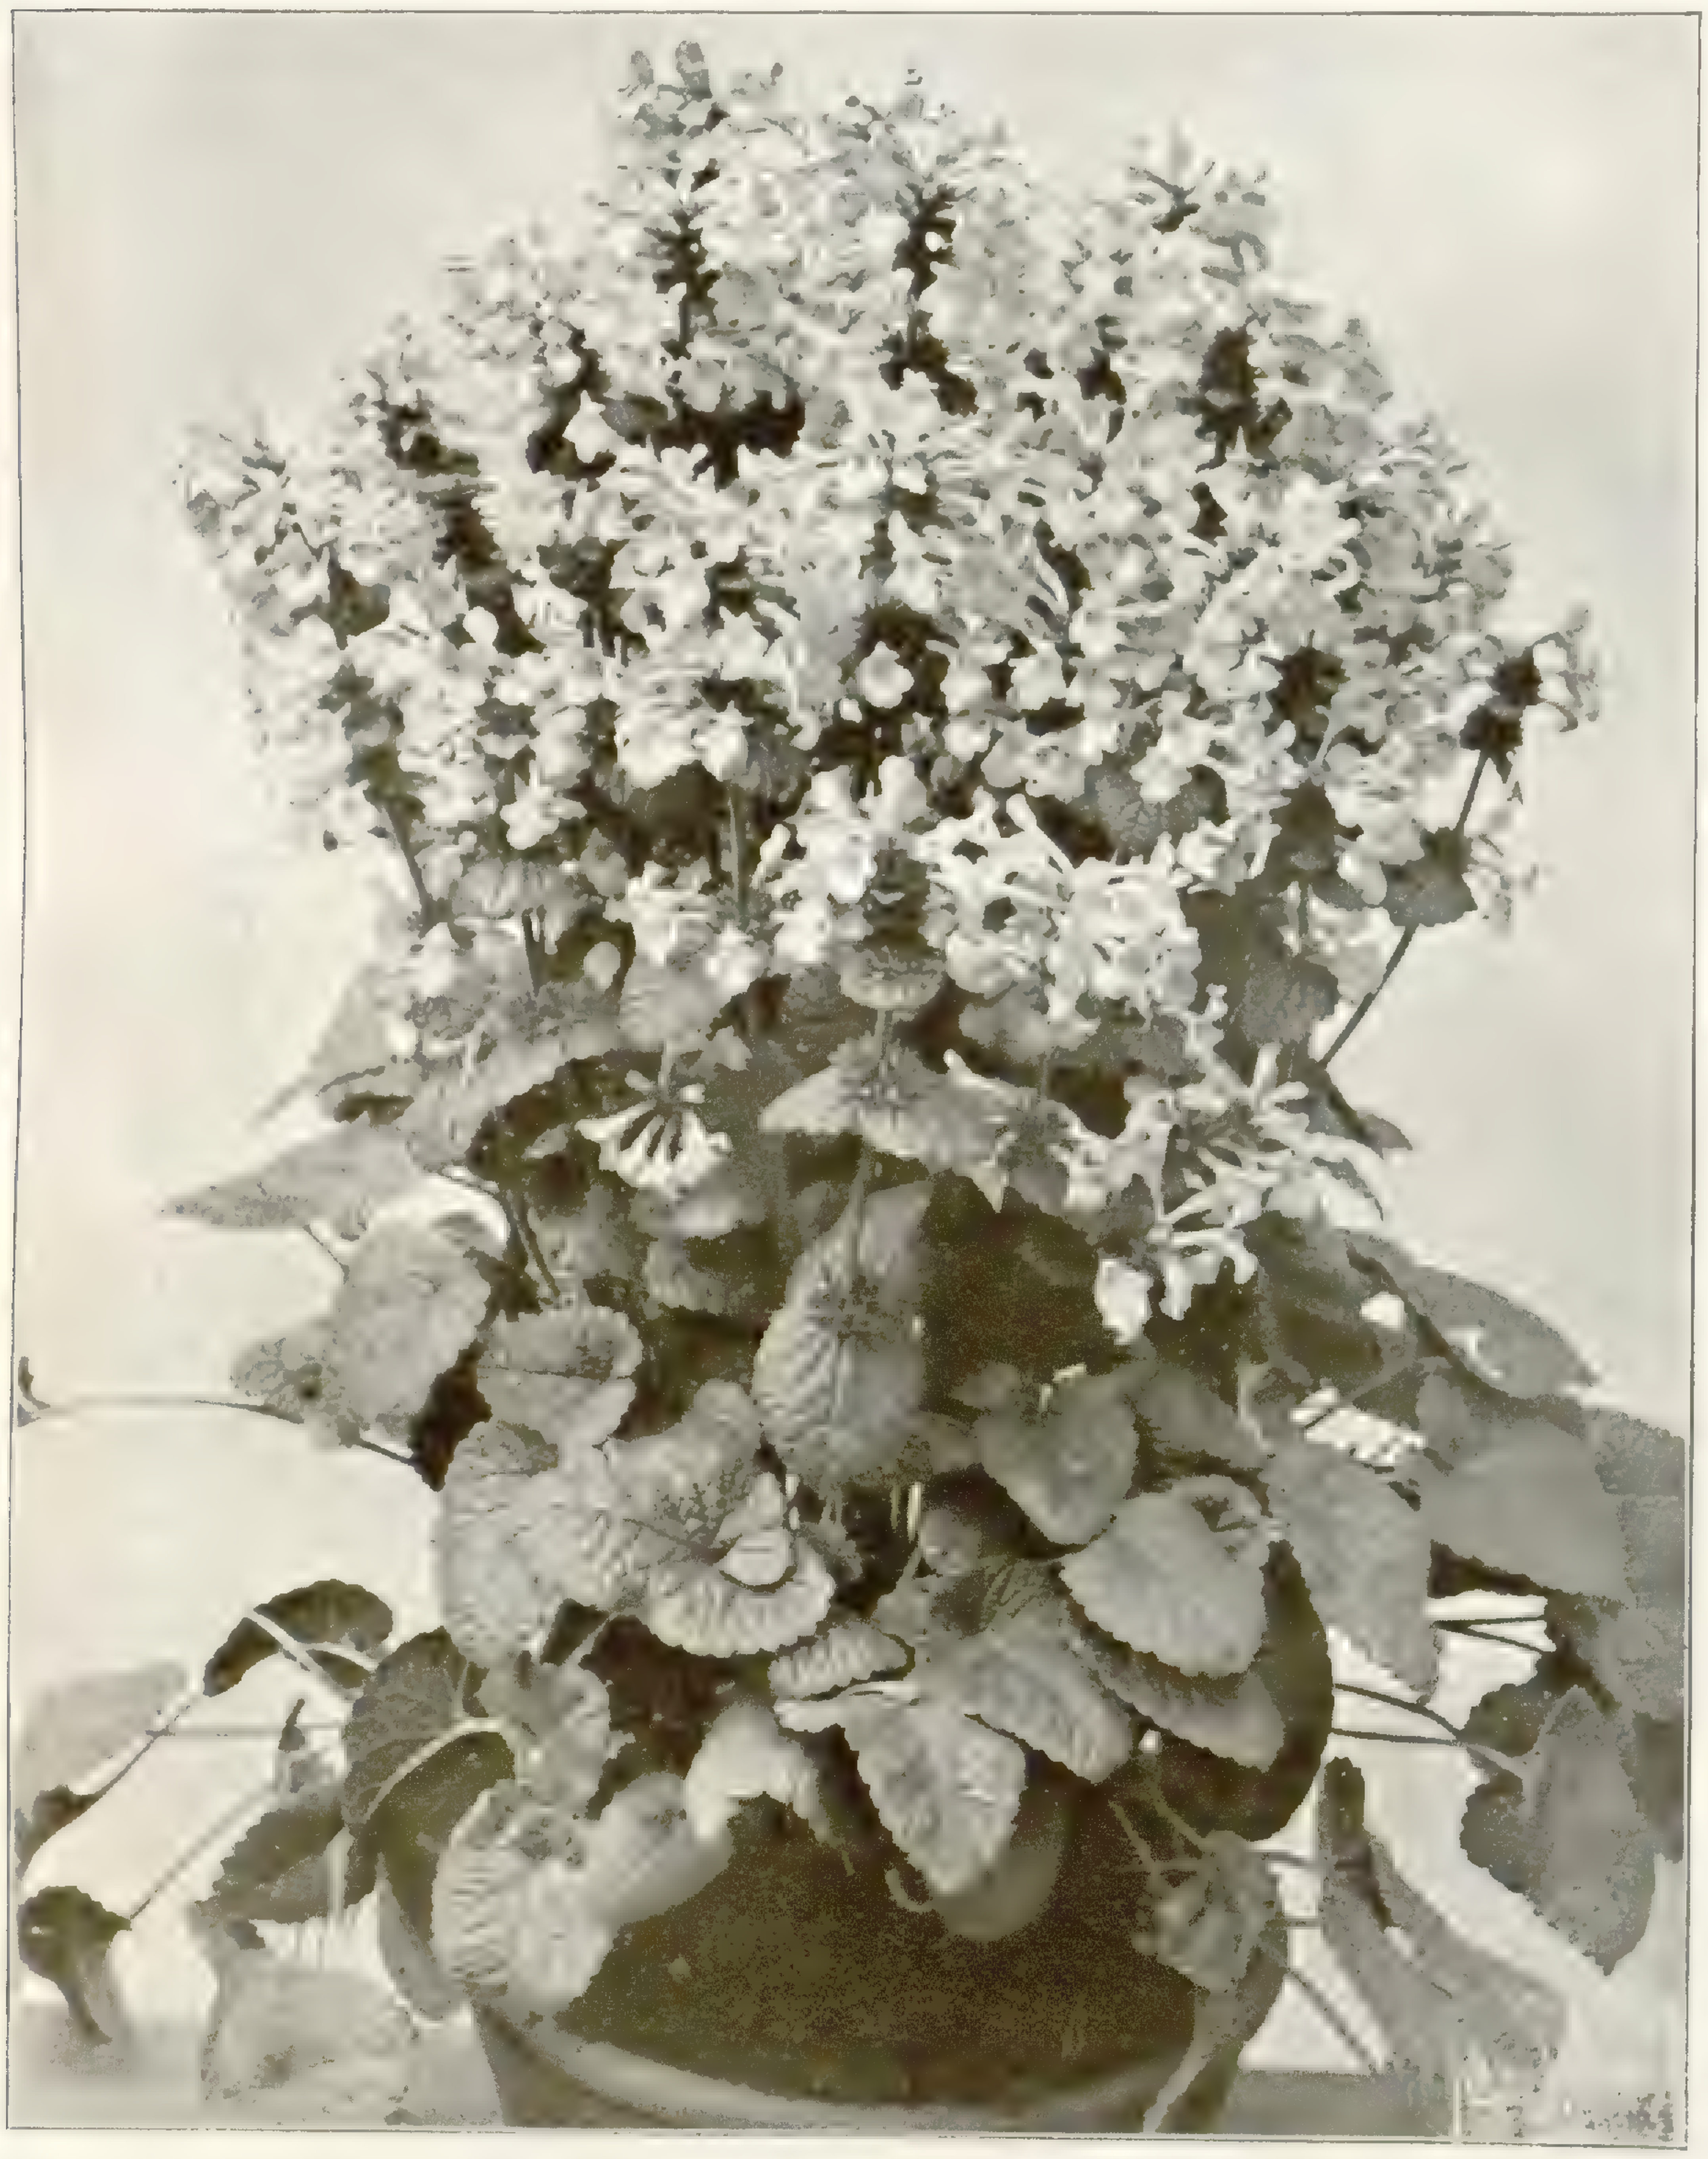
YELLOW-GROUND FANCY CARNATION LINKMAN.
Yellow, heavily marked with scarlet: as shown by Mr. Chas. Blick, Hayes, Kent, at the recent Carnation Show at Westminster.

Maincrop Cabbage.—As soon as practicable after this date a sowing should be made in well-prepared, but firm ground. Sow where no brassica tribe has been for at least two seasons. The object of two sowings is that the first-mentioned can be planted in their permanent quarters five weeks from the seed sowing. If they are well cared for during that time strong plants will be then quite ready. It will be found that the ground is well supplied with warmth, so necessary to a rapid root action. If planting is deferred until October the season is fast waning, the ground mostly wet, and, consequently, the root action slow, with the result that very little growth is made till the following spring. Excellent varieties for this sowing are Ellam's Early, Flower of Spring, and Enfield Market.—G. Ellwood, Swanmore Park Gardens.

THE BULBOUS FLOWERS OF AUTUMN.

Among the curiosities of the vegetable kingdom may surely be counted meadow saffrons, or colchicums, which flower a few weeks after they are planted in autumn. By obtaining a hundred bulbs or so, and putting them in at intervals of a week throughout August and the two first weeks of September, a plot of land can be made exceedingly beautiful from the end of the former month until November. Some growers naturalise the varieties of Colchicum autumnale in grass, and certainly they look very beautiful treated thus, whether on levels or slopes. Yet, as their after carpet of foliage is one of their charms, I consider them more fit for covering stretches of ground beneath tall deciduous trees. It will be necessary to sweep or pick away the dead leaves of the trees when a touch of winter brings them down, but then the meadow saffron leafage will become a joy, and continue until the following June or July.

Few gardeners grow even all the varieties of the common Colchicum autumnale. In addition to the familiar pale rosy-purple, we may have white (single or double, though the latter is rare and expensive), peach-lilac, rose, and dull magenta-purple. These shades harmonise to perfection, some giving a warmer effect than others when massed. In rockeries these may all be used advantageously, and spaces in semi-shade should be filled by the even finer colchicums that enterprising florists have brought us from Greece, Kashmire, the Caucasus, etc. C. speciosum rubrum is deep ruby red, large, and firm of petal; C. tessellatum shows the beautiful markings of rose-purple and white that distinguishes the meadow saffron from all other blossoms; so, too, does the rose and maroon C. Sibthorpi; C. byzantinum is rose-coloured, one of the best; C. Bornmülleri has peach-pink blooms with white centres; C. Bivonæ, peach, and C. Bivonæ superbum, vivid crimson, are perhaps finest of all; C. Parkinsoni is a chequered flower of peach and white, suited to sheltered rockeries only, and needing a cinder mulch during winter.



STACHYS GRANDIFLORA.

A fine specimen recently exhibited by Mr. Amos Perry, Enfield; flowers rich rosy-violet.

It is said that gardeners often plant in turf to keep the blossoms from becoming mud-bedraggled by the heavy rains of autumn. This can be as well prevented, however, by covering the soil of borders or beds with cocoanut fibre refuse, which shows up the pale colours admirably, or else putting the bulbs out in small spaces cleared for them in beds of stonecrops and mossy saxifrages, which give the prettiest display of all. They are suitable for window-box filling, and supply a want for those on the north, north-east, and north-west sides of houses where shade mostly reigns. A trio of fuchsias, preferably with variegated foliage, and a carpet of Sedum album, can give the summer show, and the colchicums, added in August, will soon assert themselves, their leaves remaining, if desired, as a winter effect when dwarf shrubs have been put where the fuchsias stood. A similar method suits garden vases and tubs.

Autumn-flowering crocuses offer yet more opportunities to the bulb-grower. If massed on rockeries, by rock edgings, upon bank-sides, or anywhere in turf or light rich soil, they can give colour effects quite marvellous considering their smallness and the low sum for which they can be purchased by the hundred. The cheapest is Crocus sativus, a thousand bulbs of which cost only 25s. This is a large-flowering species, mauve with deep violet markings and gay orange stigmata. C. speciosus, probably the best known, is brilliant blue, while many connoisseurs consider C. zonatus loveliest of all, so gay is the orange zone in its peach petals.

More costly species are the pale blue and white Crocus pulchellus, the rose-peach, sweet-scented Crocus longiflorus, C. asturicus, all of mauve and purple, and the wondrously hued C. tridiflorus. It is a charming hobby to cultivate both meadow saffrons and autumn crocuses in pots in the cool greenhouse and shady ferneries. Many a flower-loving amateur gardener would be glad to take up their culture in his blossomless shaded conservatory did he but know that perfect success is easy of attainment, and that the winter-flowering, as well as the spring-blossoming species of crocus could be used to keep up a succession until May; the last being quite distinct from the ordinary crocus, and obtainable in great variety.

Gladioli and montbretias make up much of the glory of the autumn bulb garden. There exists often a prejudice against the former, on account of lifting and storing, but the latter will thrive out of doors, in sun or shade, during the most severe winters, and, unless allowed to become overcrowded, never seems to fail to offer a harvest of superlatively graceful bloom-spikes. For these reasons all varieties of montbretias should be included in even small gardens, they will then be found to possess a wider range of colour than is generally imagined.

Last of all the autumn-blooming bulbs is the Caffre Crimson Flag, or Schizostylis coccinea, for in sunshine it blossoms in October, in shade during November. The bulbs are inexpensive, and if the best quality are bought there will not fail to be a rich harvest of the scarlet-crimson spikes. The ideal place for this plant is in nooks of a large shrubbery border, where it will be sheltered from cold and rough winds, and have deep, old soil in which to dwell and increase. It can also be cultivated in pots, but these should be sunk in sheltered semi-shady ground until the buds are colouring, after which it will open in room windows or cold greenhouses.

M. H.

STACHYS GRANDIFLORA.

Under the name of Betonica grandiflora the old garden plant now known as Stachys grandiflora was figured in the "Botanical Magazine" one hundred and seven years ago. The text accompanying the illustration is as follows: "It is at once distinguished from every other known species by the large size of the flowers, and by the whorls being distinct and not forming a spike. It is a native of Siberia, and, consequently, perfectly hardy. Flowers in June and July. Easily propagated by parting its roots, and requires no particular treatment. Introduced by Mr. Loddiges, nurseryman, at Hackney, within these few years. Far exceeds in beauty all its congeners."

By the careful selection of the best forms, having due regard to habit, freedom, and size and colour of flowers, a very fine type of this old plant has now become available for the hardy flower border. A goodly specimen, two or three feet wide, and eighteen inches or more in height, carrying a quantity of spikes of beautiful rosy-violet coloured flowers, is very effective in the border. The plant presents no cultural difficulties, and is a success in any good garden soil. Mr. Amos Perry, Enfield, has a fine form of this old species, and has shown it well on several occasions. The present illustration shows one of his specimens, and indicates the remarkable freedom with which the plant flowers; it may serve to reinstate a species that has been somewhat forgotten of late.

BEST PLANTS FOR GREENHOUSE.—Nearly 300 pages are devoted to the description, propagation, and culture of the best flowers and plants for the greenhouse in THE AMATEUR'S GREENHOUSE, by T. W. Sanders, price 5s. net, or by post 5s. 6d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

SUN ROSES.

When late May and early June come round we are in the full enjoyment of the helianthemums, or Sun Roses, lovely little shrubs, generally of prostrate habit, which cover themselves with bright and dainty flowers of varied colouring. There is hardly anything finer on a rockery or at the edge of a border than a group of these gay flowers, with their crinkled petals open to the sun and seeming to glow with its radiance. Fleeting, perhaps, are their beauties, and on a sunny day when there is a good deal of wind their glory may be over by midday, but the following morning, and day after day, for a while, they are again covered with these gay flowers. In duller weather they last longer in flower, and, much as they like a dry soil, they continue better in bloom if they are supplied with water in dry weather during flowering time.

Cultivation.

Their culture is easy, and they are generally hardy; some of them, perhaps, objecting to a wet position where they are exposed to keen winds in winter, as they are generally evergreen. They are most at home on the rockery, but will delight those who see them close to the front of a dry border or on the front of a sunny shrubbery. They should be planted in almost full sun, and are propagated by cuttings in early spring or October in gentle heat, or under glass in a cool house or frame.

The helianthemums can also be raised in quantity from seeds, sown under glass in spring, and the seedlings pricked off about two inches apart when they can be handled. They should be removed to their permanent quarters when quite small as large plants do not remove well. Mixed packets of helianthemum seeds can be purchased from the seedsmen at a moderate price, and for threepence or sixpence a large number of sun roses of many colours and shades can be raised.

Colours.

These colours are varied in the extreme. There are no blues, although some of the crimsons rather approach purple in their tones; but there are whites, yellows, pinks, roses, creams, scarlets, salmons, browns, and many intermediate shades.

There are also varieties with double flowers, these embracing a considerable number of the colours included above.

The singles are, to the writer's mind, the prettier, but the doubles last longer in bloom, and are exceedingly pretty also. It is of little value to name a large selection of named varieties, but a few may be mentioned for the sake of those who like the choicer varieties, although many among the seedlings will be quite as good for decorative purposes.

The Best Varieties.

Amabile, as sold, is single, and is orange and rose, but the double variety, amabile fl. pl., sometimes sold as Mrs. C. W. Earle, is deep red, and a very fine thing indeed. Jubilee, a double bright yellow variety, and Old Gold, bronzy, are the best of all the double helianthemums, holding their flowers well up, while the others droop their blooms. Of the singles Beauty is pink, with a yellow centre; coccineum is bright crimson; and Golden Queen, yellow.

Balgreen is another fine single yellow one. Magnificent is terra-cotta. Magenta Queen is rosy red, while the dainty Mrs. Croft is rose-pink with silvery-grey leaves. Pink Beauty is pink, as the name would suggest, Snowflake is a beauty with white flowers and yellow anthers; Sulphur Gem has sulphur flowers with a deeper centre; and Yellow Standard has large soft yellow flowers. Vulgare fol. aureum has yellow leaves in winter and spring, and single yellow flowers. Other doubles besides those previously named are Chocolate, Orange, Rose, White, and Yellow, but Amabile fl. pl., Jubilee, and Old Gold are better than the five last mentioned for the reason already given. Surrejanum is a small-flowered variety with soft yellow flowers, and is a dense growing plant, suitable for covering stones. Polifolium roseum is very fine.

The helianthemums can all be kept within bounds, so far as regards size, by cutting them back as soon as they have finished flowering.

Such beautiful little shrubs deserve a place everywhere, their height not exceeding six or seven inches, and their charms at all times rendering them pleasant to look upon. S. Arnott.

HELIANTHUM GOLDEN QUEEN.
An effective variety with yellow flowers.

Potatoes.—This crop perhaps has not looked better in this district than at the present time, early, midseason, and late varieties being equally satisfactory. Providing fine weather now sets in, a heavy crop of the best quality is assured. When the growth of early and midseason varieties is finished do not hesitate to lift the crop and select the "seed" for next year, spreading the tubers in a dry position to well ripen before storing away. If potatoes were lifted earlier not half the complaints would be heard of diseased and bad keeping potatoes. They may lose a little of their skin, but this will not impair their keeping qualities. —G. Ellwood.

WEEPING STANDARD ROSES

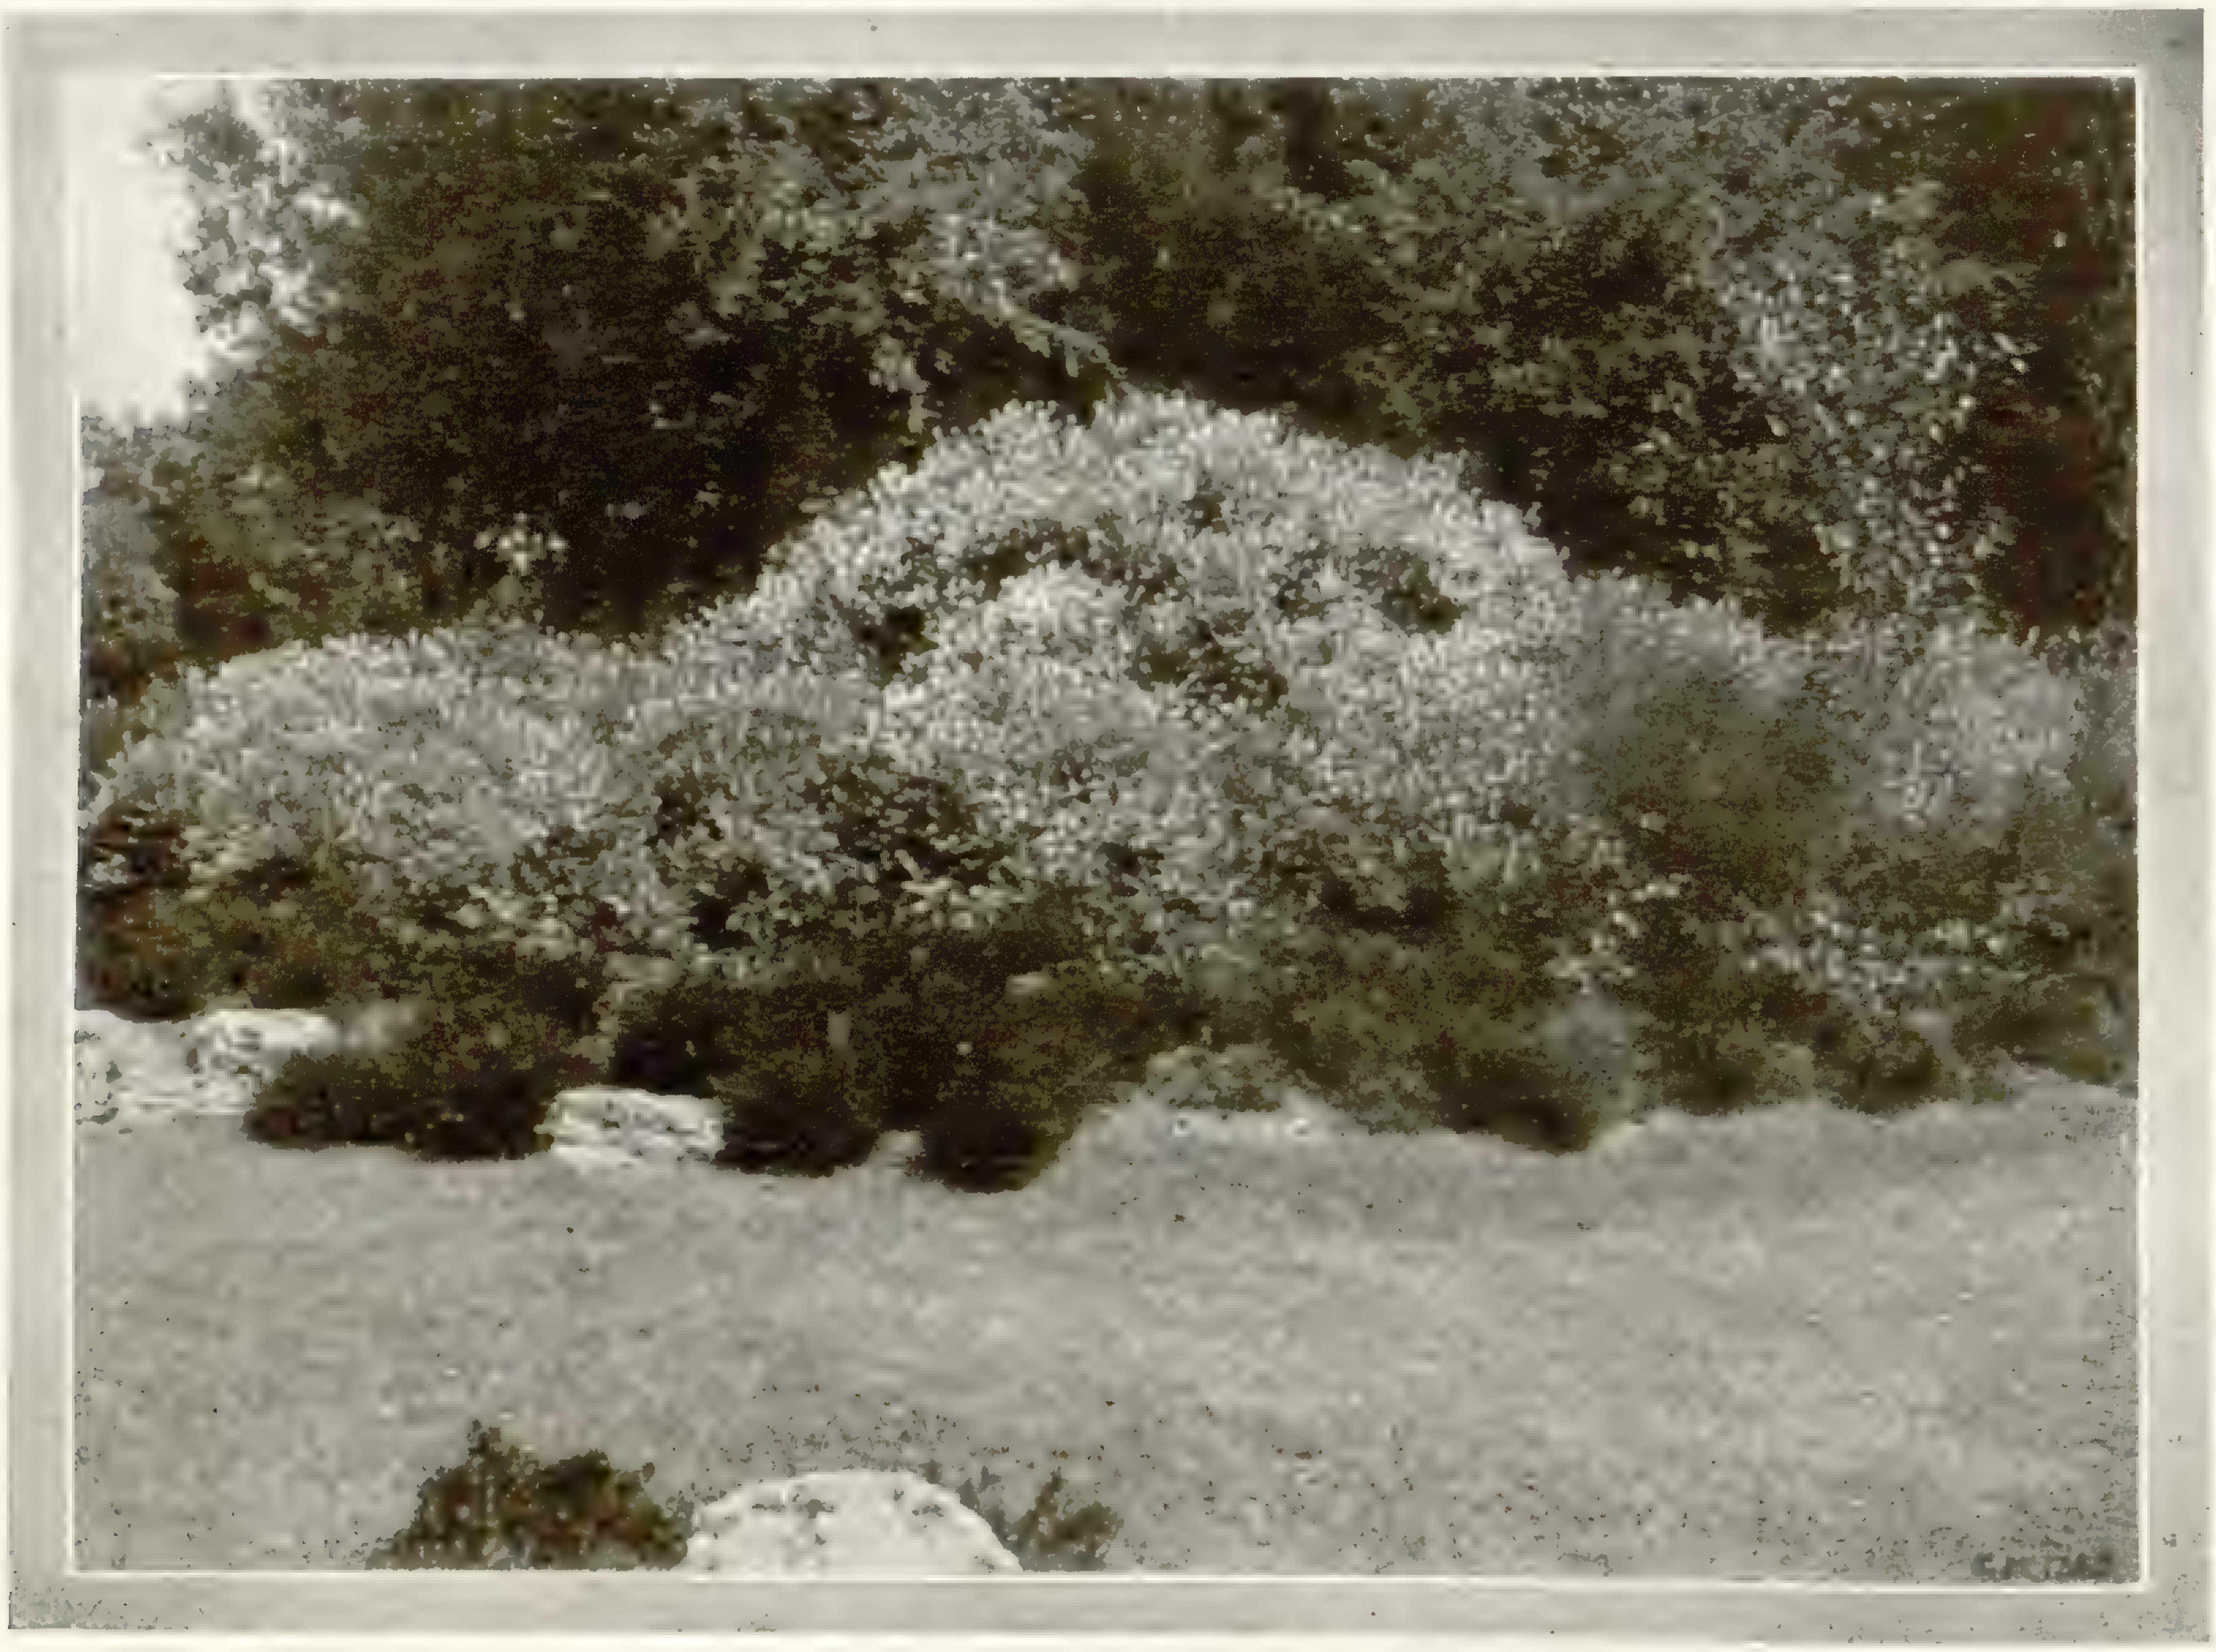
These are so very pleasing that I think a small selection of the best may be welcome. One can have them upon extra tall briar stems, or five to six feet high. In the latter case the plants have the appearance of cascades of flowers hanging down to the ground and are very pleasing. We have been fortunate in obtaining a small number of briar stocks with 7ft. to 9ft. of clean straight growth, and no better roses can be selected for these than the weepers. We plant the willow, ash, and birch in this form, and there is no reason why roses should not be made to serve the same purpose. Many of these are as free-growing and long lived as most ash or willows, with the additional charm of flowers. That they are bare in the winter is no drawback. We do not want shade then; while for the matter of that willows and ash are equally bare.

When one intends to use tall roses it is well to have some arrangement that will keep the top of the plant more in the form of an open umbrella than it would take naturally. This gives a much larger spread, and without it one cannot very well have a small stool or seat beneath.

I would suggest the following varieties: Dorothy Perkins (pink), Hiawatha (crimson), Wichuraiana (white), Evergreen Gem (pale fawn), White Dorothy (white), Delight (carmine), Gracilis (pink), The Garland (nankeen and pink), Evangeline (salmon-pink), Félicité Perpétue (creamy white) and Gardenia (yellow). This gives a good range of colour, and all are extra vigorous growers with a naturally drooping habit. A. P.

VERONICA TRAVERSI.

Within the past thirty or forty years a considerable number of dwarf-growing shrubby veronicas have been introduced to this country from New Zealand, and the more useful of them are found in nurseries where hardy trees and shrubs are largely grown, while several are freely distributed in gardens. All the species and their varieties that are in general cultivation possess merit, but they differ materially in usefulness for garden decoration, as some readily succumb to unfavourable climatic conditions, a severe frost being sufficient to seriously injure them when growing in cold heavy soils, or exposed positions. In the southern and western counties of England, and in the warmer parts of Ireland, a large proportion of the species may be planted with the full assurance of their proving satisfactory. Elsewhere it is advisable to limit the selection to a few of the kinds that can be depended upon to pass through an English winter, unless of exceptional severity, without injury, and to make a satisfactory growth, and produce a profusion of flowers.



VERONICA TRAVERSI.
A beautiful white-flowered evergreen shrubby species, growing on a rock border in the gardens of The Pleasaunce, the residence of Lady Battersea, at Overstrand.

One of the most useful of the New Zealand shrubby veronicas is that known as V. Traversi, which is now plentiful in gardens, as well as in nurseries, and so attractive when growing under favourable conditions as to fully merit the popularity it enjoys. Its comparative hardiness is a strong point in its favour, and when occupying positions where it is not crowded up by stronger-growing shrubs it forms dense shapely bushes that during the summer months bear a profusion of white flowers. It is not necessary to dilate upon the merits of the shrub, but it appears necessary to make some reference to its cultural requirements, for in not a few gardens in which it has been planted the specimens present a far from satisfactory appearance. The compact, dwarf habit of V. Traversi marks it out as of special value for a position on the margin of the shrubbery border, and its suitability for such positions is taken full advantage of. For a time all goes well, and the evenly-shaped bushes contribute their full share to the attraction of the border. Presently the strong-growing shrubs assert themselves, and overshadow their less robust neighbours, and fill the border with hungry roots. Deprived of a sufficiency of food and light, the veronicas languish, making but little new growth, and losing their leaves on the older wood, and present a half-starved and otherwise miserable appearance. There is certainly no beauty in plants grown under such conditions, and we suggest that unless it is reasonably certain they can receive the attention necessary to their maintenance in a healthy state they be not planted in the mixed shrubbery. They must have room enough for their full development, and a moderately liberal amount of food. Sufficient room can be given them by the free use of the knife upon vigorous growing neighbours, and a top-dressing annually of well-decayed manure will suffice for their food requirements.

This species, with two or three other of the dwarf evergreen veronicas, are of much value for the creation of distinct effects in the rock garden, and are frequently planted in the higher parts. Where the precaution is taken to provide a good root run, as, for example, on a broad ledge, where the soil is of some depth, they thrive, and are in every respect satisfactory. In some cases they are planted on ledges where the soil to which the roots have access is small in quantity. Here they may grow fairly well for a time, but the soil quickly becomes more or less exhausted of its nutrient properties, and the plants show signs of starvation. Small ledges are altogether unsuitable for these shrubs, for not only does the store of plant food in the soil soon become exhausted, but the ledges do not catch sufficient of the rainfall to enable the plants to have enough soil moisture. A raised border, arranged in terraces, with the aid of large pieces of stone, such as the one herewith illustrated, is admirably adapted to the requirements of the New Zealand veronicas. This border is in the gardens of the Pleasaunce, the delightful marine residence of Lady Battersea, at Overstrand, and is, especially at this season of the year, a highly attractive feature. In this position, with the needful attention given the border by Mr. Naylor, the able gardener, V. Traversi grows vigorously, and in each recurring summer produces a profusion of its flowers, and, what is not less important, is free from the premature shedding of foliage. G.

Hexacentris, or Thunbergia mysorensis, is one of those uncommon flowering plants, now so seldom met with, and for a stove or intermediate house it is most interesting. It produces its flowers in pendant racemes, resembling a laburnum, but differing in colour, being yellow and brown, a combination of colour reminiscent of Cytisus Andreanus. It should be trained near the roof glass at sufficient height to show the pendant blossoms to advantage. Mr. Emerson grows this well at Belton, one of the good old places where interesting plants are grown.—T. H. Slade.

RODGERSIAS.

Regarded simply as foliage subjects, the various kinds of rodgersia are among the most distinct and ornamental plants for grouping beside water. The oldest and best known species is Rodgersia podophylla, which produces its leaves on footstalks some eighteen inches in height. The individual leaves are bronzy-green, and divided into five broad segments, resembling in a general way the foliage of the horse chestnut, but on a giant scale. When planted in positions fully exposed, and sheltered from violent winds, the leaves become brightly coloured, their autumn tints contrasting admirably with the other occupants of the bog. R. pinnata differs from the latter chiefly in having slightly smaller leaves, which are deeply rugose; so far it has shown none of the colouring in the leaves which characterises R. podophylla; on the other hand, R. pinnata retains its leaves long after the foliage of R. podophylla is destroyed; the flowers of this species are rosy-crimson, and are produced in the form of erect panicles well above the leaves.

R. pinnata alba produces the most conspicuous flowers, and, regarded from this aspect, is the best of the group. Like those of R. podophylla, they are creamy-white, and are carried on panicles three to four feet in height. R. esculæfolia has leaves resembling the horse chestnut, of a rich bronze-green; the flowers are pinky-white, on stems about a yard high.

All the species of rodgersia are deciduous perennials, and only start into growth toward the middle of April. Propagation is effected by division, which, in the case of R. podophylla, is comparatively easy, as it increases at a surprising rate. R. pinnata and its variety, though vigorous growers, are somewhat slow in increasing. The members of this group belong to the saxifraga family, and are all natives of China or Japan.

Thomas Smith.

TABLE PLANTS.

The time will very shortly come when these plants will be required for use in the dwelling house. The present season has not been a really good one, as regards the weather, many days being sunless, and the air cold. In these circumstances it is a difficult matter to get that deep, rich colour in the leaves of fine-foliage plants so desirable. I usually grow crotons on shelves quite close to the glass, and do not shade at any time, but great care is taken to keep the atmosphere moist, and to prevent over dryness at the roots, and the attack of insect pests on the leaves. Cultivators who have not had much experience in the growing of such plants as these and dracænas for table decoration, and have kept them shaded, should, early in the autumn, remove the shading, and gradually expose the specimens to the full light and sunshine. If this be done, and water given with great care so as to preserve all the lower leaves in perfect health, very nice plants will be available.

G. B.

Lettuce.—The chief sowing for the spring supply should commence about the 20th of the present month, and ten days later. To be certain of possessing plenty of plants, sow in three positions in the garden. When sowing add a good dressing of old potting soil and burnt garden refuse, and protect from birds with nets if they are troublesome.—G. Ellwood.

RAMBLING ROSE FÉLICITÉ PERPÉTUE.
As grown against a wall in the gardens of Sandhurst Lodge, Wokingham.

ROSE FÉLICITÉ PERPÉTUE.

Very much has been written about this old rose, and in recent years attempts have been made to belittle it so that by contrast the newer roses of climbing or rambling habit might have the greater glory. This is not fair treatment. We want all the roses that are really good, and the new ones must stand or fall just as they are better or worse than old ones, or have some distinctive feature. For over three score years and ten Félicité Perpétue has been with us, and there is a great deal to be said for a rose that has graced our gardens for the greater part of that period, notwithstanding the many competitors for such places as it is usually grown in. Félicité Perpétue is an evergreen climbing rose of great value and beauty, and one that rarely fails to provide a fine crop of attractive blush-coloured flowers. It is still worth a place in a selection of climbing roses, and it will not disgrace the newest introductions. It is a good pergola rose, especially fine for pillars and chains along the side of a path, and a pretty picture when well trained over a porch or house front. In many a country village this old rose may be seen in fine condition, and it occupies a prominent position on the walls of many a country mansion. At Sandhurst Lodge, Wokingham, where roses are so well grown, the old Félicité Perpétue is seen to advantage on a wall, and the accompanying illustration serves to show its usefulness, freedom, and great beauty in such a position. This variety, with a few other of the older ramblers, should receive attention when a selection of climbing roses is under consideration.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

CALANTHES.—The deciduous calanthes will now have filled their pots with roots, and as the pseudo-bulbs are developing every encouragement is necessary to induce them to mature satisfactorily. Although I do not feed, I see no reason why the process of artificial feeding should be condemned. Different situations and the difference in the conditions under which plants have to be grown necessitate varying methods of culture; there is no class of plants in which the variation in methods of culture is so great as in the case of calanthes. They are, perhaps, more generally grown in gardens than any other orchids, and those who have had to grow them in different places have found the necessity of adopting their practice to the conditions that obtain. It is thus not desirable to condemn methods of treatment and feeding where these produce results which are in every way satisfactory. There is one thing that has always struck me as necessary, and that is to see that the plants have become well rooted before any feeding is given. It is after they have filled their pots with roots that they require a greater amount of moisture, and discreet feeding is beneficial. There is nothing more useful for the purpose than liquid manure, prepared by placing a bag partly filled with sheep or cow manure into a barrel of rain water. If a little soot is added in a separate bag, placed in the same tub, it will be an advantage. Dilute this before use, and add sufficient water to make it weak at first, and increase in strength as the plant brings its growth to maturity. About once a week use the liquid manure. Artificial manures must at all times be cautiously applied. This is the season at which the plants commence to develop what is called black spot in the foliage, and on the pseudo-bulbs. Some writers attribute this to syringing overhead, unfavourable watering, and excessive moisture in the atmosphere. I am quite willing to admit that these may be undesirable conditions of cultivation, but my experience has induced me to hold a different opinion. I have found that, with every precaution, some of the plants of even the most robust-growing kinds will develop this unsightly disfigurement when grown among others of a more weakly constitution that are perfectly clean in foliage. I have come to the conclusion that it is other than cultural treatment that causes the trouble. As the pseudo-bulbs mature more light should be admitted, and the atmosphere kept drier by more liberal ventilation and careful use of the artificial heat at night.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

PLUMBAGO ROSEA.—For winter decorations this plumbago has few superiors, especially where it can be grown in good big batches. Somewhat ungainly in habit as a plant, yet for the production of cut flowers for the decoration of the dinner table it is most beautiful. Unlike Plumbago capensis this species requires a stove temperature nearly the whole season through, and will not put up with anything like such cool treatment. Like most other occupants of the stove, this plumbago requires a fairly open rooting medium, consisting of loam, peat, and sand, with a little charcoal added, and is benefited by a little feeding when the pots become well filled with roots. Young plants rooted early in the summer should now be growing freely. They are preferably rooted in large 60's, three in each. They should be pinched once or twice during the growing season. This will make them fairly bushy, and if transferred to six-inch pots during the present month they will give some good strong spikes of bloom from Christmas on through the winter and spring. Plants a year older are even more productive of good bloom than are the younger ones, and these, if cut hard back after blooming in the spring, should also be fit for potting on, using for these seven-inch pots. If stove accommodation is not available after potting, they may be placed in a heated pit for a month or six weeks, giving them a syringing on fine days. After they are nicely rooted admit just sufficient air to ensure the young shoots growing stockily, but on the approach of cold nights, say quite by the middle of September, they must be removed to a light position in the stove where they will have ample air space between them.

IXORAS.—As these go out of bloom, any that are grown somewhat out of shape should be pruned a little, utilising the strong growing points for cuttings which, if inserted in thumb pots filled with a very fine mixture consisting of peat and sand, will soon take root if placed in the propagating frame. The old plants should have a thorough cleansing either by sponging or syringing well with paraffin emulsion; any plants that require it should be repotted, using a fairly lumpy compost of peat, leaf-soil, and sand, making it as firm as possible, and if carefully watered for a time should be well rooted again before the autumn. The younger plants may be repotted as they require it any time up to the middle of September, it not being wise to shift later.

POINSETTIAS.—Any plants of these requiring a shift should be attended to at once, as if left later they will not have time to be well established in the new soil before blooming. Plants that are nicely established and not requiring a shift may be helped by a little liquid manure. Admit sufficient air to keep the wood and foliage firm, and on all fine days spray lightly overhead both morning and evening, taking care that those in charge do not use the syringe too vigorously, as the least bruise either by the syringe or anything else will make the young tender foliage bleed. Euphorbias will require similar treatment to the above, and if trained up the wires in a melon house, as advised in a previous calendar, they should now be making good stocky growth, which is so essential for the production of good spikes of bloom later on in the autumn.

CALADIUMS.—As the earlier batches of these plants begin to show signs of a cessation of growth, by the foliage turning yellow, the watering must be slightly reduced, but not sufficient to allow the leaves to die down very quickly, or there will be some difficulty in keeping the corms in good condition through the winter. What is necessary is to just gradually withhold water, allowing the foliage to remain on as long as possible, not pulling it off on the least sign of yellowness. Needless to say, the syringe ought to be withheld during the dying down process.—Thomas Stevenson, Woburn Place Gardens.

FRUITS UNDER GLASS.

PEACH TREES IN POTS that are carrying late crops of fruit should be kept clean by being daily syringed up to the time their fruit commences to ripen, and as soon as the fruit is gathered the syringing should be resumed, and continued until the leaves fall. Applications of diluted liquid manure or other suitable stimulant should also be given until the fruit commences to ripen. Trees that have completed their growth, after having yielded an early crop of fruit, and are otherwise prepared for it, should be now moved to a sheltered sunny position out of doors. Subsequently, when their leaves near maturity, trees that require it —and it should be remembered that trees of this kind readily exhaust their compost—should be repotted. In attending to this, young trees should be given a shift into pots of a size larger than those they are occupying, and in carrying this into practice carefully turn the trees out of their pots, remove the crocks, disentangle the outside fibrous roots, and cut back strong bare ones. In repotting use well-drained clean pots; firmly ram the compost, which should be moderately dry when used. This should consist of three parts good loam and one of finely crushed mortar rubble and wood ashes, with the addition of a sprinkling of bone-meal. For a few days after potting protect the trees from powerful sunshine, and until their leaves fall syringe them overhead in the afternoon of fine days, and at all times attend carefully to watering.

FIG TREES IN POTS.—Fruit-bearing trees should be given careful treatment under glass until their fruit is gathered, when they should be gradually hardened before being placed out of doors. Early forced trees, if they have been treated as recommended in a previous calendar, should now be in proper condition for being placed in a sheltered sunny position outdoors, where their pots should be plunged in a bed of ashes. Make certain the drainage is in a satisfactory state, and give plentiful supplies of water, but manures of all kinds should be withheld. Should any of the trees require to be repotted, attend to it at an early date, when young trees should be shifted into larger pots, and those in large pots have their balls of soil, together with their roots, reduced, and be repotted, using efficiently drained pots of the size they have occupied. A compost of fibrous loam, liberally mixed with crushed mortar rubble and bone meal, made quite firm about the roots, answers well as a rooting medium. Plunge the pots, and spray the trees overhead in the morning and evening of fine days.

LATE FIG TREES IN BORDERS.—Trees now swelling their fruit, with their roots confined to a small rooting space, will require frequent applications of diluted liquid manure, or manurial top-dressings, accompanied with copious supplies of water. Thin the fruits, if necessary, by removing those nearest to the points of the shoots, and keep the growths well thinned and stopped, which will both accelerate the swelling and colouring of the fruit, and aid in maturing the wood. Up to the time the fruit commences to ripen maintain a warm temperature, and close the house early enough to secure a warmth, for a short space of time, of about 80, when the trees should be thoroughly syringed, which, together with other benefits, will keep red spider at bay. Once the ripening stage is reached discontinue syringing, maintain drier atmospheric conditions by careful ventilation, and thus prevent condensation of moisture which, if promoted, would cause damage to the fruit.

EARLY FIGS IN BORDERS.—In cases where trees from which the fruit has been gathered are unsatisfactory owing to making robust, imperfectly matured wood, their roots should, as soon as the trees' leaves are sufficiently matured, be bared up to two or three feet of the stems, the most fibrous roots raised near to the surface, and the strong bare ones cut back. Should a new border be necessary, or the drainage need rectifying, the opportunity thus afforded of improving these matters should not be missed. Attend subsequently to syringing in order to prevent the leaves flagging.—T. Coomber, The Hendre Gardens.

THE KITCHEN GARDEN.

ONIONS (SPRING SOWN).—These generally have finished their growth by the 24th of this month, therefore care must be exercised as regards watering from now onwards. If at all dry, give one more soaking of water, which should be quite sufficient. The only reason why large bulbs fail to keep is caused by imperfect ripening and rough handling. In commencing to harvest them the finer bulbs should be eased with a fork by just drawing a few roots, let them remain so, repeating the operation for three days, when they can with safety be removed from the ground entirely. Place on a soft bed of hay, protecting them from rain. A prepared cold frame would be an ideal place for them, where the lights could be placed over them each night.

ONIONS (AUTUMN SOWN).—It will now be time to prepare a bed for the Tripoli varieties. If it is intended for them to complete their bulbs where sown, the ground should be trenched and manured. If special bulbs are the aim, I would strongly advise sowing the seed about August 20, and ten days later on ground that has been occupied with potatoes by levelling it down and rolling, or made firm, in drills at twelve inches apart, and defer the planting on the prepared ground till the end of February or early March, as the weather may be. First-rate varieties are White Leviathan and Lemon Rocca.

BROCCOLI.—The late or spring varieties can still be planted as ground becomes vacant; they will be found to stand the winter far better than fully developed plants of the same variety, they having more activity whenever the temperature will allow them to grow. Winter greens and plenty of savoys should also be planted. Of the latter choose good sturdy plants.

LEEKS.—The completion of the moulding of the early batch should now be finished, and the plants should be given a good soaking of diluted liquid manure to perfect the blanching process. If the atmosphere is dry, spray the foliage.

CELERY is growing remarkably well this year, and has not been attacked by the dreaded celery fly so far; but as a prevention of an autumn attack give occasional dustings of soot and lime, which will also be useful in keeping off slugs. Earthing up should commence now with the early maincrop, precede this by carefully removing all side growths and small leaves, and if at all dry give a good soaking of diluted liquid manure. When dry commence earthing up to three or four inches, repeating the same operation every ten days. Do not attempt hastening the later plantings, as the longer they are left the better able will be the plants to withstand the severity of a hard winter.

PARSLEY previously sown for winter will require thinning out to ten inches apart. If drawn carefully the thinnings can be planted in cold frames, or at the foot of a south wall make another sowing of the variety Hardy Winter.

GENERAL WORK.—There will be much to do now, though the chief crops are fast maturing. All plots of exhausted crops, such as cauliflowers, peas, spinach, lettuce, etc., should be speedily cleared off the ground and consigned to the rubbish heap. Mulching and watering with constant hoeing must be attended to.—**G. Ellwood, Swanmore Park Gardens.**

SWEET PEAS AT BIRMINGHAM.

A fine table of sweet peas set up by Messrs. Robert Sydenham, Lim., Tenby Street, Birmingham, at the Midland Carnation Show, Botanical Gardens, Edgbaston, Birmingham.

EXHIBITIONS AND MEETINGS.

Midland Carnation Show.

The twentieth exhibition held under the auspices of the Midland Carnation and Picotee Society took place on August 4 and 5 in the Botanical Gardens, Edgbaston. The opening day was fine, and the gardens proved as great an attraction as the show. The recent introduction of numerous exotic animals, birds, and reptiles, in suitable homes was a further attraction.

The carnations were not up to best Midland form, except in a few instances, but the competition was keen in nearly every class. In addition to the carnations there were a few classes for sweet peas, and some interesting non-competitive exhibits. With the exception of Mr. Mathias, the southern growers of carnations were conspicuous by their absence.

DRESSED FLOWERS ON STANDS.

The best set of twelve selfs came from Mr. A. R. Brown, Wychall Lane, King's Norton, who had clean specimens of W. H. Parton, Ayesha, Mrs. Heward Green, Albion, Modesty, Theodore Galton, Solfaterre, Bonnie Dundee, Lyndsay, Elizabeth Schiffner, Alma, and Mulberry; Mr. Hayward Mathias, Medstead, Hants, came second, and Mr. W. Sydenham, Melbourne, third; six competitors. Mr. F. W. Goodfellow, Sutton Road, Walsall, led for six selfs with Sir Galahad, Miss Willmott, John Pope, Dinah, Daffodil, and Cardinal; Mr. G. D. Ford, Oxford Road, Acock's Green, second; and Mr. C. Alcock, Blundell Sands, third; nine entries.

Six competed in the class for a dozen yellow-ground picotees, and chief honours fell to Mr. Hayward Mathias for Gloria, Her Majesty, John Ruskin, Una, Exquisite, Deux, South Western, Mrs. Heriot, Togo, Astrophel, Thisbe, and A. Brown, all very clean, but rather small; Mr. A. W. Jones second; Mr. Wm. Sydenham third; and Mr. C. F. Thurston, Penn Fields, Wolverhampton, fourth. Mr. F. W. Goodfellow scored among eight entrants for six yellow-ground picotees with J. Ruskin, Her Majesty, Santa Claus, Togo, Exquisite, and Mrs. W. Heriot; Mr. G. D. Ford second; Mr. Harry Skeels third, and Mr. E. J. Price, Elm Road, Bourneville, fourth.

The class for a dozen fancy carnations is always an attractive one; here there were seven competitors, and first place was won by Mr. Hayward Mathias with fine specimens of Mrs. Leo Hunter, High Lees, Lord Steyne, Rhea, Linkman, Hidalgo, Hecla, Sam Weller, Father O'Flynn, Devonian, Orlando, and Mrs. Thurstan; Mr. A. W. Jones second; Mr. A. R. Brown third; and Mr. C. H. Herbert fourth. Mr. Goodfellow led for six fancies with splendid blooms of Lord Steyne, King Solomon, Rony Buchanan, Sam Weller, Linkman, and Jupiter; Mr. C. Alcock second; Mr. G. D. Ford third; and Mr. Harry Skeels fourth.

The best stand of a dozen white-ground picotees was adjudged to be the one set up by Mr. C. F. Thurstan, whose varieties were Amy Robsart, Fortrose, W. E. Dickson, White Heather, Thos. William, Excelsior, Brunette, Carrie Goodfellow, Mrs. Hoskier, Fair Maiden, Myra, and Queen of Spain; Mr. C. H. Herbert second; Mr. A. R. Brown third; and Mr. W. Sydenham fourth; six competitors. The Rev. C. A. Gottwaltz, Hadsor Presbytery, Droitwich, led for six white-ground fancies with Lady Sybil, Beatrice, Mrs. C. H. Herbert, Thos. William, Maud Brown, and Elaine; Mr. F. W. Goodfellow, second; Mr. G. D. Ford, third; Mr. W. H. Twist, fourth; six entries.

Mr. Hayward Mathias, Medstead, Hants, scored for a dozen flake and bizarre carnations with clean fair-sized flowers of Sarah Payne, Martin Rowan, G. Melville, W. Skirving, Free Trade, Merton, S. Rudd, R. Houlgrave, Sportsman, and H. Curzon; Mr. C. H. Herbert, second; Mr. C. F. Thurstan, third; and Mr. A. R. Brown, fourth. For six flakes and bizarres Mr. G. D. Ford led, followed in order by Mr. C. J. White, Charlemont Road, Walsall; and Mr. H. Boyes, Walsingham Street, Walsall.

FLOWERS IN VASES.

Mr. Parton scored for twelve single flowers, in vases, with Daffodil, Hildegarde, Lady Hermione, Bridegroom, and W. H. Parton as his best flowers; Mr. C. Alcock second with smaller and bright flowers; Mr. A. R. Brown, third; and Mr. Hayward Mathias fourth. The best six selfs, in vases, were shown by Mr. A. Gordon Russell, Wheatley, Oxford, who showed Sir Galahad, Agnes Sorrel, Cardinal, Mrs. Flight, Enid, and Daffodil; Mr. W. H. Twist, Vicarage Road, Yardley, second; Mr. J. D. Williams, third; and Mr. J. Hancock, fourth.

For a dozen blooms, in vases, yellow grounds or fancies, Mr. W. H. Parton was again to the front, and here he won with good examples of Liberté, Voltaire, Lord Steyne, Merlin, Sam Weller, Mrs. Francis Wellesley, Pasquin, Rony Buchanan, Erl King, Mandarin, R. A. Rowberry, and Westfield Seedling; Mr. A. W. Jones, second; Mr. A. R. Brown, third; and Mr. C. H. Herbert, Hazelwood Road, Acock's Green, fourth; eight competitors. For six single blooms, staged in vases, Mr. J. D. Williams, Corbett Street, Smethwick, led, with Rony Buchanan, Sam Weller, and Mrs. Thurstan as his best blooms; Mr. Joseph Hancock, Park Road, Bearwood, second; Mr. H. Skeel, Cecil Street, Walsall, third; and Mr. C. J. White, Charlemont Road, Walsall, fourth.

The class for a dozen triplets of carnations, set up in vases, was a good one, and there were eight competitors. First prize was won by Mr. W. H. Parton (gardener, Mr. Carpenter), Kingswood Grange, Hollywood, Birmingham, who on this occasion won his 250th prize for carnations. His first prize set here consisted of Sam Weller, Mandarin, Lord Steyne, Merlin, Voltaire, Sappho, Sir Galahad, Rony Buchanan, R. A. Rowberry, W. H. Parton, King Solomon, and Bridegroom; second prize fell to Mr. A. W. Jones, Albert Road, Stechford, who had his flowers set up splendidly with "grass" and buds; Mr. A. R. Brown, King's Norton, third; and Mr. C. Alcock, Blundellsands, fourth.

MR. W. H. PARTON'S FIRST PRIZE TWELVE VASES OF CARNATIONS
At the Midland Carnation Show, Botanical Gardens, Edgbaston, Birmingham.

Mr. G. D. Ford, Oxford Road, Acock's Green, scored a first for six trebles, in vases, with a good set of Linkman, Liberté, W. H. Parton, Crystal, Berenice, and King Solomon; Mr. J. D. Williams second; Mr. Joseph Hancock, third; and Mr. F. W. Goodfellow, fourth.

In the class for three flowers of one variety, in vases, Mr. A. Gordon Russell scored for a white or blush variety with Sir Galahad; and Mr. Parton for a rose or red self with lovely flowers of Mrs. Guy Sebright.

In the smaller amateurs' division Mr. J. B. Willetts, Yardley Fields Road, Yardley, led for six white-ground picotees in the amateurs' section, and was followed by Mr. E. Kenwright, Edith Road, Smethwick; and Mr. A. H. Birchley, Umberslade Road, Selly Oak. For six selfs Mr. A. H. Birchley was first, Mr. J. B. Willetts second, and Mr. T. Payne, Grantham Road, Smethwick, third. For six fancies or yellow-grounds, the prizes fell in order to Mr. J. B. Willetts, Mr. A. H. Birchley and Mr. H. J. Thornton, Maney, Sutton Coldfield. For six selfs, in vases, Mr. Birchley, Mr. Willetts, and Mr. T. Payne won the principal awards. For six fancies, similarly staged, the chief awards went to Mr. Birchley, Mr. Willetts, and Mr. Francis Woodward, Elm Road, Bourneville, in the order mentioned.

SINGLE BLOOM CLASSES.

In the single bloom classes the best scarlet bizarre was Robt. Houlgrave; the best crimson bizarre Master Fred; the best pink or purple bizarre Wm. Skirving; the best scarlet flake Sportsman; the best rose flake Meteor; the best purple flake Gordon Lewis; the best heavy red-edge picotee Beatie; the best light red-edge Mrs. Gorton; the best heavy purple-edge Mrs. G. Chaundy; the best light purple-edge Myra; the best heavy rose-edge Mrs. Twist; the best heavy scarlet-edge Mrs. Sharp; the best light red-edge Fortrose; the best light-edge, yellow-ground picotee John Ruskin; the best heavy-edge yellow-ground Santa Claus; the best yellow-ground fancy Lord Steyne; the best fancy other than yellow-ground, Nizam; the best white self Mrs. Eric Hambro; the best blush self Georgina; the best yellow self Ann Hathaway; the best buff self Mrs. E. Schiffner; the best rose or pink self Mrs. Howard Green; the best scarlet self Cardinal; the best crimson self Cain; the best purple self Royal Purple; and the best self of any other colour was Irene, of heliotrope shade.

In some of these classes the competition was very keen, and the leading prizewinners were those who secured awards in other classes.

SWEET PEAS.

There were five competitors in the class for a table decoration of sweet peas, the prizes offered by Messrs. R. Sydenham, Lim. The premier award fell to Mr. A. T. Blair, Bedford Street, Barford, Stoke-on-Trent, who had a pretty design in Constance Oliver and Countess Spencer, with gypsophila and selaginella trails; Mr. E. Deakin, Hay Hall, Hay Mills, second; and Mr. J. Sceaney, Nursery Road, Harborne, third, with a rather heavy arrangement.

The Messrs. Sydenham also offered prizes for a dozen bunches of sweet peas, and here Mr. Thos. Jones, Bryn Pen-y-lan, Ruabon, was an easy first with grand bunches of Mrs. Routzahn, Mrs. Chas. Mander, Asta Ohn, Clara Curtis, Miriam Beaver, Etta Dyke, Sunproof Crimson, Helen Lewis, Evelyn Hemus, John Ingman, Mrs. Hardcastle Sykes, and Othello Spencer; Mr. J. Haycocks, Gyfelia, Wrexham, was second; and Mr. Deakin, Hay Mills, third. For six bunches of sweet peas Mr. E. Tilt, Sycamore Road, New Oscott, was first with Asta Ohn, Helen Lewis, Evelyn Hemus, George Herbert, Countess Spencer, and Black Knight Spencer; Mr. J. Sceaney, Harborne, second; and Mr. S. Smith, Maple Road, Bourneville, third.

NON-COMPETITIVE.

Messrs. Robt. Sydenham, Lim., Tenby Street, Birmingham, had a delightful table of sweet peas, prettily disposed in rustic table ornaments, the whole making up a most elegant display. The varieties finely represented were Apple Blossom Spencer, Maggie Stark, Constance Oliver, Helen Pierce, Sunproof Crimson, Mrs. Routzahn, Countess Spencer, Evelyn Hemus, Clara Curtis, John Ingman, Etta Dyke, and Tom Bolton; it was one of the best displays the Tenby Street firm has set up. (Silver-gilt medal.) Although their flowers were rather smaller than those set up earlier in the season, Messrs. Jarman and Co., Chard, had a very pretty group of the charming centaureas, for which they are already famous. (Silver medal.)

Messrs. W. H. Simpson and Sons, Birmingham, filled the front of the orchestra platform with a display of sweet peas, and they made up a very pleasing exhibit with Henry Eckford, Helen Lewis, Countess Spencer, Evelyn Hemus, Dazzler, Constance Oliver, St. George, Edna Unwin, Elsie Herbert, and Frank Dolby, etc., set up in fine representative bunches and stands (silver-gilt medal). Mr. Welham, Danesford Nurseries, Bridgend, showed his new double cream-yellow annual chrysanthemum, named A. Welham. Mr. J. J. W. Thackery, Guernsey, sent over a few gladioli and very poor sweet peas. From the Lapworth Nurseries, Hockley Heath, came a collection of hardy flowers that was not at all well set-up. (Bronze medal.)

PREMIER FLOWERS.

Dressed Blooms.—Bizarre carnation—Master Fred, from Mr. Hayward Mathias; flake carnation—Gordon Lewis, from Mr. Hayward Mathias; heavy-edged white-ground picotee—Mrs. Twist, from Mr. W. H. Twist; light or wire-edged white-ground picotee—Mrs. Gorton, from Mr. F. W. Goodfellow; heavy-edged yellow-ground picotee—Santa Claus, from Mr. C. H. Herbert; light-edged yellow-ground picotee—John Ruskin, from Mr. C. Wall; yellow-ground fancy carnation—Highland Lass, from Mr. Hayward Mathias; self carnation—W. H. Parton, from Mr. A. R. Brown.

Undressed Blooms.—Self carnation—W. H. Parton, from Mr. A. H. Birchley; fancy carnation—Mandarin, from Mr. C. Wall; yellow-ground picotee—Agnes, from Mr. A. W. Jones.

First-Class Certificates were awarded to: Dark self carnation—Harry Parton, from Mr. W. H. Parton; fancy carnation, Hecla, from Mr. Hayward Mathias; yellow-ground picotee—Gloria, from Mr. Hayward Mathias; and rose flake carnation—Peter Pan, from Mr. C. H. Herbert.

MEDALS.

In the leading class the point medals were won by Mr. Hayward Mathias, 111 points; and Mr. A. R. Brown, 95 points. In the six-bloom classes, Mr. G. D. Ford secured the silver medal with 72 points, and Mr. F. W. Goodfellow the bronze medal with 69 points. In the single-bloom classes, Mr. C. H. Herbert won the silver medal with 37 points, and in the amateurs' section Mr. A. H. Birchley won the bronze medal with 73 points.

Bishop's Waltham, JULY 27.

The thirty-sixth annual show, held in the Palace Ruins, Bishop's Waltham, was much the best of the series. Originally this society was started for the benefit of cottagers, to whom it has given much encouragement, but latterly it has taken floral decorations in hand, and can now boast of quite one of the finest displays in the country, especially table decorations. Fruit and vegetables, too, receive much encouragement, and a strong committee, with Mr. E. Molyneux as their leader, arrange the details satisfactorily.

FLORAL DECORATIONS.

In an open class for the best decorated dinner table, 6ft. by 3ft., orchids excluded,

SANDY (BEDFORDSHIRE).
42nd ANNUAL SHOW, AUGUST 25, 1910.
PLANTS, FLOWERS, FRUIT, VEGETABLES, Etc.
DOGS, POULTRY, PIGEONS, RABBITS, and CATS.
PRIZES VALUE £1,000.
Ten Stove and Greenhouse Plants, £8, £7.
Groups, £10, £9, £8.
Entries close August 18.
Schedules and particulars of W. GREEN,
Secretary, Sandy.

SHEFFIELD CHRYSANTHEMUM
SOCIETY'S SHOWS
Will be held in the CORN EXCHANGE,
FRIDAY and SATURDAY, September 16 and 17;
FRIDAY and SATURDAY, November 11 and 12.
OVER £300 OFFERED IN PRIZES.
Schedules and all particulars on application from
C. COOK, Secretary, City Road, Sheffield.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

£5, £3, and £2 are offered as prizes, and there were seventeen competitors. After a close scrutiny, the three lady judges awarded the premier position to Miss G. Saunders, Crumpherne, Fareham, for an almost faultless arrangement of Fair Maid carnations and lily of the valley, tastefully associated with suitable greenery. Mrs. E. C. Penn, Droxford, Hants, was a close second with a very similar arrangement of the same flowers, but with just a little trifle too much greenery in the centre. Mrs. Colston Hall, Virginia Lodge, Warminster, was third with single and small yellow roses, deftly arranged in a rather too tall rustic stand in the centre. An extra prize was awarded to Mr. F. G. Bealing, Bassett, Southampton, for a table of Lyon Rose. For a table of wild flowers Miss Elsie Collins, Swanmore Park Lodge, was distinctly ahead with scarlet poppies and camomile; Mrs. W. Parvin, Durley, second.

For a table decoration, confined to members of the society only, Miss D. Gunner, Ridgemede, Bishop's Waltham, was first with nemesias, arranged effectively. Miss M. Luttrell, West Leigh, Botley, second. For the best vase or epergne of flowers Mrs. G. Ellwood was first with pink and white larkspurs; Mrs. Penn second with carnations. Eleven competed in the class for a basket of flowers, the best being a pretty combination of sweet sultans, etc., by Mrs. Colston Hall; Mrs. E. Walters, Fareham House, Fareham, second; and the Locksheath Nursery Company third.

For a basket of wild flowers Mrs. J. L. Sell, Kempton Villa, Luton, was first with a delightful arrangement; Mrs. Colston Hall a close second. Nineteen competed in the class for the best arranged vase of sweet peas, and Mrs. Colston Hall was distinctly first with an effective blending of colours. Mrs. F. G. Bealing second. For a bowl of roses Mrs. Arthur Bide, Alma Nurseries, Farnham, was first with a charming mass of Lyon Rose; Miss V. Crabbe, Aldershot, second with General McArthur.

FLOWERS.

Roses were numerously shown. For six bunches, distinct, Mr. G. Ellwood, gardener to W. H. Myers, Esq., Swanmore Park, Bishop's Waltham, was easily first, as he was also with six bunches rambling varieties, in which Lady Gay and Hiawatha figured prominently. Mr. W. Cooper, gardener to Miss Gladstone, Hampton Hill, Swanmore, was second in the latter class with a remarkably good exhibit. Mr. Cooper won the premier position for six bunches of carnations. Mr. B. Peppler, Vernon Hill, Bishop's Waltham, was first for six bunches annuals.

For eighteen bunches of flowers grown out of doors, Mr. H. Child, gardener to Mrs. C. Macrae, Meonstoke House, Bishop's Waltham, was first with a thoroughly representative exhibit of seasonable subjects.

Mr. Ellwood won Messrs. Ladham's premier prize for twelve bunches with quite an ideal set in a stiff competition. Sweet peas were numerous. Mr. E. J. J. Edwards, Portland Place, Bishop's Waltham, won the first place for twelve bunches, distinct, and Mr. Cooper won Mr. Eckford's first prize for twelve bunches, and was first for Messrs. J. Carter and Co.'s prizes, as well as Messrs. Sydenham's for six bunches. Miss Bashford, Soberton Towers, was first in Mr. C. Breadmore's class for six bunches with an attractive display.

FRUIT AND VEGETABLES.

For six dishes, distinct, Mr. Ellwood was first with Muscat of Alexandria and Madresfield Court grapes, a melon, peaches, and nectarines as his best dishes.

For four varieties Mr. Fursey, gardener to H. W. Trinder, Esq., Northbrook House, Bishop's Waltham, was first with good produce. For four varieties of outdoor growth Mr. Barnes, gardener to T. C. Wilson, Esq., The Thickets, Bishop's Waltham, won easily.

Vegetables were numerous and good. Mr. Ellwood won Messrs. Toogood's chief prize for eight dishes; Messrs. Sutton's for six dishes; as well as Messrs. Webb's. Mr. Cooper won Messrs. J. Carter and Co.'s prize for six dishes. Mr. Ellwood had the best tomatoes in a special class.

Southampton Carnation Show.

JULY 27.

The twelfth annual show was held on the pier, and if not so large as some previous ones, it provided a very good display.

DRESSED FLOWERS.

For twelve flakes and bizarres, distinct, three entered, the best coming from Mr. J. Douglas, Edenside, Great Bookham, Surrey, who staged the following in his premier exhibit: Gordon Lewis, Recorder, Rowena, Torchlight, Master Fred, Peter Pan, George Melville, Sarah Payne, Sportsman, J. H. Hextall, and Arthur. Mr. A. R. Brown, Kings Norton, second. For six, distinct, Mr. R. Ransom, gardener to C. A. Linzee, Esq., Brandean Lodge, Alresford, was the only exhibitor, showing good blooms of Sportsman, Master Fred, Mr. T. Lord, and George Melville. In the class for twelve distinct, other than flakes or bizarres, Mr. Douglas was the best of four entrants, staging Sam Weller, Daffodil, Linkman, Hercules, Hidalgo, King Solomon, Lord Steyne, Queen Eleanor, and Dido; Mr. Hayward Mathias, Medstead, Hants, second. Mr. Linzee won in the class for six blooms.

For twelve picotees, distinct, four staged, and Mr. Hayward Mathias led with good blooms of Gloria, Constance, Mr. W. Heriot, Libra, Togo Lady Gascoigne, Exquisite, and Her Majesty; Mr. J. Douglas had here to be content with second place. For six blooms in a similar section Mr. J. J. Keen, 37, Avenue Road, Southampton, was the winner among three contestants, Golden Pippin, John Ruskin, Libra, Her Majesty, and Exquisite being the best flowers; Mr. Linzee second. The premier bizarre or flake was R. Houlgrave, shown by Mr. Linzee, Mr. H. Mathias winning a like distinction for a self with Irma, and for a fancy with Hecla. The best yellow ground picotee was Onward, shown by Mr. J. Douglas.

UNDRESSED, OR BORDER SECTION.

For a display of carnations and picotees arranged with their own foliage in a space 5ft. by 2½ft., three competed, and Mr. H. Lakeman, Thornton Heath, Surrey, was first with a good display of such sorts as Solomon Gill, Santa Claus, Liberté, Togo, Daffodil, and Pathfinder; Mr. E. C. Goble, nurseryman, Ryde, second. In a smaller class Mr. J. Fairlie, Springfield Park, Acton, was first; Mr. J. H. Linnington, Southlands, Newport, Isle of Wight, second. Mr. Linzee had the winning exhibit in a class for twenty blooms, carnations or picotees, arranged for effect in a vase, Mr. J. Fairlie coming second. For six blooms of specified colours there was a fair competition, and Mr. Douglas, with Mrs. T. E. Henwood, was first for any white variety, and Mr. H. Mathias for a pink sort. Mr. A. R. Brown had Mrs. Pope as the best rose or salmon self, and, with Cardinal, Mr. Douglas led in the scarlet class, as also he did with Daffodil for a yellow self, with Mrs. Griffiths Jones as a buff, and Agnes Sorrel as a dark self.

In the fancy ground picotee class Mr. Douglas also won for six blooms with Liberté, Mr. H. Mathias occupying a like position for yellow grounds. Mr. Linzee won many of the premier awards in the smaller classes in similar sections.

Mr. J. H. Linnington, Southlands, Newport, won the silver cup offered by Mr. H. Lakeman, Queensberry Nurseries, Thornton Heath, Surrey, for twelve carnations and picotees, undressed blooms. Mr. Usher, gardener to Sir Randolph Baker, M.P., Ranston, Blandford, won for three blooms each of three American varieties, staged in vases, with a desirable exhibit.

For a dinner table arranged with carnations or picotees there were seven exhibitors, and Mrs. Ernest Ladhams, Wordsworth Road, Shirley, Southampton, was distinctly first with an effective display. Mr. John H. Cape, Ferndown, Wimborne, had the best bouquet, and Mrs. F. G. Bealing, Bassett, Southampton, the best arranged epergne or stand.

SWEET PEAS.

For Messrs. R. Sydenham's prize for twelve varieties there were three competitors, and Mr. F. Green, The Polygon, Southampton, was first with desirable specimens of Countess Spencer, Clara Curtis, Dorothy Eckford, Frank Dolby, and King Edward VII. Five competed for Messrs. Toogood's prizes for nine bunches, distinct, and here Mr. Usher won the premier place with a delightful display of Etta Dyke, Elsie Herbert, Mrs. A. Ireland, John Ingman, Audrey Crier, and Mrs. Routzahn. Mr. C. Wadey, Broadstone, Dorset, won Mr. H. Eckford's premier prize for nine varieties with a worthy exhibit. Miss N. Snellgrove, 10, Oxford Road, Southampton, had the most pleasingly decorated table of sweet peas.

Solihull.

The Solihull and District Horticultural Society held its sixth annual exhibition, as usual, in the richly-wooded park of Malvern Hall (by kind permission of D. Troman, Esq.), on August 1 and 2. The show proved to be a great success, being a considerable advance on its predecessors.

Non-competitive exhibits were a specially fine feature, and Messrs. Gunn and Sons, Olton, eclipsed themselves with an attractive contribution, about 40ft. in length, of grouplets of roses in splendid condition, the outstanding feature being a large group of the Lyon Rose, and amongst the rest of the varieties there were Hugh Dickson, W. E. Lippiatt (a new hybrid tea, rich crimson), Mrs. Joseph Hill, Caroline Testout, Richmond, Liberty, Madame Ravary, White Killarney, Pharisaer, Frau Karl Druschki, and Madame Melanie Soupert in fine condition. Surmounting the foregoing array was a series of wire arches, extending from the front to the back of the staging, and over which were trained shoots of climbing roses; while an arrangement of corresponding pillared plants at the back served to complete one of the most elegant floral creations. A gold medal was awarded, and a similar honour was accorded the firm for a charming rockery and pond, the latter daintily furnished with nymphæas; and a very fine display of phloxes and gladioli.

A gold medal was worthily awarded Messrs. Hewitt and Co., Solihull, for a capital arrangement of herbaceous flowers, carnations, roses, sweet peas, and a pond of suitable water plants and nymphæas. Mr. H. N. Ellison, West Bromwich, was conspicuous with one of his popular arrangements of ferns; a silver-gilt medal was awarded. Messrs. Neale and Sons, Solihull, were awarded a silver medal for a good and representative arrangement of hardy border flowers, and a bronze medal to Mr. T. Eborall for begonias. A first-class cultural certificate was accorded the Manor Fruit Farm Company, Knowle, for grapes, bottled fruits, etc.

COMPETITIVE CLASSES.

In the class for a group of plants arranged for effect, the show was shorn of a portion of its attractions by the unavoidable absence, almost at the last moment, of a notable entrant. Mr. W. Vause, Leamington, was the only exhibitor, and annexed the premier prize with a bold and tasteful arrangement of richly-coloured codiæums, ixoras, liliums, a fine palm, and arundinarias, etc.

Mr. H. F. Foster, gardener to Mr. F. E. Muntz, Umberslade Hall, set up an effective arrangement of codiæums (crotons), caladiums, Lilium speciosum album and rubrum, gloxinias, and pots of Selaginella uncinata, and other dainty subjects, and secured first prize in the amateurs' section, the second honours falling to Mr. T. Warner, gardener to Mrs. Upton, Solihull. The winner of the premier prize in this class, in addition, received a silver challenge cup, presented by Mr. Alfred Hughes, Solihull. There was a keen competition in the class for six stove or greenhouse plants. Mr. W. Vause, Mr. John Warner, gardener to Mrs. Wado, Sandal House, and Mr. T. Warner, won in their order named. Exotic ferns were finely staged by Mr. T. Warner, and Mr. A. Hopkins, gardener to Mrs. W. G. Grenville, Solihull. For three specimens of coleus, Mr. Hopkins won with well-grown and richly-coloured plants, with Mr. T. Warner a close second. Gloxinias were very well staged by Mr. J. Burbidge, the only entrant.

For three fuchsias Mr. John Warner was to the fore with profusely-flowered specimens; Mr. T. Warner second. There were several other exhibits, such as zonale pelargoniums and begonias of more or less merit.

Fruit, though not a leading feature at Solihull, was creditably shown, the chief exponents being Mr. F. E. Muntz, Mrs. Upton, and Mr. Grenville.

Table decorations are invariably well executed at Solihull, but, as a whole, never better than on the recent occasion. There were twelve entrants in the two classes. In the class, open only to ladies residing within six miles of the Public Hall, Solihull, sweet peas allowed, Mrs. Maurrison, Solihull, scored with an elegant arrangement of blush-pink sweet peas; Mrs. Vernon, Howson, Solihull, second with a light and elegant combination of salmon-pink perpetual carnations and white Bridal Wreath, and trails of selaginella, delicately strewn over the light blue muslin, and had it not been for the presence of the latter, which did not harmonise pleasingly with the carnations, the awards might have been reversed. In the class where sweet peas were not admissable, there was a keen contest, and Miss P. M. Pelton was the envied winner with pink carnations and foliage accompaniments, tastefully arranged; Mrs. D. Frowmar was a close second with purplish-blue campanulas (not a very suitable subject by artificial light), and francoa. Miss Irene Upton set up a brilliant arrangement of Alonsoa incisifolia, but its stiff scarlet spikelets presented a comparatively formal aspect.

Hand bouquets, sprays, and button-holes were also an interesting feature. For a hand bouquet, Mr. R. Jones, gardener to Dr. Bernays, and Mr. W. Hopkins, gardener to Mr. W. G. Grenville, were the respective winners; whilst those positions were reversed in the ladies' spray class. For a gentleman's buttonhole Messrs. W. Jones, T. Warner, and W. Hopkins followed in the order named. Roses and cactus dahlias were sparsely shown.

Sweet peas were a striking feature. In the class for twelve varieties, set up in a space not to exceed 6ft. by 3ft., first prize and the National Sweet Pea Society's Silver Medal was won by Mr. S. Thompson, gardener to Mrs. Gladstone, Manor Cottage, Eastcott. Mr. F. E. Muntz, second; and Mr. A. W. Hulse, The Dingle, Solihull, third. There were twelve entrants. For a collection of herbaceous flowers (to occupy a space 6ft. by 3ft.), Mrs. S. J. Page, Hall Green, won with a very nice arrangement; Mr. E. Hughes, Shrub Bank, second, and Mrs. Wade, third. The amateurs' classes were well sustained.

Vegetables always form a striking feature here, both in the amateurs' and cottagers' classes. For Messrs. Sutton and Sons' prizes Mr. F. E. Muntz was first for six distinct kinds.

The vegetables from amateurs and cottagers were extremely well represented, and better long-pod beans, peas, and potatoes could not well be desired. Prizes were offered for window-boxes cared for by Solihull day school children, and, as a whole, they were highly creditable. As usual, sports and fireworks and music were the attendant amusements.

Chepstow Horticultural Society.

This society's twelfth annual show was held on August 2, in conjunction with that of the Chepstow Agricultural Society, in Piercefield Park. Each year since its commencement the society has made favourable progress, at any rate, in so far as its exhibits are concerned, but unfortunately on this occasion the weather was unfavourable, and the attendance less than has been the case at most previous shows.

Of three groups shown, that arranged by Mr. Pearce, gardener to H. Oakley, Esq., was decidedly the best, and not only were the plants used well grown, and suitable in other respects, but they were very skilfully arranged. As a background palms, humeas, campanulas, and Lilium speciosum were chiefly employed, while Papyrus antiquorum, Kalanchoe flammea, Verbena Miss Willmott, achimenes, gloxinias, celosias, crotons, dracænas, palms, etc., edged with fittonias and ferns, completed the group, altogether making a most graceful and effective exhibit. Mr. J. Downie, gardener to W. R. Lysaght, Esq., was placed second with a group composed of well-grown subjects which, unfortunately, were too closely arranged; the third place was taken by Mr. Probert, gardener to H. Clay, Esq., who also staged a good group.

Six tuberous begonias made a good class, the best set being brought by Mr. Probert, who was closely followed by Mr. Phillips, nurseryman, Chepstow, Mr. H. Hare being third. Mr. Cooper, gardener to Sir W. H. Marling, Sedbury Park, had leading honours for six ferns, and staged medium-sized fresh plants of Lomaria gibba, Platycerium alcicorne, Asplenium nidus, Adiantum cuneatum, A. formosum, and Osmunda palustris; Mr. Baker, gardener to Dr. Cropper, Mount Ballan, was placed second. Mr. Canning, gardener to W. R. Price, Esq., was the only exhibitor of six hardy ferns, and deservedly secured the first prize. There were classes for fuschias and pelargoniums which did not attract keen competition.

In the cut flower section, roses, Mr. Baker took the lead for twelve roses with a good set of unnamed varieties; Mr. W. H. Miles, gardener to C. Bathurst, Esq., Sydney Park, second; and Mr. Reese third.

Carnations or picotees, border varieties, twelve blooms, in not less than eight varieties, were splendidly staged, but in no case were the varieties named. Mr. Miles took the lead with large, deep, fresh blooms, Mr. Cooper being a close second, and the Rev. N. S. Barthropp, with fresh, but smaller blooms, third. In a class for six vases of American tree carnations, distinct, and undressed, Mr. Miles was the only exhibitor. Mr. Cooper led for six blooms of any variety, and was followed by Mr. Miles, with the Rev. N. S. Barthropp third. For the best blossom staged in either class, Mr. Miles scored with a fine bloom of an unnamed variety. There were five entries in a class for twelve cactus dahlias, Mr. W. J. Gould taking chief honours with a fine set of unnamed varieties; Mr. G. C. Francis, Welsh Street, Chepstow, being a good second; and Mr. Probert third. Mr. G. C. Francis was first with twelve distinct varieties of sweet peas, twelve spikes of each, and staged Paradise Carmine, Zero, Holdfast Belle, Helen Herbert, Constance Oliver, Paradise Red Flake, Evelyn Hemus, etc., in fine condition; Mr. Canning, who had fine blooms, somewhat badly staged, was placed second, and Mr. Baker third.

Herbaceous flowers in twelve kinds brought G. C. Francis, Esq., again to the front, Mr. Cooper being second, and Mr. Baker third. For six bunches of pentstemons, in three distinct varieties, there were three good lots staged, the best being from Mr. Canning, who was followed by Mr. Probert.

Fruit was staged in good quality, though there were but a few classes devoted to it. The class for three bunches brought three competitors, Mr. Lysaght being placed first with finely-finished, medium-sized bunches of Black Hamburgh; Mr. Cooper second with larger, but not quite so well-finished bunches of the same variety; and Mr. Downie third with one bunch of each of Madresfield Court, Muscat of Alexandria, and Black Hamburgh. Mr. Downie led with peaches, closely followed by Mr. Baker; and Mr. Cooper scored with nectarines, Mr. Baker being second, and Mr. Pearce third. For a collection of eight distinct kinds of fruits, Mr. Downie took the lead with good samples of Black Hamburgh and Foster's Seedling grapes, a melon, peaches, nectarines, figs, apricots, and plums; Mr. Baker was placed second, his best dishes being black grapes, peaches, and nectarines. A grand, but unripe melon, was also staged by Mr. Baker, as one of his dishes. The best collection of hardy fruits was staged by Mr. Probert, Mr. Cooper being second, and Mr. Baker third.

There was keen competition in the twenty classes devoted to vegetables, and the quality of the exhibits was of a high order of merit, but in very few cases were they observed to be named, a state of things that detracted considerably from the interest that would otherwise have been taken in them.

Seven contested in a class for table decorations, and of these Miss Mullens, of Chepstow, secured the coveted position with a tastefully-finished table, in which rose Dorothy Perkins was chiefly made use of. Miss Cropper was placed second, and employed scarlet salvias, montbretias, and Gloriosa superba, and Miss D. Price third. For the best arrangement of cut flowers, not less than six varieties, Mrs. Stanton was first with a charming exhibit, in which The Lyon rose took the most conspicuous part.

Llanishen Horticultural Society.

AUGUST 1.

This society's twelfth annual show was held as usual in the Vicarage Field, where three spacious tents were filled with the exhibits. The show was generally considered to be the best the society has held, the classes collectively were well filled with meritorious subjects, fruit being, perhaps, the weakest division. The exhibits, with comparatively few exceptions, were unnamed, and the exhibition thereby lost much of its educational value. This could be easily rectified in future, with the result that the exhibits would be far more interesting and instructive.

GROUPS AND PLANTS.

There were four circular groups arranged in spaces of about fifty square feet, and the chief of these came from Mr. Wall, gardener to J. L. Morgan, Esq., Penarth, who had bright, graceful, and well-grown plants, the most conspicuous of which were crotons, palms, ferns, Lilium speciosum, Clerodendron fallax, and schizanthus, edged with Panicum variegatum, and Caladium argyrites, the crowning plants being a somewhat rigid Phœnix rupicola. Mr. Huxtable, gardener to J. H. Mullens, Esq., Llanishen, was placed second, and J. E. Turner, Esq., third.

For six specimen ferns, and ornamental-leaved plants, Mr. R. Matthews, gardener to W. H. Cullen, Esq., was placed first with good plants of Adiantum cuneatum, A. formosum, Pteris argyræa, Kentia Fosteriana, Latania borbonica, and Phœnix rupicola; Mr. Huxtable was a good second. For three fuchsias, Mr. G. Nurse, Cardiff, was placed first with tall, well-flowered plants of unnamed varieties, and Mr. C. Clarke, gardener to G. Robertson, Esq., second, with small plants. A dozen tuberous-rooted begonias made a splendid class, as is always the case at Llanishen, the leading exhibitor being Mr.

R. Scoble, who staged large, grandly-flowered plants. Mr. Huxtable was a good second, and Mr. Nurse third. Only two exhibitors staged in the class for six gloxinias, and of these Mr. V. Welch, gardener to the Right Hon. Bishop Hedley, was first with beautifully-flowered plants, and Mr. C. Clarke second.

CUT FLOWERS.

There were four exhibitors of twelve roses, and no one staged exceptionally fine blooms: Mr. H. Weaver, gardener to H. Wood Darey, Esq., took the lead, closely followed by Mr. R. Fisher, gardener to W. North Lewis, Esq., and Mr. R. T. Went. For six carnations or picotees, T. W. Thomas, Esq., was placed first with H. D. Corey, Lord Richness, Lulu, Miss L. Davis, Paquita, etc.; Mr. Went second, and A. W. Morris, Esq., third. For twelve blooms of cactus dahlias, in not less than six varieties, there were six competitors, the chief one being Mr. R. T. Went. Mr. Wall was a close second, and Mr. Boulton, gardener to T. Croisdale, Esq., third. Twelve pansies or violas made a fine class, in which nine competitors took a part. Here Miss Dorothy P. Lewis took leading honours, followed by Mr. Boulton, gardener to T. Croisdale, Esq., and Mr. Scoble. With twelve asters, Mr. Boulton led, and Mr. G. Nurse second, and for twelve bunches of stocks Mr. Went was the only exhibitor. In a class for twelve bunches of perennials, distinct varieties, Mr. Went, as he did at Cardiff, took a decided lead, and staged Campanula pyramidalis, Gladiolus gandavensis, G. Brenchleyensis, Gaillardia grandiflora, Chrysanthemum Robinsoni, Lythrum Rosy Queen, Pentstemon Sutton's Hybrids, Coreopsis grandiflora, Veronica spicata, Helenium pumilum, and Lilium Melpomene: Mr. Nurse was placed second. For sweet peas, nine vases, distinct varieties, twenty stems of each, Mr. E. J. Taylor, gardener to J. E. A. Gibbs, Esq., led with a fine set, comprising Mrs. H. Bell, The King, Countess Spencer, Nancy Perkins, Etta Dyke, May Gerhold, Evelyn Hemus, John Ingman, and Elsie Herbert; Mr. Gerhold, Penarth, was a close second, and staged fine examples of Ralph Crossling, May Gerhold, Clara Curtis, Elsie Herbert, Mrs. C. Foster, Etta Dyke, etc. For six roses, A. W. Morris, Esq., was an easy first, and staged capital blooms of Lady Ashtown, Victor Hugo, Mdme. A. Chatenay, Gloire de Dijon, and Helen Keller; Mr. W. C. Clarke second.

FRUIT.

For grapes, two bunches, any variety, J. E. Turner, Esq., was first with fair examples of Black Hamburgh; Mr. A. Kinghorn, second, with the same variety. Mr. Huxtable was first and Mr. Weaver second for a scarlet-fleshed melon, and Mr. Huxtable and Mr. V. Welch were in the same positions for a white or green-fleshed variety. Peaches were well shown by Mr. Turner and Mr. Wall, who took first and second prizes in the order named. Mr. Roland Thomas was first, and Mr. Huxtable second for a dish of plums; Mr. Wall first, and Mr. Huxtable second for dessert apples; and Mr. Wall and Mr. Went were in similar positions for culinary apples. Raspberries were best staged by Mr. Wall, black currants by Mr. A. Kinghorn, red currants by Mr. Matthews, and gooseberries by Mr. Wall.

VEGETABLES.

These were staged in excellent condition and made one of the most interesting features. Mr. Went, Cardiff, secured the lead with a collection of six kinds, and staged tomatoes, potatoes, cauliflowers, onions, runner beans, and carrots in excellent condition. Other successful exhibitors of vegetables were Messrs. Boulton, Pitman, Gerhold, G. Robertson, Matthews, Wall, Richards, W. Buffy, Nicholls, Hancock, Chappel, and Taylor.

NON-COMPETITIVE.

Non-competitive exhibits were not numerous. The principal ones were an attractive collection of miscellaneous plants from Mr. G. Wells, seedsman, florist, etc., Llanishen, and a full display of herbaceous and other cut flowers from Messrs. H. and W. Evans, of Llanishen. In each case a gold medal was awarded. Mr. Pike, of Llanishen, also staged

WOOD GARDEN HUTS
for use as Tool-sheds, Workshops, Potting Sheds, Play-rooms, Cycle Houses, Motor-car Houses, etc., etc. Strongly built of selected materials by skilled workmen. Made in sections for easy erection and removal by local workmen. Painted and finished throughout in a superior manner.
Prices from £4 upwards. Carriage Paid.

carnation blooms in quantity, and of splendid quality. Messrs. Lewis and Sons, Cardiff and Penarth, had a large exhibit of horticultural sundries.

DECORATIONS.

Table decorations were much admired, and in many cases deservedly so. There were fourteen competitors, and of these Mr. F. Harvey took the lead with a table decorated chiefly with sweet sultan and Bridal Wreath. The second prize was taken by Mr. G. L. Lewis, who used yellow Iceland poppies, and yellow tropæolums, together with Gloriosa superba—a combination not agreeable to all tastes. Miss M. Morgan and Miss M. C. Lewis, who each used Mrs. F. W. Flight rose with considerable good taste, took equal third prizes.

Basingstoke, AUGUST 1.

The annual show was held in Golding's Park, and was not so numerously attended by exhibitors as in the past. The plant classes showed a distinct falling-off in point of numbers, but there was sufficient to make a creditable display in the four tents erected.

For a group of miscellaneous plants, arranged for effect, Mr. G. Wassell, gardener to W. H. McConnel, Esq., Baughurst, Basingstoke, was first with a bright, effective arrangement of palms, crotons, gloxinias, achimenes, liliums,and carnations, amongst which a very fine pure white dwarf form of Phlox Drummondi was used with effect. Mr. W. Green, gardener to S. E. Bates, Esq., Manydown Park, Basingstoke, was second, with a too formal arrangement of desirable plants.

Tuberous begonias were well shown, and Mr. F. H. Sweet, gardener to J. G. Holt, Esq., Kingsclere, was first for eight plants with double and single varieties, well flowered; Mr. W. E. Perris, gardener to Rev. A. H. Gay, Worting, second. Dr. Maples, Kingsclere, had the best six miscellaneous plants. Mr. Green had pyramidal-trained coleuses, richly coloured specimens, from 4ft. to 6ft. high, and secured a first prize. Mr. C. Wassell was first for four foliage plants, staging Kentia Belmoreana, Dracæna Lord Wolseley, and Maranta zebrina.

Sweet peas were numerous and good. For twelve bunches Mr. A. Childs, gardener to the Hon. Mrs. Baring, Cardover House, Alresford, was distinctly first with clean, large blooms of popular varieties; Mr. R. W. Dean, gardener to L. Simonds, Esq., Audley's Wood, second; six entries.

Gladiolus were well shown by Mr. F. H. Sweet. For twelve bunches of flowers, Mr. Childs was easily first with desirable subjects, all well staged. For twelve show dahlias Mr. Childs was first with shapely blooms of John Walker, Arthur Rawlings, and Henry Walton, etc. For twelve cactus dahlias Mr. Childs was again first with really good blooms of D. B. Crane, J. H. Jackson, Primrose, and Mrs. McMillan; Dr. Maples second. Mr. Sweet had the best three dozen carnations in twelve varieties.

Mr. Childs won for twelve roses with fairly good specimens, and Mr. W. Dean won for twelve bunches of hardy herbaceous flowers with huge sheaves of phloxes, monarda, sidalcea, and Helenium pumilum; Dr. Maples second.

For a collection of out-of-door flowers set up on a 6ft. run of tabling, Mr. R. W. Dean was easily first with roses, spiræas, sweet peas, and carnations effectively displayed. Dr. Maples had the best Black Hamburgh grapes, and Mr. W. Dean was first for any other black with Gros Maroc; and also for Foster's Seedling in the "any other white" class. Melons were numerous, Mr. W. Green winning for a green flesh with Sutton's Ringleader, a fine fruit. Mr. Dean had the best peaches—Gros Mignonne.

For Messrs. Sutton's prize for six dishes of vegetables, Mr. W. Green was easily first with good tomatoes, onions, potatoes, carrots, and cauliflowers. Mr. H. E. Wallis, gardener to Mrs. Trevor Goff, Sherfield Hall, won the premier award in the society's class for eight dishes of vegetables with desirable produce.

For a decorated table for six persons (orchids excluded), Miss N. Wadmore, Woodside, Basingstoke, was easily first with an effective arrangement of pink carnations and sweet peas, with suitable greenery; Miss N. S. Gosling, St. Aubyn's, Basingstoke, second with sweet peas. For a similar-sized table, but with orchids admitted, Mrs. E. Ladhams, Shirley, Southampton, was distinctly first with Odontoglossum crispum, Dendrobium phalænopsis, carnations, etc.; Miss M. Cannon, London Street, Basingstoke, second.

Broughty Ferry Horticultural Association.

The exhibition and sweet pea conference held by this association on August 3 was a great success. There was a good display, and the conference was opened at three p.m. by Lady Baxter, of Invereighty, after which Mr. A. Malcolm, Duns, Berwickshire, who also acted as judge in the competitive classes, gave an interesting address from his expert knowledge of the cult. Mr. William Grant also gave a short address on the aims and objects of the association, and referred in brief to some of the work done during its twenty-two years of existence.

In the evening Mr. James Bethel presided, when Mr. John Macher, Fotheringham Gardens, gave a practical and instructive lecture on "Growing and Showing Sweet Peas, with Hints on Manuring and its Effect." Many practical and helpful hints were brought out in the lecture and the ensuing discussion.

The following were the principal prizewinners in the competitions: Messrs. George Reid, Downfield; John Macher, Fotheringham Gardens; James Bethel, The Grange Gardens; Wm. Grant, Fernhall Gardens; John Bell, Corona Gardens; George Reid, Invertay Gardens; William Grieve, Hazelwood Gardens; George Masson, Estrie Gardens; David Kiellor, Seabourne Gardens; and David Brown, Ethiebeaton Gardens.

Non-competitive exhibits were staged by Messrs. Laird and Sinclair, Messrs. D. and W. Croll, Messrs. Storrie and Storrie, James Younger, Esq., Mount Melville; J. S. Neish, Esq., Afflect Castle; Fergus Baxter, Esq., Balunie; Mr. William Grant, Fernhall; Mr. D. K. Meston, The Lodge Gardens, etc.

The finest flowers shown were Paradise Pink, Paradise Crimson, Paradise Ivory, The King, Douglas Unwin, Tom Bolton, The Marquis, Masterpiece, Evelyn Hemus, Elsie Herbert, Etta Dyke, White Spencer, Clara Curtis, Miriam Beaver, Mrs. Henry Bell, Mrs. H. Sykes, John Ingman, Helen Lewis, Spencer America, and Countess Spencer.

The British Pteridological Society.

On August 1, as customary on the August Bank Holiday, this society held its annual meeting, this time at Moffat, in Dumfriesshire, as affording a good field for fern-hunting before and after the actual business meeting, which was conducted at Beattock Junction for the convenience of some of the members. The report of the society was of a particularly satisfactory nature, the establishment of the "British Fern Gazette," in conjunction therewith, having resulted in the addition of about one hundred new members, and the placing of the society upon a far more substantial and far-reaching basis than before.

Despite the expense incurred by the tentative issue of the first four quarterly numbers, the balance-sheet showed an increase of the funds in hand, evidencing the complete success of the experiment, which it was resolved should become a permanent institution, Mr. Charles T. Druery, V.M.H., F.L.S., having consented not only to continue the editorship, but also, owing to the much-regretted resignation of Mr. G. Whitwell, the hon. secretary since the inception of the society, to undertake the secretarial duties as well. A very cordial vote of thanks was passed to Mr. Whitwell for his valuable services in the past. The treasurer, Mr. Wilson, being also precluded by his engagements from continuing to hold the office, now that the work had so much increased, Mr. W. B. Cranfield very kindly consented to take that office over, specially as this involved a great saving of work owing to his proximity in London to the new secretary, Mr. Druery. The rest of the business was more or less formal, and terminated after the re-election of Mr. Alex. Cowan as president and chairman on that occasion, in a hearty vote of thanks to him for his services in that connection, and particularly for the great trouble he had taken in making the needful arrangements at Moffat for the accommodation of the members.

As usual on such occasions, fern-hunting parties were organised for the exploration of the district, but, as the weather was very fickle, heavy downpours of rain, chilly gales, and general moist conditions handicapping research materially, no very marked "finds" turned up, though a number of angustate and crispate forms of Lastrea montana, the prevalent species, were discovered of sufficient merit to be taken for growing on and testing, prior to which it was hardly deemed safe to definitely name them.

At the meeting it was determined to hold the 1911 meeting at Barnstaple, in Devonshire, in order to afford the many members in the Midlands and the North, where the species are relatively much less numerous, an opportunity of studying the more abundant and more varied fern flora of the South of England. In view of the newly-established position of the "British Fern Gazette" as an organ for the dissemination of a wider knowledge of beautiful fern varieties, and for bringing native fern-lovers into closer touch with each other, it is to be hoped that many such will swell the existing membership, the subscription to which, including four quarterly issues of the "Gazette," is five shillings only. The secretary, Mr. Druery, 11, Shaa Road, Acton, London, W., will be happy to forward all particulars and a specimen number to intending subscribers, on receipt of a postcard.

Bristol Gardeners' Association.

The monthly meeting was held at St. John's Parish Rooms, Mr. Hayball presided over a good attendance. Mr. Taylor, of Bath, read a paper upon "Grape Thinning." The lecturer said the first operation in connection with thinning was disbudding, and in deciding which buds to leave preference should be given to those on the upper side. Ten days after flowering thinning should commence, and seven out of eight berries should be cut out, removing the under-placed berries first, leaving nearly all the berries near the top, as the bareness on the top of the bunches so generally seen was the fault of cutting out too many top berries. The final operation should be done before the berries touch. Muscat of Alexandria should be sparingly thinned at first, but Alicante must not be long deferred.

A good discussion followed, after which a hearty vote of thanks was given to Mr. Taylor.

For four vases of sweet peas Mr. T. Clark was first, and Mr. Binfield second.

FLOWER SHOW SCHEDULES.

We shall be obliged if secretaries of societies will forward us a copy of their schedule for the present year.

Sheffield Chrysanthemum Society.—This society will hold two exhibitions in the Corn Exchange. The first will include vegetables, dahlias, and early chrysanthemums, and will be held on September 16 and 17; the second, to be held on November 11 and 12, will be the Chrysanthemum Show proper, and the prizes in the open classes are very attractive.

Huddersfield Chrysanthemum Society will hold its nineteenth exhibition on November 11 and 12, in the Town Hall, Huddersfield.

Doncaster Chrysanthemum Society. — The eighteenth exhibition will be held on November 9 and 10, in the Corn Exchange, Doncaster.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

RICHARDIA LITTLE GEM.—We shall be glad if our correspondents who have been successful in the cultivation of Richardia Little Gem will kindly send particulars of the treatment given, as one of our readers fails to flower it.

EARLY POTATOES. — M. L., Bovey Tracey: It is quite time the early potatoes were lifted; indeed, if they are left longer in the ground they will almost certainly become diseased. Lift them, and allow them to remain on the ground until dry, and then store them in the dark in a shed or cellar.

PEAR TREES NOT FRUITING.—C. N., Southampton: Probably the trees are in soil that does not suit them, or the downward roots have reached a cold subsoil. If the trees are not very large lift them as soon as the leaves change colour, and replant on warmer, higher ground. If the work is done early and carefully, there should be no losses.

BOUSSINGAULTIA BASSELLOIDES. — M. E., Warwick: Except in very sheltered places in the south and south-west, this climbing plant cannot be regarded as hardy, and even under such exceptional conditions it will succumb during the sharp frosts of a severe winter. In a cool conservatory it makes vigorous growth, and is a very interesting climber, and in the autumn it bears clusters of white, fragrant flowers. It succeeds in sandy loam over good drainage.

PROPAGATING VIOLAS. — S. P. L., Broadstairs: From the middle to the end of September is usually regarded as the best time to propagate violas by means of the young growths that are then usually plentiful in the centre of each plant. But in the case of special varieties, and where a considerable stock is desired, the work may be commenced at once. The soil should not be very rich, otherwise a rank growth may follow when the cuttings are rooted, and such growth may succumb during the winter. If the flowering growths are cut off at once there will be plenty of young growths to propagate from a month hence, except in the case of a few exhibition varieties that are not so free-growing as others.

CANKER ON DWARF BEANS.—J. J. E., Glossop: Canker on both runner and dwarf bean pods is due to the attack of a fungus. In America the same fungus is said to be parasitic on the living rind of cucumbers, vegetable marrows, water-melons, and musk-melons. On the pods the first indication of the disease is the appearance of small, scattered, dark-coloured specks surrounded by a reddish line. These spots gradually increase in size, and often run into each other, forming irregularly-shaped patches which become sunk below the general level of the surface. In due course the sunken brown patches become more or less covered with a thin whitish crust, consisting of a dense mass of spores or reproductive bodies of the fungus. When mature these spores are carried by rain, insects, etc., and infect neighbouring plants. Pods that are attacked when quite young frequently become variously bent and contorted. The parasite often passes quite through the pod and attacks the beans. If such infected beans are used for seed the crop shows the disease at an early stage of growth, and is killed before the flowering season is reached. Although the appearance of the disease on the pods is generally accepted as the first evidence of its existence, it nevertheless usually appears first on the stem, where it forms brownish sunken patches. If such patches are confined to one side of the stem the plant is not killed outright, and the injury may escape notice; on the other hand, when a diseased patch girdles the stem, the portion above the wound withers and dies. In some instances the leaves are also attacked, and the diseased portions soon become dry and drop out, leaving irregular holes usually attributed to the ravages of insects. As a rule, the pods are infected by spores produced on the stem or leaves, and consequently much depends on dealing with the disease on its first appearance. The Board of Agriculture recommends as a preventive measure that Bordeaux mixture of half the normal strength should be used until the pods are set, after which a solution of potassium sulphide—one ounce dissolved in four gallons of water—should take its place. Even this fungicide should be discontinued when the pods are about half-grown. To make normal strength Bordeaux mixture: (1) Dissolve 20lb. of sulphate of copper (bluestone) in a tub of cold water; (2) slake 10lb. of lime in another vessel; finally, mix the contents of the two vessels in a wooden tub by stirring thoroughly, and make up to 100 gallons. To make this half the normal strength double the quantity of water must be used.

SOWING PANSIES.—W. J. S., Worcester: Seeds may be sown at once in pans or boxes of sandy loam, and placed in a warm frame to germinate. Ventilate as soon as germination takes place, and prick out the seedlings into other boxes as soon as they can be handled. A cold frame will afford ample shelter during the winter, and then in early spring the seedlings should be planted out on a prepared site, where the soil is deep and rich, and contains plenty of leaf-mould. The seeds may be kept until February, and then be sown in gentle heat, but, as the seeds are from carefully fertilised flowers, you had better sow them at once, so as to secure strong plants to bloom early next season, and show their character at once.

CAMPANULA LACTIFLORA.—C. C. W., Moseley: Campanula lactiflora is a strong growing, handsome and effective species, and one eminently suitable for a large herbaceous border. It grows from four to six feet high, and flowers over a long period during summer and early autumn. It is a Caucasian species, introduced as long ago as 1814. There are numerous varieties, ranging from the milk-white type to a fairly deep blue colour. C. lactiflora thrives in any good garden soil, and may be increased by seeds or division.

NAMES OF PLANTS.

C. R., Devon.—1, Indigofera Gerrardiana; 2, Sedum spurium; 3, Sedum album; 4, Inula Helenium.

H. W., Hungerford.—Probably Celtis occidentalis pumila; we should like to see another specimen.

E. C. C. D., Southborough.—1, Erica Tetralix; 2, Erica cinerea; 3, Calluna vulgaris—Common Ling.

W. P. W., Leicester.—1, Trachelium cæruleum; 2, Yucca recurvifolia; 3, Veronica virginica; 4, Sedum spectabile.

J. M., Southampton.—1, Centaurea macrocephala; 2, Santolina Chamæcyparissus; 3, Olearia Haasti; 4, Inula Helenium.

S. R. M., Aylesbury.—1, Hypericum calycinum; 2, Bougainvillea Sanderiana; 3, Spiræa bumalda Anthony Waterer; 4, Gilia androsacea.

C. F., Malpas.—A poor specimen, but apparently Tamarix æstivalis, a species that does well in the South of England, but we know nothing of its behaviour in Cheshire.

E. R. V., Chepstow.—1, Sidalcea Listeri; 2, Limnanthemum peltatum; 3, Erigeron speciosum; 4, Campanula longistyla; 5, Alyssum maritimum; 6, Galtonia candicans.

G. F. T., Taunton.—The flowers had fallen to pieces when they reached us, but, judging from the colour and fragrance of the petals and the style of growth, we believe the variety to be Marechal Niel.

W. H., Swansea.—The damp moss in which they were packed had taken all the colour out of the flowers, but, so far as we were able to judge, there were no true picotees among them. No. 2 is a self, and the others appear to be fancy varieties of no special value.

TRADE NOTE.

AN ATTRACTIVE FLORIST'S SHOP WINDOW.

Modern and up-to-date shopkeepers in any line of business use their best efforts to make their windows attractive. The florist should certainly be able to vie with and excel almost any trade in this respect, his one and only drawback being that the greater part of his wares are rapidly perishable. The value of the advertisement obtained should, nevertheless, compensate for a good deal of loss involved in presenting to passers-by a well-decorated window. When in Wolverhampton recently we were much pleased by the exceptionally fine display made by Messrs. Bakers, the well-known firm of nurserymen and florists. Messrs. Bakers' shop in Lichfield Street has a fine frontage with three large windows, and on the occasion referred to each of the windows was well dressed. The floor space of one window was transformed into a miniature lake, upon the surface of which floated Nymphæas marliacea, carnea, and chromatella, N. fulgens, and N. Gladstoniana. The margins of the water were clothed with mimulus in full bloom, with groups of sarracenias, Butomus umbellatus and the very beautiful Juncus zebrinus, with growths much resembling beautifully-coloured porcupine quills. The bamboos, typhas, and spiræas, which filled the background, completed a very realistic and pretty water and bog-garden. A second window was filled with large masses of early-flowering gladioli, the bright scarlets, delicate pinks, and pure whites of which combined to produce a very fine effect. Sweet peas, artistically arranged, formed the display in the other window, and the splendid bunches of such good things as Masterpiece, Mrs. Chas. Foster, Czarina, Winsome, and Etta Dyke, bore ample testimony to the quality of Messrs. Bakers' stock. Small wonder is it that a throng of highly interested spectators surrounded these windows, and Messrs. Bakers are to be congratulated on their enterprise, which might well be emulated by many another firm.

SUTTON'S HARBINGER CABBAGE (NEW).—Matures in spring much earlier than any other variety.
Per packet 1s. 6d., post free.
Mr. R. Watson, Gardener to Major L. Rowe, writes:—"I have tried Harbinger Cabbage alongside of three varieties, and I find it quite a month in advance. I have been cutting since the middle of March, and am certain it is a great improvement on Flower of Spring. Not a plant shot. The heads are crisp and firm, and I could not wish for better. With every confidence I recommend it as the earliest Cabbage in commerce."

SUTTON AND SONS, THE ROYAL SEED ESTABLISHMENT, READING.

KELWAY'S "COLOUR BORDERS" (Regd.)

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

Galls.

Amongst the most curious phenomena of inter-relation between plants and insects, the galls rank pre-eminent. Every observer of Nature will be familiar with the berry-like growths to be found upon the oak, and known popularly as oak apples and commercially as nut-galls, but these only represent one phase, since on the same tree we may find other and very dissimilar growths, some brown and shaggy like aborted fir cones, and others fleshy, flat, and disc like, while on the wild rose we may frequently find green mossy-looking bunches on the stems which are also galls, though as different as possible from the others cited. Although all these are purely vegetable growths and often closely resemble true fruits, we shall find if we cut them open that they are the homes of one or more grubs or maggots, and if we follow out the life history of these, we shall see them eventually emerge, usually as flies of different species according to the sort of gall concerned. There are, however, very curious exceptions to this, since it has been demonstrated that, with some galls, the insects pass through alternate phases, not simply those of grub and fly, but of grub of one kind in one shape of gall which yields a fly of a certain description, while this fly produces a gall of a different kind inhabited by a different grub which eventually produces a fly of the first kind, and so on. This is the case with the gall known as the oak spangle, a fleshy disc on the under side of the mature leaves and the small berrylike gall which infests the earlier buds and growths. The mysterious part of gall production consists in the fact that when the egg of the gall-fly is deposited, some subtle poison is injected which so affects the cells in the vicinity that they depart entirely from their normal function of contributing to the growth of the tree or plant of which they are part, and proceed to build up an altogether abnormal structure at the plant's expense, but destined only to form at once a habitation and a supply of food for the grub which hatches within it. We have here a parasitism of a very special kind. Parasites mostly exist by simply sucking the blood or the sap of the plant or animal attacked. The dodder and mistletoe insert their absorbent rootlets into the tissues, and are capable of killing the infected branch or plant by simply appropriating to their own service all the sap supplied for the service of their hosts, mere bloodsuckers in fact. It is, however, a very different thing when the host is induced by some potent influence to build up a special, and, to all intents and purposes, a healthy growth—for the oak apple in its young state is devoid of any signs of disease, its flesh is white and juicy as any apple proper, and the moss gall of the rose is equally sound—for the encouragement of its parasites, providing both food and lodging on a liberal scale for their exclusive benefit. It is curious, too, that in so doing actual fruit should be imitated, rosy cheeks and all, which for frugivorous birds and animals must be veritable Dead Sea fruits, if we may select the nut-gall as an example. In this the acrid principle of the oak bark, by which the tanner profits, appears to be concentrated, since the galls themselves not only owe their name to this, but are especially valuable to the leather dresser. The digestive apparatus of the parasitic grubs must be very different from ours to enable them to thrive upon such a quintessence of astringency, but as it is the dried and abandoned husk which they desert as flies which provides the tanner's material, we may perhaps assume that the internal flesh is better adapted for grub food. The species of gall producing insects are very numerous, as are those of the plants they attack. The forms of the galls produced are also extremely diverse, and it is here that the chief wonder comes in, viz., the extreme subtlety of the infiltration which determines so many different kinds of growth, in all cases quite foreign to the normal cellular growths of the plants concerned. To all intents and purposes they are vegetable tumours, and not diseases such as are induced by parasitic fungi. The growths are confined to the spot in which the eggs are inserted by the ovipositor, and sting of the fly, and it is here that the affected cells, instead of being killed, set to work and multiply themselves energetically, in order to house and nourish on liberal lines a brood of absolute aliens, who, in some inscrutable fashion, have found a way to force them into their service.

MR. E. F. HAWES.
Secretary of the National Dahlia Society.

Mr. E. F. Hawes, whose portrait we give in this issue, is well known as chief of the gardening staff at the Royal Botanic Society's gardens Regent's Park, and as an active worker in the cause of the dahlia, and it is as the secretary of the National Dahlia Society that he is obtaining at this season special attention. On the death of Mr. R. Dean, who was the founder and honorary secretary of the London Dahlia Union, Mr. Hawes was appointed his successor, and continued in that office until the amalgamation of the London Dahlia Union with the National Dahlia Society, when he became, with Mr. H. H. Thomas, joint secretary of the latter. On the retirement as co-secretary of the last-named gentleman, at the end of last year, Mr. Hawes was appointed secretary, and this might well be regarded as evidence of the high appreciation of his services by the members of the executive and the society. In other directions Mr. Hawes has shown much activity in furthering movements that have for their object the advancement of horticulture and the welfare of those engaged in gardening. He has been for some years past the vice-chairman of the National Chrysanthemum Society, and a member of the council of the British Gardeners' Association, and was for several years the chairman of the London branch of the association. Of Mr. Hawes' work at the Royal Botanic Society's gardens there is no occasion to speak further than to say that he has proved a worthy successor to Mr. William Coomber, who for so long a period had charge of the practical work of these gardens.

Baron Schroder Memorial. — From the Rev. W. Wilks, M.A., secretary of the Royal Horticultural Society, we have received the following letter: "The Council of the Royal Horticultural Society have established, in grateful memory of the late Baron Schröder, a perpetual pensionership, under the rules and regulations of the Gardeners' Royal Benevolent Institution, and have suggested to the committee that it would be very pleasing to the Council if the widow of the late Mr. Wildsmith, head gardener to Lord Eversley at Heckfield, were appointed the first Schröder pensioner. Mr. Wildsmith rendered great and willing help to the society in the difficult days of the society's leaving South Kensington. The Council have been informed that Mrs. Wildsmith has been duly appointed."

Mr. W. J. Tutcher.—We learn with a great deal of pleasure that Mr. W. J. Tutcher, who for nearly twenty years has been Assistant Superintendent of the Botanical and Forestry Department at Hong Kong, has now been appointed superintendent, in place of Mr. S. T. Dunn, who has resigned.

Royal Botanic Society.—The Council of this society was able to present at the annual meeting held on the 10th inst., one of the most satisfactory reports the Fellows have had submitted to them for some years past. Mr. Pembroke Stephens, K.C., who presided, stated, in moving the adoption of the report, that an immense improvement had taken place in the position of the society during the past year. The number of Fellows in 1909 was 1,570, while the number now was 1,834. This, he said, was a substantial increase on which the society might congratulate itself, bearing in mind all that had been said from time to time. Many debenture holders had, Mr. Pembroke Stephens stated, handed back their debentures, and the Council had given them life Fellowships for each £100 given up. The net results of that and other operations had been that whereas in June last year the debenture debt was £24,284 now it was £14,714. By the surrender of the debentures the society had also saved £1,236 18s. 9d. accrued interest, and a sum of £250 14s. 9d., which was an annual charge in respect of interest. With reference to the current account Mr. Pembroke Stephens stated that the current liabilities, which in 1909 were £3,050, are now £572. He also announced that His Majesty King George had become a patron of the society. The report was unanimously adopted, and the retiring members of Council were reelected.

Tax on Gardeners.—In our issue of the 13th inst., we referred to the fact that the Duke of Bedford had been summoned, at Bow Street, by the London County Council for employing five male servants without licences. The men are employed in Bedford Square Gardens and other ornamental open spaces, and the Council contended that they were gardeners, The defence was that they were only men working in a garden, and were therefore exempt from taxation. Mr. Marsham reserved his judgment, which he has since given. He decided that Mr. Peck, the head man, was a gardener within the meaning of the Act, and that the other four came under the denomination of men working in a garden.

Memorial Open Spaces.—The Lord Mayor's Committee of the Mansion House Fund for providing a memorial in London to King Edward VII. has been considerably enlarged within the past few days. Suggestions as to the form the memorial should take are being received, and those relating to the provision of open spaces in populous districts in the Metropolis appear to be the most numerous. Canon H. D. Rawnsley, and Mr. Nigel Bond, hon. secretaries of the National Trust, write with reference to what is being done in the Lake District as follows: "It is with great pleasure that we announce that our president—her Royal Highness the Princess Louise—has determined to purchase the superb view-point of Grange Fell in Borrowdale, and make it, through the National Trust, a gift to the public in memory of the late King. Henceforth, as we have an association with Queen Victoria on Derwentwater, so we may associate the memory of King Edward with Grange Fell in Borrowdale. There are still several acres of the Fell that can be added to the memorial if friends desire to do so—an acre costs £7 7s. We have raised £1,650; there remains £750 to be obtained before the purchase can be completed."

Proposed National Hardy Plant Society.—A meeting of those specially interested in the culture and improvement of hardy plants was held on Wednesday evening, August 17, at the George Hotel, Shrewsbury, under the presidency of Mr. A. J. Macself. A resolution to the effect that a National Hardy Plant Society be formed was carried with enthusiasm, and the meeting proceeded to elect Mr. A. J. Macself chairman of committee, Mr. J. S. Brunton treasurer, and Mr. Frank Bouskell as secretary. A provisional committee was appointed to proceed with preliminary work, and arrangements were made to hold another meeting in connection with the Edinburgh Show early in September.

Presentation to Mr. and Mrs. Charles Foster.—At the annual dinner on the first day of the National Sweet Pea Society's show, the question of making some suitable acknowledgment of Mr. Foster's invaluable services as superintendent of the society's trials was discussed in his absence. For a number of years Mr. Foster has been in full charge of the trials without fee or reward of any kind. The proposal was enthusiastically received, and it was resolved to limit individual subscriptions to 5s., as it was felt that Mr. and Mrs. Foster would appreciate a presentation subscribed for by several hundred members rather than one limited to a few who would be willing to subscribe big amounts. From members of the society who may not feel able or disposed to subscribe 5s., smaller sums will gladly be received and equally appreciated. A special committee was appointed to deal with the matter, and Mr. Cuthbertson, 5, Durham Road, Portobello, Mid-Lothian, was asked to undertake the duties of secretary and treasurer, and it is requested that subscriptions be sent to him.

Town Planning and Open Spaces.—The conference which has been organised by the Royal Institute of British Architects to consider the question of town planning, will be held in London from October 10 to October 15, both days inclusive. The King has signified his intention of continuing the Royal patronage to the conference originally bestowed upon it by King Edward, and Mr. John Burns, M.P., will, on the invitation of the Institute, be hon. president, and will deliver his inaugural address on the opening day. The papers of special interest to horticulturists include "The Town Planning Act and Open Spaces," by Sir W. B. Richmond; "Public Parks and Gardens," by Mr. T. H. Mawson; and "Open Spaces, Gardens, and Recreation Grounds," by Mr. Basil Holmes. The inaugural meeting will be held at the Guildhall, but the subsequent meetings, when the conference will be divided into sections, will be held at the headquarters of the Royal Institute, in Conduit Street. It is expected that there will be at least 1,000 delegates, who will be received by the Lord Mayor at the Mansion House, and a conversazione will be given by the Royal Institute of British Architects.

A New Park for Exmouth. A new park, with an area of nearly sixteen acres, was opened at Exmouth a few days since. The park is the gift of the family of the late Sir John Budd Phear.

Insect Pest Prevention in British Columbia.—In the spring an immense number of fruit trees were destroyed by fire in British Columbia under the direction of the provincial inspector of fruits and orchards. The trees destroyed came from Japan, Germany, Holland, Belgium, France, the United Kingdom, and from the United States, and consisted of some 30,000 trees and plants infected with San Jose scale, borers, root gall, apple-tree anthracnose, pear blight, and all the other various fruit tree diseases known. The trees included apple, pear, quince, peach, apricot, crab, nectarine, small fruit, and ornamental shrubs. The inspector stated that there was enough infection destroyed in this lot to have infected the whole of British Columbia. Not only is the imported nursery stock inspected, but all the nurseries throughout the province. No company or individual is permitted to distribute trees until they have passed inspection by competent inspectors. The same rule is followed regarding the sale of fruit, and there is not, it is said, a package of infected fruit sold in British Columbia today. All is carefully inspected, and if found to be diseased is condemned and cremated, or sent back to the country from which it was shipped.

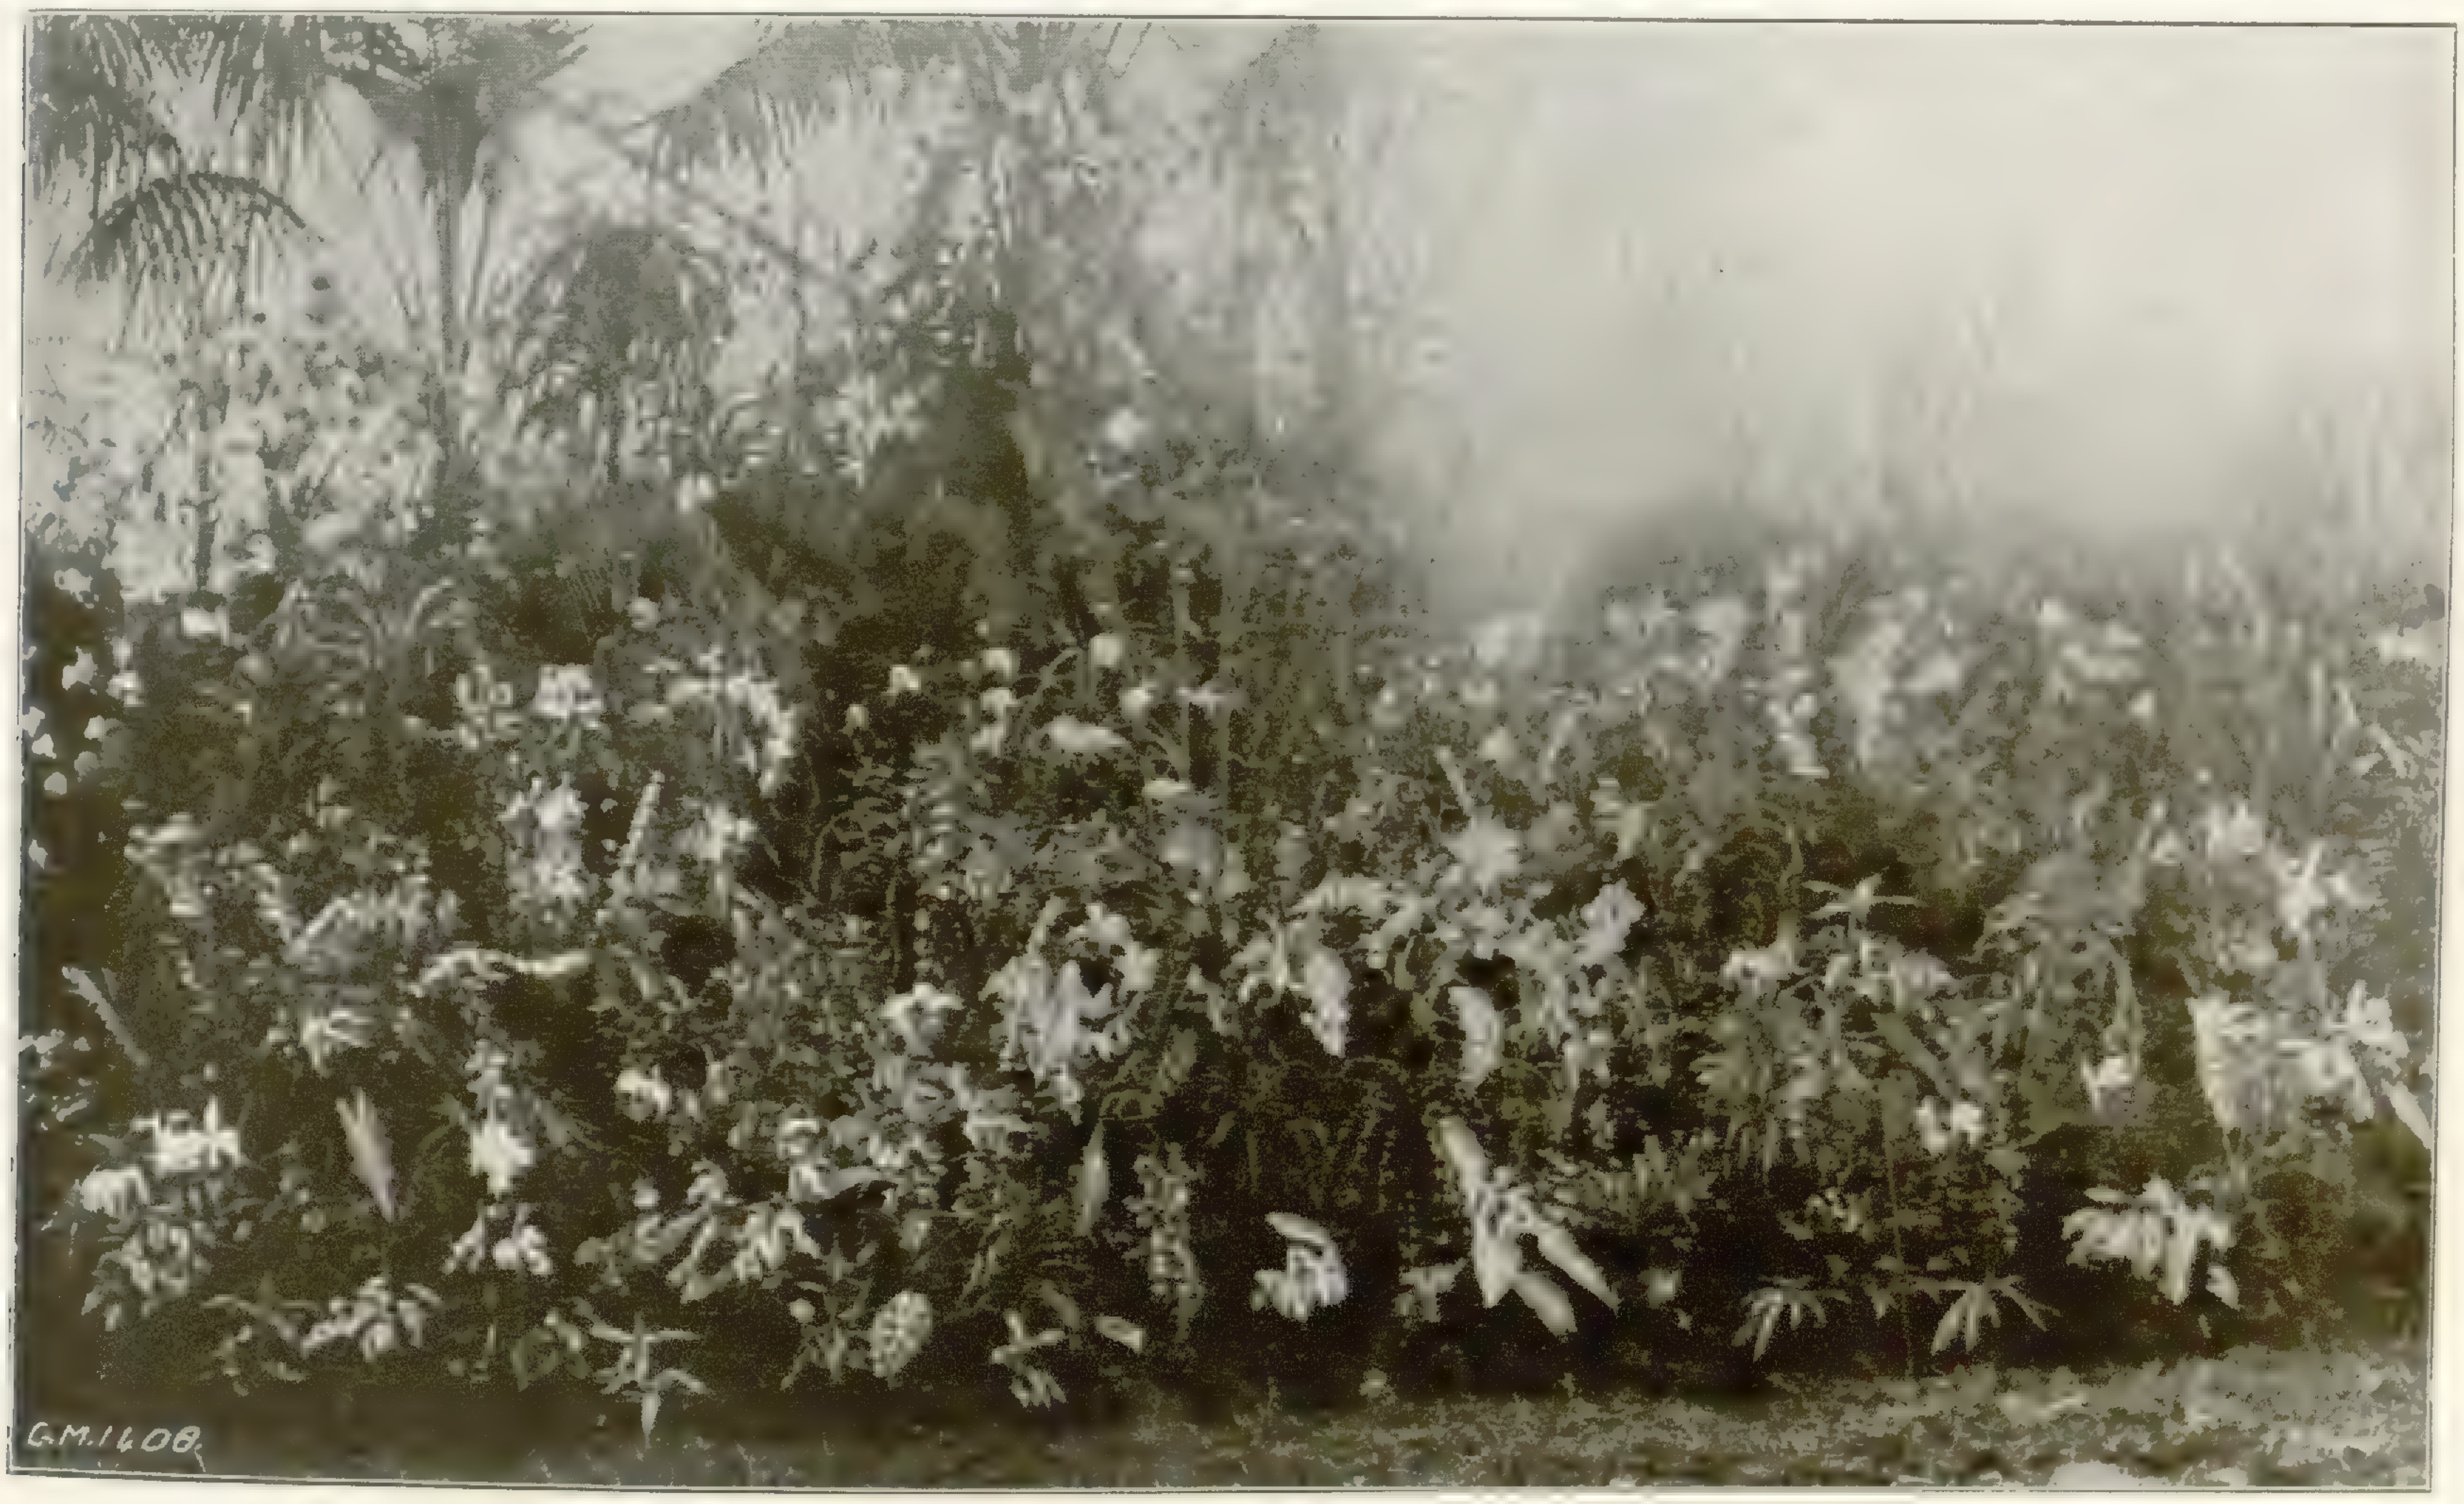
Barr Memorial Fund.—Since the publication of the list of subscribers to this fund in our issue of the 13th inst., Mr. H. B. May, the hon. treasurer, has received contributions from Baron de Soutellinho and Messrs. P. D. Williams, C. Smith and Son, Ant. Roozen and Sons, J. C. Williams, G. Vanden Horst, J. and E. Page, Brodie of Brodie, J. Fairchild, De Graaff Bros., Van Konisberg, L. Buckland, Palmer Mooy, Baylor Hartland, and R. Hooper Pearson.

New Park at Friern Barnet. A few days since the Lord Mayor entertained at luncheon Mr. Sydney Simmons, who recently presented to Friern Barnet a park of about thirty acres. It would have been opened in May last by the Lord Mayor, but, owing to the lamented death of King Edward VII., the ceremony was abandoned. Colonel and Alderman Sir William Dunn, M.P., introduced Mr. and Mrs. Simmons to the Lord Mayor and the Lady Mayoress. Mr. Simmons then presented the Lord Mayor with a gold key of the park as a souvenir. It may be of interest to mention that a few years since Mr. Simmons presented a park to Okehampton.

SHREWSBURY FLORAL FETE.

Once again it gives us the greatest possible pleasure to record a great horticultural success at Shrewsbury. It was a grand show that was held in the fine old Quarry Grounds, amid beautiful surroundings, on August 17 and 18, and this was the thirty-sixth of the series. Since its inception Messrs. Adnitt and Naunton have acted as secretaries, and they have seen a wonderful development during that time. So big has the fête become that nine or ten huge tents, one of immense dimensions, are required to hold the abundant and splendid exhibits. The great features of the show were the fruit classes, the group classes, the big plants, the vegetables, and the sweet peas. Fruit was a grand feature, and there were about four hundred bunches of grapes on view. It was a great pity that in the decorated dessert table class the pointing of the individual dishes was not recorded on the point card, as in some previous years, so that the public, as well as the competitors themselves, might then understand the value of each item. This year the whole of the grapes, peaches, or any other kind of fruit staged in this class had their points lumped together, instead of each variety and dish being separately and distinctly appraised. The judges had not completed their awards in this and the champion grape class, until long after the public were admitted, and as the public were this year admitted at 11.30 a.m., it seems very desirable, in the interests of competitors and judges (not to mention the pressmen who have to work jammed in a crowd of jostling, perspiring humanity), that the time for judging should be made still earlier than it is, or, would not a three days' show be a better arrangement, the public to be admitted at, say, two o'clock on the first day, and judging to commence at ten a.m. on the opening day? If this were possible, it would be a much better arrangement all round. If it is not possible, a much larger number of judges should be provided, and these should commence at nine o'clock. In the vegetable section, and also in the group and plant sections, the judges could not finish by the opening hour, and consequently had to finish their work under extreme difficulties, hampered by the ever-increasing crowd.

It was a grand show, however, and, after a few squalls in the early morning, the weather was delightfully summer-like, and the attendance appeared to be very large on the opening day.



THE FIRST PRIZE GROUP AT SHREWSBURY FETE.
Staged by Messrs. J. Cypher and Sons, Cheltenham, in the new Group Class.

GROUPS.

There were four entries in the big group class, where the stipulation is for a display on a space of 250 square feet, to consist of an artistic arrangement of miscellaneous flowering and fine foliage plants. The premier award was once more made in favour of Messrs. J. Cypher and Sons, Cheltenham, who had a charming exhibit. The arched background was of crotons, dracænas, palms, and liliums, and the front mounds were of elegant palms, glorious brasso-cattleyas, odontoglossums, Vanda cærulea, Caladium argyrites, Cattleya Hardyana, and other beautiful things. The groundwork was of brilliant crotons, Cattleya guttata, dracænas, and light forms of Lilium speciosum over a base of ferns and moss. Mr. J. V. Macdonald, gardener to Sir G. H. Kenrick, Edgbaston, Birmingham, was a close second, and he had a delightful display, in which brilliant and beautifully-grown crotons were the great feature. His elegant background was also brightened by the charming Fuchsia triphylla, as also were the two side arches, on which Phalænopsis Rimestadiana was very fine. Oncidium flexuosum raised its elegant golden sprays among graceful bamboos, and a few well-grown cattleyas made a fine foreground. Mr. W. Vause, Leamington, occupied third place, and he had crotons, ixoras, and oncidiums in abundance. Mr. W. R. Manning, Dudley, was awarded a third prize.

A new and special group class was provided on this occasion for a display of indoor and outdoor plants and flowers, cut and growing, to occupy a space of 250 square feet. The desire on the part of the council was to secure a novel arrangement, and the judges were instructed to take into consideration the quality of the plants and flowers and the general effect produced. Messrs. J. Cypher and Sons put up a beautiful group, and secured the premier award—£20 and a large gold medal—with an exhibit that fully complied with the schedule requirements, and showed how both flowers and plants could be pleasingly associated. There was an arched background, and two side arches furnished with ferns, palms, small caladiums, and orchids of many kinds. Beneath the back arch were groups of tritomas, Galtonia candicans, and Lilium speciosum, while in the centre were statices, Disa grandiflora, and Francoa ramosa, with a few crotons and orchids. In the foreground were mounds of odontoglossums, some small and brilliant crotons, with cypripediums and lily of the valley nestling in the mossy groundwork. Nertera depressa and moss made a pretty edging just in front of the tiny caladiums, alocasias, and Rex begonias. Mr. J. V. Macdonald was again second, and his great feature was a central arch of Phalænopsis Rimestadiana and Cattleya Warscewiczi over a very brilliant groundwork of crotons. There were side stands of cut roses and gladioli, but cut flowers were not a prominent feature. Nandina domestica, little groups of tagetes, and Fuchsia triphylla were other features. Messrs. Artindale and Son, Sheffield, had a striking exhibit, and secured third prize, but they rather overdid their display with tall arches and pillars of cut roses and carnations, and their background of liliums against a screen of green material was rather flat, but they produced a novel and striking feature. The groundwork was of bamboos, lychnis, and variegated hop, and through this ran a tiny stream, in which were water lilies. A little spar-covered pathway was carried over the stream by means of a small rustic bridge.

It was the most novel arrangement of the set. Mr. W. Vause, Leamington, gained a fourth prize.

In the county class for a group of plants Mr. Swann won first place, and Mr. R. Taylor, Abbey Forgate, was placed third; apparently no second prize was granted.

PLANTS.

Messrs. J. Cypher and Sons, Cheltenham, scored for fifteen stove and greenhouse plants, and did so with giant examples of Statice intermedia, Statice profusa, Ixora Duffi, I. Shawi, I. Pilgrimi, Allamanda nobilis, Clerodendron Balfouri, and fine crotons and kentias; Mr. W. Vause second, and Mr. W. R. Manning, Dudley, third. For six stove and greenhouse plants Messrs. J. Cypher and Sons were again to the fore, and here they led with glorious examples of Ixora Duffi, Allamanda nobilis, Statice profusa, S. intermedia, Clerodendron Balfouri, and Rondeletia speciosa major. Mr. W. Vause second with smaller examples.

Messrs. J. Cypher and Sons had the best thirty stove and greenhouse plants, and in addition to kinds already mentioned they showed Clerodendron fallax, Acalypha hispida, Alocasia intermedia, and Davallia polyantha in good style; Mr. W. Vause was second, and Mr. C. Roberts, gardener to Mrs. Swann, Halston Hall, third.

Messrs. Blackmore and Langdon, Twerton-on-Avon, appeared to be the only exhibitors in the class for a group of tuberous begonias, and they were awarded first honours for a display that would have taken a deal of beating. They presented double varieties only, and their plants and flowers were of superb quality, some of the blooms being of immense size, notably those of Lady Tweedmouth, Mrs. G. F. Fry, Mrs. Lockwood, King Alfonso, Miss Ethel Gill, Mdme. Tetrazzini, and Beatrice Rose.

In the county (Salop) classes, for six stove and greenhouse plants, Mr. T. Lambert was to the front with an allamanda, clerodendron, bougainvillea, and Gloriosa superba; Mr. A. Farrant, Cleveland Street, Shrewsbury, second. Mr. Hammonds, Castle Street, led for tuberous begonias.

Mr. T. Lambert led for six dracænas, and Mr. E. Killans, gardener to E. Vaughan, Esq., scored for caladiums. Mr. Jowett, gardener to E. Bridge, Esq., showed the best four fuchsias, and was first for double pelargoniums. Mr. Cliff, gardener to R. Taylor, Esq., led for single pelargoniums, and Messrs. Blackmore and Langdon were to the front for six tuberous begonias. Mr. J. George, gardener to T. Hanbury, Esq., Roby, scored for a dozen table plants with a bright, neat set.

PREMIER GRAPE CLASS.

In the premier grape class, for a dozen bunches, not more than four bunches of one variety, there were seven competitors, and here the chief honours, both for grapes and decorations, fell to Mr. W. Parker, gardener to J. Drakes, Esq., Market Rasen, with a grand display.

His bunches were as follows:

	Variety	Points Awarded.	Possible Points.
1	Black Hamburgh (labelled Gros Maroc)	9	10
2	Muscat of Alexandria	9	11
3	Madresfield Court	9	10
4	Muscat of Alexandria	8½	11
5	Madresfield Court	9	10
6	Canon Hall	9	10
7	Madresfield Court	9	10
8	Muscat of Alexandria	8½	11
9	Gros Maroc	8	9
10	Gros Maroc	8	9
11	Muscat of Alexandria	8½	11
12	Madresfield Court	9½	10
		105	122

Mr. Parker is a new man in this class, and has come to the top at once. His Madresfield Court grapes were very fine, and easily the best in his set. He did not gain maximum points in any instance, but had a high average of quality all through; his best bunch of Madresfield Court seemed good enough for full points, but, of course, the judges had better opportunities of close inspection than we had. The floral decorations were of pink and white carnations, gypsophila, odontoglossum and oncidium sprays, montbretias, and a few cattleya blooms. Second prize was won by Mr. W. H. Cooke, gardener to Lord Belper, Kingston Hall, who scored 101 points out of a possible 123, and it appeared to us his bunches were pointed particularly high, as compared with those in the premier set. Mr. Cooke had fairly large berries all through, but many of the bunches, notably 9 and 10, Muscat of Alexandria, and 6 and 7, Muscat Hamburgh, were not equally well filled all over. Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, third, with 99½ points out of a possible 124; he gained full points for one bunch each of Madresfield Court and Black Hamburgh; the latter was a large cluster, and the former finely coloured; Mr. G. Mullins, gardener to Lady Henry Somerset, Eastnor Castle, was placed fourth, with 95½ points out of a possible 123, and he secured third prize for decorations. Second prize for decorations fell to Mr. J. Jones, gardener to Mrs. F. Need, Malvern, who also secured an extra (seventh) prize for his grapes, with 86½ points out of a possible 117. Mr. G. F. Richardson, gardener to H. St. Maur, Esq., Newton Abbott, gained fifth prize for grapes with 95 out of a possible 124 points; and Mr. W. A. Coates, Glan Conway, gained sixth prize, with 89 out of a possible 124 points.

CHAMPION DECORATED FRUIT TABLE CLASS.

In this famous class for a table of thirty dishes of ripe fruit, the whole florally decorated, the premier award, a champion twenty-five guinea cup, a gold medal, and £20, was won by Mr. N. Barnes, gardener to the Duke of Westminster, Eaton Hall, Chester, with a grand table, beautifully decorated with liliums, oncidiums, masdevallias, oncidiums, and francoas The competition was extremely keen. The leading dishes were Madresfield Court grapes, apples, pears, peaches, and apricots: the total points were 211½, out of an unknown possible. Mr. J. H. Goodacre, Elvaston Castle, was second with 200½ points; Mr. James Gibson, gardener to the Duke of Portland, Welbeck Abbey, Worksop, third, with 193½ points; Mr. Parker, gardener to J. Drakes, Esq., Market Rasen, fourth, with 189½ points; Mr. Mullins fifth with 177 points.

COLLECTIONS OF FRUIT.

The best collection of nine dishes of fruit came from Mr. J. Mills, gardener to Captain Heywood Lonsdale, Shavington Hall, who showed well-coloured Madresfield Court and Muscat of Alexandria grapes, Nectarine peaches, Pitmaston Orange nectarines, Rival and Chas. Ross apples, and melon; Mr. W. Taylor, gardener to F. Bibby, Esq., Hardwicke Grange, second; and Mr. Roberts, gardener to Mrs. Swann, Halston Hall, third. Mr. Taylor had the best floral decorations in this class; Mr. Mills second, and Mr. Roberts third.

There were seven competitors in the class for a dozen dishes of fruit, decorated, to fill a space 6ft. by 4ft. 6in. There was a keen competition, and premier honours fell to Mr. S. Barker, Worksop, for Muscat Hamburgh and Muscat of Alexandria grapes, Royal Jubilee and Seedling melons, Washington apples, Goshawk and one other peach, Negro Largo figs, Coe's Golden Drop plums, and Humboldt nectarines; Mr. Barker was second for decorations with Mrs. H. Burnett carnations. Mr. H. Cooke, gardener to Lord Belper, Kingston Hall, second, with fine nectarines, apples, and apricots; Mr. H. Cotton, gardener to Lord Biddulph, Ledbury Park, third, and first for decorations with orchids; Mr. J. Jones, gardener to Mrs. Need, Malvern, third; Mr. W. E. Hyde, Sheffield, was third for decorations.

GRAPE CLASSES.

The best four bunches of grapes, two each of black and white varieties, were those from Mr. T. Lambert, gardener to Lord Harlech, Brogyntyn, who scored among five competitors with finely coloured clusters of Madresfield Court and Muscat of Alexandria; Mr. S. Barker, Worksop, second; and Mr. T. Cave, gardener to E. Bewley, Esq., Dublin, third. There were seven competitors in the class for two bunches of Black Hamburgh grapes, and here Mr. G. Mullins, gardener to Lady Henry Somerset, Eastnor Castle, Ledbury, led with medium sized, large-berried clusters; Mr. H. Wilson, gardener to J. Brinton, Esq., D.L., Stourport, second; and Mr. W. Dawes, gardener to Lord Trevor, Brynkinalt, third.

Mr. Mullins scored for one bunch of Black Hamburgh grapes, and was followed in order by Mr. H. Wilson, and Mr. W. Dawes. For two bunches of black Muscat varieties Mr. A. H. Hall, gardener to Colonel France Hayhurst, Middlewich, led with good clusters of Madresfield Court; Mr. E. Jones, gardener to G. E. Lomax, Esq., Huyton, Liverpool, second, with Black Hamburgh; and Mr. Wilson third with Madresfield Court. Mr. W. Parker, gardener to J. Drakes, Esq., Market Rasen, scored for two bunches of Madresfield Court grapes with very heavy clusters, but rather small berried; Mr. A. H. Hall, Middlewich, second; and Mr. S. Barker, Worksop, third.

For two bunches of Alicante grapes, Mr. A. H. Hall led from six competitors with large, finely coloured bunches; Mr. E. Jones, Huyton, second; and Mr. G. F. Richardson, gardener to H. St. Maur, Esq., Newton Abbott, third. For a pair of bunches of any other black variety, Mr. H. Parker, Market Rasen, led with good clusters of Appley Towers; Mr. D. McKelvie, gardener to J. Stone, Esq., Roby, Liverpool, second, with Alnwick Seedling; and Mr. W. Faulkner third with Gros Colmar.

Muscat of Alexandria was finely shown, and there were five competitors in the class for a pair of bunches. Here Mr. W. Parker scored with long, well-filled, and well-coloured clusters, berries a trifle on the small size; Mr. G. F. Richardson, Market Rasen, second with neat clusters of big berries, finely coloured; Mr. C. Price, gardener to Colonel Mellor, Tan-y-Bryn, third.

The best single bunch of Muscat of Alexandria was from Mr. W. Parker, who led, among seven competitors, with a very fine bunch; Mr. T. Lambert second, and Mr. N. F. Barnes, gardener to the Duke of Westminster, Eaton Hall, third. Mr. A. Child, gardener to H. E. Attenborough, Esq., Daventry, scored for two bunches of any other white grape with grand bunches of Chasselas Napoleon; Mr. E. Jones, second with Buckland Sweetwater, and Mr. A. H. Hall, third with Chasselas Napoleon; seven competitors.

OTHER FRUITS.

The best dish of eight peaches came from Mr. Mullins, who had beautifully coloured specimens of Bellegarde; Mr. S, Barker second with Belle de Doue, and Mr. A. Heber Percy, Hodnet Hall, third, with Goshawk; fifteen entries. There were twelve dishes of nectarines, and the best was a dish of Pineapple finely shown by Mr. Mullins: Mr. Hall, gardener to the executors of Lady Ashburton, Romsey, second, and Mr. A. R. Searle, gardener to the Marquis of Northampton, Castle Ashby, third with Humboldt. Out of ten entries in the class for a dish of apricots, Mr. A. Langston, Wychbold, was first; Mr. J. Mills second; and Mr. Pritchard, gardener to Major A. H. O. Lloyd, Leaton Knolls, third. Mr. Searle had the best green-fleshed melon; fourteen entries; Mr. H. Cooke was first for a scarlet-fleshed melon with The Manchester; fifteen entries; Mr. Davies, gardener to Mrs. T. Alderson, Welsh Frankton, first for a white-fleshed variety; fourteen entries.

Mr. Searle had the best dish of gage plums. Oullin's Golden Gage; seven entries. He was also first for a dozen yellow plums with Jefferson, and first for a dozen purple or red plums with Kirke's. Mr. A. Hall led for a dish of cherries.

VEGETABLES.

These were grandly shown and finely staged. In the society's class for a collection of nine kinds of vegetables, Mr. E. Beckett, V.M.H., gardener to the Hon. Vicary Gibbs. Elstree, Herts, won first place with a magnificent collection, comprising celery, leeks, Early Mammoth cauliflowers, Ailsa Craig onions, Marrowfat parsnips, Stourbridge Marrow peas, potatoes, carrots, turnips, cucumbers, and tomatoes; Mr. J. Hudson, Leicester, second; and Mr. G. F. Hallett, gardener to Sir T. Hesketh, Bart., Easton Neston, Towcester, third.

In Messrs. Sydenham's class for eight kinds the prizewinners in order of merit were Mr. W. Jones, Newtown; Mr. E. Deakin, Hale Hall; and the Rev. R. Davies, Stackpole Rectory.

In Messrs. Sutton and Sons' class, Mr. J. Gibson, Welbeck Gardens, scored a fine first with superb produce; Mr. J. Hudson came second, and Mr. J. Mills, third. In Messrs. Carter and Co.'s class Mr. W. Gaiger, gardener to H. T. Latham, Esq., Kendall Hall, was first; and Mr. E. Deakin, second. In the Messrs. Webbs' class Mr. Beckett led, with Mr. Hudson second, and Mr. Hallett third.

GOLD MEDAL ROSES AT SHREWSBURY FETE.

View of the fine group of roses exhibited by Messrs. Alex. Dickson and Sons, Newtownards: Gold Medal awarded.

In Messrs. Clibran's class the prizewinners were Mr. A. R. Searle, Castle Ashby, Mr. Gaiger, and Mr. Oakley, gardener to A. E. Humphreys, Esq., Berriew. In the county class for nine kinds of vegetables, Mr. J. Mills led the way, with Mr. W. Dawes second, and Mr. T. Birch, gardener to Colonel A. King, Sholton Hall, third. Messrs. Murrell's prizes brought out a good competition. Mr. T. H. Pugh, Newtown; Mr. H. Turner. Overley Hall Gardens, Wellington; Mr. W. Astley, Hadnall; and Mr. J. Howells, Belle Vue Gardens, Shrewsbury, won prizes in order of mention.

FLORISTS' DESIGNS.

Premier award for a bride's bouquet and two bridesmaid's bouquets was won by Mr J. Knight, Wolverhampton, with phalænopsis and odontoglossums in the former, and carnations in the latter; Mr. W. J. Garner, Altrincham, second; and the King's Acre Nurseries, Lim., Hereford, third. For a brides bouquet, Mr. W. J. Garner scored with an arrangement of white phalænopsis, odontoglossums, carnations, and cattleyas; Mr. A. Adshead, Gatley, Cheshire, second; and Messrs. Bottomley and Burton, Elland, Yorks, third.

Mr. Adshead scored for a bouquet of flowers with a gorgeous design in cattleyas, cypripediums, odontoglossums, and oncidiums; Mr. W. J. Garner second, and King's Acre Nurseries, Lim., third. Mr. Garner had the best feather-weight bouquet, and the King's Acre Nurseries, Lim., second. Mr. W. Treseder, Cardiff, showed the best bouquet of dahlias. Mr. W. J. Garner led for a basket of cut flowers, showing a great variety of orchids in fine style; Mr. Adshead second, and Mr. Garner third. Mr. Garner had also the best stand of cut flowers for a table decoration, and put up Gloriosa superba and francoa sprays prettily; Mrs. B. Vernon, Bowden, second, and Mr. Adhurst third.

CUT FLOWERS.

There were seven competitors in the class for a collection of hardy flowers, arranged on a space with a 10ft. 6in. frontage, no duplicate bunches allowed. Messrs. Gunn and Sons, Olton, won the chief honours in a very close fight for premier honours, with a grand collection, in which Lilium auratum, Campanula pyramidalis, C. lactiflora, gladioli, Chrysanthemum maximum varieties, montbretias, Allium descendens, coreopsis, poppies, veronicas, lupins, eryngiums, and sunflowers were the leading subjects. Mr. F. Eames, Floral Nurseries, Frome, Somerset, was a good second, his liliums, gaillardias, and phloxes being especially fine; Messrs. Harkness and Son, Bedale, third. This bank of hardy flowers was one of the great features of the show. Messrs. W. Artindale and Son, Sheffield, were fourth prize winners, and the other competitors were Mr. R. T. Went, Llandaff, and Messrs. Gibson and Son, Bedale.

Messrs. Keynes, Williams, and Co., Salisbury, secured the first prize for a collection of cactus and decorative dahlias, arranged on a space with 8ft. 6in. frontage. The flowers were shown in great variety, and put up very charmingly in tall stands, low vases, and on boards, and associated with fern, asparagus, and gypsophila; Messrs. M. Campbell and Son, High Blantyre, gained second prize; and Mr. John E. Knight, Wolverhampton, came a close third, each of the latter showing well.

For six bunches of sweet peas Mr. J. H. Emmett, Earlstown, was first with a beautiful set, and Mr. F. J. Harrison, Alverstone, second. Mr. Harrison was also second to Mr. R. Hallam, Radcliffe-on-Trent, for a dozen bunches, and they won in a keen competition. Mr. T. Jones, Ruabon, led for twelve bunches in Mr. Eckford's class with grand bunches of Syeira Lee, Earl Spencer, Clara Curtis, Elsie Herbert, Audrey Crier, Mrs. C. Foster, Tom Bolton, The King, Queen of Norway, George Stark, Dazzler, Helen Lewis, Menie Christie, Marjorie Linzee, and Etta Dyke; Mr. G. H. Robertson, Gresford, second; Mr. J. Fletcher, Auchenarck, Lanark, third; a grand class.

Mr. C. F. Waters, Balcombe, Sussex, led for a collection of cut perpetual carnations with a beautiful group, and Mr. J. Knight, Wolverhampton, was second. Messrs. Gunn and Sons were first, Mr. F. M. Bradley, Peterborough, second, and Mr. Stephen Treseder, Cardiff, third, for an artistically arranged collection of cut roses, and each showed well. Mr. C. H. Herbert, Acocks Green, beat Messrs. Campbell and Son, High Blantyre, for a collection of carnations and picotees, and they made striking displays of fine flowers. Mr. C. Alcock, Liverpool, scored in the amateur's class for carnations, and Mr. C. H. Herbert had the best twelve vases of carnations and picotees. For a dozen bunches of stove and greenhouse flowers Mr. McKilvie, Roby, was to the front, and for a dozen bunches of annuals, sweet peas excluded, Mr. Oakley was the chief prize winner.

Messrs. A. Dickson and Sons, Newtownards, had the finest set of twenty-four cut roses, and Mr. H. Dickson, Belfast, was second. These growers had their positions reversed in the class for eighteen roses, distinct, and they each showed fine flowers for the time of year.

NON-COMPETITIVE.

The trade and other non-competitive exhibits were a great feature of this great show.

The difficult point about describing the exhibit of Messrs. Sutton and Sons, Reading, is to convey in the space of a few lines anything like an idea of the great variety, the superb quality and attractiveness they contrived to get into their exhibit of vegetables, melons, and floral decorations. Needless to say, every dish was really good, and the tasteful arrangement of the flowers was a credit to the stagers. The principal feature of the large and elaborate exhibit from Messrs. Jones and Sons, Florists, Lim., Shrewsbury, was a bright and pleasing mass of sweet peas.

Messrs. Webb and Sons, Wordsley, Stourbridge, arranged one of the excellent displays of vegetables and flowers that have become well-known as the particular style of the firm. Tomatoes, beans, onions, beet, and one might almost say every vegetable worth growing except cabbages, were represented, and the familiar epergnes of sweet peas, carnations, and lilies were well furnished; the melons, too, were of excellent quality. A new tomato named Fonthill was shown by Messrs. Isaac House and Son, Westbury-on-Trym. It was a fair sized, symmetrical fruit, hanging in large clusters on short-jointed vines. The same firm showed good phloxes, violas, and alpines, and on another stand a really fine lot of border flowers. Mr. Edwin Murrell, Shrewsbury, occupied his usual bay in the big fruit tent, and his crescent-shaped staging was covered with a nice array of roses.

Messrs. Wm. Cutbush and Son, Highgate Nurseries, London, N., put up an excellent exhibit of perpetual flowering carnations, which included such good things as Lady C. Waring, Victory, C. W. Cowan, and all the older favourites; dwarf polyantha roses and some fine foliage plants were used to good purpose on the stand. King's Acre Nurseries, Lim., had on view a collection of fruit trees in full bearing, which was of great interest to gardeners and the general public, and reflected great credit upon the firm for their enterprise, and their grower for his skill. A fine collection of herbaceous flowers was in its way an equally meritorious exhibit from King's Acre, Romneya Coulteri, eremurus, Scabiosa caucasica, and phloxes were the principal items. Messrs. Bakers, Wolverhampton, again demonstrated the beautiful effects that can be obtained by skilful planting of water margins; Astilbe Davidi, typhas, Scirpus zebrina, and other things were grouped around an improvised lily pond. A great bank of herbaceous flowers and sweet peas also came from Messrs. Bakers.

As usual, we found Messrs. Dicksons, Lim., Chester, showing hardy flowers in a most pleasing manner. Their liliums, romneyas, and gladioli were well up to the firm's usual standard. Zonal pelargoniums were shown both as pot plants and cut flowers, by Messrs. A. Myers, Sutton Lane Nurseries, Shrewsbury.

In one of the big bays in the fruit tent Messrs. Hobbies, Lim., arranged a very pretty group of roses. Dwarf polyanthas carpeted the ground, arches of ramblers broke up the space, and weeping standards, bunches of hybrid teas, and masses of the popular bedders completed the group. The same firm brought a nice collection of cactus and pæony-flowered dahlias. Dobbie's sweet peas, scabious, and large-flowered cosmos were right up to the high quality which marks the firm associated with Rothesay, but now of Edinburgh.

A very large and attractive exhibit came from Messrs. Dickson and Robinson, Manchester; tall stands of phloxes, liliums, and perpetual carnations formed a background for the collection of early chrysanthemums, dahlias, antirrhinums, etc. Moneymaker and Manchester Rival tomatoes were also upon the stand. From Hatherley, Cheltenham, Messrs. Young and Co. brought a lovely lot of perpetual carnations.

Messrs. Robert Sydenham, Lim., Birmingham, arranged a pleasing display of sweet peas in their well-known rustic table decorations. A small, but very choice, exhibit of carnations was staged by Mr. W. Angus, The Gardens, Penicuick, N.B., who also showed some nicely-flowered plants of Disa grandiflora. Sweet peas, lovely large blossoms in great quantity, were exhibited by Mr. Henry Eckford, Wem, Shropshire. The length of stem and the clearness of the flowers did much toward making the exhibit most attractive to the visitors. Very clean and creditable for the time of year were the roses staged by Messrs. W. and J. Brown, Stamford; Lyon and Madame Melanie Soupert were strong features. Messrs. Jarman and Co., Chard, Somerset, arranged their pretty centaureas in a tasteful manner.

The whole of one side of the central stage in the sweet pea tent was occupied by Mr. Robert Bolton, Warton, Carnforth. Every vase in this extensive display was a picture of loveliness. It would be difficult to particularise varieties where all the best seemed to be represented. Messrs. Gunn and Sons, Olton, Birmingham, showed extensive collections of phloxes, and hardy border flowers. The latter included montbretias, aconites, campanulas, etc., and the phloxes embraced such sorts as Sunrise, Mons. Kind, Royal Charter, and Le Mahdi. Violas, border chrysanthemums, and carnations were the feature of Messrs. W. Seagrave and Co.'s exhibit from Sheffield.

Profuse and enthusiastic were the comments drawn from spectators by the great mass of delphiniums and spiraeas arranged in a bold group on the ground by Mr. Amos Perry, Hardy Plant Farm, Enfield. Lamartine, an intense blue single, and Mrs. Creighton, a rosy-purple semi-double, were very attractive. The exhibit of ferns brought up by Messrs. H. B. May and Sons, Edmonton, was so varied and interesting that one might have spent an hour in examining the choice things staged. Crested scolopendriums were particularly fine. The pentstemons and phloxes from Hawick were of that stamp of perfection which has made the name of Forbes so familiar.

The collection of apples, peaches, plums, and other choice fruits in pots, which came from Messrs. Thomas Rivers and Son, Sawbridgeworth, was worthy of highest praise, and, indeed, everybody was enthusiastic over it. The examples of Lady Sudeley apple, Oullin's Early apricot, and Peregrine peach were grand. Messrs. Hewitt and Co., Solihull, had their usual position at the end of the group tent, where they had a bold display of hardy border flowers, including choice phloxes, pentstemons, and some good early-flowering chrysanthemums. A table of chrysanthemums, in pots, from Messrs. Pritchard and Sons, Shrewsbury, embraced a number of good varieties.

A very choice collection of stove and greenhouse plants was arranged in a bay of the group tent by Messrs. James Veitch and Sons, Lim., Chelsea. A mound of orchids in the foreground, some splendid nepenthes, tall crotons, such as Prince of Wales, and a nice batch of bertolonias were features of this well-arranged group of good plants. A circular group of caladiums from Messrs. John Peed and Son, West Norwood, was reminiscent of the time when such were among the finest exhibits in a show.

Messrs. R. Wallace and Co., Colchester, were out in full strength with montbretias, which produced a perfect blaze of colour. King Edmund, Geo. Davidson, Hereward, and Westwick were among the best; Liliums, such as tigrinum splendens, Auratum rubro vittatum, and Batemanniæ, were largely shown by the Colchester specialists, who also had capital gladioli and herbaceous flowers. In a recess between three of the tents Messrs. Tom B. Dobbs and Co., Wolverhampton, laid out a model garden, in which rustic garden furniture, rose pillars and arches played a prominent part.

Mr. C. W. Breadmore, Winchester, had sweet peas that were of first-rate quality and substance. Such bright things as Dazzler, King Edward Spencer, and King Alfonso showed up among the delicate shades of Mrs. Hugh Dickson, Mrs. C. W. Breadmore, and others. Messrs. Webb and Brand, Saffron Walden, showed hollyhocks, as only that firm can. The spikes of immense double flowers in all colours, from white to deepest mahogany, were quite a sight to see. Mr. J. Stevenson, seedsman, Wimborne, was another sweet pea exhibitor, his arrangement and colour blending was very tasteful.

A glorious lot of roses came from Messrs. Alex. Dickson and Sons, Lim., Newtownards, Ireland. Their Lyon, Dean Hole, and Mrs. C. C. Harrison were superb. Mr. H. N. Ellison, West Bromwich, put up an excellent batch of choice ferns, among which were Polypodium glaucum crispum, and the newer nephrolepis. A unique and very interesting exhibit was that of Messrs. Storrie and Storrie, Glencarse, Perthshire. Dishes of enormous gooseberries, fruiting bushes in pots, and some perfectly-developed cockscombs were the main features.

Kelway's gladioli were shown in immense quantity, and were very fine. Some of the yellows and whites were particularly pleasing, and such good crimsons as Viper, Mrs. Wood, and Western Glory made choice variety. Messrs. Clibrans, Altrincham, surpassed themselves as experts in the exhibition of choice vegetables, their big exhibit being arranged in a new and novel way.

It is not often we see Messrs. Barr and Sons, Covent Garden, London, coming out as exhibitors of vegetables, but they came out at Shrewsbury in fine style. About 100 dishes, and practically every type of vegetable, were staged.

MEDALS.

Large Gold.—Messrs. James Veitch and Sons, Chelsea, for miscellaneous group; Messrs. T. S. Rivers and Sons, Sawbridgeworth, for fruit; and the King's Acre Nurseries, Lim., for fruit.

Small Gold.—Messrs. Clibrans, Altrincham; Messrs. R. Wallace and Co., Colchester; Messrs. Bakers, Wolverhampton; Messrs. Kelway and Son, Langport; Messrs. Hobbies, Lim., Dereham; Messrs. Sutton and Sons, Reading; Mr. Edwin Murrell, Shrewsbury; Messrs. Webb and Sons, Wordsley; Messrs. Jones and Son, Lim., Shrewsbury; Messrs. Alex. Dickson and Sons, Newtownards; Messrs. W. and J. Brown, Peterborough; and Mr. Robert Bolton, Carnforth.

Silver-gilt.—Messrs. J. Peed and Sons, Norwood; Messrs. Hewitt and Co., Solihull; Messrs. Gunn and Sons, Olton; Mr. H. N. Ellison, West Bromwich; Messrs. Simpson and Son, Birmingham; Messrs. Dicksons, Chester; Messrs. Isaac House and Son, Bristol; Messrs. W. Cutbush and Son, Highgate; Messrs. Jarman and Co., Chard; Messrs. Dickson and Robinson, Manchester; Messrs. Young and Co., Hatherley; Mr. H. Eckford, Wem; Messrs. T. B. Dobbs and Co., Wolverhampton; Messrs. Pritchard and Sons, Shrewsbury; and Messrs. Artindale and Son, Sheffield.

Silver.—Mr. Amos Perry, Enfield; Messrs. Webb and Brand, Saffron Walden; Messrs. H. B. May and Sons, Edmonton; Messrs. John Forbes, Lim., Hawick; Messrs. Seagrave and Co., Sheffield; Messrs. Barr and Sons, Covent Garden, W.C.; Messrs. Storrie and Storrie, Dundee; Mr. A. W. Thorpe, Lichfield; Messrs. Dobbie and Co., Edinburgh; Mr. Albert Myers, Shrewsbury; Messrs. R. Felton and Son, Hanover Square, London; Mr. J. Stevenson, Wimborne; and Mr. C. W. Breadmore, Winchester.

Bronze.—Mr. Wm. Angus, Penicuik, N.B.; Mr. S. R. Crampton, Macclesfield; Mr. W. L. Pattison, Shrewsbury; Messrs. Robert Sydenham, Lim., Birmingham; and Hugh Aldersey, Esq., Aldersey Hall, Chester.

AWARDS OF MERIT.

To Mr. W. Angus, Penicuik, for border carnation, Mrs. Angus; to Messrs. Storrie and Storrie, Dundee, for improved strains of cockscombs, and for improved strains of Iceland poppies; to Hugh Aldersey, Esq., Aldersey Hall, Chester, for sweet pea Tortoiseshell; to Messrs. Dobbie and Co., Edinburgh, for Cosmos White Queen, and Dobbies' strain of scabious; and to Messrs. Kelway and Son, for gladioli Delicata and Snowdon.

CORNFLOWERS.

Some will think that nothing need be said about this weed—for such it is in many gardens—but the ragged disorder in which one often sees it growing shows that some improvement in its cultivation is desirable. It is grown almost entirely for the sake of its clear blueness, so rare in flowers that the expression "cornflower blue" is used to describe it. But we often see more pinks and purples than blues, and when these have found their way into a garden it takes some time to get rid of them, for they come up year by year, and as it is only when they flower that they can be known, and then one does not care to pull them up immediately, they soon seed again.

Cornflowers become very weedy after the first two or three weeks of flowering, especially in the middle of the summer, and in a dry soil at any time, and it is only in the late spring—when flowers for cutting are getting rather scarce—that they are really worth growing, for it is then that the flowers are finest. To get them at this season they should be sown early in August, preferably where they are to flower, and the seedlings kept thinned out, so that they do not suffer from overcrowding, deferring the final thinning out to a foot or more apart till the early spring, so as to allow for casualties during the winter. Two feet apart is not too much for vigorous plants in good soil. Such plants will be coming into flower by the middle of May in a normal season. Slugs are partial to the young plants, and where these are very troublesome seed should be sown in pots, three or four in a forty-eight, only one plant, and that the strongest, being eventually left in a pot. They should be given the shelter of a frame during the winter, and planted out as soon after February as conditions permit.

Cornflowers are sometimes allowed to grow as wild plants in odd places of all sorts, but they rarely give any satisfaction in this way as a garden plant, however useful they may be to provide a supply of cut flowers, and if they are worth growing at all they are worth growing well. They are not suitable for the mixed border, not only on account of their weedy habit, but because of the big gap they make in July. The best place for them is the reserve or cut-flower garden, usually as a patch in the border of the kitchen garden.

Alger Petts.

LAPAGERIAS IN THE OPEN.

Although the lapageria is a very beautiful climber for growing in a greenhouse, it is not commonly seen in robust health in such structures, although there are notable exceptions. But I wish to refer to the lapageria as a fit subject for outdoor cultivation. I have not had sufficient experience of it in this respect to say with confidence that it would live outside in the southern counties, even in the most favoured situations, during a fairly hard winter. But I do know that plants have done remarkably well in mild winters grown in a south-west position and trained on a wall, so as to escape the cold east winds in spring time, without any protection, in the county of Hampshire. Furthermore, with the protection afforded by a mulch of dry fibrous peat, or cocoanut-fibre, over the roots, and a piece of tiffany wrapped round the gathered and bundled shoots, lapagerias have withstood rather severe winters.

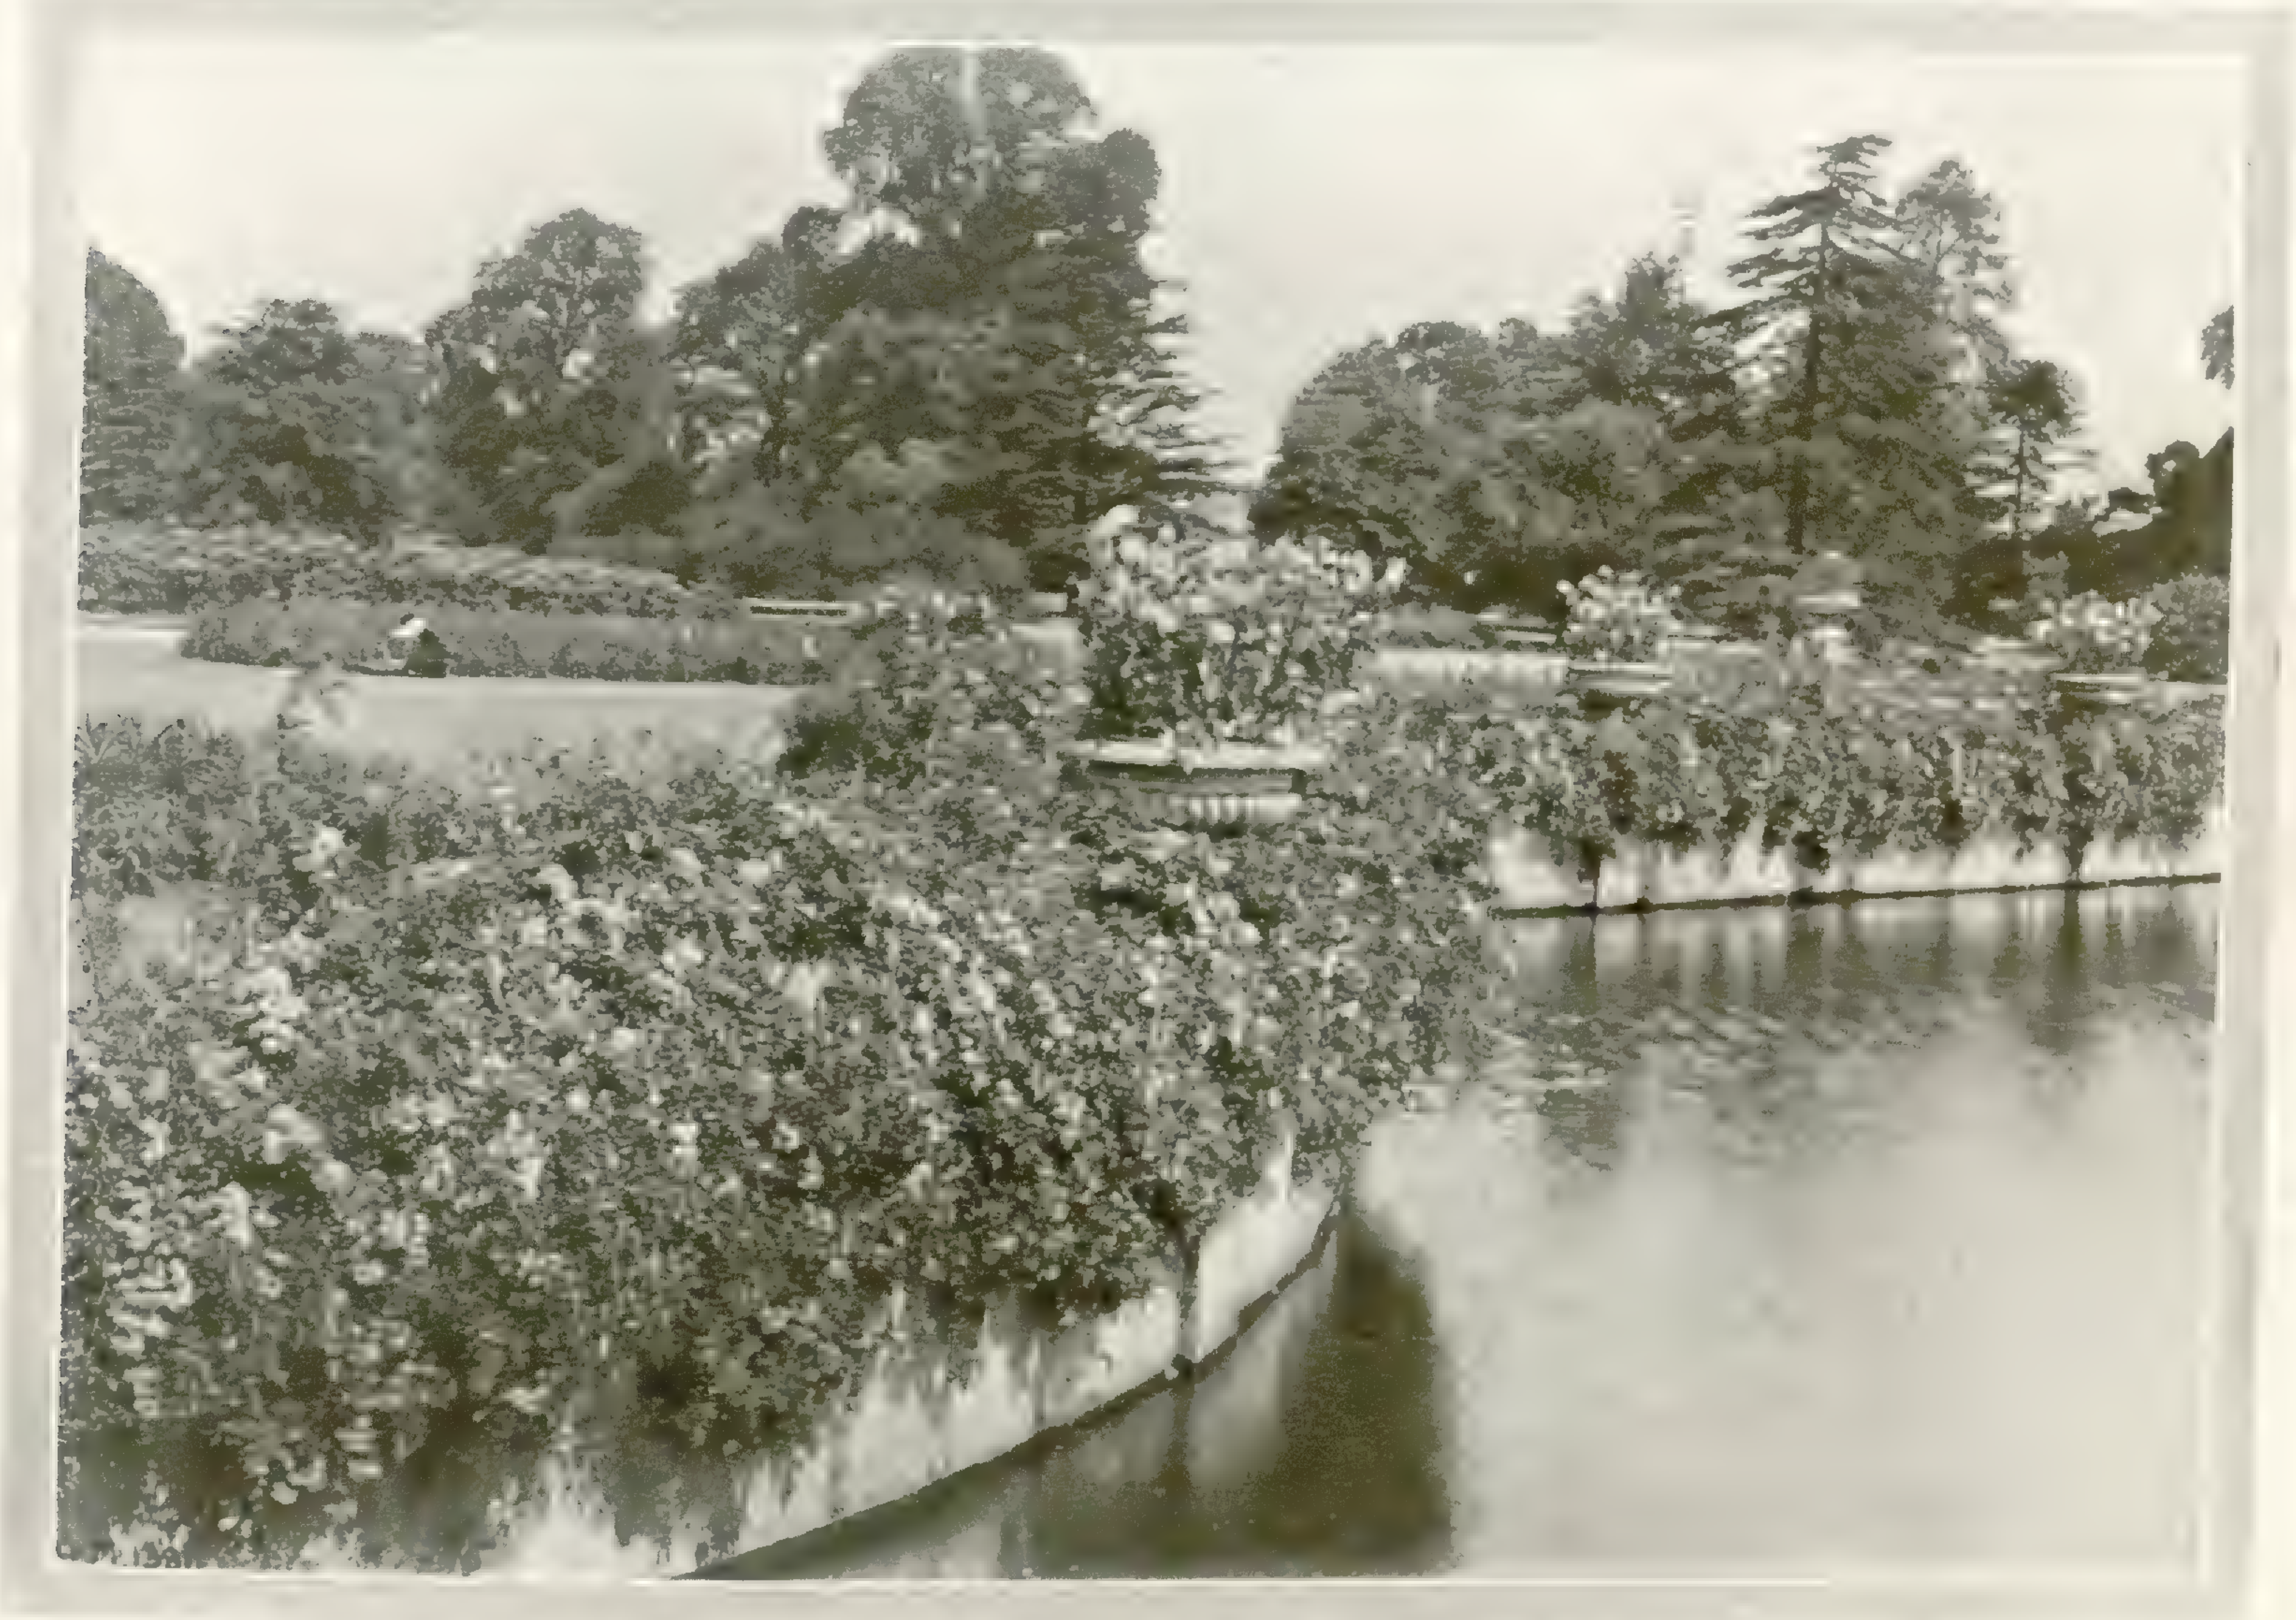
I should like to know if any readers of the Gardeners' Magazine, especially those residing in Devonshire and Cornwall, have had much experience in the growing of these climbers on outside walls.

I may say that the shoots made, when the plants become established, are very fine indeed, and massive flowers are produced.

Geo. Garner.

ROSE DOROTHY PERKINS ON MARGIN OF WATER.

Of the many beautiful effects produced by this charming Wichuraiana rose that have come under our notice during the past few years, not one has been superior to that produced on the margin of the lake in front of the principal museum in the Royal Gardens, Kew. This is the first instance that has come under our notice in which Dorothy Perkins has been used in association with masonry and water, and we feel that those responsible for the inception and making this new departure may be heartily congratulated on the results obtained. Along a part of the eastern and western ends of this lake the ground is supported by a white stone wall, surmounted by an elegant balustrade. Along the outer side of each of the two walls there is a narrow border, in which the roses are growing. A small portion of the growth has been allowed to spread over the surface of the border, while the remainder has been trained over the balustrade and allowed to droop naturally over the water, as so well shown in the accompanying illustration. The effect is indescribably beautiful; the glossy green leaves present a pleasing contrast to the white masonry, and the great masses of rich pink flowers hanging over the water produces an effect that has been startling in its beauty. The heavy storm on the 5th inst. greatly reduced the period over which the flowers retained their beauty, but it has been long enough for many thousands of visitors to have an opportunity of enjoying the display, and learning the lesson it has been so well able to teach. The roses illustrated are at the western end, where, enjoying full exposure to sunlight, they have made a stronger growth and bloomed more profusely than those at the eastern end, where the light is intercepted by tall trees.



ROSE DOROTHY PERKINS.

As growing on the western margin of the Lake in front of the principal Museum at Kew.

AMONG THE ALPINE FLOWERS.

"Mark our ways, how noiseless,
All, and sweetly voiceless.
. . . .
We thread the earth in silence,
In silence build our bowers,
And leaf by leaf in silence show, till we laugh atop
sweet flowers."

Leigh Hunt.

The glories of the alpine flowers have long passed their meridian, and day by day we see fewer of the bright blossoms which in the early season delight us. Yet there are compensations as we look upon those which remain, and upon the mounds and carpets and veils of verdure preparing to give us their wealth of flower when another year comes round again. We cannot but look forward now, just as we look backward upon the past pleasures. Many of our treasures are safe and snug beneath the surface, but many are evergreen, and seem to tell us of their renaissance, when they will gleam with brightness, and gladden us with their beauty. But it is to the present and not to the future that we must turn, gleaning from our fields of flowers the remnants of the once bright harvest of bloom.

Tunica saxifraga.

How often are the unassuming flowers, like some of our friends, of most value in days when these are scarce! And this little rock tunica is one of these gentle, modest plants, whose beauty we seem to have most favour for as the days of autumn speed on. Fortunately it reserves its brightness for the time when other flowers have grown fewer. Beside the sheets of aubrietia of the spring it would look dull and sparse. Now, when the purple rock cress is in its workaday attire, it is clad in softly-coloured lacework, and is pleasant to look upon as it hangs its little curtain over a stone, and bedecks its hard surface. Light and graceful is Tunica saxifraga, and its trailing growth is so subdued in its vigour that it will hardly ever work woe to its neighbours. "Lacework" is the best description of the inflorescence of this little plant, which loses none of its worth to us when we realise that it can be raised from seeds at the cost of a few pence, and that it flourishes in a dry soil. Nor does it grumble should it be given a little shade, and there it will probably last in bloom long, until, indeed, the frosty mists of the early winter evening and morning come to mar its beauty, and to make us mourn the departure of these sweet little pale rose flowers. In sandy soil it will thrive, and give us many years of pleasure.

The Indian Knotweed.

It is in autumn that we come to realise the true worth of the Indian Knotweed, Polygonum affine brunonis. In spring and summer it strikes us as far from an attractive plant, with its rough carpet of leaves, which, notwithstanding, deserves some study even then. If you examine these leaves you will perceive that they are as if hemmed with white thread; the hard branches give one little impression of beauty to come from them later on. But in autumn there rises from this carpet of lanceolate leaves, often coloured with crimson towards the end of the season, a number of little spikes of a fine rose colour. The whole plant varies from about six inches to a foot or so high when in bloom, and it is seldom that it reaches the greater stature given. Each little spike is clad with small flowers to a length of three inches, or a little less, and a good plant trailing over a bank in the alpine garden looks pretty indeed. In actual practice it may be said to be quite hardy, but I have known it to be lost in the north as the result of an unusually trying winter. But this native of the Himalayas is practically hardy, and those who wish an autumn-flowering plant of its type may well cultivate it in their rock gardens.

It is a plant which increases readily by division, but is one which should not be planted close to one of the more delicate and tiny gems of the alpine garden. It soon makes a mat of leafage, and increases with fair, although not riotous, rapidity. I prefer to grow it in full sun, and it seems to like some moisture at the roots in summer and autumn, although preferring a dry bed in winter and early spring. Not a gem of the first water, it is yet a precious thing for the rockery, and one not to be forgotten, although Mr. Reginald Farrer does not even mention it in a review of the knotweeds in his "Alpine and Bog Plants." It is a much easier thing to grow than P. vaccinifolium, although it is less refined, it may be. I am somewhat at a loss to know, by the way, why P. vaccinfiolium bears such a good reputation as an easy doer. It is not so with me, or with many other growers whom I know, but, subject to the reservation already mentioned, P. affine, or brunonis, is much hardier and more reliable.

Miss Willmott's Nepaul Cinquefoil.

Some there are who might deny Miss Willmott's Nepaul Cinquefoil, a fine form of Potentilla nepalense, a place in the rock garden, but those who know it best will be disposed to think that its true sphere is there, and not in the border. It is less trailing than the typical P. nepalense, but, on the other hand, it shows up its bright flowers so much more effectively when a little above the ground level—say, three or four feet above it—that it is deserving of this little bit of consideration. Then the rock garden is much benefited by the presence of its bright red flowers at a season when plants of a moderate stature, although not miniatures, are none too numerous. I have here a plant about three feet above the level of the path by the rock garden, and very bright and pleasing it is now, with its cheery red flowers, which, like those of the type, are unfailingly attractive, and which appeal to us, and not in vain, as we pass them by.

Other Flowers.

As we look round again and again we seem to feel that, after all, we have slandered the rock garden in implying that its brightness was past for the season. If we had said that it was only past its zenith we would have been more literally correct, as we see many things as we look around anew. Here are bright heaths, varieties of erica and calluna in several species; there is the scarce, although not immaculate, yellow-flowered Patrinia gibbosa. There are yet sedums, and still sempervivums, with their curious star-like flowers on great stout stems; violas gladden us as we see their blue and white, and yellow and other coloured blooms. There are yet dianthuses, campanulas, even thrifts. We see asters, a late alyssum or two, olearias, euphorbias, low spiræas, and other flowers of the time, besides those of the earlier season which yet "linger in the lap of time." If the borders have their glories, the rock garden has its beauties, which forbid us to spend all our time among the opulent charms of the former, and so we wander among our alpines seeking, and finding, joy in their loveliness and their brightness.

S. Arnott.

THE MAIDENHAIR FERN.

Adiantum cuneatum, of which I now write a few notes, is popularly called the "Maidenhair Fern." Other adiantums are called "maidenhairs," but A. cuneatum is most generally meant when Maidenhair Fern is spoken of. This species is very popular, all people are fond of it; it seems inseparable from our existence as gardeners, as it is found in all gardens, small and great; it is valued as a decorative plant, and it is invaluable in a cut state for association with cut flowers, and also in bouquets and all kinds of floral decorations. Whether in a small state or as a large specimen in a very large pot, when well grown it is always pleasant to look upon, and at almost any season of the year.

A. cuneatum is very accommodating, as it will grow in a comparatively cool greenhouse, but it will not succeed like some ferns as a window plant for the dwelling-house, as in winter the house is not quite warm enough, and the fronds turn brown and die; indeed, to grow Adiantum cuneatum well it must have generous treatment and a fairly warm house.

I was looking round an establishment once, and I noticed some very miserable specimens of A. cuneatum in the conservatory; they look starved, and produced very short fronds, about four to six inches long. I told the gardener I thought the plants would be better in a warmer house; he said his employers liked short fronds. I said that is contrary to our requirements, we like long ones.

We obtain large plants, with long, well-grown fronds, as follows: Our plan is to select small seedlings that spring up in various places about the plant and orchid houses, and, some time in March, put them into the smallest thumb pots, and place them on a shelf in a warm stove, close to the glass, keep them shaded and well watered, etc., and by June they are ready to be sorted over, and the best examples transferred to three inch or four inch pots; at this period we discard those that have not done well, also those that depart in a great degree from the type, as, of course, seedlings vary considerably. I may as well at this point make it clear why I suggest seedlings to grow into specimen plants. In my younger days the practice that obtained was to divide old plants into two, three, or four parts; the result of this was very onesided specimens, as the centre of the plant was always dead, and that dead side never produced new fronds when repotted; the case is quite different with seedlings, as they grow equally well all round, assuming, of course, that they are turned occasionally, and receive proper attention in a good position.

At the end of the first year the plants are in three-inch or four-inch pots, and the room that is made by discarding the poor ones will just afford the necessary place for the new ones for the first winter. The next March we look them over again, and shift the best examples into five-inch or six-inch pots, according to their vigour, and place on lower stages further from the glass, when they make splendid plants for decorative purposes.

The following March business proper begins. Some of the plants are transferred to eight-inch and nine-inch pots, with the result that large specimens are obtained. The following spring the best of these are shifted on to twelve-inch pots, and the next year some of them into fourteen-inch and sixteen-inch pots, when, as far as we are concerned, the climax is reached, for when they are in the large pots we let them remain two years, and then discard for younger ones. In our case we cut them up into small pieces, and plant them amongst the rockwork in the fernery. I have thus shown how to grow immense specimens in five years.

The value of specimens is demonstrated when a large quantity of cut ferns is required. During the interim from small to large plants we always keep a very watchful eye on the ferns intended for specimens; we do not cut from them or use them for decorative purposes. As I have already stated A. cuneatum requires generous treatment, as its native country is Brazil. It was introduced about 1820. A structure rather warmer than the greenhouse, i.e., an intermediate house, is just the place for it, for if too warm the fronds become drawn and attenuated, and are, moreover, very tender, and soon become flaccid when cut. Adiantum cuneatum requires a good supply of water when growing freely, and must never be allowed to become dry in winter, or the ends of the roots die, with the result that the fronds become brown. It is not very subject to insect enemies; sometimes scale is rather troublesome, and the remedy is cutting off the infested fronds. Snails are very fond of the young fronds, and the remedy is to catch them at night by the aid of a lantern light.

The last thing to note is the compost to grow this fern in. We have found two parts turfy loam, one part good leaf-mould, and one part sandy peat, all well mixed, with a liberal addition of coarse silver sand, to be the best suited for good healthy growth. If the loam is very heavy and lacks fibrous matter a little less of it, with a little more peat and leaf-mould, will be better. The pots should be well crocked with clean potsherds, and these should be covered with moss, and the soil should be made fairly firm at each potting, care being always taken that enough room is left at top to allow for a sufficient quantity of water to be given to soak the ball through, as sometimes through an error in this respect the soil becomes dust dry towards the bottom of the pot, which is very detrimental to the growth.

Cheshire. W. M.

Sollya Drummondi.—This pretty little Australian climbing plant mounts upwards by twining its slender stems around any support. For training up the rafter of a small greenhouse it is well suited, or it may be grown in pots and allowed to twine around a few sticks. The leaves are narrow and evergreen in character, while the small, drooping, bell-shaped blossoms are of a delightful shade of blue.—W. T.

Tamarix Pallasi.—This is superior to the commoner Tamarix gallica, although even the latter is one of the most beautiful flowering shrubs that can be grown. The advantages in favour of T. Pallasi are a more compact, or perhaps it would be better to say a less rampant habit, and the flowers are of a brighter shade of colour, this latter may be described as rich rosy-pink. The exceedingly light and feathery formation of the flowers softens the shade of colour, and during the months of August and September there are few things so charming as the gossamer-like plumes of T. Pallasi. Planted in the form of a hedge, with strained wire supports to which the vigorous growths can be tied, this tamarix quickly forms an effective screen, and becomes an object of superb loveliness. It is remarkable that a shrub built on such slender lines should be as hardy as a plant can well be. It seems almost as though the more wind it has to resist the better it thrives. Gardeners by the seaside should make great use of the tamarix.—A. J. M.

RHUBARB.

Now that rhubarb is practically out of season, there are many gardeners who remember only too well that their supply has been short; this experience is not uncommon in private gardens where a large number of crowns are forced each season. There is certainly no more wholesome and useful vegetable than rhubarb; and one can very well say that it is probably on account of its free and easy growth that it does not receive the amount of attention which so valuable a plant deserves. But this is ever so; plants that are difficult to grow are often killed with kindness, while those which are happy and contented with a little attention are too frequently neglected altogether.

The red-stalked varieties are those commonly cultivated, the most desirable being those which can be produced with good colour when forced. It may be said of this plant that the earlier varieties are undoubtedly the most valuable, for generally speaking, these are the smallest, the most delicately flavoured, and the most pleasing to the eye. In the early part of spring early supplies of delicately-flavoured rhubarb are invaluable for culinary purposes, especially when preserves are exhausted and gooseberries yet unfit for gathering. For preserving and other similar purposes, such as wine-making, the later crops are preferred; these are generally less delicately flavoured, but they afford much larger supplies than the earlier kinds. Among the best varieties of rhubarb are Hawke's Champagne, a superior early rhubarb, Mitchell's Royal Albert or Early Red, Myatt's Victoria, Linnæus, a prolific maincrop rhubarb, and Early Scarlet. Victoria is considered to be the finest rhubarb in cultivation. If a large number of roots are required it is advisable to procure them from a place where a good form is cultivated.

Soil Conditions.

The soil most suited for rhubarb culture is a deep, rich, and moist loam, although almost any kind of soil is capable of producing satisfactory crops, provided the plants are well supplied with moisture and nourishment. Deep cultivation and liberal manuring are very necessary where the crop is intended to be a permanent one; that is, where the leaf stalks are to be pulled as fast as they grow. In moist, retentive soils, however, it is scarcely necessary to provide manure at all; at least, quite satisfactory crops can be raised on deep, heavy loams without any further stimulant in the shape of farmyard manure or stable dung. On soils that are apt to become waterlogged, however, rhubarb will make a poor growth; neither will it succeed in exposed situations. Where liberal supplies of manure are considered necessary it is best provided in the shape of well-decayed stable manure. This should be dug in during the autumn when the ground is being tilled, so that it may become thoroughly incorporated with the soil before planting.

On soils that are deficient in lime, applications of basic slag are considered beneficial; this fertiliser may be supplied in conjunction with the stable manure, and the quantity of the latter modified proportionately. Subsequently, the crowns may be fed by working in amongst them a good dressing of well-rotted farmyard manure or dung.

Planting.

To ensure the most successful results the plants should be set out in the rows not less than three feet apart. One grower of my acquaintance raises splendid crops on a border of deep damp loam. The stools are here planted four and a-half feet apart, and even that is a trifle too close, for the growth is tremendous. Good large roots should always be planted, as these give the quickest and best returns, and each crown should be buried just below the surface of the soil. The propagation of rhubarb is effected by division of the roots, the sowing of the seed being rarely practised. To divide the crowns in this way all that is necessary is to cut down by the side of the roots with the spade, and then carefully slice off pieces of the root, each piece being provided with a crown. These cuttings should be established as quickly as possible.

Of course, a plantation may be formed with strong, well-grown crowns put direct into their permanent quarters. All planting is performed when the crowns are dormant, that is, during the autumn or latter part of winter. Subsequent treatment will consist of periodical hoeings to keep the surface soil open and prevent the growth of weeds, the removal of seed spikes, and slight protection with strawy litter during severe weather. Rhubarb plants can be very easily exhausted by extravagant pulling, hence they should not be unduly weakened by drawing out the leaf stalks too late in the season. As a rule, it is best to allow them to make a good growth after the last pulling.

Forcing Rhubarb.

An extremely large quantity of forced rhubarb is produced for market purposes, often in very queer situations, such as caves, disused mines, etc., where the crowns, grown and raised on neighbouring lands, are transferred, and made to produce useful winter crops. Darkened sheds are also utilised for this purpose, much in the same way as for mushrooms, protection from light being commonly supposed to improve the quality of the produce, though the colour is by no means heightened, but rather the reverse. Pits of fermenting material are very frequently made use of for the purpose of forcing rhubarb, such material being composed of stable manure, decayed leaves, and other fermenting vegetable matter.

Excessive heat is neither necessary or desirable, as a temperature of more than, say, 85 degrees F., often causes considerable injury. From 70 to 80 degrees of heat will usually suffice to induce a rapid growth.

Doubtless the best means of forcing rhubarb is to stimulate it into rapid growth on the ground where it grows. This can be done in a variety of ways. Some growers invert an empty barrel over each crown, covering the whole with fermenting material; others erect a framework of laths over the rows, about two and a-half or three feet in height, and as wide as the crowns. These are placed over the rows in the early part of February, and covered with a good layer of long thick litter. Such rows should be set at about two feet apart. Rhubarb, when forced in this way, is so profitable, and so easily managed, that anyone who requires a supply of delicately flavoured produce from Christmas to May will do well to give it their attention. Of course, for the earliest supplies rhubarb is usually forced indoors under the greenhouse staging, or as near to the heating pipes as possible, and in the darkness. When forced in such manner the roots are seldom fit for further use, as the heat imposes a great strain upon them; they may, however, recover themselves if planted out in good soil that has been freshly dug and manured. J. C. Newsham.

Old Basing.

NOTES ON ROSES.

Although the frequent rains have undoubtedly spoilt a large number of roses, especially those varieties having single or very double blooms, they have kept the colour in our beautiful dark shades better than is often the case during a hot and dry summer. The chief drawback in our own case was the spattering of blooms upon quite short, dwarf-growing plants. Here we again experienced the great benefit of short hedge briars, particularly in the case of pendent growers, such as Maman Cochet, Mrs. Edward Mawley, and others of like habit. I do not find the rain itself harm the flowers of these nearly so much as in the case of bolder growers, their tendency to droop being a great protection in that matter, but unless fairly well off the ground the flower is badly spattered by dirt, especially during such heavy rainfalls as we had here. With frequent use of the hoe this has been even more noticeable than if the soil had not been surface cultivated so freely.

PERGOLA OVER STONE PATH IN MR. SWINSTEAD'S GARDEN.

With the exception of the enthusiastic exhibitor few care to see heavy mulchings of manure among their plants, which detracts very much from the pleasure in stepping amongst them to more closely examine some attractive flower, and the present dripping season has been ideal for the occasional use of artificial stimulants. Another effect of the rains has been comparative cleanliness from insects after the early part of the season, and in spite of the sudden and extreme changes of temperature our plants so far are free from mildew. This is rather surprising to me, because we have had a few hours of sultry weather, followed by cold nights that were often as low as 10 degrees above freezing. Just the sort of atmospheric change that has so often been associated with the advent and spread of this disease. Nor have I met with it in neighbouring gardens. Most roses are growing very strong and promising.

We shall keep the hoe going as much as possible for two reasons: to prevent the surface caking, and to keep down the seedling weeds that evidently enjoy this season. I think we might well continue the removal of ill-placed growth from the centre of the plants just as much as with the first growths of spring. The suckers upon hedge briars have flourished amazingly during this showery season, and need constant attention, more especially upon those to be budded this summer, which naturally possess more embryo eyes than the older stems that have had theirs removed for a number of seasons. So far as our own budding has progressed it promises to be a good year, and stocks could not lift in a more pleasing way. This is very noticeable upon the shoulders of standards. We think, too, that many hedge briars we had looked upon as doubtful have been saved by the generous showers. Although there is every prospect of a lengthened budding season, I would prefer the work to be completed by the end of the present month, as this gives the bud and stock a better chance to unite.

Some few roses have been very beautiful this summer, and the many forms of climbers—particularly those called ramblers—have been delightful. Well-ripened wood of the previous year passed through the winter satisfactorily, and was, of course, the chief cause of this. But we have also had a good time for the free-opening cluster varieties, and to these must undoubtedly be added the large number of grand hybrids from the Wichuraianas that have been in commerce long enough now to exhibit their full beauty. To name those that have come out most prominently would occupy far too much space, but I feel sure no roses are more satisfactory when planted in suitable positions, and as we now have a vast range of colour, together with the extreme hardiness and certain flowering of the majority, they will, if possible, be more largely used in place of other climbers. Their handsome and clean foliage will help them much in this connection. Then the hybrid teas have been exceptionally good, if we omit a few of the full-centred varieties that did not have enough bright weather to develop, while our own plants never promised so well for a late August and September display.

NEW BOOKS.

THE STORY OF MY OLD WORLD GARDEN.

By G. Hillyard Swinstead, R.I. (Baines and Scarsbrook, Swiss Cottage, London, N.W.) Price 10s. 6d.

In the course of the past twenty years or so we have had submitted to our notice a considerable number of books that have been more or less devoted to the description of gardens that have been designed, constructed, and planted by the authors, and as evidence of well-directed endeavour a considerable proportion of them have possessed much interest. We have a clear recollection of some of the best of them, but we are quite unable to call to mind one that could compare with "The Story of My Old World Garden" in interest or usefulness, and certainly none afforded such remarkable evidence of the possibilities in the creation of small gardens when the necessary taste and judgment is forthcoming.

It would be interesting and pleasurable to give a summary of Mr. Swinstead's description of his garden from the time when, on the completion of his studio, he decided to so alter its character as to suggest a garden that belonged to the distant past, and to afford accommodation to roses, hardy herbaceous plants, and other subjects that are at once beautiful and capable of producing picturesque effects. But such summary, while not wanting in usefulness, would fail, and necessarily so, in conveying an adequate idea of Mr. Swinstead's success in garden making, and it would require more space than can now be spared. Moreover, it would not be possible to give, with the aid of letterpress alone, a clear impression of the many distinct and beautiful features that have been formed within a comparatively small area. This can only be done with the aid of illustrations, and we shall best serve the interest of our readers by refraining from summarising the contents, and advising them to obtain the book, which is illustrated with fifty original drawings, designs, and photographs by the author. Of these a considerable proportion are veritable works of art, and the frontispiece depicting the entrance gate shortly after a heavy fall of snow is well worth the half-guinea charged for the book. The work is equally suitable for the drawing-room and the garden library, and the author has rendered owners of small gardens good service in showing them how they can render them beautiful, interesting, and varied at, evidently, a comparatively small cost.

SOILS AND MANURES IN RELATION TO PLANT GROWTH.

(Continued from page 592.)

The Action of Water.

In continuation of our subject upon the formation of soils, we have now to consider the action of water upon them. Water, as we know, dissolves various substances. If we shake up sugar with water the sugar dissolves, or "melts." If we shake nitrate of soda or sulphate of ammonia with water they dissolve. Water is a very universal solvent: it dissolves, more or less, the great majority of substances that exist on the surface of the earth. Most of them dissolve exceedingly slowly, but rain water, as it passes through the air, takes with it some of the carbonic acid existing in the air, and water so impregnated is a much more powerful solvent of rocky substances than pure water.

Consequently, rain water is a quite powerful solvent of rocks. "Soda water" is simply water impregnated with carbonic acid. If we take some soda water and shake up with it finely powdered limestone the liquid will be found to contain a very notable proportion of carbonate of lime, and upon boiling the clear liquid the carbonate of lime comes down as a precipitate, because, when the carbonic acid is expelled by boiling, water can no longer retain carbonate of lime in solution. That is the incrustation commonly seen on boilers when hard water is used. The object of softening water is to precipitate the carbonate of lime it contains, so that it will be freed from this substance, may be "soft," and not cause the incrustation of the boilers which is seen when hard water is used. The point of all this is that when rain water acts upon the limestone rocks it rapidly dissolves the carbonate of lime, of which that description of rock is chiefly composed, and all that remains behind is just a certain proportion, which is not soluble, or is much less soluble, in carbonic acid water, and these remains of the limestone rock, together with fragments of undissolved rock, are what form the mineral constituents of a large proportion of our soils.

Alternating heat and cold also cause rocks to break down and crumble into small fragments, and so by these various agencies a layer of particles is formed of sizes varying from that of stones down to particles so small that we cannot measure them under the microscope. These particles form the nucleus of primitive soil. The primitive soil may remain where it was formed, or it may be blown by wind or washed by rain to lower levels.

The Action of Vegetation.

When a small amount of primitive soil is collected certain primitive plants spring up, such as we find growing on the rocks near the sea coast where there is a thin powdery layer of soil. And then tiny primitive plants, such as lichens, and then mosses, will in time die and decay on the surface of the rocks, and in decaying they will add vegetable matter to that primitive soil. This layer of fine mineral particles, together with the vegetable matter, will form our first true soil.

The other agencies most important in the formation of soils are the higher plants themselves, which die and decay, adding matter and returning plant food to the soil, earth-worms, and certain minute organisms called "bacteria." When the primitive plants have lived and died alternately for some years we shall find higher plants commencing to take up their abode, and we shall find trees and shrubs of the most developed kinds; these latter annually drop their leaves and branches, which, when decayed, form the decaying vegetable matter called "humus," a most important constituent of all fertile soils.

In this manner a large accumulation of humus takes place in the virgin soils of primeval forests, and since this humus is of an acid nature, and is also continually giving rise to the formation of carbonic acid, the rain water that percolates through the soils of primeval forests is a most potent and rapid agent in the disintegration or crumbling down of the underlying rocks adding rapidly to the thickness of the soil.

We now know that the soil is not merely an inert mass, operated upon only by physical and chemical forces, but it is a realm of intense life, and the discovery of this fact has radically modified our conception of the soil and the means of treating it. Enriching the land is no longer the adding of mere plant food; it is also making the soil favourable to the multiplication and well-being of micro-organisms.

Harpenden. J. J. WILLIS.

(To be continued.)

WATER PLANTS IN MR. SWINSTEAD'S GARDEN.

Quisqualis indica. — This stove climber was introduced from India nearly a century ago, but it is very seldom met with in gardens. It is of a free rambling style of growth, the long flexible branches being clothed with oppositely-arranged ovate leaves. The flowers, which are individually a good deal like a long-tubed bouvardia, but with five points, are somewhat pale when first expanded, but when fully developed they are bright red. This quisqualis, known popularly as the Rangoon Creeper, is a near relative of another good old stove climber, namely Combretum purpureum.—W. T.

THE GARDEN IN AUGUST.

> And Nature holds, in wood and field,
>   Her thousand sunlit censers still;
> To spells of flower and shrub we yield
>   Against or with our will.
>
> J. G. Whittier.

One of the ways in which August differs from the other months of the year is in the diverse points of view with which it is regarded by gardeners or garden-lovers, according to the character of the gardens with which they are associated. A generation ago, when there was remarkable uniformity in bedding out—pelargoniums, calceolarias, lobelias, ageratums, verbenas, etc., with a due proportion of carpet bedding in the gardens of the well-to-do August, or at least, the first half of it, was regarded as the climax of the year, the time when all the plants had made sufficient growth to cover the ground and make their greatest display of flower and foliage. But now, "nous avons changé tout cela." Not that we have discarded pelargoniums for bedding out, or are likely to do so, as they are still second to nothing for making a brilliant splash of colour for a prolonged period; but so much of the summer bedding now takes on, to a greater or less degree, the character of the mixed border, and though bedding of this sort is infinitely more interesting, because possessing so much more individuality, yet, like their prototype, they often become an eyesore, or an anxiety, soon after July is out, unless they have been kept bare of blossom all the middle of the summer for the purpose of making a display later. It would seem as if there was a different season for the old and the modern style of gardening, the latter making its greatest show in June and July, instead of August. So great, indeed, is the difficulty of keeping up a display of the mixed, or herbaceous, beds and borders at this latter season that a writer in "The Times" two or three years ago had an article on "The Problem of the Herbaceous Border," while one of the recent illustrated works on gardening has a chapter on "The Rout of August."

August, then, is a rather sad time in the flower garden, a month when our enthusiasm is at a low ebb. Many, perhaps the majority, are content to go away at the beginning of the month and come back a month later to find the signs of decay all too manifest. Others feel that nearly all the hopes which make the springtime so full of absorbing interest and delight have either been fulfilled or have resulted in disappointment, little new remaining to look forward to—that great zest of gardening. If one must be away from the garden for a month in the growing season, perhaps we miss least of actual interest in August, though it is, or should be, second only to July as a month for enjoying its outdoor life. It is a month of reaping, in the garden as on the farm, and the garden will be what we have made it by our industry and foresight, knowledge, and skill, for many months, and even years, previously. If we know how, those herbaceous perennials which last but a short time, and are then an eyesore, will be arranged in such a way that their desolation is concealed as far as possible. We shall avoid putting plants of short duration in such positions that there are bad blanks at this season, and where ugly gaps do occur, either unexpectedly or because we cannot help it, we shall fill them up with some of the plants that we have had growing in pots or in nursery beds through the summer, and so keep up that prosperous appearance which is one of the charms of mixed beds and borders.

But in the garden as elsewhere, the busy man is the happy man, and if we are at home in August there is no reason why we should not be both, for there is much besides gathering the fruit and floral harvest which can be done at this season, and is, in fact, better done now than at any other time. The flower garden needs constant attention to keep it from becoming a wilderness, and we should endeavour to be in readiness for those disastrous storms of wind and rain which usually work such destruction in the latter half of the month, especially among those tall perennials which flower late in the summer and autumn. The rambler roses need the cutting out of their spent wood, and the tying or nailing in of the vigorous young shoots of the current year's growth. But it is the preparations for next season which begin in real earnest now, and constitute that charm of the autumn work in the garden which is not equalled at any other time of the year. There are cuttings to be taken of pelargoniums, pentstemons, violas, antirrhinums, etc., annuals to be sown for flowering early next summer. Madonna lilies, where they are beginning to deteriorate, to be taken up and replanted, bulbs to be potted up for forcing, and even planted in the open where there is space available—these and many other necessary operations will give one plenty to do in the flower garden alone.

And it is a busy time still in the fruit garden, for those who take a real interest in it apart from enjoying the produce. Now is the time to do the final pruning of gooseberries and currants of all sorts, and the sooner this is done after the fruit is picked the better. The same applies to the cutting out of the old raspberry canes, and any superfluous and feeble young ones still remaining, to let in the sun and air to those selected for next season. Stone fruit trees on the wall should be pruned and nailed up as soon as the fruit is picked, there being little danger in a normal season of fresh growth being made after pruning if this is not done before the middle of the month. The protecting of dwarf apples and pears from the birds is often an anxious business, the tits pecking holes in the nets sometimes to get at the trees. With the later varieties of fruits the first week or fortnight is the time to assist heavily-laden trees to swell up their crops by judicious applications of artificial manure, either in a liquid form or lightly hoed in round the trees in unsettled weather.

Where trees have been kept mulched through the summer it is a good plan to rake off the loose material after the middle of the month in order to let the soil about the roots have the full benefit of the usually diminished heat of the sun, always remembering that fruit which ripens in a dry soil is likely to have a better flavour than that which ripens in a wet one. From mid-August to mid-October is certainly one of the most interesting times of the year to the grower of apples and pears, for that is the time when fruit swells up faster and colours better than at any other time of the season, and many turn out to be a better sample than we have been expecting up to that time. Thus August, to the pomologist especially, is still a time of anticipation, a time when he is looking forward to the culmination of the year's hopes—the gathering of the fruit.

Alger Petts.

BULBS.—A practical treatise on the cultivation of hardy, hothouse and greenhouse bulbous and tuberous rooted plants is "Bulbs and their Cultivation," by T. W. Sanders, price 2s. 6d. net, or by post 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

LEAF-SHEDDING IN CONIFERS

Leaf-shedding in conifers, due to Botrytis cinerea, is the subject of a leaflet (No. 234) issued by the Board of Agriculture, and it is pointed out therein that the disease is well known both in this country and on the Continent. It has been recorded as attacking the following trees: Douglas Fir (Pseudotsuga Douglasi Carr.), Silver Fir (Abies pectinata DC.), Spruce (Picea excelsa Link.), Larch (Larix europæa DC.), Wellingtonia (Sequoia gigantea Lind. and Gord.). It has also been observed on junipers, and the Scots Fir (Pinus sylvestris L.) has been infected artificially with spores obtained from a diseased larch. Young nursery stock suffers most, but the youngest shoots of very old trees are also attacked.

The first indication of disease is a yellowing of the leaves, which finally turn brown and die, but are frequently prevented from falling, being held in a tuft by a delicate weft of brown cobweb-like mycelium. The affected shoots are usually variously twisted or curved downwards. When infection is due to spores conveyed by wind or insects, the uppermost shoots are most frequently attacked, whereas when infection is due to the presence of the parasite in the soil, the lower part of the stem from the ground-line for two or three inches upwards is attacked, and the younger branches remain free from injury. Leaves and shoots attacked by the disease eventually fall to the ground, where they remain until the following spring, the mycelium of the fungus present in the tissues having in the meantime given rise to numerous minute black sclerotia or compact masses of mycelium, which are more or less buried in the dead tissues. Just at the time when the young pine leaves are appearing, these sclerotia produce myriads of spores, which are distributed by various agents, and infection results.

The spores are capable of directly infecting young leaves, the germ-tube piercing the epidermis, whereas the bark of a two-year-old seedling can only be entered by some wound caused by late frost, punctures of insects, and similar agencies.

Preventive Measures.

1.—Perfect cleanliness in the seed-bed is of primary importance. Weeds should not be hoed up and left to die on the ground in the spring, as the Botrytis grows on all kinds of dying and dead plants, and the spores pass on to the leaves of the seedlings.

2.—In one instance the fungus causing the disease was found to have spread from stable manure, which had been imperfectly buried in the soil. The projecting portions of straw were thickly covered with the Botrytis.

3.—The fungus is very dependent on moisture, and only produces spores in a humid atmosphere, hence it is important that damp, low-lying situations should be avoided for nursery purposes.

4.—When the disease is present, spraying with the following solution will check its progress:

Sulphate of copper	11 lb.
Carbonate of copper	16 lb.
Permanganate of potash	1 lb.
Soft soap	3 lb.
Rain water	100 gall.

Every part of the ground within and for some distance beyond the affected patch should be thoroughly wetted. The soft soap should be dissolved in hot water. The remaining ingredients are soluble in cold water.

5.—All diseased seedlings should be collected and burned.

The Alpine Rose (Rhododendron ferrugineum). — Among the low-growing members of the rhododendron family, this is one of the most delightful, forming as it does a dense mass of neat, yet handsome, leafage of a rich green colour. The brightly-tinted blossoms are borne in great profusion. There are several allied kinds, but this is the equal of any of them. —W. T.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

SOBRALIAS.—There are few more useful orchids where large conservatories have to be furnished with decorative and flowering plants at all seasons of the year, than the species and hybrids of the genus Sobralia. Their elegant bamboo-like stems, plentifully provided with foliage, render them useful for placing against back walls. They are most tractable under cultivation, and many of them thrive under the ordinary conditions that obtain in the warm conservatory. In rock ferneries they are particularly useful, and, providing a temperature of 55 degrees can be maintained in winter, they do remarkably well planted out. Large specimens are particularly useful for exhibition purposes, there is nothing more effective for the back of a group than a few finely-flowered plants of sobralias. There is no doubt that the reason why sobralias are not generally grown is the short time the flowers retain their beauty. Some of those closely allied to S. macrantha hardly remain in perfection a single day; but S. Kienestiana, S. xantholeuca, and S. Lucasiana, with the hybrids S. Veitchi and S. Amesiana, last in good condition for two or three days, and as a succession of flowers is produced from the same stem, the plants generally give a fine display of bloom for several weeks.

A PORTION OF THE COLLECTION OF ZONAL PELARGONIUMS AT TAUNTON.

Exhibited by Mr. Vincent Slade, Staplegrove Nursery, Taunton.

CULTURE OF SOBRALIAS.—We grow the whole of the sobralias at the cool end of a large intermediate house in which the phaius and the cool cypripediums have a place. When thoroughly established they are gross feeders, and as it is not desirable to annually repot them, the pots should be large enough to allow the roots to extend freely. The best time to repot is immediately the flowering season is past, or as soon as some new roots are observed at the base of the season's growth. The pots selected should be clean, and about one-third filled with clean broken crocks. The potting compost should consist of fibrous peat, turfy loam, and a little leaf-soil, with sufficient rough sand to render the whole porous. Press the soil firmly about the roots, and surface with sphagnum. After repotting shade them for a few weeks, and syringe the foliage daily in warm weather. When the plants have become established they require almost unlimited supplies of rainwater during the season of active growth. During the resting season careful attention is necessary, as excessive root moisture generally results in disfigurement of the foliage. With regard to newly imported plants, I would suggest their being grown in a rather higher temperature than is advised for the established examples for a year or so, until they have become established. The stock may be increased by division at the time of repotting. Thrips and red spider are the principal insect pests, but by careful sponging and spraying these are easily kept in check.

EPIPHRONITIS VEITCHI.—I regard this as one of the finest of bigeneric hybrids. There is no orchid I am acquainted with that grows more freely when a position is found to suit its requirements. Not only does it produce side shoots from the stems of the older growths in a remarkable manner, but its freedom of flowering leaves nothing to be desired. It is a plant that should always be grown on a stage, so that it may have the benefit of rising moisture. I have never seen it do satisfactorily hung up, although its dwarf habit would suggest such a position for it. We find it does well with the seedling cattleyas, in pans filled to one-half their depth with broken crocks, and in a compost of about equal proportions of fibrous peat and chopped sphagnum moss. The plants take very little rest, and are practically in active growth at all seasons of the year, and therefore must not be allowed to remain long without root moisture.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

HELIOTROPIUMS.—Plants in small pots should now be shifted into 5-inch pots. Pot firmly, and afterwards place in a close frame for a few days; but when they have recovered from the shift stand them in the open on a layer of ashes. They may remain in this position until September, when they should be placed in a warm house, in which they will flower.

PRIMULAS.—After this date it will not be wise to remove the lights from frames at night-time, as there is danger from heavy rains; but the lights may be tilted to admit plenty of fresh air. Except those of the latest batch, all the plants should now be in their flowering pots. Well-rooted plants may receive doses of liquid manure in which some soot has been mixed. To obtain large specimen plants the following year seeds should be sown now and the seedlings be potted off singly about the third week in January.

CYCLAMENS.—As autumn-raised cyclamens are generally the most satisfactory, seeds should be sown about this time in pans filled with sandy soil. They germinate best in an intermediate temperature, and the atmosphere of the house must contain a moderate amount of moisture.

CAMELLIAS.—These also require some assistance in building up their flower buds. Whilst the plants in pots and tubs are still out of doors they should be thoroughly cleaned, as this is a good opportunity to get round about the plants easily.

ROMAN HYACINTHS.—The first batch will now have arrived, and should be potted immediately. After potting a good soaking of water will settle the soil around the bulbs, and the batch should then be placed in a frame, or out of doors, and covered with fine ashes or leaf-mould to the depth of six or eight inches.

SOUVENIR DE LA MALMAISON CARNATIONS.—As soon as the layers become rooted sever them from the parents, and in the course of a few days pot into three or four-inch pots, using a compost of good loam, leaf-mould, sand, a little bone-meal, and a sprinkle of soot. Shade the newly-potted plants from bright sunshine until the roots become active, and afford water carefully.

CHRYSANTHEMUMS.—The earliest varieties have now set their buds, and should have their shoots tied out evenly, training the tallest to the centre. Use stout sticks, not too long, and in tying in the shoots endeavour to hide the sticks as much as possible, never using two stakes where one will do. Attend regularly to feeding; give the plants liquid manure once a week, presently increasing it to twice or three times a week. Guard against greenfly, and as soon as this is noticed dust with tobacco powder in the evening and syringe it off in the morning.—W. Staward, Belford Hall Gardens.

THE FLOWER GARDEN.

ERYNGIUMS (SEA HOLLIES) are now making a bold show in the herbaceous beds and borders, and, notwithstanding the unfavourable weather this season, their colouring does not seem to have been affected. For bold groups, or even as dot plants in beds, these are most useful, being very effective. E. Oliverianum, E. alpinum, or E. giganteum are perhaps the most useful to use where a really bold effect is desired; these remain in flower for a very considerable length of time, and are free flowering. E. amethystinum, for some reason difficult to understand, is sometimes confused with the stronger growing Oliverianum, but the former seldom exceeds a height of 18 inches, and has smaller and less brightly coloured flower heads; but as a "dot plant" it is most useful and ornamental. Most of the eryngiums thrive best when growing in a somewhat dry border, with the exception, perhaps, of E. alpinum, which will thrive in a stiff loamy soil, and in a partly shaded position. Plants raised from seeds in 1909 are now making a fine show in these gardens, both involucres and stems being singularly bright and beautiful, and they are holding their own in comparison with less hardy and choicer bedding plants.

FIRST PRIZE COLLECTION OF SWEET PEAS AT TAUNTON.
Exhibited by Mrs. Howard Young, Filton Avenue, Horfield, near Bristol.

HERBACEOUS PLANTS are well repaying the grower for all the extra attention given them this season in the way of staking, tying, etc. At the present time phloxes are in grand condition, as the cool weather has suited them. Now is the time to make note of any variety of special merit desirable for another season, for as soon as they have ceased flowering, propagation by root division may be safely performed, as the roots will then establish themselves in their new quarters before the advent of wintry weather, and with the addition of a suitable mulching, should go through the severest winter unharmed.

DECIDUOUS HEDGES should now be carefully trimmed before the growths become too hard; discretion must be used in dealing with this class of work. For some of these the pruning knife, and not hand-shears, should be used, removing only those growths that are spoiling the general appearance or symmetry of the hedge or bushes.

PROPAGATION should now be proceeded with without further delay. Owing to the excessive rainfall and little sunshine, most of the bedding pelargoniums have made very rank and rapid growth of late. Careful attention is therefore needed in the selection of suitable growths for cuttings, and their immediate treatment, or many losses from damping off will occur. Perhaps during a season like the present it is wiser to depart from the orthodox rule of striking these out of doors fully exposed, placing them instead under the shelter of frames, or in a light, airy greenhouse fully exposed to the sun. Lobelias that may have been selected for stock should be carefully trimmed back to encourage new growths before being potted up and stored for the winter. Where verbenas are grown from cuttings it may be necessary to similarly treat the selected stock plants, to obtain cuttings in time for autumn propagation; at the present time suitable growths are not obtainable. Box or pot off young seedlings of Coreopsis grandiflora, gaillardias, pentstemons, and similar subjects as soon as they are ready.—W. Hedley Warren, Aston Clinton Gardens.

HARDY FRUITS.

GOOSEBERRIES AND CURRANTS.—All fruits will be gathered from the bushes by the time these notes appear, and immediate steps should then be taken to cleanse the trees from insect pests if any are present. The old fruiting wood of black currants should be cut clean away to allow the current season's growth to mature and thoroughly ripen; side growths of red and white currants and gooseberries, should also be shortened back to within four or five leaves. The surface soil should be frequently stirred with the Dutch hoe, and every means should be taken to keep the plantations free from weeds. It is a common mistake to neglect small bush trees after the fruit has been gathered; a little timely attention is all that is required to ensure good, strong, healthy trees, that cannot fail to bear heavy crops of fruit next season.

STRAWBERRIES.—Where the ground has been prepared by trenching and manuring, as advised in a previous calendar, no time should be lost in commencing to set out the plants for a new plantation; a distance of twenty-four to thirty inches should be allowed each way between the plants, according to the variety. Some are more robust, and make more foliage than others, so these require a further distance apart. The soil must be made moderately firm by treading, choosing a fine day for this operation. When planting, care should be taken not to break the ball of soil adhering to the roots. The crown of each plant should be raised slightly above the level of the soil. If dry weather prevails a good soaking with clear water should be given the plants after they are set out to settle the soil well around the roots. After the planting is completed, very little attention will be required other than keeping the weeds in check, but frequent Dutch hoeing will accelerate growth. Push on with the work of cleaning plantations that are required for fruiting purposes next season. It will be found that large quantities of runners have rooted into the soil and made good plants; these should be carefully lifted with a trowel and planted on a border, in nursery rows six inches apart, as they will be found most useful for planting out six weeks or two months hence. The autumnal fruiting varieties, such as St. Antoine de Padoue and St. Joseph, will soon be ripening their fruits, and nets should be placed over them without delay to protect the fruit from birds; also see that plenty of clean straw is placed under the fruits, as at this season of the year they are liable to rot very quickly if allowed to come in contact with the soil.

APPLES AND PEARS.—Many of the early varieties will require to be gathered shortly, but this work must on no account be commenced until the fruits have been thoroughly examined. A good specimen should be cut open with a sharp knife, and if the "pips" are brown in colour, and the fruits part from the branches easily, it is a sure indication that they are fit to be gathered. Plenty of patience must be exercised at all times before commencing to gather these fruits, and especially is this so when the variety has good keeping qualities. Many fruits are absolutely ruined both for culinary and dessert purposes when they are gathered before they have properly matured.—Henry R. Farmer, Cardiff Castle Gardens.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

Taunton, AUGUST 11.

Maintaining its enviable reputation for being favoured with fine weather, the Taunton Horticultural Society held its annual show on Thursday, August 11, in the pretty public park. For several years past there has been a two days' show, but on this occasion the society deemed it advisable to revert to their original course of holding a one-day show. There was some division of opinion as to the wisdom of this step, but it must at all events be recorded that the show was a very fine one throughout. The amateurs' and cottagers' sections were particularly strong, the entries in the vegetable classes surpassing, in both numbers and quality, many of the best exhibitions in the country. Mr. R. A. Goodman held the secretarial reins for the first time, Mr. Winsor, who held office for a long period, having retired. He was, at the luncheon on Thursday, the recipient of an illuminated album, which was presented to him as a token of esteem and appreciation of his services to the society.

Messrs. J. Cypher and Sons, Cheltenham, were the only exhibitors in the open class for a group of stove and greenhouse plants occupying a space 13ft. by 10ft. Their exhibit was a choice little group of oval shape with an irregular outline. A central pyramid of brightly-coloured foliage plants was topped by a good palm, and other points were marked by tall, shapely crotons and mounds of smaller subjects, finished off with Cocos Weddelliana. Cattleyas, Disa grandiflora, and other orchids, with white liliums, Clerodendron fallax, etc., provided colour, and assisted in the effective arrangement of a good exhibit.

In a smaller group confined to amateurs, first prize was awarded to Mr. Chas. Cook, gardener to H. Cornelius, Esq., who used Liliums lancifolium, rubrum, and album, Campanula isophylla alba, and other flowering plants, in conjunction with an assortment of foliage plants. Second prize went to Mr. W. Cox, gardener to Mrs. Bernard, whose arrangement was bright with carnations, campanulas, statices, and other flowering plants, whilst in the third prize group, arranged by Mr. S. Kidley, gardener to Colonel Sanford, C.M.G., Campanula pyramidalis and bright caladiums were freely used.

Messrs. Cypher and Sons swept the board in the several open classes for specimen stove plants, exhibiting some grand examples of ixoras, clerodendrons, statices, bougainvilleas, etc. The same firm also carried off the chief awards for foliage plants and for orchids. Mr. T. Essex, gardener to C. E. D. Esdaile, Esq., won first for a specimen fern with a capital plant of Adiantum Farleyense, Mr. W. Cox taking second with Nephrolepis Amerpohli. For twelve stove and greenhouse plants in the amateurs' section, Mr. S. Kidley scored with fine specimens of Bougainvillea glabra Coker Court variety, Dipladenia Brearleyana, and other favourite subjects. Mr. J. Stuckey, gardener to B. C. Shepherd, Esq., was second, and Mr. W. Cox third.

Mr. Cox was first for caladiums, Mr. Stuckey taking second place. Some splendid coleus were staged, the best six being those of Mr. Patrick Fawle, gardener to the Lady Abbess, Franciscan Convent; second Mr. Stuckey. Mr. W. Cox showed six magnificent ferns, including Adiantum trapeziforme and A. Farleyense. He was awarded first prize, Mr. W. H. Bruford, gardener to the Hon. H. P. Gore-Langton, coming second, Microlepia platyphylla being one of his best examples. Mr. F. Hubbard, gardener to Alex. M. Wilson, Esq., led for six fuchsias, and Mr. W. H. Bruford for zonal pelargoniums. Mr. Herman, gardener to H. Powell, Esq., being second in each case. Mr. T. Essex showed four grand pans of achimenes, for which he received first prize; and Mr. W. Cox had the best four pots of Lilium lancifolium. Mr. Stuckey took first for a specimen of Lilium auratum, second going to Mr. Wm. Gould.

CUT BLOOMS.

These were presented in good numbers, but the intense heat in the tents was responsible for the speedy collapse of most of the blooms. Messrs. Perkins and Sons, Coventry, won premier honours for thirty-six roses, and also for eighteen, some of their best being Florence Pemberton, Lyon Rose, Queen of Spain, Frau Karl Druschki, and Mme. Cadeau Ramey. The King's Acre Nurseries were second for the thirty-six, and Messrs. Jarman and Co., Chard, third, the latter firm being second for eighteen, and running the winners very close. In the amateurs' rose classes Mr. S. G. Burgess, gardener to F. G. Hayes, Esq., secured first for eighteen, and for twelve teas, Mr. A. E. Dunster being second in both these classes, and first for twelve distinct varieties.

Messrs. J. Cray and Sons, Frome, were the principal winners for dahlias, taking the lead for cactus, show, and pompons. In a class for twenty-four trusses of zonal pelargoniums Mr. W. Hayward, gardener to Miss Neal, won well, showing Ville de Poitiers, Fraicheur, and a number of other favourites, both in doubles and singles; the second went to Mr. J. Thorne, and third to Mr. O. Burton. It is a pity the varieties of such subjects are not labelled, as it adds much to the interest and educational value of the show when all exhibits are named. A very good class was that for twelve single spikes of phloxes, some enormous examples being brought forward. Mr. J. Webber scored, showing Mme. Carniodet, a capital white; Flambeau, brilliant scarlet; and other first-rate things. Dr. Bois, Meteor, and Mrs. John Harkness were among the best on the second prize stand put up by Messrs. Rich and Co., The Nurseries, Bath. A wonderful lot of asters were staged, Mr. J. H. Harris scoring for twelve Comets and twelve French or pæony-flowered, Mr. J. H. Merrett winning for Victorias.

Mr. F. Eames, Frome, had first for twenty-four gladioli, showing a clean, bright lot of well-flowered spikes. Mr. T. Totterdell was placed second. Mr. Chas. Wall, South Down Nurseries, Bath, won for both self and fancy carnations, showing Mrs. R. Morton, Terra Cotta, Daffodil, and Mrs. M. V.. Charrington among the selfs, and some grand blooms of Lord Steyne, Mandarin,and Richness in the fancies. Mr. A. R. Brown, King's Norton, took second in each class. For six vases of perpetual carnations the first prize was easily won by Messrs. Young and Co., Hatherley, Cheltenham, Messrs. Hodge and Co. being awarded second prize.

Classes were provided for cut blooms of both double and single begonias, Mr. S. Dight, gardener to Rev. Daniel Pring, winning well in both classes. His flowers stood right away from the other exhibits, and were a really grand lot. Mr. W. H. Bruford staged twelve good bunches of stove and greenhouse flowers in his first-prize exhibit, Begonia Carolina and Pancratium excelsum being very choice. Mr. Kidley followed. The winning stand of eighteen bunches of hardy perennials came from Mr. F. Eames, The Nurseries, Frome, who had Liatris spicata, Astilbe Davidi, Veronica subsessilis, and other showy things. Messrs. Rich and Co., Bath, were second, having some capital phloxes on their stand.

SWEET PEAS.

These were shown remarkably well, and occupied quite a large amount of space. In the open class for twelve bunches, the winning exhibit was staged by Mr. J Stuckey, who had Mrs. C. Foster, Audrey Crier, W. T. Hutchins, Mrs. Routzahn Spencer, and others in good style. He was followed by Mr. H. Ellis, gardener to R. Donne Hancock, Esq., whose flowers were carried on much shorter stems, and did not show to such advantage. Mr. A. E. Richards was placed third, and Mr. E. Argall, gardener to E. Constable Curtis, Esq., fourth. There were five entries in the class. Mr. Henry Eckford, Wem, offered prizes for a collection of twelve varieties, selected from his catalogue, and Mr. A. Shakelton, gardener to Freeman Roper, Esq., scored with good flowers, the effect of which was not improved by the use of vases of varied patterns. Mr. S. C. Shattock took second place.

In the class provided by Messrs. Robert Sydenham, Lim., Birmingham, there were eight entries, and competition was very keen. Mrs. Howard Young, a lady amateur, of 17, Filton Avenue, Horfield, near Bristol, who won easily, is to be congratulated on having the finest lot of peas in the show. The blossoms were large, clean, and of good colour, carried on long, strong stalks, and were lightly arranged in tall glass vases; Mr. J. Moore, gardener to Rev. E. Felton, was a good second, his Constance Oliver and Helen Lewis being specially noticeable. Mr. E. Ellis was third, and Mr. H. Cullwick, gardener to R. A. Sanders, Esq., M.P., brought up the rear. The Messrs. Sydenham also provided a class for six bunches, the prizes going to Mr. C. J. Curtis, gardener to G. S. Lysaght, Esq.; Mr. J. Foster, gardener to Reginald Boyle, Esq.; and Mr. W. Sage, gardener to W. F. S. Hodgson, Esq., in the order named. In Messrs. Webb and Sons' class Mr. T. H. Bolton, gardener to the Earl of Devon, took the lead, his vase of Nancy Perkins being very richly coloured. Mr. Jas. Chidzly, gardener to A. W. Hosegood, Esq., followed, and Mr. A. Shakelton came third.

DESSERT TABLES AND FLORAL DECORATIONS.

In the open class for a dessert table laid for eight persons, and decorated with flowers and foliage, Mr. C. J. Ellis, florist, Weston-super-Mare, claimed premier honours. His fruit included good figs, grapes, pineapple, and melon, and the floral decoration was tastefully carried out with richly-coloured cattleyas and suitable greenery. Mr. J. T. Curtis, Bristol, gained second prize, and his table was also well arranged with pink and mauve orchids. He had some good peaches. Mr. F. J. Cole was awarded third, but the use of many colours was the weak point in his exhibit.

VEGETABLES AND FRUIT.

The vegetable section was very strong throughout. A large number of prizes were offered by seed firms, and Mr. J. Stuckey and Mr. W. Cox were among the most successful exhibitors. The collections in the special classes provided by Messrs. Sutton, Carter, Webb, Sydenham, and Veitch brought out some beautiful produce, and the manner in which the exhibits were staged was highly creditable.

Fruit was also largely shown, Mr. T. Wilkinson, gardener to G. A. Gibbs, Esq., M.P., Tyntesfield, Bristol, winning in both the six and four-dish classes with some excellent peaches, melons, grapes, and plums. The single dish classes were well filled.

NON-COMPETITIVE EXHIBITS.

These had a large tent to themselves, and were of a high order of merit throughout. A most interesting and valuable exhibit was staged by Messrs. R. Veitch and Son, Exeter, who, as usual, showed very choice flowering shrubs and rare border perennials. Ceratophyllum gamiferum, Desfontania spinosa, and Pentstemon corditolius were represented, and a vase of the rare and beautiful Mutisia decurrens was conspicuous. Carnations, roses, gladioli, and a whole host of seasonable flowers made up a grand exhibit. Messrs. Isaac House and Son, Westbury-on-Trym, had remarkably good sweet peas, phloxes, and pyrethrums in great quantities. On the stand occupied by Messrs. Barr and Sons, King Street, Covent Garden, phloxes and varieties of Chrysanthemum maximum predominated.

Mr. Lowis, The Perennial Nurseries, Leversdawn, Bridgwater, put up a number of good things in the way of herbaceous flowers. Mr. Fred. Adams, Station Road, Taunton, had an exhibit of choice fruit and effective floral designs, which attracted much attention. Mr. A. E. Richards, Taunton, staged beautiful begonias and sweet peas. The display of perpetual carnations from Messrs. Young and Co., Hatherley, Cheltenham, was staged in the style that has become characteristic of the firm's exhibits. Duchess of Westminster is proving a good crimson, and was well represented here. Messrs. Rich and Co., Bath, showed phloxes F. W. Moore, Coequelicot, Iris, and other good varieties, together with Montbretia Messidor, and a number of border subjects. Mr. W. J. Godfrey, Exmouth, showed zonals, perennials, and a batch of his effective strain of amaranthus. An unusually bright lot of annual statices and some good border carnations were exhibited by Messrs. W. Tuplin and Sons, Newton Abbott. Roses, including such varieties as Richmond, Liberty, and Mme. Ravary, came from Mr. Rowland Adams, White Wells Nursery, Bath. Cut begonias, both double and single, were shown by Messrs. B. R. Davis and Sons, Yeovil, and a group of roses was arranged by King's Acre Nurseries, Lim., Hereford.

One of the most effective exhibits in the show was the large collection of vegetables, staged by Messrs. Jas. Carter and Co., High Holborn, W.C. Sweet peas, from Mr. H. Eckford, Wem, were a choice lot, and well staged. Othello, Dodwell F. Brown, Mrs. E. Gilman, and Mrs. Henry Bell were a few distinct varieties noted among many beautiful varieties represented by finely-developed and clean flowers. Messrs. W. E. and T. Cousins, the Taunton Florists, arranged a very attractive display of floral designs.

Roses were largely shown by the West of England Rose Farm, Lim., Henlade, Taunton; moss-covered baskets of hybrid teas, bamboo stands of ramblers, and boxes of exhibition varieties helped to make a good display. Mr. H. Clarke, Greenway Nurseries, Taunton, showed border flowers, sweet peas, and violas in a very pleasing and creditable manner. From Messrs. Jarman and Co., Chard, came one of the fine exhibits with which this enterprising firm are identified. The sweet sultans were, of course, well represented. Mr. Vincent Slade, of Taunton, staged a collection of the newest and best varieties of the ever-useful zonal pelargonium; the flowers were bright and showy in the extreme, and every variety used was a good one.

The extensive collection of gladioli staged by Messrs. Kelway and Son, Langport, embraced a wonderful variety of beautiful colours and perfectly-formed spikes. Among varieties that were most conspicuous were Mrs. G. W. Willcock, Peace Envoy, Queen Mary, and George V. Messrs. Geo. Massey and Sons, Spalding, brought a very large exhibit of potatoes, peas, melons, and a few gladioli and montbretias. In a special tent the Alpha Extinguisher, Lim., Ross, Herefordshire, exhibited their spraying machines. The various patterns were shown at work, and the gardeners and fruit growers of the district evinced keen interest in the demonstration. Messrs. Saunders and Biss, Exeter, exhibited greenhouses and frames glazed in the grooved bars, which are the firm's speciality, and dispense with the necessity for heavy wood rafters and putty.

MEDAL AWARDS.

Large Gold. — Messrs. Kelway and Son, Langport, for gladioli; Messrs. J. Carter and Co., Holborn, W.C., for vegetables.

Small Gold.—Mr. H. Clarke, Taunton; Messrs. Isaac House and Son, Westbury-on-Trym, for hardy flowers; the West of England Rose Farm, for roses.

Silver-Gilt. — Messrs. Jarman and Co., Chard, for cut flowers; Messrs. W. E. and T. Cousins, Taunton; Messrs. Geo. Massey and Sons, Spalding, for vegetables; Mr. Rowland Adams, Bath; the Alpha Extinguisher, Lim., for spraying machines.

Large Silver.—Messrs. Robert Veitch and Son, Exeter, for miscellaneous plants and flowers; Mr. Henry Eckford, Wem, for sweet peas.

Small Silver.—Mr. F. Adams, Taunton; Messrs. Rich and Co., Bath, for herbaceous flowers; King's Acre Nurseries, Lim., Hereford, for roses.

Bronze.—Mr. W. J. Godfrey, Exmouth; Mr. A. E. Richards, Taunton; Messrs. Barr and Sons, Covent Garden, London.

Sparkhill Horticultural Fete.

The tenth annual show, which took place on Saturday last in Sparkhill Public Park, in ideal weather, proved to be the largest on record, the entries in the amateurs' and cottagers' sections being abnormally large, and eclipsing in this respect the recent Wolverhampton and Handsworth Shows by several hundreds, hence asserting some claim to be the "Shrewsbury of the Midlands." The arrangements were efficiently superintended by the hon. secretaries, Councillor Wm. Marriott and Mr. Wm. W. Staples. It may, however, not be out of place to remark that at least one important item was non est, viz., the addresses of the entrants upon the exhibit cards, a matter worthy the attention of the executive on future occasions.

There was a record attendance of visitors, the major portion of whom were evidently attracted by the display of athletics and sports. The exhibits were contained in two monster marquees, and the array of cut flowers and vegetables in the amateurs' and cottagers' marquee presented a magnificent feature, so uniform was the quality throughout.

OPEN SECTION.

As heretofore, the chief centre of attraction was the groups class. The four exhibits, though hardly equalling a few previous creations, were meritorious. In selecting the group for premier honours the judges were considerably exercised, but eventually decided to grant it to Mr. J. Bastin for an attractive display, but with an extremely formal and massive centrepiece, carrying a tall palm above large plants of highly-coloured coleus and other heavy subjects. At each of the four corners of the design was a mound or grouplet furnished with crotons, caladiums, etc., and topped with a tall arundinaria, towering nearly to the height of the central palm. On one side of the design was placed a tall fasciated Lilium auratum, carrying about a dozen blooms, while the opposite side of the design contained a corresponding specimen of Lilium speciosum rubrum. The second prize was won by Mr. J. Earle for a light and artistic arrangement; and the third honours fell to Mr. J. A. Kenrick, Harborne (gardener, Mr. R. Usher), who used a cork-bark arch as his centrepiece; there was a lack of sufficient flowering plants in this otherwise tasteful arrangement, or a higher position would have been secured.

Stove and greenhouse plants were not in strong force, and the successful exhibitors were Messrs. F. Reily, H. Green, and J. Boston, in the order named. Fuchsias, which always are a feature here, were very well staged by Messrs. J. Earle, E. J. Dalby, and H. Green; and coleuses by Messrs. J. Earle, H. Green, and J. Boston. Three stove and greenhouse plants were best shown by Messrs. F. Reily, H. Green, and J. Boston. Liliums were very well set up by Messrs. R. Usher, J. Earle, and H. Bartlam.

Shower bouquets were most creditably arranged by six entrants; Mrs. H. S. Pratt led with a charming composition of creamy-white roses; Miss Emily Cope second, also with roses; and Mrs J. Cope third.

In the special classes for seedsmen's prizes the competition was keen. Messrs. W. H. Simpson and Sons, Birmingham, provided a class for nine varieties of sweet peas, and Miss Jessie Hurst was to the fore with excellent blooms of Mrs. H. Sykes, Clara Curtis, Evelyn Hemus, Helen Lewis, Constance Oliver, Etta Dyke, Frank Dolby, and Countess Spencer; second, Mr. S. Smith; and third Mr. C. Brazier. Messrs. Bakers, Wolverhampton, provided prizes for six distinct varieties of sweet peas, and Miss C. S. Hopkins led with good examples of Mrs. H. Sykes, Helen Lewis, Geo. Herbert, Countess Spencer, Constance Oliver, and Frank Dolby; second, Mr. W. G. Southgate; and third, Mr. R. E. Fowler. Messrs. Webb and Sons, Wordsley, Stourbridge, provided prizes for six bunches of sweet peas, and Mr. R. Dawes, Knowle, was to the fore with fine examples of Countess Spencer, Frank Dolby, Etta Dyke, John Ingman, Black Knight, and Queen Alexandra; second, Mr. H. Mitchell; and third, Miss Page. In the society's class for the best collection of sweet peas, space not to exceed 15ft. by 3ft., Mr. W. R. Bromley, Selly Hill, Birmingham (the only exhibitor), was accorded the first prize for a splendid and well-staged lot, comprising eighteen varieties, viz., Apple Blossom Spencer, Miss Willmott, Nora Unwin, Mrs. Hardcastle Sykes, Agnes Eckford, Paradise, Black Knight Spencer, Frank Dolby, Audrey Crier, Evelyn Hemus, Mrs. Walter Wright, Primrose Spencer, Etta Dyke, King Edward VII., Helen Lewis, Mrs. Routzhan, and Geo. Herbert.

Fruit was very well represented, and Lady Hindlip, Hadzor House, Droitwich, sent a very fine collection, not for competition, Appley Towers, Madresfield Court, Muscat of Alexandria, and Buckland Sweetwater grapes; Crimson Galande and Princess of Wales peaches; Lord Napier, and very large and highly-coloured Dryden nectarines; Negro Largo figs, three melons, apricots, Peasgood's Nonsuch apples, and Leader gooseberries were included, all tastefully decorated with vases of Francoa ramosa and scarlet montbretia, with appropriate greenery. A gold medal was awarded.

In the classes for grapes there were only two entrants for three bunches of black or white varieties (the first prize given by Mr. J. Udale, Droitwich), and here Lady Hindlip scored with good examples of Madresfield Court, and Mr. A. G. Buller with fine and well-finished Black Hamburgh, was second. For a dish of six peaches Lady Hindlip, the Earl of Shrewsbury, and Mr. A. G. Buller were the winners respectively.

Table decorations, ladies, were an attractive feature, and were highly creditable to the fair contestants. There were ten entrants, and the coveted honour was annexed by Mrs. H. V. Pratt, with a dainty arrangement of salmon and coppery roses, single and double varieties, with Selaginella uncinata trails. A close second was Miss Emily Cope, with a somewhat similar arrangement, but including Francoa ramosa and dainty sprays of a bright purple acer; Miss N. Guest, and Mrs. J. Cope were respectively third and fourth.

There was a brisk competition in the special classes for vegetables. Messrs. W. H. Simpson, Birmingham, offered prizes for six distinct kinds, open to all classes of exhibitors, and Mr. H. Foster annexed the premier prize with good examples of cauliflowers, carrots, scarlet runner beans, Quite Content peas, Cigarette potatoes, and Ailsa Craig onions; Mr. E. Deakin, second, with a close lot. In Messrs. Webb and Sons' class for six distinct kinds, Mr. Hugh Mitchell was to the fore with Early Mammoth cauliflowers, celery, Ailsa Craig onions, carrots, The Gladstone pea, and New Guardian potatoes; Mr. E. Deakin was second. Messrs. Yates and Sons provided prizes for a collection of five kinds of vegetables, and good examples were trayed by Messrs. F. Whitbread, E. P. Peel, and A. Hill, in the order named.

A gold medal was awarded to Messrs. W. H. Simpson for a magnificent arrangement of sweet peas, intermixed with plants of Nandina domestica and Kochia trichophylla. A silver-gilt medal was awarded to Mr. H. N. Ellison, West Bromwich, for a collection of ferns.

United Horticultural Benefit and Provident Society.

The usual monthly meeting of this society was held at the Royal Horticultural Hall, Westminster, on Monday evening, August 8, Mr. C. H. Curtis in the chair. One new member was elected, making a total of fifty this year so far. The death certificate of Mr. Robert Anderson (a lapsed member) was produced, and the amount standing to his credit, viz., £29 13s. 6d., was granted to his nominee. Several members over sixty years of age have taken advantage of Rule 18 to withdraw their interest on their deposits to enable them to pay up their contributions. The amount of sick pay for the past month was £29 17s.

Royal Horticultural Society.

AUGUST 16.

The usual fortnightly meeting was held at Vincent Square, Westminster, and proved a very good show for the holiday season. The out-standing features were the phloxes to be seen in most collections of hardy flowers. The collection of fruit trees in pots from Messrs. James Veitch and Sons, Lim., and the fine examples of Campanula pyramidalis from **Colonel G. H. Trollope** were especially noteworthy. Hardy flowers came in abundance from Messrs. George Bunyard and Co., Lim., Maidstone, and a fine display they made. The pentstemons were quite a feature, the most conspicuous varieties being **Southgate Gem, Grandeur,** and G. Holme. Gladioli were in fine form, as were also a good collection of phloxes, in which Iris, Coquelicot, Belvedere, and Sprite were noted. The gaillardias, coreopsis, and delphiniums, too, added interest to the exhibit.

AN EXCEPTIONALLY FINE GROUP OF DISA GRANDIFLORA.

Exhibited by Mr. Taylor, gardener to Mrs. Bischoffsheim, Warren House, Stanmore, at the R.H.S. meeting on Tuesday last.

Messrs. Barr and Sons, King Street, Covent Garden, had a showy collection of hardy flowers, which included some good bunches of phloxes, such as Selma, Frau Buchner, General Von Heutry, and Lady Molly. **Delphiniums were also a feature,** while gladioli, too, were noteworthy.

Mr. F. Woolard, Lewes Road, Brighton, had an exhibit of roses that were lightly arranged, mostly in vases, the most conspicuous being Mrs. A. Ward, Trier, Mdme. A. Chatenay, and Mrs. P. Blair. From Colonel G. Haward Trollope, Fairmile Hatch, Cobham, came a small group of Campanula pyramidalis, in both white and blue. The specimens were of large size, splendidly flowered, and attracted much attention from the visitors.

Mr. C. W. Breadmore, Winchester, occupied the end of the hall with a fine exhibit of sweet peas in about forty varieties, though there must have been nearly one hundred and fifty vases, all lightly arranged, and producing a pleasing effect. The varieties were all up to date, and were excellent for such a late period.

Mr. James Box, Lindfield, staged a fine group of phloxes arranged in tall bamboo stands. The most attractive were Wolfgang, Bacille, Lindfield Beauty, which appeared to be Elizabeth Campbell with all the other exhibitors, Selma, and Iris. A ring of delphiniums and montbretias completed the group.

Hardy flowers from Messrs. Whitelegg and Page, Chislehurst, were bright and well arranged. Phloxes, pentstemons, and delphiniums were their chief features.

Messrs. Kelway and Son, Langport, had a full table of splendidly-developed gladioli spikes, consisting of the fine varieties that have been raised by the firm. Just a few of the best were Golden Treasure, Lady White, General French, and Sulphur King, though **nearly all were worthy of mention. Messrs.** Kelway and Son also exhibited delphiniums in variety, with capital late crop flowers of pyrethrums, and some splendid vases of gaillardias, in which were noted Great Western, Earl of Listowel, and James Kelway.

A glorious table of montbretias came from **Sidney Morris, Esq. (gardener, Mr. G. Henley),** Wretham Hall, Thetford. The varieties were not only well grown, but beautifully staged with asparagus, smilax, and similar foliage. Some of the best forms were **Messador, Lord Nelson, St. Botolph, George** Davidson, and Westwick.

Nymphæas came from Mr. Leopold de Rothschild (gardener, Mr. J. Hudson, Gunnersbury). The best of the new varieties were Virginale, Newton, and Splendida.

From the Earl of Warwick (gardener, Mr. H. Lister), Easton Lodge, Dunmow, came vases of the rich blue Nymphæa Pennsylvania, and Lord Brooke, a rosy-pink form of N. stellata.

Mr. A. J. Harwood, St. Peter's Nursery, Colchester, staged a well-arranged table of hardy flowers, in which were to be seen some good phloxes, Sidalcea Rosy Morn, and the double gypsophila.

A miscellaneous group of flowering plants **came from Messrs. James Veitch and Sons,** Lim., Chelsea. These comprised good decorative plants of Abutilons Golden Fleece, Red Gauntlet, and Boule de Neige. A collection of well-grown cannas, Crowea latifolia in fine form, and Exacum macranthum. The same firm also had a group of standard Salvia splendens, beautifully flowered, and ivy-leaved pelargoniums trained in the same way.

Border carnations from Messrs. W. Watson and Sons, Lim., Clontarf Nurseries, Dublin, were nicely staged in clear glass vases, with plenty of carnation "grass." The best were Scarlet Banner, Countess of Aberdeen, Lady Cory, and Lady Haddo.

Messrs. Carter Page and Co., London Wall, E.C., had the first dahlia exhibit of the season. They occupied an entire table with cactus, pæony-flowered, pompon, and single varieties, the whole being nicely arranged with palms, grasses, and other suitable foliage.

The Guildford Hardy Plant Company were represented by an exhibit of hardy flowers, which included tritomas, gladioli in good variety, and a collection of phloxes.

Messrs. T. S. Ware, Lim., Feltham, occupied an entire table with a magnificent col**lection of hardy flowers. These included** finely-grown phloxes, heleniums in variety, liliums, and statices, the whole being lightly arranged.

Ferns were the chief exhibit of Messrs. **H. B. May and Sons, Upper Edmonton, in** which were placed standard hybrid veronicas. The ferns were chiefly decorative nephrolepis in variety, and some handsome crested forms of Polypodium vulgare.

Another exhibit of hardy flowers came from Messrs. G. and A. Clark, Lim., Dover, who had as special features Anchusa italica Dropmore variety, larkspurs, gladioli, lupins, and carnations. Tuberous begonias came from Mr. L. Gwillim, Cambria Nursery, New Eltham. A few named double varieties in pots were very fine; while the doubles were arranged in colours on boards.

Messrs. F. Cant and Co., Braiswick Nurseries, Colchester, had a pretty exhibit of roses, chiefly of a decorative character. The **most prominent were Mrs. P. Blair,** Gottfried Keller, Theresa, Lyon, Mrs. A. Tate, Avoca, Papa Gontier, and Mrs. E. G. Hill. Messrs. W. Wells and Co., Lim., Merstham, staged some fine phloxes, the brightest being Le Siècle, Elizabeth Campbell, Alliance

Russe, and Queen Alexandra; also some good bunches of early-flowering chrysanthemums, such as Gertie, Polly, Roi des Blanc, and Holmes' White.

From Messrs. Rich and Co., Bath, came a collection of phloxes arranged in good bold masses. The best were Baron von Deden, William Ramsey, Elizabeth Campbell, Sinbad, and Selma.

A table of cut carnations in bamboo stands, with a similar exhibit of single early-flowering chrysanthemums, was presented by Sir D. Gooch, Bart. (gardener, Mr. P. Wilkinson), Hylands, Chelmsford. The former were nicely set up with suitable foliage. The chrysanthemums did not appreciate the humid atmosphere of the hall, though they were represented by some of the best varieties in this section. Mr. M. Prichard, Christchurch, presented a large exhibit of hardy flowers, which were staged in his well-known style. The tritomas formed a fine collection, the best being Canary Bird, Glow, Egypt, and Chrysantha. Two groups of Crinum Powelli, and its white form attracted much attention, as did also the rarer hybrids of gladioli, and a collection of well-developed phloxes. Messrs. S. Bide and Sons, Farnham, staged a large exhibit of sweet peas in a pleasing manner. The whole were good, but the most striking were Elsie Herbert, Helen Lewis, St. George, Ellen Willmott, and James Grieve.

Phloxes were the chief feature of the large and attractive group of hardy flowers from Messrs. Paul and Son, Cheshunt. They had fine masses of Danton, Etna, Daniel Lesseur, and Coquelicot, with sunflowers, montbretias, and tritomas between.

Gladioli from Mr. W. Pfitzer, Stuttgart, attracted much attention. The hybrids, taken as a whole, were not up to our standard, but the following varieties were most pleasing: Europa, a splendid white; Grafin Degenfeld, Negerfurst, and Fred Lauferer.

Mr. F. Brazier, Hardy Plant Nursery, Caterham, arranged a large group of phloxes, carnations, sweet peas, and violas. The phloxes were fine in size and colour.

ORCHID COMMITTEE.

A magnificent group of Disa grandiflora came from Mrs. Bischoffsheim, (gardener, Mr. Taylor), Stanmore. The plants were in pots, all carrying splendid spikes of flowers, the development being truly remarkable, and a clear evidence of cultural skill.

A fine plant of Cypripedium Wiertzianum came from Mrs. Temple (gardener, Mr. E. Bristow), Leyswood, Groombridge. It was carrying eleven fine flowers on three spikes.

H. S. Goodson, Esq. (gardener, Mr. G. E. Day), Fairlawn, Putney, sent a few choice specimens, which included plants of Cattleya Crawshayi var. Leopoldi, Sophro-lælio-cattleya de Vere Beauclerc, L.-c. St. Gothard, a form with a splendid purple lip of great substance, also a few fine odontoglossums.

Lieut.-Colonel Sir G. Holford (grower, Mr. H. G. Alexander), Tetbury, staged some splendid plants, the chief being Vanda cærulea. The plants were in a robust state of health, and flowering freely, many of them carrying spikes with fifteen to eighteen flowers. The Westonbirt variety in the group was remarkable for its deep colour and clear marbling.

Messrs. Charlesworth and Co., Haywards Heath, had a nice collection, in which were noted Ærides Lawrenceæ, with four fine spikes, Stanhopea oculata, Cycnoches chlorochilon, Lælia Bella with a well-striped lip, Mormodes luxatum punctatum with eight well-developed flowers, and oncidiums in variety.

Mr. E. V. Low, Haywards Heath, exhibited several choice orchids, the most noteworthy being the beautiful Oncidium Mantini Lowi.

A small collection of botanical species from Sir Trevor Lawrence, Bart., Burford, were certainly an attraction to lovers of these plants. They included the quaint forms of Theodora gomezoides, Dendrobium ciliatum, and a polystachya, the species of which was not determined.

From de Barri Crawshay, Esq. (grower, Mr. W. J. Stables), Sevenoaks, came beautiful plants of Odontoglossum Queen Alexandra, and a fine plant of O. Thwaitesiæ.

Mrs. Norman Cookson (gardener, Mr. H. Chapman), exhibited a very fine variety of Odontoglossum Pescatoreæ Cookson's var., also a fine example of Cattleya Oakwoodiensis, and some hybrid cypripediums.

Messrs. Stuart Low and Co., Bush Hill Park, had a nice display of orchids, which included good examples of Cattleya Gaskelliana, Lælia-cattleya Epicata, L.-c. Lustre magnifica, a lovely form; L.-c. Callistoglossa Ignescens, with a splendid deep purple lip, and a fine example of Cattleya Hardyana.

Messrs. Sander and Sons, St. Albans, had a very nice exhibit of orchids in variety. Some of the most noteworthy were Cattleyas Vulcan, C. Atalanta, C. Lord Rothschild, and Lælio-cattleya Bletchleyensis.

FRUIT AND VEGETABLE COMMITTEE.

The only real exhibit before this committee was a large group of fruit trees in pots from Messrs. Jas. Veitch and Sons, Lim., Chelsea. These occupied a large space on the floor of the hall. The sections represented were peaches, nectarines, plums, figs, and apples. The trees themselves were in splendid health, and all carried full crops of fruit, in fact, some were bearing a double crop. The peaches included fine examples of Marquis of Downshire, Dr. Hogg, Nectarine Peach, Thos. Rivers, Late Devonian, and Prince of Wales. The nectarines were equally well fruited, especially Elruge, Early Orange, Goldoni, and Stanwick Elruge. The figs also were carrying fine crops of ripening fruit.

AWARDS.

First-class Certificate.—To Vanda cærulea Westonbirt variety, from Lieut-Colonel Sir. G. Holford.

Award of Merit.—To Gladiolus Primulinus, from Messrs. Kelway and Son, Langport; to Gladiolus Grafin Degenfeld, from Mr. W. Pfitzer, Stuttgart; to the same exhibitor for Gladioli Europa and Karl Luz; to Oncidium Mantini Lowi, from Mr. E. V. Low, Haywards Heath; to main crop peas, grown at Wisley, Carter's Exhibition, from Messrs. James Carter and Co.; to Magnum Bonum, from Messrs. Barr and Sons; to Satisfaction, Windsor Castle, Yorkshire Hero, from Messrs. Sutton and Sons; to Melon Early Favourite, from Mr. A. E. Smith.

MEDALS.

Gold Medal.—To Messrs. Jas. Veitch and Sons, for fruit trees in pots.

Silver-gilt Flora.—To S. Norris, Esq., for montbretias; to Lieut.-Colonel Sir Geo. Holford, for orchids.

Silver-gilt Banksian.—To Mr. C. W. Breadmore, for sweet peas; to Messrs. Kelway and Son, for gladioli.

Silver Flora.—To Messrs. F. Cant and Co., for roses; to Mr. W. Pfitzer, for gladioli; to Mr. M. Prichard, for hardy flowers; to Messrs. Paul and Son, Cheshunt, for phloxes; to Messrs. Sander and Sons, for orchids; to Messrs. Stuart Low and Co., for orchids.

Silver Banksian.—To Messrs. G. Bunyard and Co., for hardy flowers; to Messrs. Carter Page and Co., for dahlias; to Messrs. Jas. Veitch and Sons, for flowering plants; to Col. G. H. Trollope, for campanulas.

Bronze Flora.—To Mr. J. Box, for phloxes; to Messrs. H. B. May and Sons, for ferns; to Messrs. T. S. Ware, Lim., for hardy plants.

Bronze Banksian.—To Mr. F. Brazier, for phloxes; to Sir D. Gooch, for carnations and chrysanthemums.

The Silver-gilt Lindley Medal.—To Mrs. Bischoffsheim, for Disa grandiflora.

Cultural Commendation.—To Mrs. Temple, for Cypripedium Weitzanum.

West Derby, AUGUST 1.

The nineteenth annual show was held in the Rectory Grounds, by kind permission of the Rev. Percy Stewart. The large marquee was crowded with exhibits, which were fully up to average merit. The weather was delightful, and, judging from the crowded tent and grounds, the committee should be fully satisfied with the results.

In the class for a group of plants, three exhibits were staged, each being highly creditable. The premier combination was well arranged, bouvardias and verbenas being used to great advantage, whilst the crotons, although good, were perhaps rather too freely utilised. The third group was a pleasing one, and if the pots on the extreme edge had been hidden would have taken a higher position. The prize-winners were Mr. George Osborne, gardener to Drs. Tisdall and Ingall; Mr. S. Spencer, gardener to G. Layton, Esq.; and Mr. H. Spencer, gardener to A. H. Jones, Esq.

For a table decoration Mrs. V. Young outclassed her competitors with a pleasing design of carnations.

In the plant classes Mr. G. Osborne secured the first award with a well-flowered ixora; he also had the two best pots of liliums, the best four stove and greenhouse plants with crotons, crinum, etc.; the best six table plants, the best two palms—Kentias Fosteriana and Belmoreana, and the best specimen foliage plant—Areca lutescens. The same exhibitor scored for herbaceous cut flowers, for twelve vases of sweet peas, six tomatoes, and nine vegetables.

Mr. R. Cleaton, gardener to H. McCubbin, Esq., had the leading twelve bunches of annuals, best two dishes of peas, Queen of Marrowfats being good. Mr. I. J. Edgar, gardener to the Rev. Percy Stewart, won for six dishes of vegetables, and had the leading dozen dahlias. Mr. H. Osborne, gardener to Miss Heap, was successful for six distinct kinds of fruit with good black and white grapes, nectarines, peaches, etc.; for six dishes of hardy fruits, for two bunches black grapes (with Black Hamburgh), for two bunches of white grapes, and for twelve roses.

Mr. Ogden had the best carnations and the best bouquet, and Mr. S. Spencer, the leading zonale pelargoniums. Mr. C. Nicoll secured the silver challenge vase for twelve varieties of sweet peas with a fine set.

Prescot, AUGUST 1.

The twentieth annual show of this society was held in the beautiful park of Knowsley, by the kind permission of the Right Hon. Earl of Derby, under the most favourable weather conditions. The entries were not quite up to the average, but the exhibits were good.

For a collection of plants, arranged for effect, Mr. W. H. Roberts, gardener to F. Dixon Nuttall, Esq., was first, and the only exhibitor staging a bright combination, his adiantums and crotons being fresh and bright. For two palms or cycads, Mr. W. H. Roberts was to the fore with a good pair of latanias; Mr. D. McKelvie second. For four stove or greenhouse plants Mr. D. McKelvie led the way with fair specimens; Mr. J. George, gardener to T. Henshaw, Esq., second. In the class for four greenhouse plants in flower Mr. D. McKelvie took the lead, followed by Messrs. W. H. Roberts and J. George. Mr. J. George scored for one stove plant in flower with a well-flowered Clerodendron Balfouri; Mr. D. McKelvie second with a small ixora. Mr. W. J. Roberts scored with a fine plant of Nephrolepis Pearsoni, and Mr. D. McKelvie was second for one specimen fern. Mr. W. H. Roberts had the best hanging basket, and Mr. C. Houghton, gardener to E. S. Eccles, Esq., was first for three caladiums, and for a single plant. Mr. A. Rose was the winner also for four begonias and for gloxinias. For three zonal pelargoniums Mr. W. H. Roberts led with well-bloomed plants. Mr. Roberts was again to the fore with fuchsias, showing well-flowered pyramids.

The best eighteen roses were from Mr. J. W. Barker, his best blooms being Lyon Rose, Mrs. J. W. Grant, and Pharisaer; Mr. C. Houghton second. For six roses Mr. J. W. Barker also led. For twelve bunches of herbaceous cut flowers Mr. J. George staged an excellent collection, and he was first for twelve carnations.

Fruit formed a good section; the grapes were moderate in size of bunch, but well

BOULTON & PAUL, LTD., HORTICULTURAL BUILDERS, Norwich.

EFFECTIVE, PRACTICAL CONSERVATORIES.

finished throughout. For four dishes of fruit Mr. W. Oldham, gardener to J. Beecham, Esq., held the position of honour with Black Hamburgh grapes, melon, Downton nectarine, peaches, etc.; Mr. D. McKelvie second with good Pine Apple nectarines. For two bunches Black Hamburgh grapes Mr. D. McKelvie led with good berries, and for two bunches of white grapes Mr. T. M. Nelson, gardener to E. Stapleton Bretherton, Esq., won, while for two bunches of "any other black" Mr. D. McKelvie led with Madresfield Court.

Vegetables were good throughout, and the prize-takers for eight kinds were Messrs. J. George H. McFall, and W. H. Roberts, who were placed as named.

Harborne Gooseberry Show.

The ninety-fifth annual exhibition of the above society was held, as usual, at the Green Man Inn, the venue since its inauguration in 1815—verily a record. The above show was held on the 6th, 7th, and 8th inst., and there were nearly 100 dishes of berries, but as regards size and weight of berry, there was a considerable falling-off from last year's produce, this being attributed to the unfavourable season. Last year's premier berry, Collis Lane, weighed 28dwt. 1gr., whilst this year's premier, Ringer, weighed 22dwt. 5gr., and so on in proportion throughout the exhibits. It is interesting to remark that the champion prize-winner consecutively for the last seventeen years, Mr. Emanuel Withers, had to succumb to his old opponent, Mr. R. Smallwood, on this occasion, who showed Ringer, 22dwt. 5gr., as already stated. The "best beaten berry," 20dwt. 22gr., was shown by Mr. E. Withers. Following the schedule, here is the list of awards: Premier berry, Mr. R. Smallwood, with Ringer, 22dwt. 5gr.; best "beaten" berry, Mr. E. Withers, with Ringer, 20dwt. 22gr.; single red berry, Mr. E. Withers first with Bobby, 22dwt. 4gr.; Mr. William Timmins second with Lord Derby, 20dwt. 15gr.; Mr. C. Corbett third with Dan's Mistake, 18dwt. 17gr.

Single Yellow Berry.—Mr. R. Smallwood first with Ringer, 22dwt. 5gr.; Mr. E. Withers second with Leveller, 20dwt. 3gr.; Mr. G. Nicholls third with High Sheriffs, 18dwt. 9gr.

Single Green Berry.—Mr. E. Withers first with Matchless, 19dwt. 5gr.; Mr. R. Smallwood second with Hockwell, 18dwt. 6gr.; Mr. R. Shepperd third with Surprise, 17dwt. 3gr.

Six Berries, red.—Mr. E. Withers first with Bobby, 122dwt. 12gr.; Mr. G. Nicholls second with five Bobbys and one Lord Derby, 109dwt. 20gr.; Mr. R. Smallwood third with six Bobbys, 106dwt. 3gr.

Six Yellow Berries.—Mr. E. Withers first with three Ringers and three Levellers, 112dwt. 18gr.; Mr. R. Smallwood second with five Ringers and one Leveller, 110dwt.; and Mr. W. Timmins third with five Levellers and one Thatcher, 105dwt. 18gr.

Six Green Berries.—Mr. E. Withers first with four Surprise and two British Oak, 101dwt. 2gr.; Mr. W. Corbett second with Surprise, 94dwt. 2gr.; Mr. H. Giles third with Surprise, 94dwt.

Six White Berries.—Mr. E. Withers first with Transparent, Fascination, and Faithful, 110dwt. 12gr.; Mr. H. Giles second with Fascination, 97dwt. 18gr.; Mr. J. Davies third with Transparent, 93dwt. 4gr.

I will be seen that the redoubtable Mr. Withers, despite his defeat for the premier berry, maintained his long record as an all-round winner and champion.

Bournemouth Gardeners' Association.

The committee met a few evenings since to arrange the programme for the next six months. There was a full meeting, presided over by Mr. J. B. Stevenson. The first event of the next session will be a meeting of the members at Messrs. G. Watts and Sons' Talbot Woods Nurseries, then there will be lectures on "Roses," "Manuring Vegetable Gardens," "Manuring Grass Land," "The Cultivation of the Cineraria," and other useful subjects. Several exhibitions are also arranged, namely: Four classes for dahlias on September 6; Begonias of Gloire de Lorraine type, and six distinct varieties of zonal pelargoniums, three trusses of each, to be shown in vases with any kind of foliage, on December 6; on January 3, three gentlemen's buttonholes, to be shown on boards.

In the dahlia classes two are for the blooms to be shown in one vase, to show how useful this popular flower is for decorative purposes. These small exhibitions lend an added interest to the meetings of the members, and prove highly educational also.

OBITUARY.

◆

EARL SPENCER.

Earl Spencer, who died at Althorp Park, Northampton, on Saturday, August 13, had for a long period held a high position in the political world, and was twice Lord Lieutenant of Ireland. The late Earl was very fond of his estates and gardens, and under his guidance the gardens at Althorp have attained considerable eminence. Mr. Silas Cole, the Earl's gardener, it will be remembered, introduced the waved sweet pea to public notice, and the beautiful variety named Countess Spencer, the first to appear, is still one of the best, while the bright-hued Earl Spencer, a waved Henry Eckford, is another fine variety raised at Althorp.

FORTHCOMING ENGAGEMENTS.

TUESDAY, August 23. — Oxford Horticultural Society; autumn show.
THURSDAY, August 25.—Aberdeen Horticultural Society; three days.
Sandy Horticultural Society.
Ellesmere Horticultural Society.
Blaenavon Flower Show.
SATURDAY, August 27.—Hawick Horticultural Society.
TUESDAY, August 30.—Royal Horticultural Society Committees meet at 12 o'clock; lecture on "The Effects of Overhead Electrical Discharges upon Plant Growth," at 3 o'clock, by Mr. J. H. Priestley, B.Sc.; Scientific Committee, 4 o'clock.
WEDNESDAY, August 31.—Glasgow Horticultural Society.
Carlisle Flower Show; two days.
South Shields Flower Show; two days.
Chester Agricultural Society, Horticultural Section.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

MUSHROOM SPAWN.—H. G., Derby: The pieces of spawn used should be 1½ to 2 inches square, and inserted two, or at most three inches, deep in the prepared bed, and nine inches apart each way.

RUST ON CHRYSANTHEMUMS. — F. D. C., Chichester.—The brown patches are evidence of the presence of the rust fungus (Puccinia Hieracii), that is frequently found on chrysanthemums and other composite flowers. Remove and burn the affected leaves and spray the plants with a weak solution of potassium sulphide at intervals of a week or ten days.

ACETYLENE GAS REFUSE.—D. C., Craven Arms: The refuse of the calcium carbide after it has been used in the manufacture of acetylene gas is not so useful for garden purposes as ordinary unslaked or newly slaked lime. If the soil lacks lime the refuse may be used at the rate of about 1½lb. per square yard. The material should be spread on the ground as crops are removed and dug in, in the case of land previously heavily manured. But where trenching and manuring are to be carried out the lime should be applied in the spring or early summer as a top dressing, and hoed in.

SEEDLING RANUNCULUSES.—E. C. C. D., Southborough: If the seedlings are left in the ground all the winter they must be protected by means of frame lights, and a light covering of bracken on the soil. This will keep them from harm during frosty and wet weather. If the tubers are in heavy, damp soil it will probably be a better plan to lift them when the foliage dies down, and plant at once in light, rich, sandy soil in a cold frame, where protection can be given from frost and cold rains or snow. Here they will start into growth early, and may be planted out in April or May. If the soil is light and the position a warm one, then do not lift the seedlings, but protect them as advised above. The seedlings should flower in the third year.

AUTUMN-SOWN ONIONS.—S. H. H., Bromwich: Make a sowing at once and another at the end of the month. Sow thinly in shallow drills on soil that has been well dug, finely broken down, and made firm, but not freshly manured. Thin the seedlings, but not severely, and hoe among them freely. Transfer the strongest plants to a bed of rich soil at the first favourable opportunity next spring and set them out about a foot apart. The utmost care must be taken in lifting and transplanting; plant firmly, water in, and mulch with friable decayed manure, and you will obtain fine bulbs for use or for exhibition at the early summer exhibitions. White Leviathan, Red Rocca, Lemon Rocca, and Ailsa Craig are all good for autumn sowing.

CONSERVATORY WALL. — Homebird, Streatham: The green-covered wall and small border will never be a real success if the bench is permitted to remain in position, because the drip from the pot plants will spoil everything underneath it. In a heated house many subjects could be grown under such a bench, notwithstanding the drip. The little border should be a couple of feet deep, with six inches of drainage (potsherds and clinkers), in the bottom, and good loam mixed with coarse sand filling the upper eighteen inches. In this plant half a dozen small-leaved ivies purchased in pots, and train the growth to the wall. These will soon cling to the wall, and in a year or so completely cover it, and there will be very little trouble in keeping it close and tidy. Hedera caenwoodeana is an elegant little ivy with divided leaves, in which the veins are light-coloured. This would do very well for the wall, but you should visit a nursery where shrubs are grown largely, and choose a small-leaved

*** If a receipt is required for amounts under 10s. a stamped envelope should be forwarded.

ivy that pleases you. In front of the ivy plant a few of the better forms of hardy ferns; nearest the ivy put some of the crested Male ferns, and nearer the edge of the border plant some of the beautifully-crisped and crested Scolopendriums (Hart's Tongues). If a few hooks are placed in the wall, at reasonable intervals, it would be possible to suspend flowering or other plants from these in the spring and summer time, as they could be lifted down for watering, but nothing should be hung on the wall all the winter.

PLAGUE OF ANTS.—A. G. N., Missenden: Locate the nests and pour petroleum into them, or use a strong decoction of quassia or alum. The ants in the greenhouses and conservatory may be trapped by means of pieces of coarse sponge and castor sugar. The sponges are laid in suitable places and the sugar sprinkled in them. The ants will crowd into the sugared sponges, and the latter may then be picked up and dropped into boiling water, to be eventually squeezed dry, sugared, and used again. Ants are invariably attracted by sweet things, so that sugar and treacle may be made free use of as baits

HARDY ORCHIDS.—Cotswold, Loughton: Some of the hardy orchids need a limestone or chalky soil, while others are a success in a mixture of loam, leaf-mould, and peat. Some require quite moist conditions all through the year, while others do not need so much moisture. You may get a very good idea of the soil and conditions most suitable by studying the plants, where they grow and flourish naturally, and reproducing those conditions, as far as possible, in your own garden. You can obtain most of the hardy species from those nurserymen who specialise in hardy plants, and advertise in our columns. Many of the hardy orchids benefit from a light mulching of half-decayed leaves during the winter.

RHODODENDRON COUNTESS OF HADDINGTON.—Mr. Thomas Lees, of North Berwick, writes: "Turning back the pages of the Gardeners' Magazine the other day I noticed a reference to Rhododendron Countess of Haddington on p. 592, by "W. T.," in the issue of July 30. The writer states that he has obtained the above variety himself by crossing Rhododendron Dalhousiæ with the pollen of R. ciliatum, and asserts that Mr. W. A. Cook is wrong in stating (p. 486) that R. Countess of Haddington is a R. Nuttalli cross. "W. T." is quite right, as I well remember my father making the original cross and sowing the resulting seeds in 1858 or 1859. He obtained a First-class Certificate for R. Countess of Haddington at Edinburgh in the early sixties, and afterwards the hybrid was distributed by the late Mr. Robert Parker, of Tooting, near London." We are obliged to Mr. Lees for his letter.

NAMES OF PLANTS.

G. W., Wendover.—Oncidium sarcodes.

J. M. E., March.—1, Helenium pumilum; 2, Lobelia cardinalis; 3, Scabiosa caucasica.

R. J. B., Everton.—1, Cedrus atlantica glauca; 2, Funkia Sieboldi; 3, Berberis stenophylla; 4, Campanula isophylla.

South-Eastern Agricultural College, Wye.—The following awards, with others, have been made to students at the close of the 1909-10 session:—Diplomas and certificates. Diploma with honours: H. F. Carter, A. G. Cutler, C. S. Vetch. Diploma: F. A. Bell, L. M. Davenport, E. Deane-Freeman, T. H. Holland, J. H. Mattinson, A. W. T. Nieman, J. A. Pittock, S. Skelton, E. H. Strickland, A. L. Tate, R. Wellington, T. B. Worthington. Certificate: A. C. L. Thomas. Farm certificate: R. B. Strang, C. Sutton-Nelthorpe. Horticulture certificate: T. B. Mathieson, P. P. Scott. Diploma Prizes. Third year: Agriculture, J. H. Mattinson and S. Skelton (equal), prox. acc., R. Wellington; Agricultural Botany, J. H. Mattinson, prox. acc., E. H. Strickland; Agricultural Chemistry, J. H. Mattinson, E. H. Strickland, R. Wellington (equal).

Horticultural Builder, St. Andrew's Road,
Huddersfield.

CATALOGUES RECEIVED.

SUTTON AND SONS, READING. As usual, the Reading firm issues a beautifully got up catalogue of bulbs and uses many charming illustrations. A special feature is made of hyacinths, tulips, and crocuses for bedding purposes, but choice named varieties are also listed and described.

CHRISTOPHER BOURNE SIMPSON, BLETCHLEY. Mr. Bourne, son of the late Rev. S. Eugene Bourne, has taken up daffodil culture professionally after long association with his father as an amateur grower. He issues a very neat descriptive and illustrated catalogue, in which many choice varieties are offered for the first time.

GILBERT AND SON, DYKE, BOURNE, LINCS.—An interesting and freely illustrated catalogue of anemones, bulbs, and sweet peas for autumn sowing.

DICKSONS, CHESTER. — A very comprehensive catalogue of bulbs and horticultural sundries.

J. A. COOPER, LISSADELL, SLIGO.—From the famous Lissadell Bulb Farm comes a very businesslike catalogue of daffodils, with illustrations both in colour and black and white. Choicest daffodils for the specialist as well as popular kinds for the ordinary flower lover are listed and described.

GUNN AND SONS, OLTON, WARWICKSHIRE.—An illustrated list of new and choice phloxes illustrated in half tones and in colours.

BARNARDS, LIM., NORFOLK IRON WORKS, NORWICH.—A very interesting and useful catalogue of requisites for the garden, park, farm, and stables. Garden seats are a speciality.

H. N. ELLISON, WEST BROMWICH. A select list of bulbs, ferns, and seeds for autumn sowing. Mr. Ellison sends bulbs on approval.

"**Artificial Manures.**"—We have to acknowledge the receipt of a copy of Professor John Percival's excellent book on "Artificial Manures, and How to Use Them," from Messrs. E. A. White, Lim., Beltring, Paddock Wood, Kent. Professor Percival is the Director of the Department of Agriculture and Horticulture, University College, Reading, and in the course of some twenty-eight pages has succeeded in giving much useful information on the selection and application of artificial fertilisers in the cultivation of vegetable and fruit crops.

SUTTON'S HARBINGER CABBAGE (NEW).—Matures in Spring much earlier than any other variety.

Per packet 1s. 6d., post free.

Mr. R. Watson, Gardener to Major L. Rowe, writes:—"I have tried Harbinger Cabbage alongside of three varieties, and I find it quite a month in advance. I have been cutting since the middle of March, and am certain it is a great improvement on Flower of Spring. Not a plant shot. The hearts are crisp and firm, and I could not wish for better. With every confidence I recommend it as the earliest Cabbage in commerce."

SUTTON AND SONS, THE ROYAL SEED ESTABLISHMENT, READING.

KELWAY'S "COLOUR BORDERS" (Regd.)

Artistic and permanent—arranged for continuous bloom and colour effect.

These Borders can be purchased BY THE SQUARE YARD for any position all ready arranged for planting.

"I am thinking of planting a few borders with perennials. I am tired of continually planting bedding plants. Mrs. ——."

Write now stating your area, position, soil, etc., for planting in the Autumn, to

KELWAY AND SON, The Royal Horticulturists, LANGPORT.

VOL. LIII.—No. 2,965 SATURDAY, AUGUST 27, 1910.

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

A National Hardy Plant Society.

As will have been gathered from the announcement we were able to make in our issue of the 20th inst., it was decided at a meeting held in Shrewsbury, on the evening of the first day of the floral fête, to form a special society in the interests of hardy plants, and that in accordance with this decision a committee was elected for making the necessary arrangements in connection therewith. We have no sympathy with those who would multiply special societies unnecessarily, for, unless a society has ample justification for its existence, it cannot possibly become sufficiently strong to do useful work, and afford encouragement to either cultivators or raisers of the class of plants with which it is associated. There are not wanting proofs of this; but for our present purpose it will suffice to say that a special society to serve a useful purpose must be organised on such lines as to appeal with considerable force to those who are specially interested in the plants, flowers, fruits, or vegetables with which its name is associated, possess abundant vitality, and be prepared to undertake work that is not done by any existing body. We may assume that those who are responsible for the promotion of the National Hardy Plant Society will make strenuous endeavour to formulate a scheme of work that will obtain for it the support of those who fully appreciate the charms of hardy flowers, and are anxious to see them properly represented at public exhibitions; that they will initiate a policy having the advantage of novelty, and carry it out with the necessary vigour. If the promoters succeed in doing these things, there will be justification for the existence of the society, and the cause of hardy plant culture will be advanced. There is, we need hardly say, much that might be accomplished in the improvement of hardy flowers, in the methods of their culture, and in the manner of presenting them to public notice at the exhibitions. Notwithstanding their ever-increasing popularity, but little has been done for them by existing societies, except to offer prizes for so many bunches or kinds, and this not always in a satisfactory manner. Not infrequently the conditions governing the competition for prizes for hardy flowers are so faulty as to occasion much perplexity to exhibitors, and to lead now and again to disqualification of the collections when judged by those who are fully conversant with the fact that carnations, pentstemons, and plants of similar habit are not "herbaceous" in growth, or, in other words, do not die down annually and produce new growths from the base. A society that will be able to impress upon the framers of schedules the necessity of clearness of statement in the drafting of conditions, and to suggest classes that will ensure an adequate representation of the more important kinds at the exhibitions, will render useful service. This alone will not be sufficient to ensure a full measure of success. The society should, and indeed must, hold exhibitions that will in some degree serve as models for general societies. For the sake of clearness we have assumed for the moment that the society will chiefly concern itself with hardy perennials that yield so freely of their floral wealth during June, July, and August, but it does not necessarily follow that it will do so. On the contrary, we shall be much surprised if the promoters do not take a much broader view of their responsibilities, and avoid setting so great a limitation on the society's opportunities for usefulness. The question, What is a hardy plant for the purposes of the society? has not, we may assume, been formally discussed, much less determined by those engaged in promoting the society. They have doubtless their views upon the point, but a decision having much practical value could not be arrived at until some progress has been made with the work of formation. The question will, of course, have to be considered at an early period, and we shall await with much interest the answer given, because upon this the success of the initiatory stages will depend. The term "hardy plants," includes so wide a range of subjects as to impress one with the impracticability of any one organisation successfully dealing with them. There are the hardy perennials, whether herbaceous or not, in almost endless variety, including the daffodils, the early and late flowering tulips, the hyacinths, the winter and spring flowering crocuses; there are British and other ferns in large numbers; there are the annuals almost innumerable, and then there are the hardy trees and shrubs remarkable for the beauty of their flowers or foliage, or for nobility of aspect or elegance of habit. A society embracing all these classes of plant life would, unless we are much mistaken, be practically impossible, because of the diversity of interests that would have to be considered and adjusted. By the exclusion of the arborescent and ligneous forms of vegetation, the ferns and the annual flowers, there would be a concentration of interest; but a National Hardy Plant Society that does not recognise the hardy annuals would fail in some degree to justify its name. When these important groups are excluded the question will have to be considered whether the daffodils and the tulips shall be left to the societies specially devoted to them, or be brought within the scope of the new society's operations. How far it will be possible to give equal encouragement to the rock plants flowering in spring, and the more robust border plants that bloom in the summer and autumn, remains to be seen. There cannot be any material differentiation in their treatment, and the holding of several exhibitions in the year will involve a heavy annual expenditure. Another point of interest is the arrangements for making awards to meritorious novelties, for these will have an important bearing upon the usefulness and welfare of the society. New species

MR. JOHN HUDSON.

and varieties as they make their appearance must be carefully examined and awards made to those deserving distinction, and the difficulties in the way of doing this by a society that does not hold meetings periodically throughout the year are great because of the long period over which the flowering of hardy perennials extends. Let us hope these matters have had due consideration, and the foundations be so laid as to make it possible for the society to render good service in the cause of hardy plant culture.

Mr. John Hudson, whose portrait is given herewith, has by means of unquestionable skill and remarkable energy obtained for himself a foremost position among the great cultivators of vegetables for exhibition in this country, and, having had opportunities for seeing the products of his skill at the exhibitions, we have no doubt as to his maintaining the high position he occupies. Mr. Hudson has a market garden or nursery about two acres in extent in the midst of about 70 acres of allotments in the borough of Leicester, in which he grows produce for the local market. He has from the first been a strong believer in growing a few things in large quantities, and in growing them well, and we may see at one time from 15,000 to 20,000 lettuces, and at another the same quantities of celery, with half an acre or so of choice varieties of potatoes, chiefly seedlings of his own raising, and some 3,000 roots of rhubarb for forcing. There are in the nursery ten glass structures, which are chiefly devoted to bedding plants, chrysanthemums, cucumbers, tomatoes, and rhubarb. Mr. Hudson commenced exhibiting vegetables in 1894, when Up-to-Date potato was a novelty, and his crop was so good that Mr. Harrison persuaded him to show two dishes at the exhibition held by his firm. He exhibited with the potatoes six heads of celery, and was awarded three first prizes. This induced him to devote some share of his attention to the cultivation of vegetables for exhibition, and during the sixteen years that have elapsed he has been awarded upwards of 1,200 prizes, the majority in the keenest of competitions. For some years past Mr. Hudson has annually won at Leicester, where vegetables are a great feature, the first prize in each of the five or six classes for collections against a large number of competitors; and a considerable number of first prizes in the single dish classes. While Mr. Hudson has been successful in winning so large a number of prizes, there are some contests that are strongly fixed in his mind, and of which he is justly proud. At the Abbey Park Show at Leicester, in 1903, he had the honour of winning the first prize in the open class in competition with Mr. E. Beckett, V.M.H. In the following year Mr. Hudson was successful in winning in nearly the whole of the potato classes at Messrs. Fidler and Son's exhibition at Reading, and had the champion dish in the show. In November of the same year he staged fifty-four dishes of potatoes at the Spalding Exhibition, and won in every class provided by the society. Eight years ago Mr. Hudson turned his attention to Shrewsbury, and exhibited there with much success; but it was not until 1909 that he achieved the distinction of obtaining premier honours in the champion class, and this he did against such formidable competitors as Mr. J. Gibson and Mr. Ben Ashton. It may be mentioned as a point of some interest that Mr. Hudson grows his vegetables for exhibition more as a hobby, and quite apart from his business.

International Horticultural Exhibition, 1912.—We are informed that it has been decided to hold this exhibition in the grounds of the Royal Chelsea Hospital, which, it may be mentioned, were laid out by Sir Joseph Paxton. The area leased to the exhibition authorities, including the Ranelagh Gardens, is about twenty acres, of which nearly sixteen acres will be available for the accommodation of the exhibits. The grounds of the Royal Hospital are easily reached from all sides of London, and entrance to them can be obtained from the Embankment on one side and Bridge Street on the other.

Working Men's Flower Show at Edinburgh.—For nearly half a century there has been annually held in Edinburgh an exhibition of cut flowers, window plants, and vegetables grown by the working classes who live within the city boundary, and the show, which was held a few days since in the Corn Exchange, was one of the best of the series. There were over 1,000 entries, and there was a good competition for the prizes offered by Mr. Mackenzie for produce grown in the poorer parts of the city. Bailie Smith Elliott distributed the prizes, and in the course of an interesting speech expressed the opinion that it was the duty of city corporations to encourage gardening among the working classes; and he mentioned that the Parks Committee of the Edinburgh Corporation had, on his suggestion, given for some years past seeds and plants to those who desired to grow flowers in their window-boxes.

Gardeners' Wages at Glasgow.—For some time past a movement has been on foot with a view to obtain an increase in the wages of the men employed in the public parks and gardens under the control of the Glasgow Corporation. We are informed by a Glasgow correspondent that at a recent meeting of the Parks Committee, Councillor H. Forsyth's motion, recommending an increase of the gardeners' wages, was adopted, and that the recommendation is now before the Finance Committee.

Groups of Plants at Chesterfield.—At the exhibition of the Chesterfield Horticultural Society the groups of plants arranged for effect formed one of the many fine features of the display. The competition in the class for groups, each occupying a space not exceeding 180 square feet, was of much interest from the fact that two of the prizes were taken by amateurs. The first prize of £20 was awarded to Mr. W. Haslem, Hardstoft, Chesterfield, who is an engineer by profession, for an extremely beautiful group, in which caladiums, crotons, humeas, lilies, orchids, and palms were freely employed. Mr. W. Holmes, Brampton Nurseries, was a good second, with admirably-grown plants that were arranged with much taste; and Mr. T. Butler, of Tibshelf, who at one time was engaged in mining, won with a beautiful group, in which rambling roses were employed with much taste. Mr. H. Rodgers, of Leicester, and Mr. G. Taylor, of Alfreton, who were fourth and fifth, also had meritorious groups. Mr. W. Haslem and Mr. W. A. Holmes were first and second also in the class for smaller groups with tasteful arrangements.

Ghent Quinquennial, 1913.—The provisional programme and schedule of the International Horticultural Exhibition, to be held at Ghent in 1913, afford evidence that the Council of the Royal Agricultural and Botanical Society of Ghent are not less mindful of the points essential to success in carrying out international gatherings than they have been in the past. There are 763 classes in the schedule, and these are divided into 27 groups. The first of the groups is devoted to new plants, and the second to orchids, which, as on the occasion of the centenary of the society two years ago, have liberal provision made for them. In this group there are 78 classes, and these range from classes for collections on which there is no limit down to those for single specimens, Stove plants, remarkable for the beauty of their flowers or foliage, have seven groups devoted to them. Greenhouse plants are not less liberally provided for; and it need hardly be said that azaleas and rhododendrons have a prominent position in the several groups set apart for plants grown in cool houses. The exhibition will be held at the end of April, 1913, on dates yet to be fixed, and schedules may be obtained of M. Ceuterick, general secretary of the society, Ghent.

Electricity and Plant Growth.—At the meeting of the Royal Horticultural Society on Tuesday next, 30th inst., Mr. J. H. Priestley, B.Sc., will deliver a lecture on "The Effect of Overhead Electrical Discharges upon Plant Growth." The lecture will, as usual, commence at 3 o'clock.

R.H.S. Medal Awards.—Mr. E. V. Low informs us that he was awarded a silver Flora medal for orchids at the last meeting of the Royal Horticultural Society.

Wart Disease of Potatoes.—The Board of Agriculture desire us to remind growers of potatoes that it is their duty, under the Destructive Insects and Pests Order of 1910, to report to the Board all outbreaks of wart disease, otherwise known as black scab of potatoes, cauliflower disease, "fungus," etc., in counties in which no officer has as yet been appointed by the local authority to receive reports. The penalty for neglecting to report disease is £10. The presence of disease should be again reported this year, notwithstanding the fact that it may have existed and been reported last year. A leaflet describing the disease may be obtained on application to the Secretary, Board of Agriculture, 4, Whitehall Place. Letters so addressed need not be stamped.

School Gardens.—In a circular issued by the Education Department, containing suggestions for the consideration of teachers and others concerned with the work of elementary education, it is pointed out that the garden makes two powerful appeals to those who wish education in our public elementary schools to be more practical; it leads to the formation of habits of thoroughness, and it is eminently useful. But it may also be dealt with on a much higher plane. The purpose of the garden should be to educate boys and girls, and not merely to show them the usual ways of cultivating the common vegetables and flowers, or to practise them in the manual operations of gardening. The scholar must be led to understand the reasons of the common processes in their relation to the soil and climate, the causes and conditions of health or disease in plants, and something of the principles on which the selection and improvement of seeds and plants depend. It is, indeed, a branch of nature study rather than a training for a profession, and it has two great advantages over many other branches: it produces visible and tangible results—thereby appealing forcibly to the utilitarian instincts of the child—and it does not, or should not, degenerate into the series of disconnected object-lessons of little educational value that sometimes passes under the name of nature study. Gardening has, it is suggested, another great advantage over other subjects in that it is essentially experimental. Set experiments cannot easily be made because the areas are far too small for inequalities of the ground to be smoothed out; indeed they may be wholly misleading. But throughout the scholar is trying and trying again, observing his results, attempting to account for his failures, and to devise better methods for the future. The teacher has to strike the happy mean between doing too much for the scholars, thus relieving them of the responsibility of thinking, and of doing too little, and leaving them overwhelmed with a sense of failure.

A Sportive Phlox.—To a recent meeting of the R.H.S. Scientific Committee, Mr. J. Douglas contributed flowers from the plants shown on August 31 last year, which until then had produced white flowers, but were then flaked with lilac. These plants had been carefully marked, and had this year produced flowers almost entirely white, but with slight touches of lilac in them. The calyx was purple.

Land Valuation.—From the Land Union, whose offices are at St. Stephen's House, Westminster, we have received a copy of the "Guide," which has been drawn up for the purpose of assisting owners of property in filling up the Government valuation forms. The "Guide" has been prepared by the committee of the Land Union with considerable care, and as this body is composed of men engaged in the practical management of all kinds of property (including land devoted to horticultural purposes), the publication should be of considerable service in clearing up doubtful points.

The Blue Rose Again.—When our American friends make a real effort at description they generally produce wonderful results. With the rambling Rose Veilchenblau as subject, the following description was given in a circular sent out by an enterprising American florist: "It is here at last, and it has remained for this first decade of the twentieth century, which has seen the discovery of the North Pole, the practical application of the flying machine, and development of many other heretofore 'impossible' things, to witness this latest triumph in the realm of growing things—The Blue Rose. The easiest way to describe it is to say it is a Blue Crimson Rambler—that is, imagine a climbing rose with all the strength and vigour of the Crimson Rambler, covering immense spaces with its wondrous heavy canes and large, splendid foliage, and bearing immense trusses of roses, all the way from twenty to one hundred in number, but, instead of the gorgeous crimson flowers we all know so well, picture it in your mind with similar clusters of exquisitely beautiful violet-blue roses. The rose world is wild about the blue roses, and we expect even our enormous stock of the plants to be speedily exhausted. This wonderful production of the heretofore elusive colour in the rose world is a seedling from the Crimson Rambler discovered by a poor German florist. What a beautiful effect can be produced by having a red, white, and blue Rambler all trailing on the same porch, fence, or trellis, forming the national colours, or even on the lawn, or in the rose garden. It is a mistaken idea that ramblers have to have a support: they can be grown very successfully in bush form."

NOTES FROM KEW.

◆

Greenhouse Flowers.

The greenhouse at Kew, No. 4, is just now particularly gay, in fact it is furnished with a wealth of blossoms from end to end, and that, too, despite the fact that some of the summer flowering subjects are now past their best. The different liliums just now contribute their share to the floral display, chief among them being the variable Lilium auratum, and its distinct and massive-flowered variety, platyphyllum or macranthum. Lilium speciosum is represented by different coloured forms, most of them being in masses or clumps, that is to say, three or more bulbs are apparently grown in one pot, the result being several stems, and, when needed for grouping purposes this method is, generally speaking, preferable to putting each bulb in a single pot. Lilium longiflorum, too, is in good condition, and a very pretty semi-circular group is formed of this lily, alternated with a deep red variety of Nicotiana Sanderæ.

The practice of arranging plants in groups or masses prevails more at Kew now than was at one time the case, and several pleasing effects are in this way produced. A number of tall, stately plants of both the blue and white varieties of Campanula pyramidalis, bordered by somewhat shorter specimens of the Bridal Wreath (Francoa ramosa), make a noteworthy group, and flowering examples of many kinds of agapanthus all brought together are both attractive and interesting. Beside the typical A. umbellatus is one bearing the varietal name of maximus, but though the name is decidedly appropriate, the colour of the flowers is quite pale, and very different from the maximus generally met with in nurseries, which is, except in vigour, a counterpart of A. umbellatus itself. The pure white variety is also well represented at Kew, and so is the double-flowered form, which rarely opens in a satisfactory manner. Mention, too, must be made of A. Mooreanus, with rounded heads of flowers. This is totally deciduous, and is the hardiest of the agapanthuses.

A large group of heliotropiums attracts by reason of its fragrance, a feature in which some of the newer kinds are much lacking, while a number of bushy plants of Alonsoa incisifolia have been for months thickly studded with their bright orange-red blossoms, and bid fair to maintain the display for a long time yet. Begonias, too, of course, contribute just now a considerable share to the floral display, notably the large, bold-growing kinds, such as B. coccinea, B. Luzerna, and B. President Carnot, while the bushy-growing B. Corbeille de Feu is equally desirable for greenhouse decoration or for bedding out. The tuberous-rooted varieties are freely represented, an interesting feature being furnished by flowering examples of some of the original species from whence these numerous garden forms have sprung.

The different plants commonly employed for greenhouse decoration, such as fuchsias, pelargoniums of various classes, especially the members of the ivy-leaved section, and cannas, all combine to form a wealth of colour, while of more uncommon subjects worthy of especial note are: Campanula Vidali, an almost shrubby species from the Azores, with spreading spikes of drooping urn-shaped blossoms, in colour waxy white, stained with yellow at the base; Lantana salviæfolia, a delightful plant for draping a roof in the greenhouse, though rarely employed for the purpose. It is the same as Lantana delicatissima of parks and gardens. The two large-growing calceolarias, namely, C. Burbidgei and C. integrifolia, are valuable for greenhouse decoration at this season, while a pretty little white-flowered, continuous-blooming plant is Matricaria mondeana, which appears to be a form of M. inodora.

Victoria regia.

This magnificant water lily, from the Amazon, which has formed, perhaps, the subject of more notes than any other plant grown solely for its ornamental qualities, is doing well at Kew this year. The magnificent leaves are in good condition, and the flowers, though perhaps scarcely proportionate in size to the foliage, are nevertheless very striking.

Impatiens Hawkeri ignea.

Quite recently I noted in the Gardeners' Magazine the success attending the culture of the typical Impatiens Hawkeri in the intermediate portion of the T range. There is now in the same structure another very striking balsam in flower, under the name of Impatiens Hawkeri ignea. Its general appearance would almost suggest that it may be the result of a cross between Impatiens Hawkeri and I. Holsti. At all events, the stems and leaves are paler than those of I. Hawkeri, while the flowers are of a warm orange-salmon tint, with a tiny violet-purple marking in the centre. This newcomer should prove a welcome addition to the members of the balsam family that require a warm house for their successful culture.

Ixoras.

When specimen plants lost their popularity many subjects quickly declined in favour, and among them were the different ixoras, but of late these have come more prominently forward, owing, in all probability, to the fact that they flower well in a small state, and are at their best at this season, when bright-coloured flowers in the stove are by no means numerous. A group of them in the warmest portion of the T range shows these shrubs at their best. Particularly noticeable among those in bloom are Ixora macrothyrsa (or Duffi, as it is often called), with long leaves, and huge heads of bright crimson blossoms. This is a true species, while of garden forms the best are I. Westi, pink; I. Dixiana, I. Prince of Orange, and I. Williamsi, all of some shade of orange or salmon.

Clerodendron squamatum.

This is not widely removed from the better known Clerodendron fallax, but as the two are now flowering side by side in the intermediate portion of the T range, the points of difference can be readily noticed. In C. squamatum the flower panicles are more dense than in C. fallax, though the individual blooms greatly resemble each other. The leaves, however, form the most markedly distinguishing feature, for though somewhat alike in shape and size, those of C. fallax are very hairy, whereas in S. squamatum they are a good deal thinner in texture, and much smoother.

Cæsalpinia Gilliesi.

This South American shrub, which is also known by the generic name of poinciana, is now in flower trained to the front of Museum No. 2. In general appearance it rather suggests an attenuated form of Acacia lophantha, but the flowers are very different. In this cæsalpinia they are borne in large terminal racemes, the colour being yellow, with long, prominent red stamens, thus giving a fluffy appearance to a head of bloom. The beauty of the flowers well repays close inspection, but as when trained to a wall the branches mount upward considerably this is not always possible. K.

PROBLEMS UNDER CANVAS.

I will undertake to say that every reader of these lines has at some time or other formed one of the crowd in the tent on flower show morning, and observed the hurrying and skurrying which often takes place in order to get the stuff staged in readiness for the judges. At such a moment one can think out a few of the problems which present themselves under canvas, some of which may readily be solved while others are more difficult, but in their way they involve show officials, exhibitors, judges, and even the visiting public. Problem one: How does the secretary manage to keep his temper on show morning? Some, I know, hopelessly lose it for the time being, and they are deserving of some sympathy, but others (and a good many of them) keep calm, contented, and good-humoured through it all. Well, it is all a question of human nature, first, on the part of the man himself, and, secondly, on the part of the individuals he has to deal with, but all men are not cut out to be show secretaries.

Problem two: How to enforce punctuality at local shows. Dear reader, have you never been asked as a judge to be at a show, say, at ten o'clock, and, when you have arrived, you have been informed that the exhibits were not quite ready? You have waited about for an hour or more before the tents were cleared, and then you have had to rush through your work at a pace which was unfair to the exhibitors. This is the kind of thing that ruffles judges. But how different things are at the show where everything is ready at the time appointed, and one has ample time to carefully examine everything that is presented for inspection. Here again it is a question of method, or lack of it. A good secretary, who is backed up by a working committee, is always punctual, and never seen rushing about on show day, because he makes his arrangements beforehand; but my sympathy is extended to the secretary who finds himself deserted by his committee at the time when he most wants them, i.e., on flower show day. And struggling along alone as best he can, it is no wonder the man gets behindhand, and earns for himself the unenviable reputation for being unpunctual.

Here we have a problem which an exhibitor is trying to solve. He is standing before a collection of vegetables, with a thumbed schedule in one hand and a half-inch stump of lead pencil in the other. A second prize card rests on the collection in front of him (his own, by the way), and, on the next, there is the first prize card. No, he is not a cantankerous, dissatisfied exhibitor, but just an ordinary human being, trying to find out where he is beaten with the object of doing better next year, but the competition is so close that he cannot see where the other man gained the advantage. Who can help this man to solve his problem? The judges might have done it easily enough if, when they pointed up the collections, they had put a card on each exhibit showing the marks they had given to the individual vegetables. In regard to this matter I would add that cards for the purpose should be provided at all shows, and these should be filled up by the judges and placed on the collections. If this were done the problem which puzzled our friend would no longer exist.

A few days ago four judges and a flower show secretary were partaking of a well-earned lunch after a hard morning's work when an excited individual entered the tent, apologised for intruding, and stated that he wished to lodge a protest against another exhibitor. It happened in this way. The schedule asked for a collection of annuals, twelve varieties, and in selecting his flowers the injured one had been careful to keep to one colour in cornflowers, coreopsis, etc., while the man objected to had mixed the colours, and the contention was that he had more than the specified number of varieties. I am aware that the schedule meant species, instead of varieties, and should have said so, but the problem is, supposing you show a bunch, say, of salpiglossis, or cornflowers, containing half a dozen different coloured flowers, is each one to be taken as a separate variety? If so, the judges in question were wrong in upholding their decision, and not allowing the protest, but perhaps some readers of the Gardeners' Magazine will let us have their views on this particular problem.

There is still some confusion amongst exhibitors at shows in respect of the words "kind" and "variety," and at a certain show, not long ago, a man exhibited black and red currants in a collection as distinct kinds. Another competitor pounced on it, promptly decided, to his own satisfaction, that the black and red currants were distinct varieties, but not distinct kinds, and, on these grounds, he lodged his protest. The problem was discussed in quite a hearty manner, but I am not quite sure whether the protester was convinced when it was pointed out to him that the red currant (Ribes rubrum) and the black currant (Ribes nigrum) represented different species, and, consequently, were distinct kinds, with just as much difference as there is, say, between the black currant and the gooseberry (which is Ribes grossularia). Varied opinions were expressed by the suporters on both sides, but one man, I noticed, was quite happy about it, namely, the individual who showed the red and black currants, and still retained the prize card.

Sometimes judges are faced with little problems that are out of the ordinary way of things, and in which prompt action is essential. As a case in point, two judges were making their awards at a show where there is a spirit of very keen rivalry amongst the exhibitors, and, as is usual, the tent was cleared, and they had it all to themselves. The classes for potatoes and onions were duly disposed of, and the judges were going on to the collections, when one of them noticed the toes of half a dozen pairs of boots showing under the canvas wall of the tent. The individuals who stood in the boots were, of course, listening to the remarks of the judges, oblivious of the fact their understandings were betraying their presence. One of the judges grasped the situation, motioned to his colleagues, pointed a finger at the row of shoe toes, and observed in a loud voice, "I think before we go any further we'll judge those boots under the table." The problem of eavesdropping was solved, and the way those boots vanished was positively amusing.

There is a problem, not a pleasant one, by the way, which local flower show committees have to deal with, and it is that of the dishonest exhibitor. It is hard to believe that men are unscrupulous enough for the sake of winning a few shillings in prizes to exhibit produce as their own which they have not grown, but, unfortunately, there are, and this kind of thing has wrecked more than one show. Not infrequently other exhibitors know about the dishonesty, or have suspicions, but cases are not easily proved, and men who show straight themselves hesitate about making themselves conspicuous by raising protests. Instead of doing this, they talk amongst their neighbours, cease exhibiting, and the show gets in bad odour. There is only one way of dealing with the problem of the dishonest exhibitor, and that is for the committee to take the responsibility of investigating the first suspicious case, and, if necessary, making an example of the offender. In fact, there is no other proper course, for if dishonest exhibiting is winked at, this is really admitting that it is tolerated. H.

GRAPE PRINCE OF WALES.

It would be interesting and instructive to me, and probably also to other readers of the Gardeners' Magazine, if cultivators of the Prince of Wales grape would be good enough to give their experience of it, and I, especially, should be grateful if successful growers would explain in detail their made of treatment.

We secured a young vine when it was distributed, and inarched it upon an old one of Alnwick Seedling, but have so far been unsuccessful in our attempts to obtain good results, its defects being imperfect setting of the fruit and scalding of foliage, and so bad in each case are these failings that the rod is quite a disfigurement to the house that contains it. The vine gives large clusters of inflorescences freely, but the flowers open badly, owing to the "cap," in most cases, remaining fixed in such a way as to cause difficulty in removal, even by artificial means, and when unnaturally taken away, the anthers and pistil often adhere to it, and even when this does not happen, and the "cap" is free, but little pollen is produced. The vine is excessively robust in growth, both in wood and leaves, and to this the uncommon nature of the blossoms, as alluded to, may possibly be correctly attributed; or could it be rightly laid to the effect of the stock?

Alnwick Seedling is well known, at any rate under some conditions, to require artificial treatment in order to ensure a perfect set of fruit. I recollect, if my memory serves me rightly, that the late Mr. W. Thomson, skilled grape grower as he was, failed, in the first instance, with it owing to its bad setting character, and destroyed a house of it at Clovenfords after the first season the vines blossomed: after taking this step, however, it occurred to him that if the glutinous matter that formed upon the pistil, and thus prevented fertilisation, was removed by the aid of a syringe, the difficulty would be overcome. We had at that time, like Mr. Thomson, failed to set this grape, but after adopting his suggestion we were among the first to exhibit it in good condition.

I have observed but comparatively few remarks in the gardening Press about the Prince of Wales grape. Is this because it has been generally found to be unsatisfactory? Only on one occasion have I noticed it exhibited, and then, I believe, by Mr. T. Heron, gardener to H. B. Brandt, Esq., last autumn, at one of the R.H.S. meetings held at Vincent Square, when he staged some good bunches of it among other varieties in a collection of grapes.

T. Coomber.

The Hendre Gardens.

NEW PLANTS, ETC.

VANDA CÆRULEA WESTONBIRT VARIETY.

A remarkably distinct and handsome variety of this beautiful species. The flowers are produced in bold spikes, and range from four to five inches in diameter, and the sepals and petals are of great breadth, and richly veined with deep blue on a light blue ground, the lip violet-blue. F.C.C., R.H.S., August 16; Lieut.-Colonel Sir George L. Holford (orchid grower, Mr. H. G. Alexander), Westonbirt, Tetbury.

ONCIDIUM MANTINI LOWI.

A handsome form, remarkable for the large size and fine form of the flowers, which are produced in compact spikes; the colour is deep lemon-yellow, with pale-brown markings on petals, sepals, and lip. A.M., R.H.S., August 16; Mr. E. V. Low, Vale Bridge, Haywards Heath.

BULBOPHYLLUM VIRESCENS.

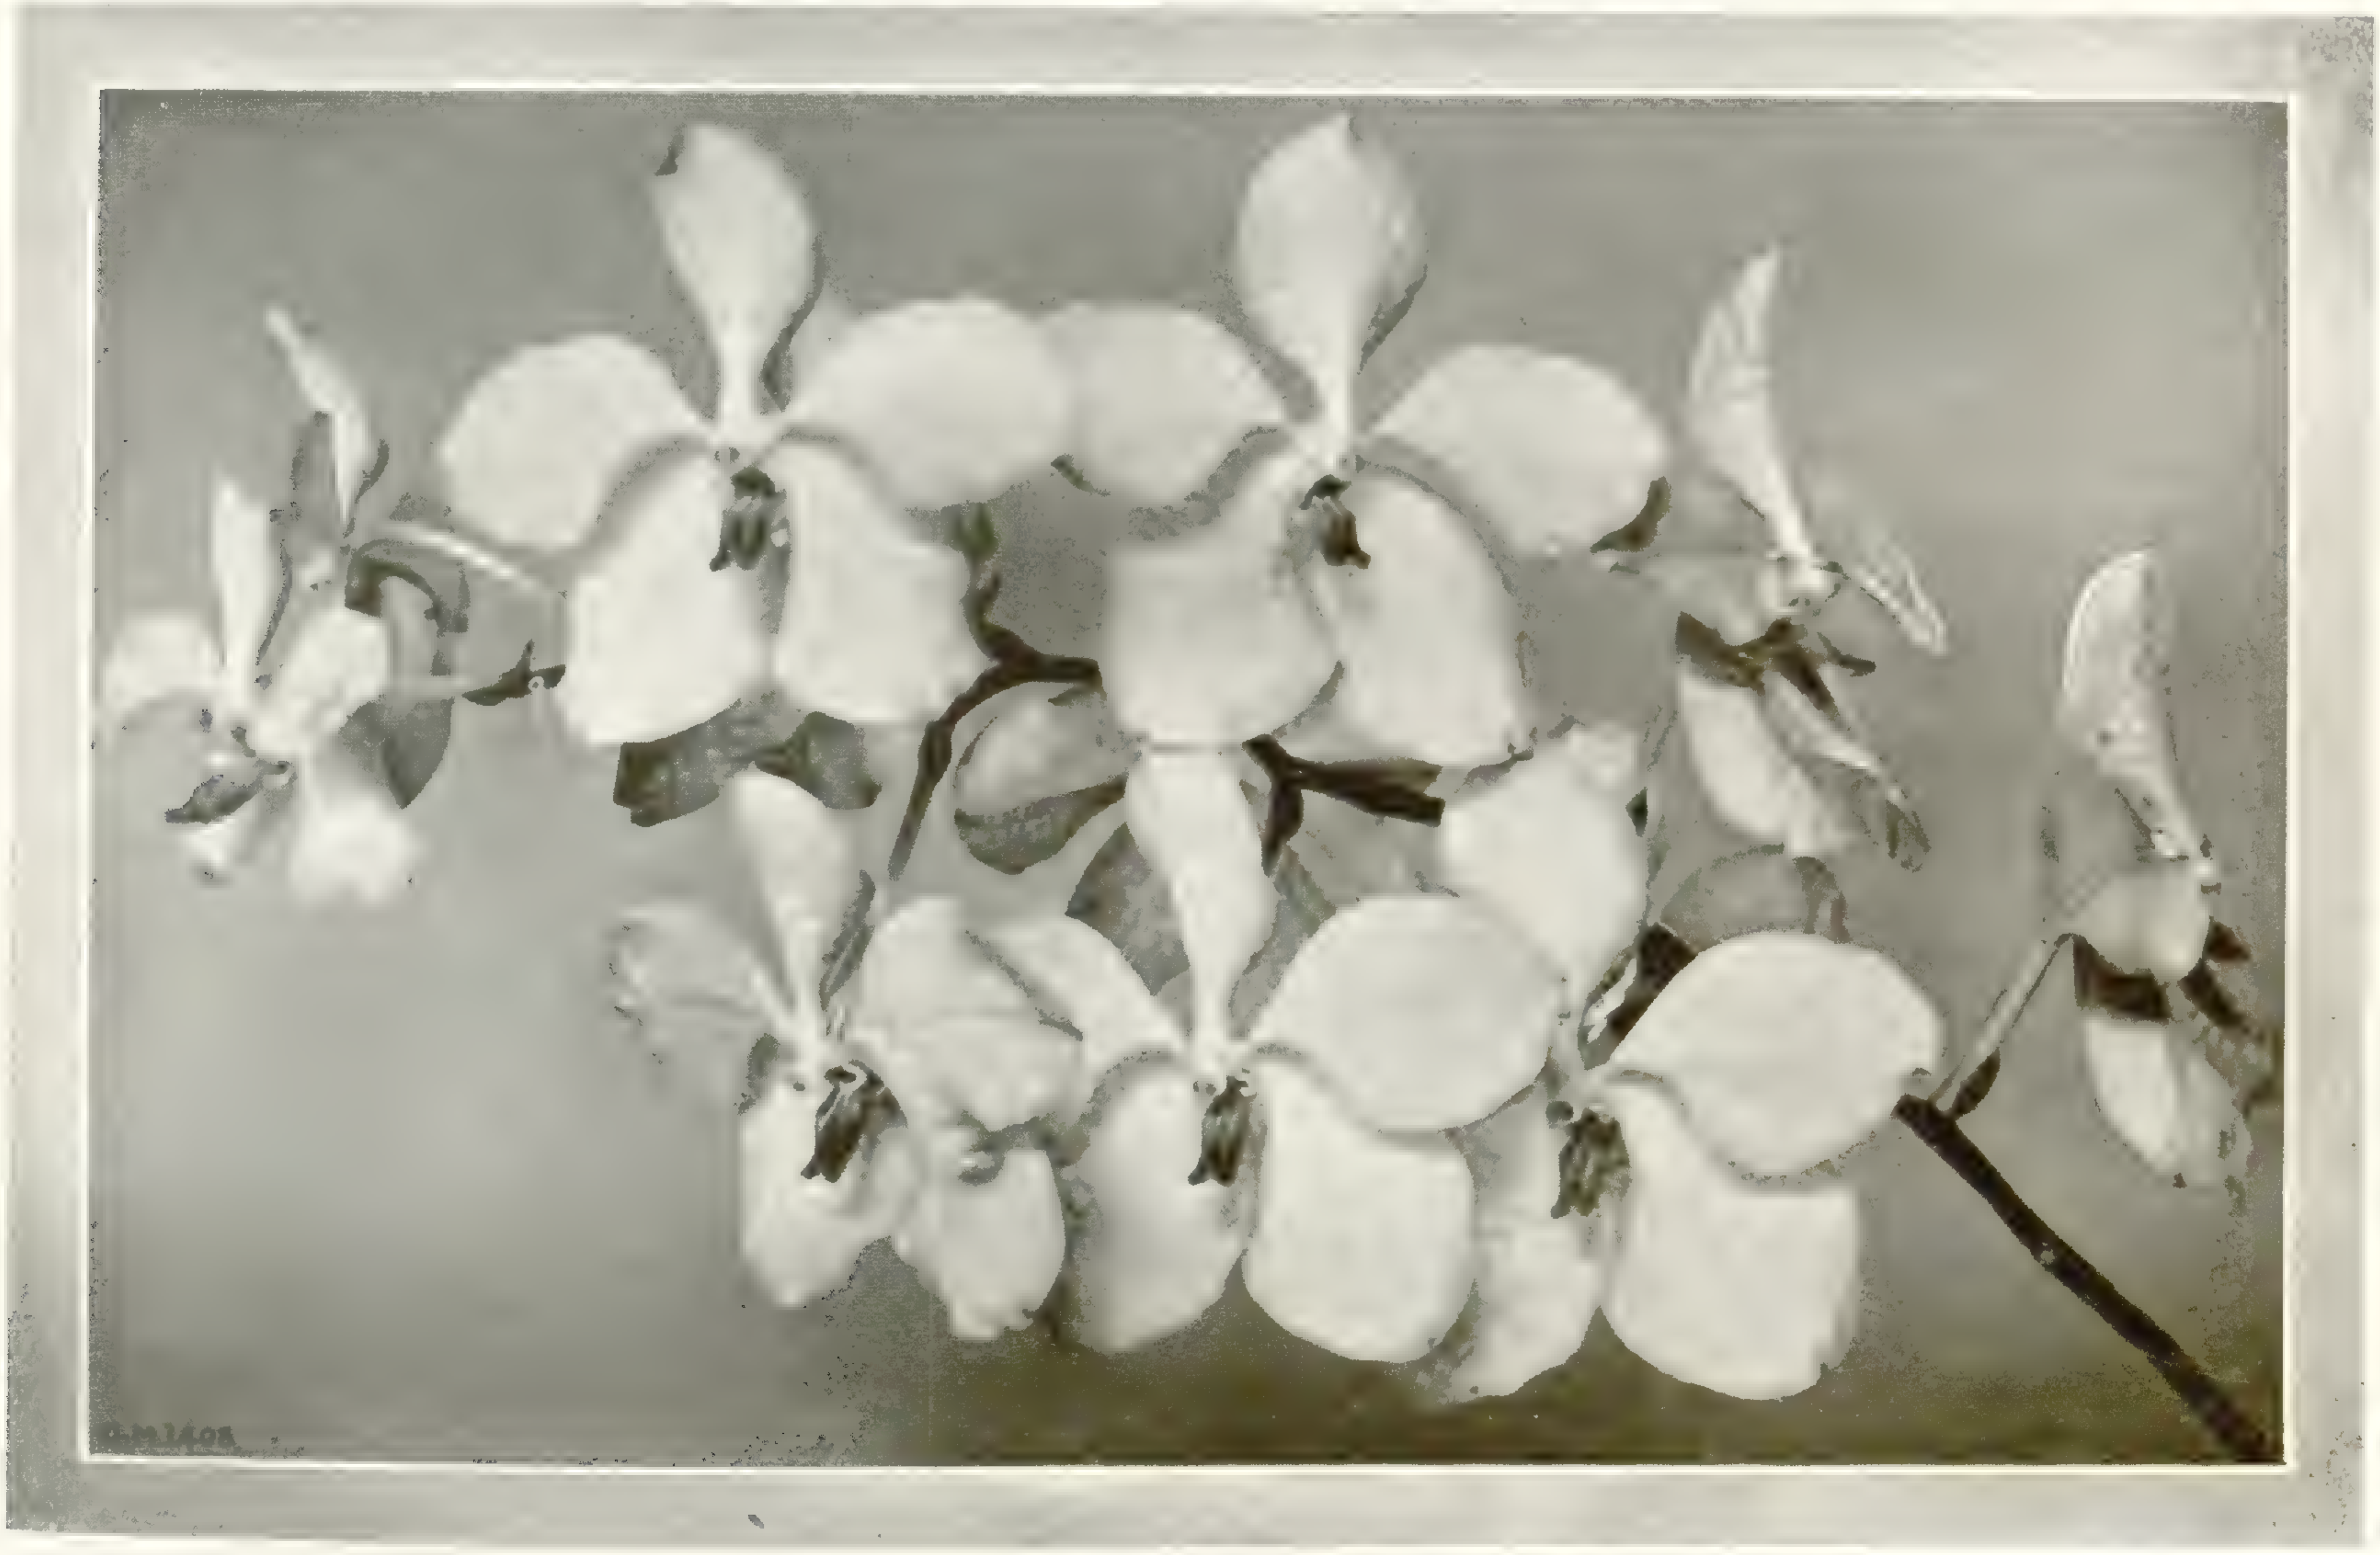
An attractive species, first described ten years since from specimens collected on Mount Tuna, in the island of Amboina. The flowers are large, pale yellow-green with brown veins. "Bot. Mag.," t. 8,327.

PATRINIA TRILOBA.

A hardy herbaceous perennial, native of Japan, and bearing with considerable freedom cymes of yellow flowers. This species has the advantage of being successfully cultivated without any special difficulty. It thrives in the rock garden at Kew, and blooms freely in July and August, the two months in which its flowers are produced in a wild state. "Bot. Mag.," t. 8,327.

PTEROSTYRAX HISPIDUM.

A hardy Japanese tree remarkable for the beauty of its flowers, which are borne in profusion in June. The flowers are pure white with bright yellow anthers, and are borne in drooping panicles. The tree has proved quite hardy at Kew, and in gardens in the south-west parts of Ireland there are trees that have attained to a height of 40 feet. "Bot. Mag.," t. 8,329.



VANDA CÆRULEA WESTONBIRT VARIETY.
A remarkably handsome form, the flowers very large and chequered deep blue on a light blue ground. F.C.C., R.H.S., August 16; Lieut.-Colonel Sir George L. Holford.

BEGONIA MARTIANA VAR. GRANDIFLORA.

A charming variety of this well-known begonia, distinguished by its strong growth and the relatively large flowers, which are rose-pink and freely-produced in July. "Bot. Mag.," t. 8.322.

IRIS CLARKEI.

A beautiful species, first met with in 1848 by Sir J. D. Hooker, who found it on Tonglo, and also on the Yakla in Sikkim at about 10,000 feet above the sea level. It was subsequently gathered by several other botanists, among them being Mr. C. B. Clarke, to whom it was dedicated by Mr. Baker. Under cultivation it grows to a height of some three feet, and bears flowers about three inches in diameter, the colour rich purple. "Bot. Mag.," t. 8.323.

PHILADELPHUS DELAVAYI.

A moderately vigorous growing species, first introduced to European gardens by the Abbé Delavay, who collected seeds in Yunnan in 1893. The flowers are white, tinted with rose in the bud state, and they are about one inch in diameter, fragrant, and produced profusely. "Bot. Mag.," t. 8.324.

GLADIOLI.

Primulinus. — A distinct and elegant species, introduced from Central Africa a few years since, and bearing rich yellow flowers. A.M., R.H.S., August 16; Messrs. Kelway and Son, Langport.

Europa.—A beautiful pure white variety with large finely-formed flowers. A.M., R.H.S., August 16; Mr. W. Pfitzer, Stuttgart, Germany.

Karl Luz.—An effective variety, bearing large deep crimson flowers. A.M., R.H.S., August 16; Mr. W. Pfitzer.

Gräfin Degenfeld.—A distinct and attractive variety; the flowers are soft yellow, marked with crimson on the lower segments. A.M., R.H.S., August 16; Mr. W. Pfitzer.

MELON EARLY FAVOURITE.

A distinct green-fleshed variety bearing rather large oval fruits of excellent flavour. A.M., R.H.S., August 16. Raised in R.H.S. Gardens, Wisley.

CAMOGYNE PULCHRA.

A distinct arad, introduced from the Malayan Peninsula, compact in growth, and producing crimson spathes. It requires a plant stove for its successful cultivation, and at Kew it thrives on the small rockery in the nepenthes house. "Bot. Mag.," t. 8,330.

PSORALEA AFFINIS.

An interesting and attractive hard-wooded plant, which, according to Aiton's Hortus Kewensis, was grown at Hampton Court in 1690. The plant is elegant in habit, and grown in a light greenhouse, blooms freely, the flowers being blue. Trained to a pillar or under the roof of the greenhouse, it will reach a height of ten feet or so; but it can be readily grown in the form of a bush, three feet or so in height. "Bot. Mag.," 8,331.

ARISTOLOCHIA MONPINENSIS.

A hardy species from Western China, with entire leaves, and bearing comparatively small flowers. The perianth tube is pale green, and the limb is yellowish with red markings on the inner side. It requires a sunny position, and rather strong soil. "Bot. Mag.," t. 8.325.

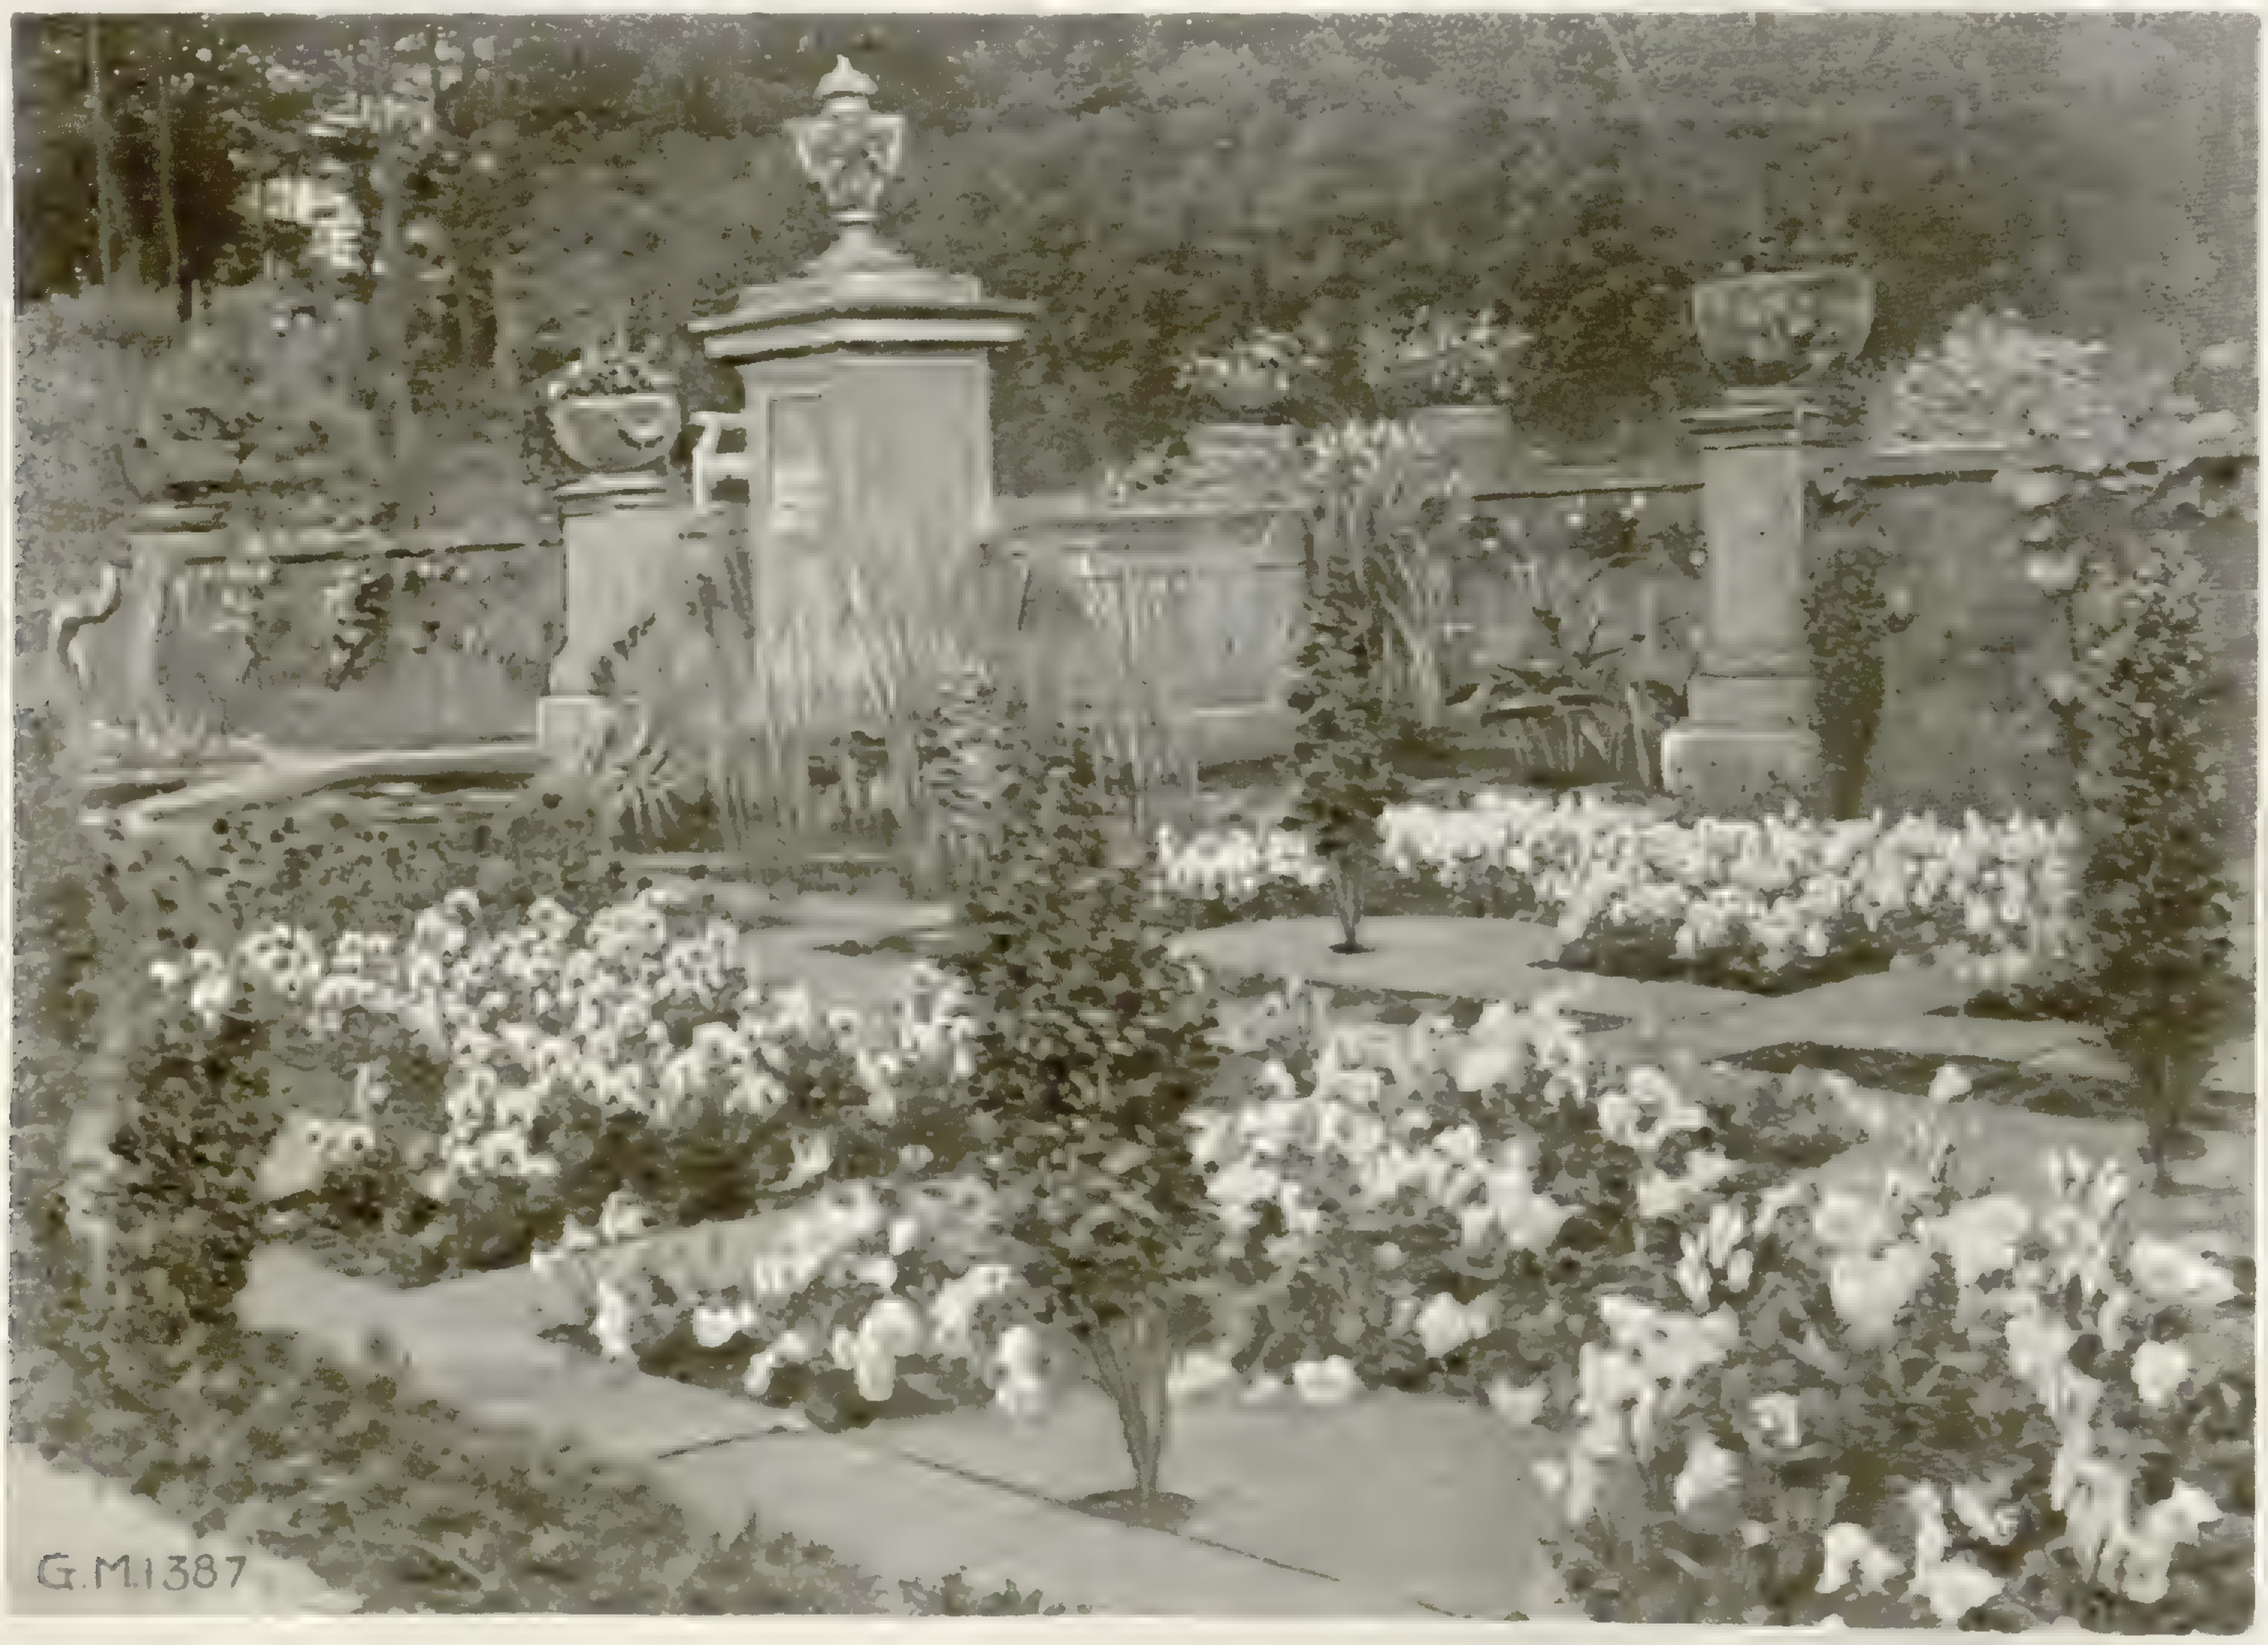
RHODODENDRON FLAVIDUM.

A charming yellow-flowered species, dwarf in growth, and flowering with great freedom. The flowers are produced in trusses, ranging from three to five in each, and are pale-yellow. This rhododendron is a native of Western China, and is hardy in this country. "Bot. Mag.," t. 8.326.

TUFTED PANSIES FOR MASSING.

The violas, or tufted pansies, have always been regarded as among our most beautiful hardy flowers, and at no period have they enjoyed greater popularity than at the present moment. Their utility is equally great, for they are amenable to a variety of conditions, while, with special culture and suitable varieties, enormous latitude in their flowering season can be secured.

Like most of our best garden flowers violas reward us most generously when their cultivation is carried out in a thorough and systematic manner. The present is the best time to insert cuttings, which should always be selected from the young growths that have not flowered. Insert these in a firm bed of sandy loam, placing the cuttings three inches apart. The bed should be enclosed by boards, so as to form a roughly improvised frame, over which hand-lights can be placed, both in order to hasten root formation now, and again during winter in periods of severe weather.



AN EFFECTIVE ARRANGEMENT OF VIOLAS OR TUFTED PANSIES
In the Gardens of Walmsgate House.

Once the cuttings are inserted, water them thoroughly, and place the lights in position, lightly shading the plants during the sunniest part of the day. This treatment ensures a stock ready for planting out early in spring, and therefore specially adapted for furnishing a display throughout summer and autumn. Plants obtained from cuttings taken in July form suitable material for planting late in autumn to yield a display in early spring, although, from plants a year older a much greater quantity of flowers is produced, if only slightly smaller. When the latter are employed it is advisable to trim off the older growth in autumn, as at this season the plants are generally exhausted by flowering, new growths speedily replace the old shoots, and these break into flower at any favourable opportunity in spring.

Where the plants are retained in situ for the spring display a rich top-dressing of soil and manure must be given in autumn, and, this being washed into the roots during winter, will maintain them in the maximum of vigour. When the plants are lifted from their summer quarters and transferred to another position, the soil should be liberally manured, and the plants made thoroughly firm at planting, in order to safeguard against upheaval by frost.

Violas call for little attention during the flowering season, the main object being to secure continuous blooming, which is rendered more certain by constantly removing all spent flowers and supplying adequate moisture, both in the form of clear water and liquid manure. Their decorative value is practically without limit, they are free enough for informal bedding, and neat enough for the most rigidly formal or geometrical lines, while as a groundwork for other plants they approach perfection.

Varieties of tufted pansies are exceeding numerous, so that it is only possible to offer a small selection here. Virginalis is one of the purest whites, the ground being relieved by soft blue pencilled lines; Duchess of York has rayed flowers of a creamy-white colour; Cream King is a rayless flower of a fine cream colour, the habit being a trifle loose; The Lark produces large white, rayed flowers, which are edged with heliotrope; James Pilling is a rayless white, with a lavender edge; Kitty Bell is a beautiful pale lavender self; and William Niel is a rosy-lilac, and extremely neat in habit; Bridal Morn is a fine shade of heliotrope; Mrs. C. F. Gordon and Mrs. H. Bellamy have a rich velvety ground colour, relieved by white, this being most in evidence in the first-named variety; among strong yellows, Bullion, Constance Leonora, and Lizzie Paul are good reliable varieties, the first and last-named being rayed.

Thomas Smith.

THE COMMON POLYPODY.

In most of the counties of Great Britain and Ireland the pretty Polypody (Polypodium vulgare) is found growing on old walls, in the forks of ancient trees, and in the dykes by the roadside. In the ferny districts in the west it is so abundant in many places that for miles at a stretch its once-divided, long, narrow fronds may be observed peeping out from the hedge tops in myriads, and the tops of stone walls will be densely draped by colonies and clumps in compact masses.

Normally, its fronds are very simple, consisting of a long stalk for about a third of the length, which then becomes a midrib to two rows of smooth-edged side divisions touching each other at their bases, and terminating in a rounded tip. Towards the end of the frond these taper to a bluntish point. I have measured fronds over two feet long, but, as a rule, eight or nine inches is nearer the average. On examination we find that these fronds do not spring from a definite centre, like the Male Fern, or other large-growing species, but from a mass of fleshy creeping root-stocks, whence they rise one after the other. These root-stocks, or rhizomes, are as thick as a stout lead pencil, greenish, and somewhat scaly. They creep about by extension of the growing tips, whence the fronds arise and attach themselves very firmly to the stonework, when growing on walls, by roots which emerge from their undersides, and which penetrate the crevices and interstices to form an anchorage and obtain nourishment. In the hedge banks these root-stocks travel more freely, and are usually found to be revelling in the loose sandy compost of decayed leaves and dust which accumulate in such positions.

We may gather from this that the fern favours well-drained positions, and where it grows in the soil, that soil must be open and friable. In point of fact, we never find the polypody growing in such wet soil, on the flats, so to speak, as suits the Lady Fern and other robust species; it is always on lumpy, rocky elevations, or among tree roots, or some accumulation of that kind that we find it at home elsewhere than on trees or walls or hedge tops. Its creeping root-stocks, in short, demand ventilation, coupled with conditions which permit of their rambling about freely, and obtaining a fair amount of light for the fronds which they send up. It is for these reasons that culture in shallow pans or in suspended baskets is better suited than culture in ordinary pots, while out of doors some sort of rockwork is better adapted than planting in flat beds.

The common polypody, like most of our native fern species, has been liberal in "sports," and no thoroughgoing cultivator of British ferns devotes much, or any, space to the common form described. In some subtle fashion Nature here and there inspires the common polypody to depart from the beaten track of its ancestors, and adopt new and often far more beautiful types of frondage. One variety, called Polypodium cambricum, or the Welsh polypody, figures in the oldest fern books, even in Gerard's "Herbal," and is one of the finest and best known of the varietal types. In this the simple smooth-edged lobes of the frond are greatly lengthened and widened, and cut into long, acutely-pointed subdivisions, utterly transforming the frond. As this form has never been observed to bear spores, it is a singular fact that it has been found at widely distant places, not only in Wales, but in several other districts. It is also reported in the United States, and in our Lake district here several quite distinct sub-varieties of it have been found, all of which are equally barren of spores, and thus individually incapable of spreading, except locally, by their travelling root-stocks.

It is clear, therefore, that these numerous independent finds must be due to as many individual "inspirations," and consequent departure from the normal simple type either by means of an inspired spore or an inspired bit of rhizome, but which we shall never know. In one case, P. v. cambricum Prestoni, we may assume that a spore was so gifted, since it was discovered as a tiny plant in a cleft in a rock, which the finder had to roll home in order to coax the youngster out of its retreat without the imminent risk of destroying it by removal in situ. This plumose, or feathery type of variation exemplified in P. v. cambricum, and in the Barrowi, Prestoni, Hadwini, and serratum varieties, is, however, by no means the only one.

The common polypody has sported in many other ways; there is a crested or tasselled section, of which P. v. cristatum, grandiceps Fox, P. v. grandiceps Parker, P. v. grandiceps Forster, and P. v. bifidimultifidum are the élite, a foliose section, akin to cambricum, but fertile and coarser, with P. v. pulcherrimum and P. v. omnilacerum. Among many other variants we have the wonderful P. v. elegantissimum or cornubiense, found on a pollard tree in Cornwall, which, in its thorough type, has extremely finely dissected fronds like a delicate trichomanes, or Filmy Fern, but almost invariably produces two other types, one more coarsely cut, and the other the plain homely frond of its original ancestor. All three types may appear in one and the same frond, as a sort of patchwork. This reversion has been nearly bred out in P. v. trichomanoides, but I doubt if it is so entirely, as it seems to be ineradicable.

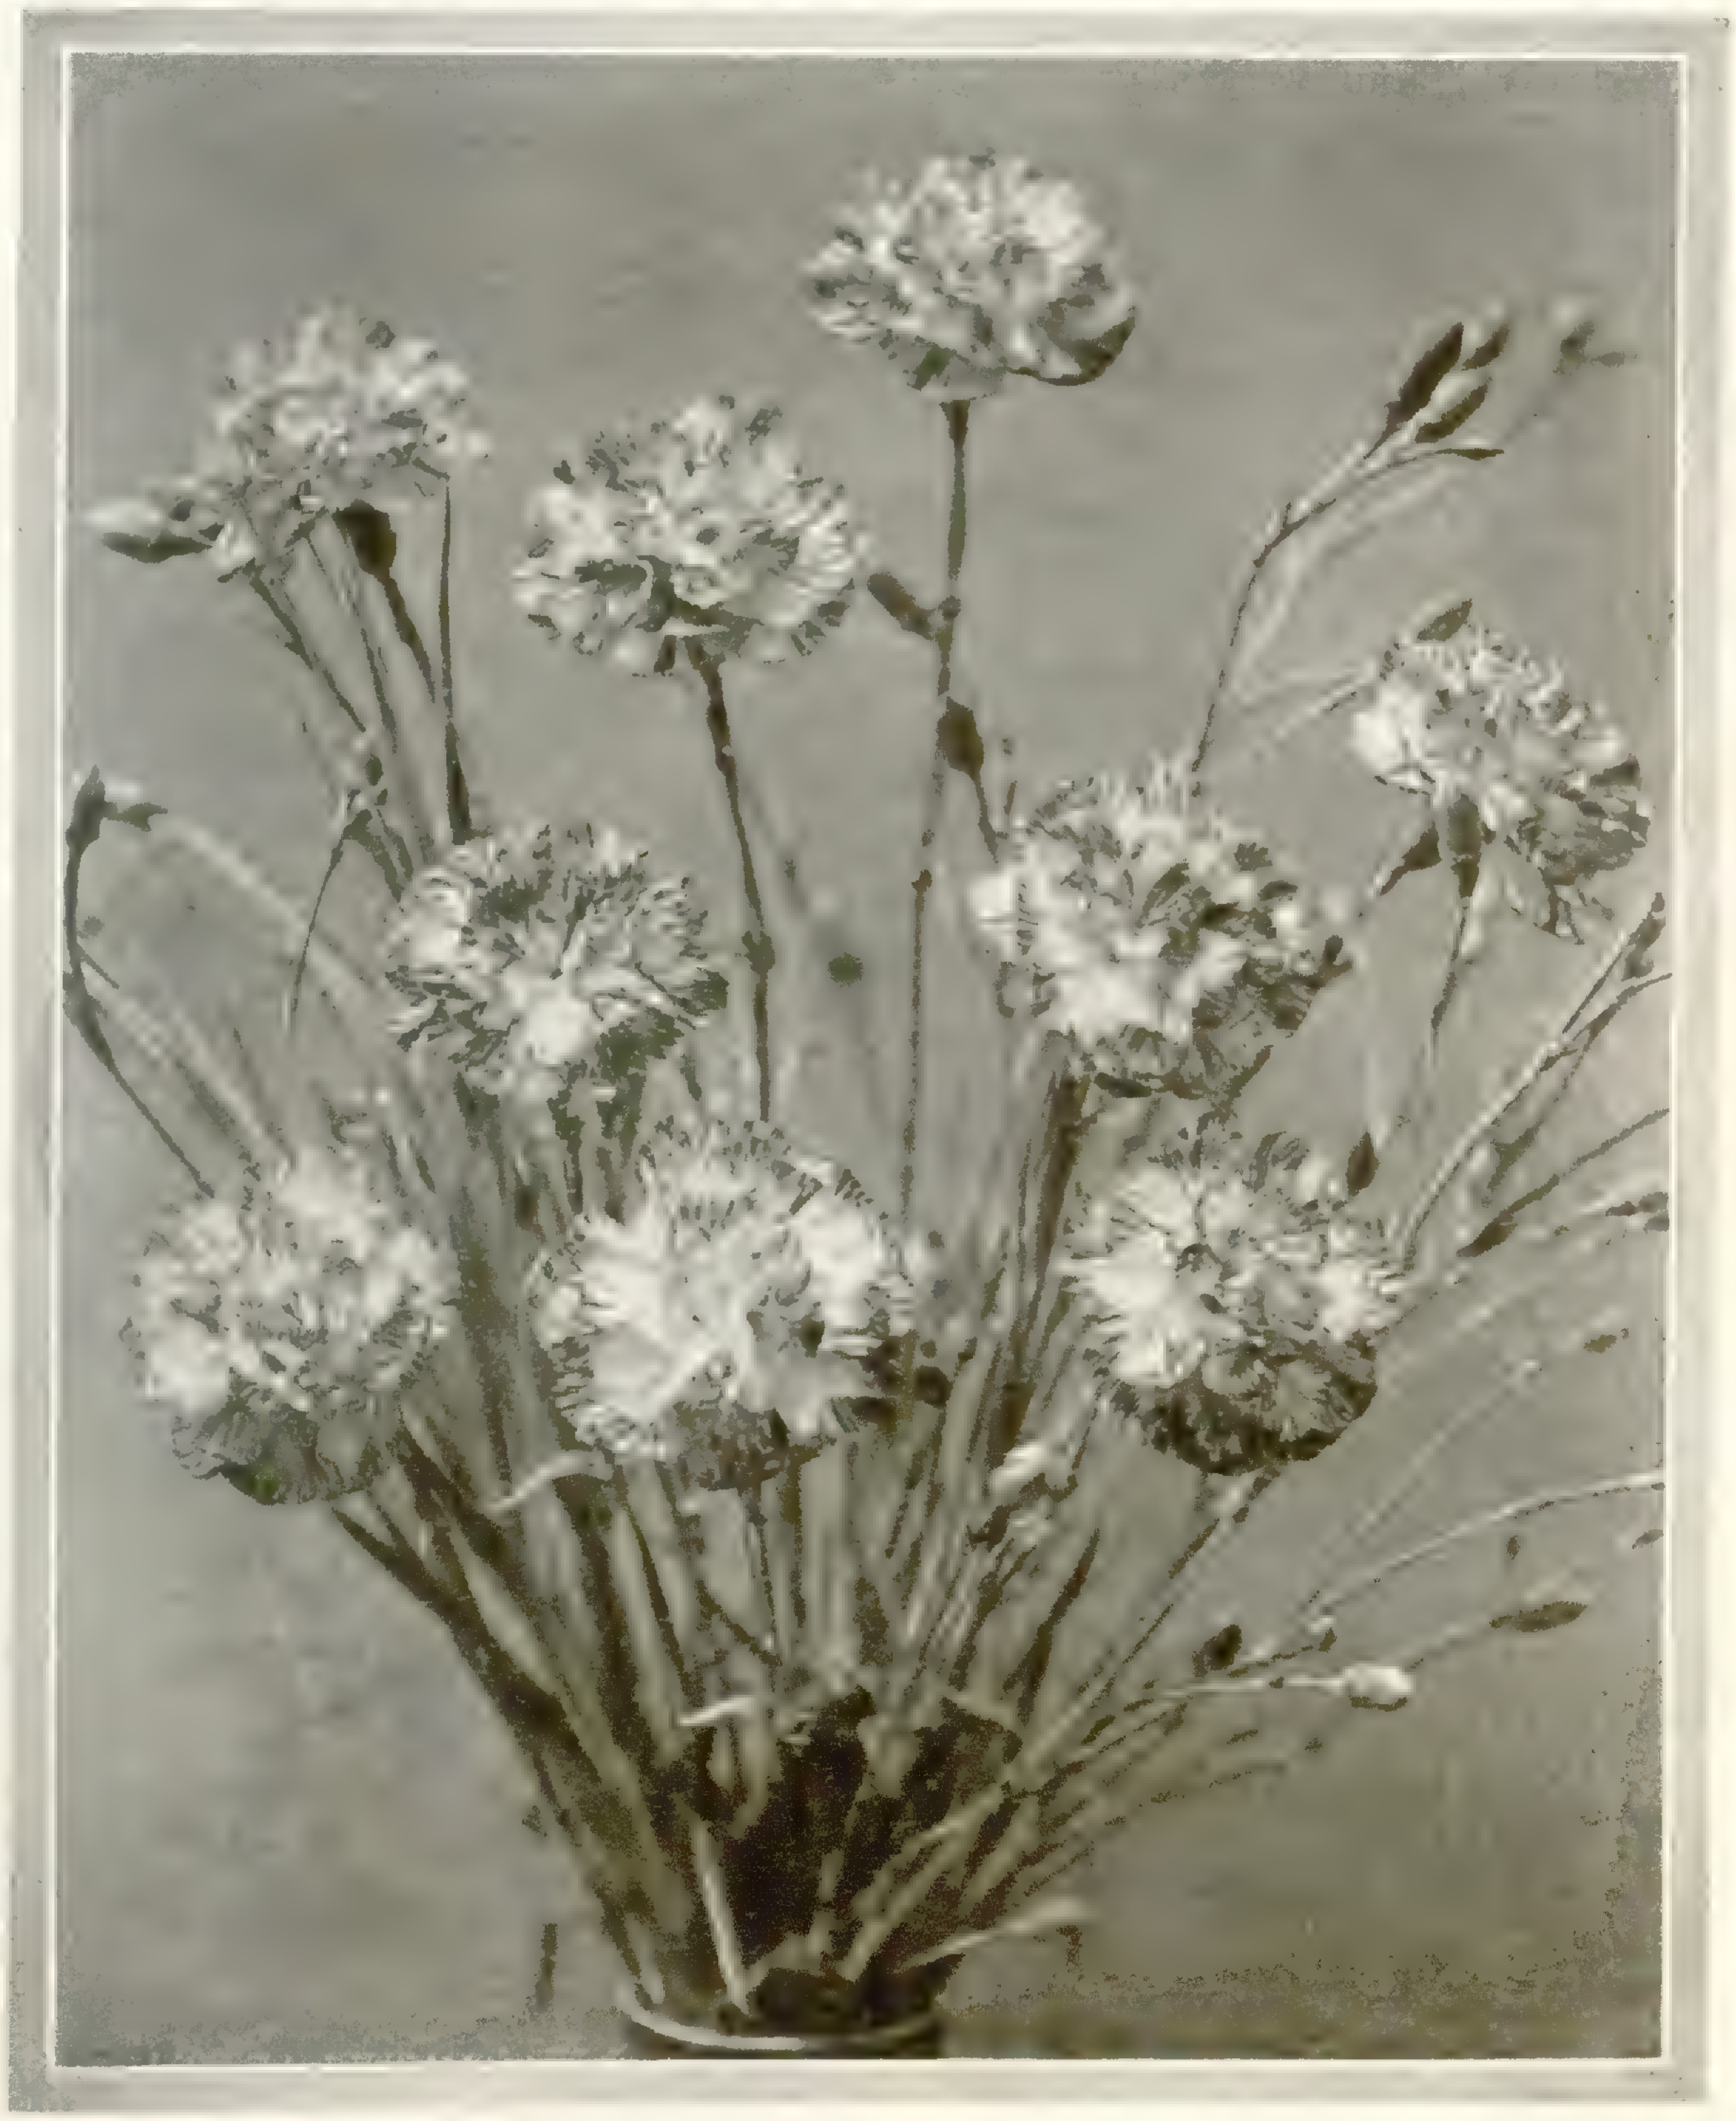
WHITE GROUND FANCY CARNATIONS.

The illustration of Delicia that is given herewith conveys an excellent idea of the white ground fancy carnations. Visitors to the carnation societies' exhibitions may have observed on an examination of the exhibits, that all, or nearly all, the successful competitors choose yellow grounds, also buff or apricot grounds, variously marked with rich colours. The white grounds are left severely alone, judges and exhibitors alike favouring the coloured grounds. It is scarcely a matter of taste, for exhibits quite as tasteful might be made of white ground fancies, as witness the group of nine stems of Delicia, an exquisitely beautiful seedling raised by Mr. J. Douglas in his nursery at Great Bookham.



CARNATION DELICIA.

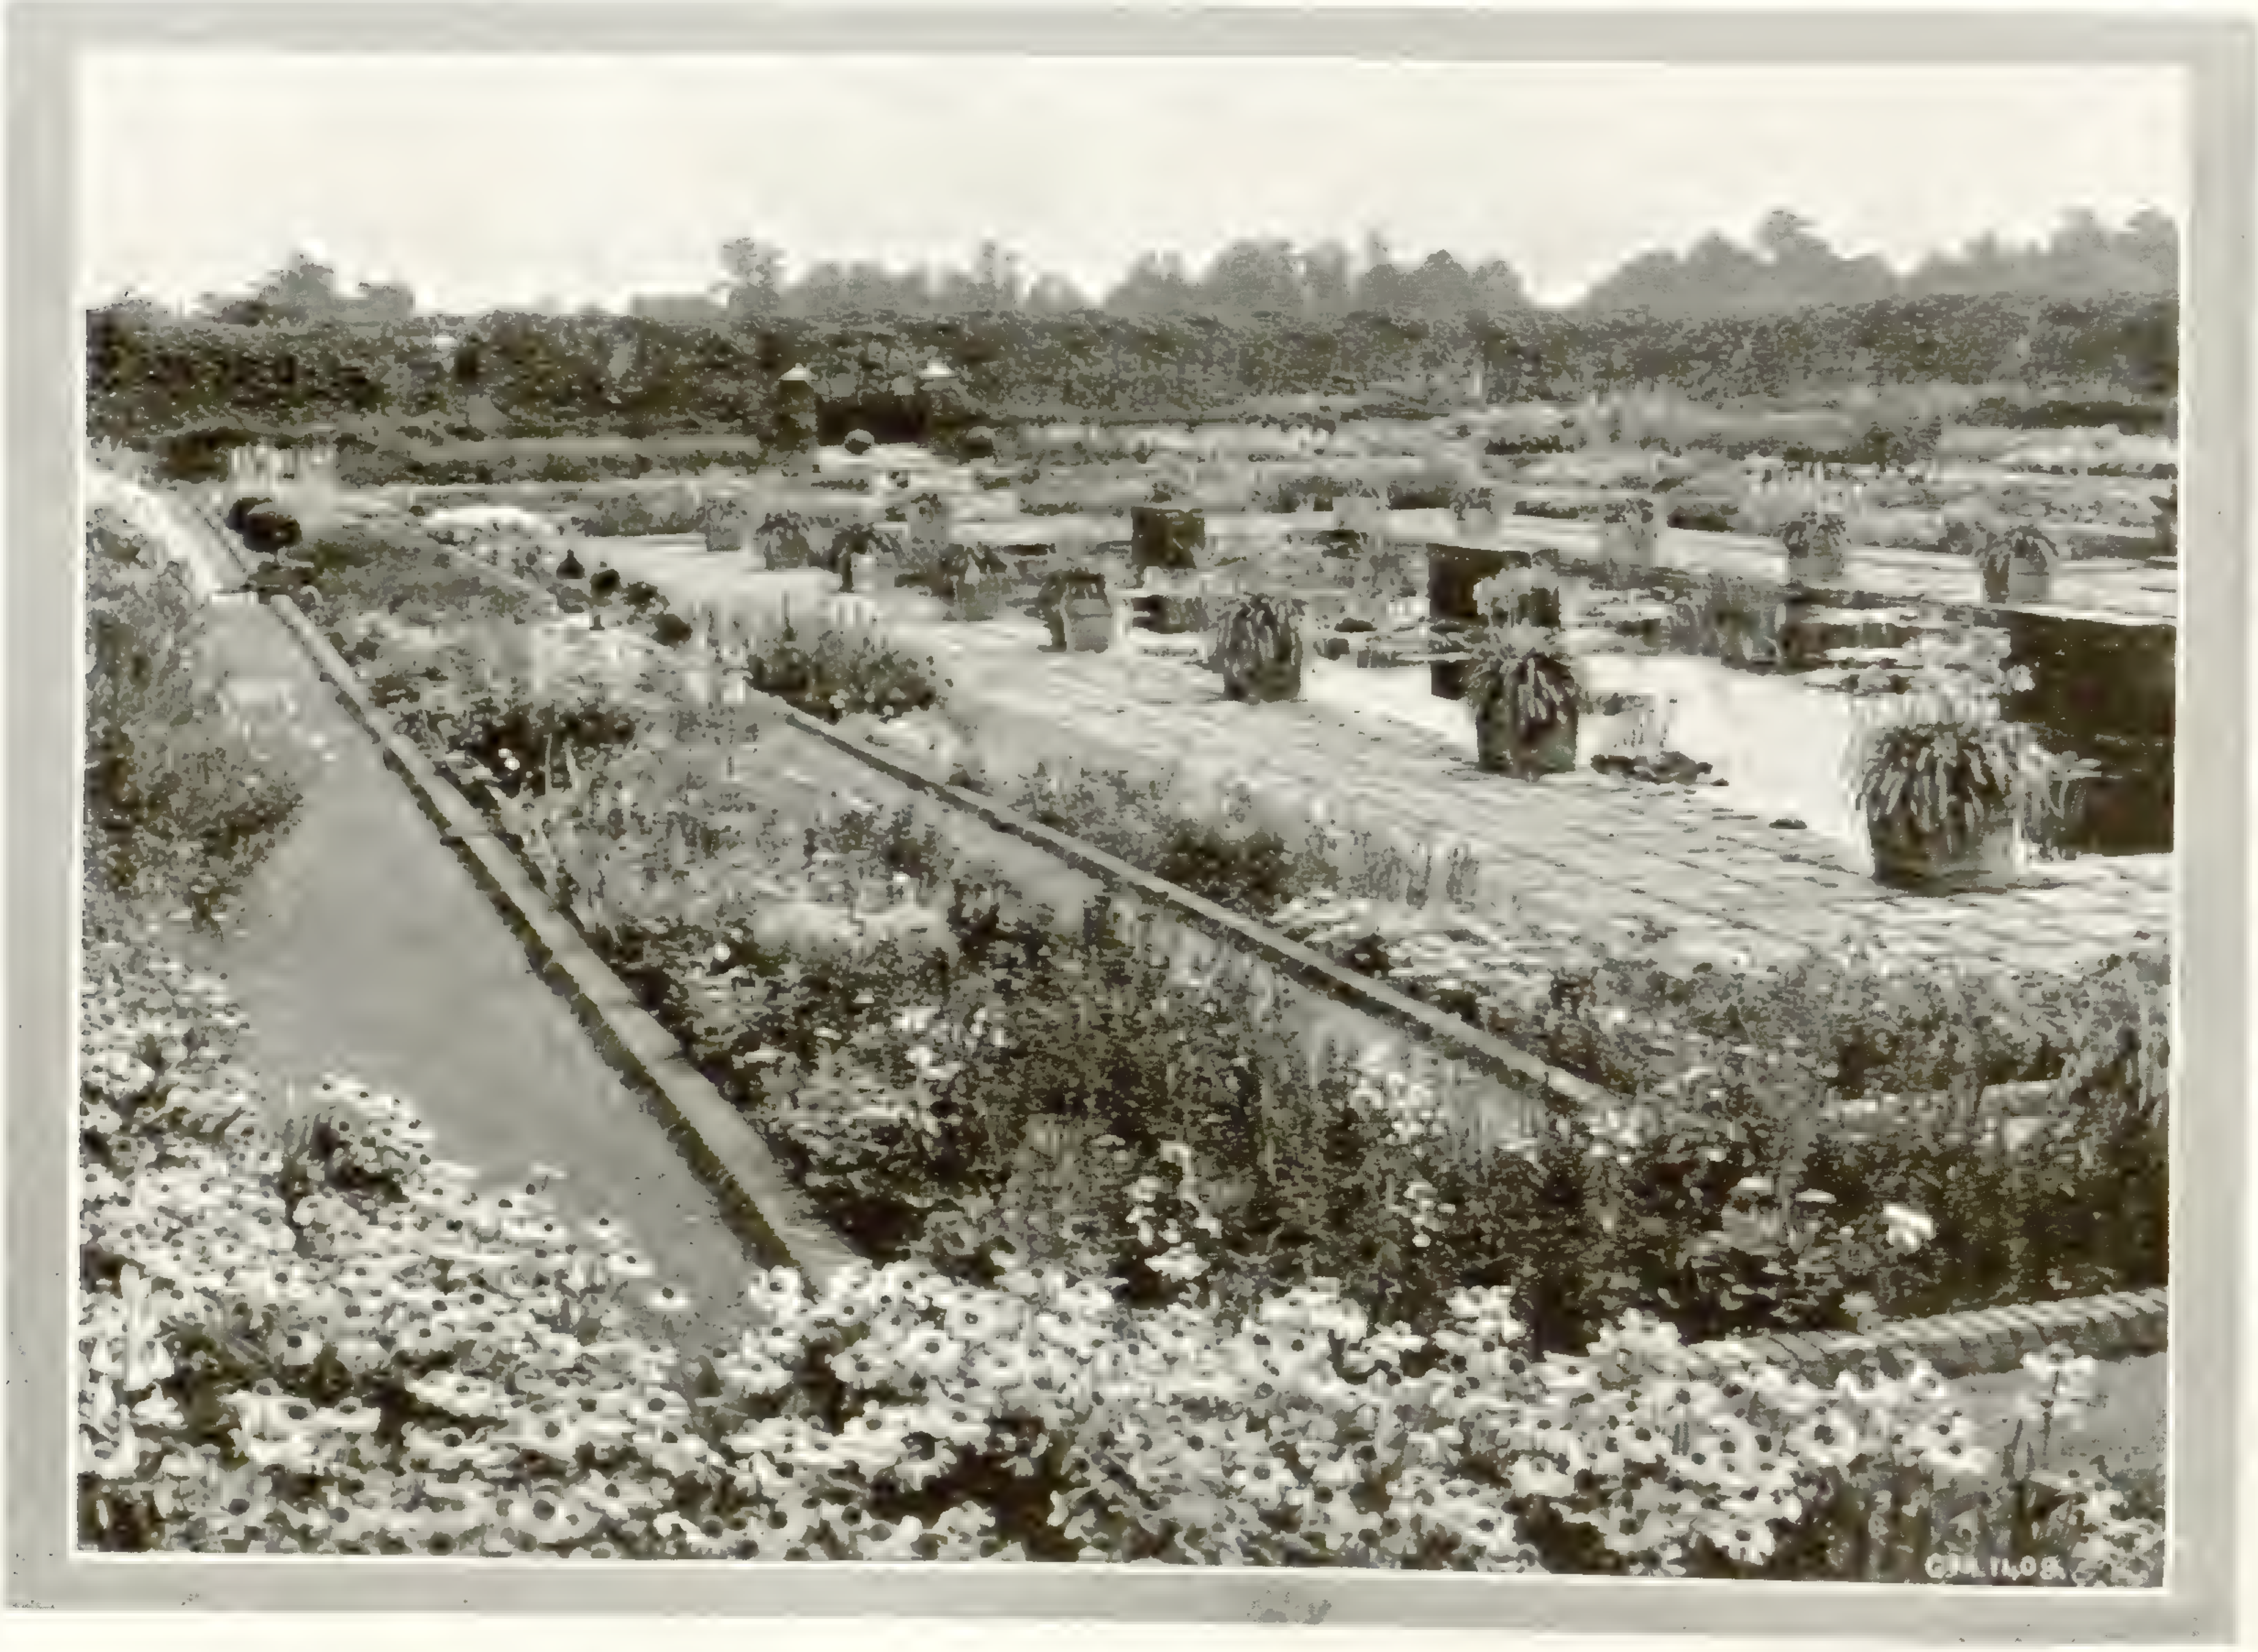
A beautiful white-ground fancy variety, raised by Mr. J. Douglas; the flowers are large and richly marked with scarlet on a pure white ground.

There are many very beautiful white ground varieties in cultivation. One named Willie has been in evidence for a number of years. Besides Delicia, which is new this year, another fine variety is The Bride, a pure white ground lightly marked with rose flakes. Sweet Briar is another very charming white ground, marked with lavender and rose. Cæsar and Pompey are two distinct varieties, but both are pretty, and if you have Cæsar one year it may be Pompey the next, or vice versa. Charm is another delicately coloured white ground of merit. Hon. Dorothy Legge is a distinct variety, white, very freely marked with bright rose. Rhoda (Taylor) is a quite distinct and charming white ground, the petals very freely marked with lavender and rose. The Nizam is also a beautiful variety, quite distinct in its pure white ground and scarlet markings. There can be no doubt that it is possible to make a stand of single flowers or a group in vases of white grounds to equal, if not to surpass, the coloured grounds, and the special societies should give such encouragement to them as would give them due prominence. The white grounds are practically ignored in classes for fancies, therefore if prizes were offered specially for white grounds the result would doubtless be a large accession to this class. There seems to be a general feeling that self-coloured carnations and fancies are quite out of place displayed on cards. These classes might be eliminated from the schedule of the National Carnation Society, and a class for vases of white ground varieties be provided, the blooms to be shown as grown, like the group of Delicia. The vases would certainly form an attractive and interesting feature.

DAHLIAS TO PERFECTION.—A thorough guide to the successful culture of these popular flowers is "Dahlias and Their Cultivation," by J. B. Wroe, price 1s. net, by post 1s. 2d., bound in cloth 1s. 6d., by post, 1s. 8d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

NEW SUNK GARDEN AT KENSINGTON PALACE.

Within a comparatively short period of the opening of Kensington Palace to the public, in 1899, in celebration of Queen Victoria having attained her eightieth year, it was suggested that the time had arrived when something should be done to improve the grounds around this historic building. The authorities were slow in acting upon the suggestion, for not until five years had elapsed was any definite action taken to remove the glasshouses that had so long occupied a prominent position under the windows of the state apartments. Originally the houses occupying this area were devoted to the production of fruit and forced vegetables for the Royal table, and to the growth of plants and flowers for the decoration of the apartments of the Royal residences; they were employed in this way until the magnificent fruit and kitchen gardens were formed at Frogmore early in the reign of Queen Victoria. Subsequently the structures were utilised in the preparation of the immense stocks of bedding plants required for beautifying Hyde Park, Kensington Gardens, and other open spaces under the same management, and for wintering the palms and other specimen plants.



GENERAL VIEW OF THE NEW SUNK GARDEN, KENSINGTON PALACE.

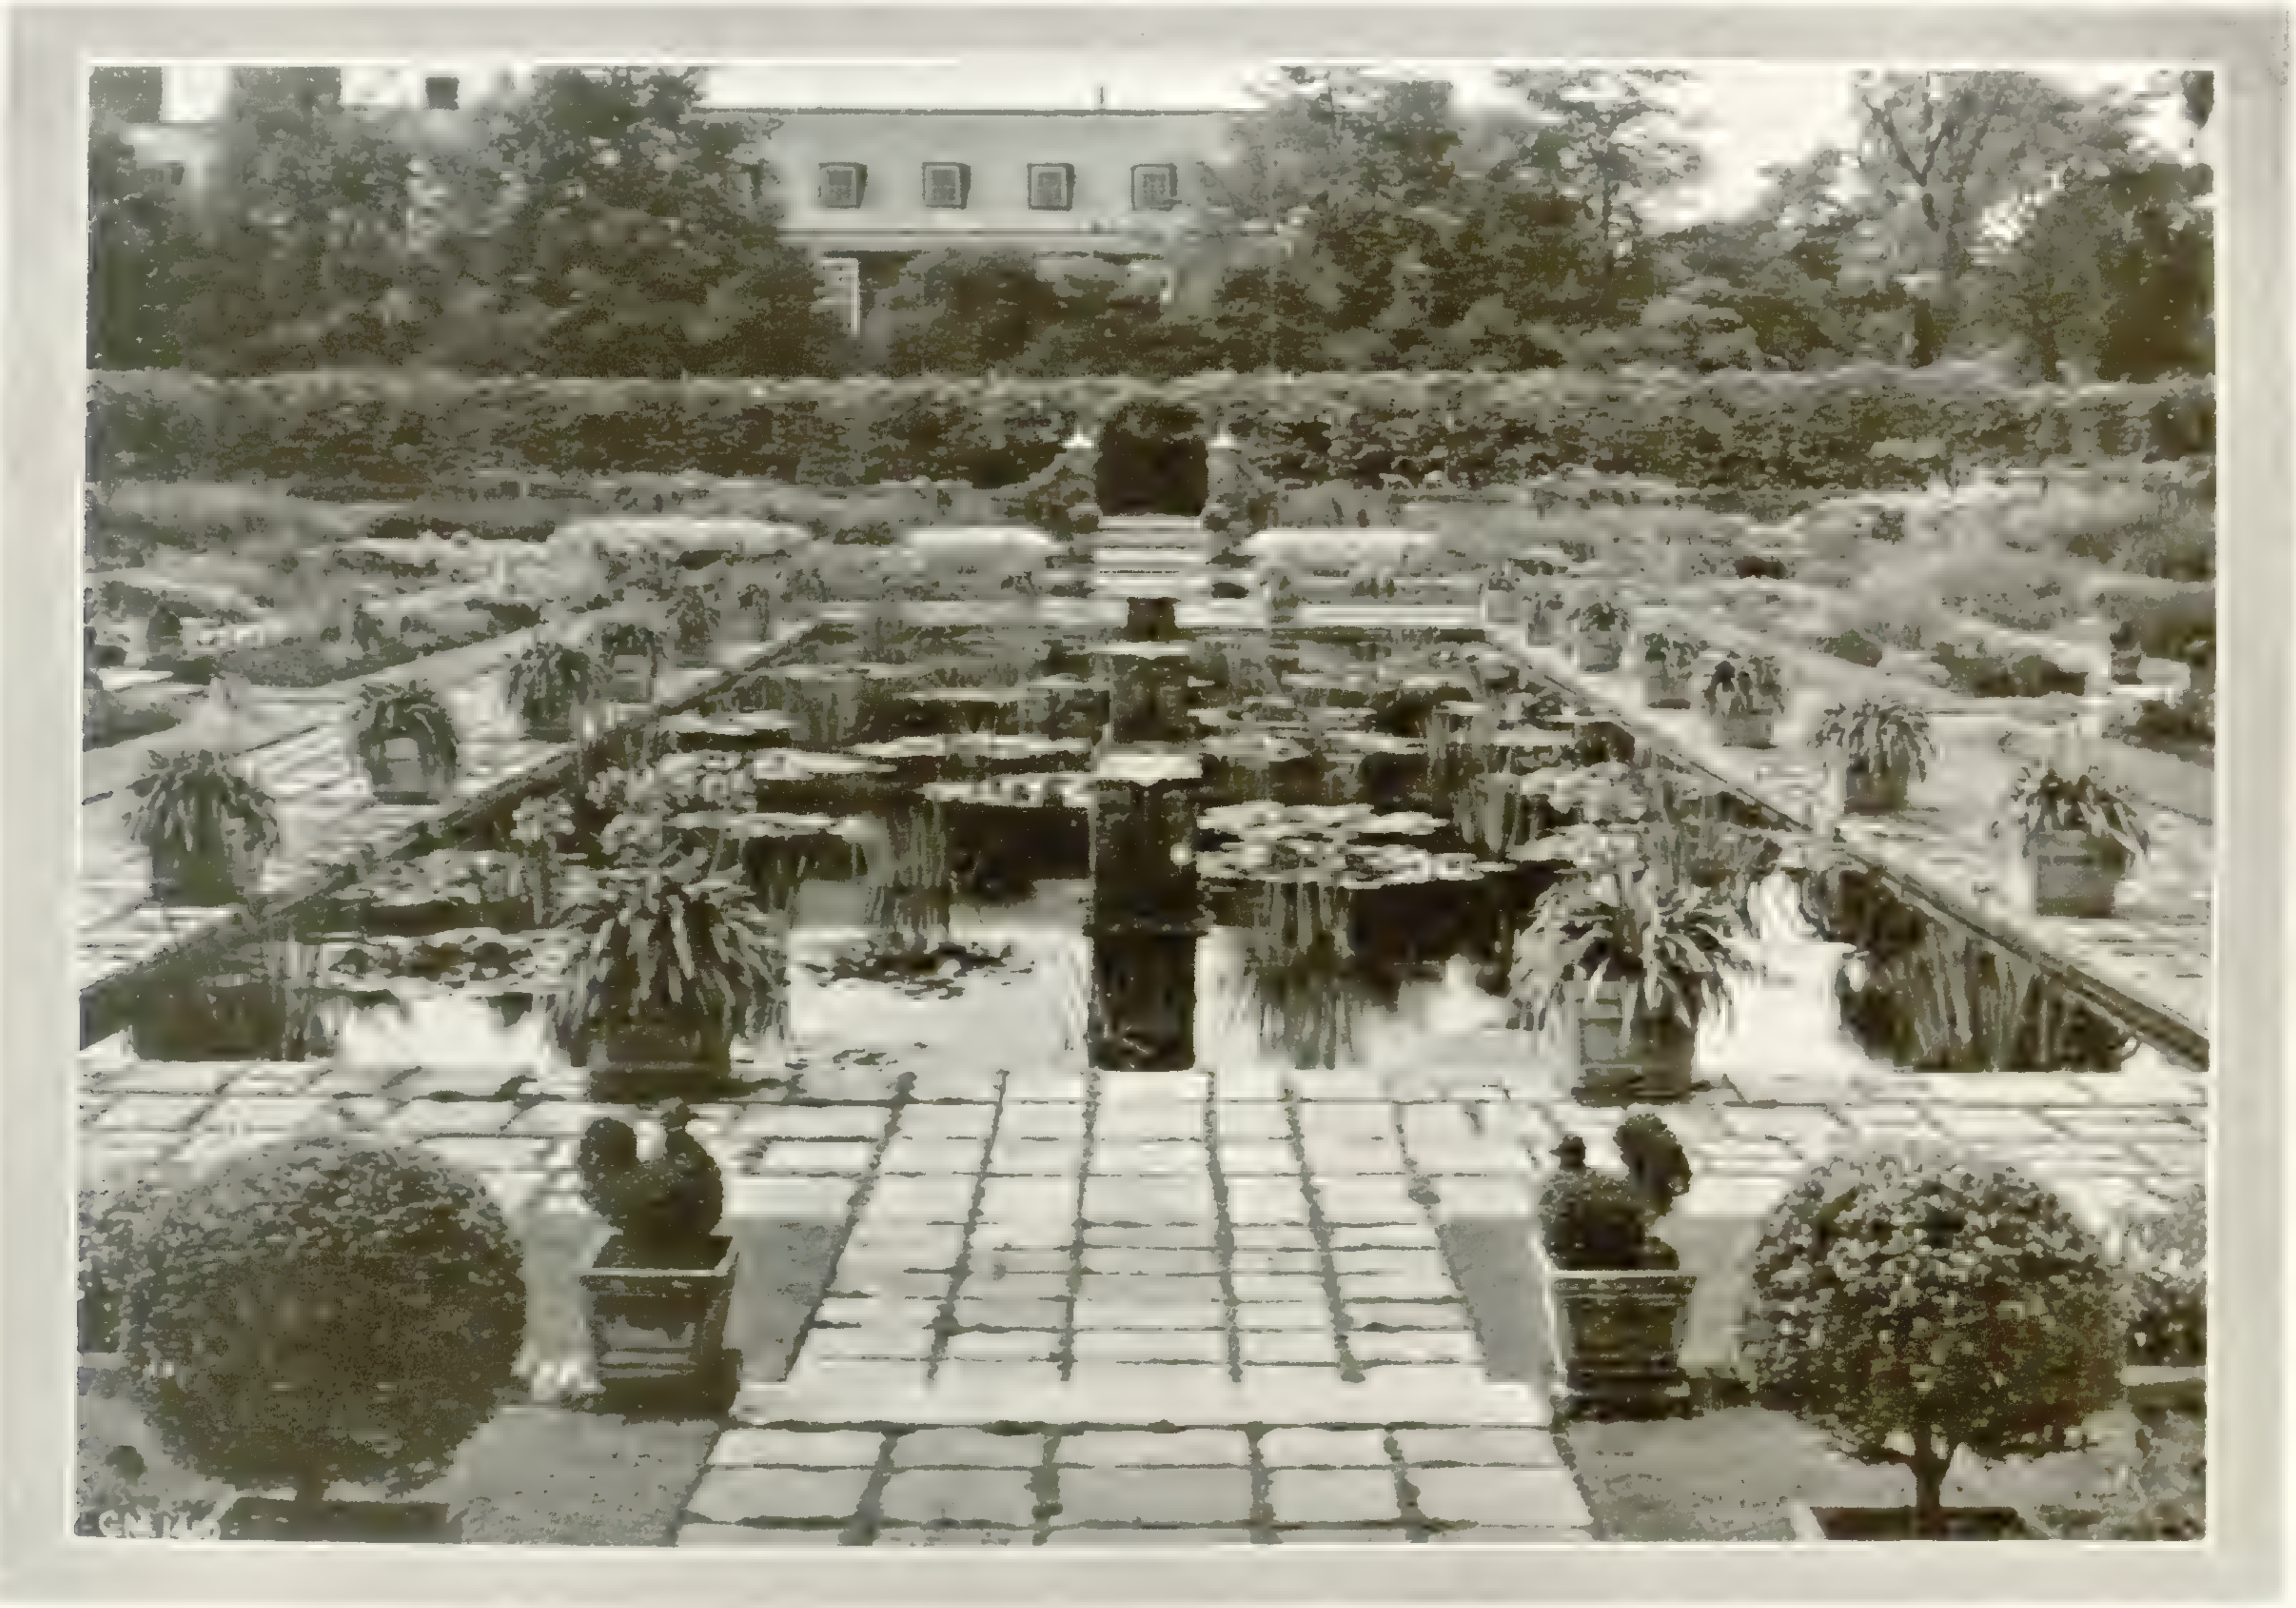
Six years since a site was found for the plant nursery in Hyde Park, and when houses of modern design had been built the removal of the "glass" from the Kensington Palace Gardens was commenced, and proceeded with as rapidly as the circumstances of the case permitted. It is of interest to remember in this connection that the late King Edward evinced the warmest interest in the scheme for improving the gardens, and readily gave his assent to the arrangements made for carrying it out. For some time previous to taking active steps to effect the much-desired improvement it was felt that an old-fashioned flower garden would be more in keeping with Kensington Palace, and would be desirable also as affording an example in the Metropolis of one of the forms of garden design that found favour with our forefathers in the distant past. It was eventually decided by the authorities that there should be a representation of the "sunk" garden which appears to have enjoyed a considerable degree of popularity throughout the sixteenth century. The design and construction of the new garden have been the joint work of the late Mr. Jordan and the present superintendent, Mr. Gardener, and the success achieved has been such as to well merit the warmest commendations.

The site of this new sunk garden is on the east side of Kensington Palace, and in front of the Orangery, which has long been an interesting feature of the grounds. It is rather farther from the latter structure than to some may appear advisable, but, of necessity, a sunk garden, with its pond, should be at a relatively low level, and the ground whereon the garden has been formed is lower than that in front of the Orangery. It has been mentioned as probable that the sunk garden has been designed in accordance with the plan of the "pond" garden constructed at Hampton Court during the reign of Henry VIII., and filled up by William III. This possibly may have been the case, but the present garden is the larger of the two, and it is profusely embellished with flowers. Whether the Hampton Court "pond" garden contained flowers is problematical; there is no record of them, but as there are records of rather large sums of money having been expended on carved animals, or "beestes," as they are called in the accounts for Hampton Court, it may be assumed that some of them were used in decorating the "pond" garden. The sunk garden at Kensington Palace is an oblong, and although this shape is not in accordance with the views of the sixteenth century writers on gardening, so far as concerns the outline of the whole garden, there can be no doubt that the oblong form was frequently adopted in the creation of secondary gardens—the Hampton Court "pond" garden, for example. In this connection it may be of interest to mention that with reference to the shape of gardens, Bacon writes, in his essay "On Gardens": "The garden is best to be square, encompassed on all four sides with a stately arched hedge." Parkinson states that this shape was preferred to "an orbicular, a triangle, or an oblong; because it doth best agree with a man's dwelling."

As in the case of the garden described in "Measure for Measure," the one under notice is "circummured with brick," but the walls are low, being probably not more than three feet high from the surface of the highest of the three flower borders. These walls are of red brick, with an opening on each side, and at either end, this being closed by a neat gate in wrought iron. From each of the four gates the lily pond, which extends the greater part of the length of the garden, is reached by flights of steps, that, as in the case of the space immediately round the pond, are formed with flagstones. From the outer wall to the paved space the ground falls in a series of terraces, consisting in about equal parts of flower border and grass turf. The borders, as will be seen in the general view of the garden given herewith, are planted with irregularly arranged groups of flowering plants, and the effect produced by the great masses of flowers in contrast with the red brick walls, the green alleys, and the grey paving stones, is indescribably beautiful. The principal flowers used in the embellishment of the garden comprise heleniums, marguerites, gladioli, galtonias, godetias, celosias, lemon and orange-coloured pot marigolds, Verbena venosa, and Sedum spectabile. As a matter of course, the lily pond, which constitutes so charming a feature, conforms in outline to that of the garden, and is furnished with nymphaeas and other aquatics. Arranged down the centre of the pond are three eighteenth century decorated lead cisterns, with jets, which add much to the interest and assist in a marked degree to give an old-time appearance to the scene. Arranged in vases round the pond are a score or so of well-flowered specimen agapanthuses, which, need it be said, add materially to the attractions of the garden.

Bacon's injunction that the garden should be "encompassed on all four sides with a stately arched hedge" has not been overlooked in the construction of this garden, if not acted upon to the letter. There are arched hedges or pleached alleys on the east, south, and west sides, but as the broad walk leading to the Orangery skirts the north side, there is only a single hedge. The hedges are formed wholly with the red budded lime, and as the trees have had two season's growth they are now beginning to fill the allotted space, and to shew that it would have been advantageous had the slope of the stems commenced a little higher up, but this is a small matter, and can soon be set right. Openings have been formed at intervals to allow visitors to have a view of the flowers as they enjoy the shade and seclusion of the "pleached alley," the garden itself not being open to the public. It is an advantage to the garden to have the gates closed, and it is certainly no disadvantage to visitors, for the finest views are those obtained from the "pleached alley."

G. G.



LILY POND IN NEW SUNK GARDEN, KENSINGTON PALACE.

ROMAN HYACINTHS.

Though these may not flower quite so early in the open as the winter aconite and the snowdrop, yet when grown in pots they are so easily first, even with the slight protection of an unheated frame, that they may really be considered as heralds of the glorious progress of spring. They may be obtained in bloom as early as November with very little heat, while with a house kept just warm enough to exclude frost they will be well in flower by Christmas. In an unheated frame in an open winter they will be in flower early in January. They are not often grown in the open ground, though it is quite easy to do so, given a favourable soil and situation, but the fragile character of their blossom looks rather out of place in the winter. It is the early white form which is usually grown, and it is the best.

The great essential in the cultivation of the Roman hyacinth is early potting, the end of August being quite late enough if they are to be brought into flower before Christmas. The compost should consist of two-thirds turfy loam and one-third leaf-mould, with a dusting of bonemeal. After being watered the pots should be set outdoors in a cool place—a north aspect by preference—and covered with cinder ashes, cocoa fibre refuse, etc., so that there is a thickness of three inches above the surface of the pots. This will secure a fair uniformity of moisture and temperature, and no water need be given them while they remain there. Someone, however, wrote in one of the gardening papers, some time ago, that in growing these bulbs he had let the pots stand on the greenhouse staging from the time they were potted till they flowered, and the result was quite satisfactory, but the quality of the flowers could not, of course, be judged by the reader. When treated as suggested the pots should remain buried for about three months, after which they may be taken out, a few at a time, as required, and put in a greenhouse, frame, or room, in which to flower. They should be kept partially shaded for a week or so until the callow spears become partially greened, after which they should be kept in as full a light as possible. For the same length of time they should not be put in a dry atmosphere or draughty place, or the growing tips of the leaves may be turned brown. The great mistake in forcing these early bulbs, as others, is giving them insufficient time to become thoroughly well rooted before forcing begins. Another mistake, too, is the use of second-size bulbs. The difference in price between first and second size bulbs will be from sixpence to a shilling per dozen, but while the former will only produce a single spike of blossom per bulb, and that perhaps of poor quality, the latter may average three

Roman hyacinths lend themselves admirably to culture in bowls of pebbles, fibre, and other materials now sold for the purpose. The principles of cultivation are similar to those for growing in pots as regards early planting, plunging in a cool place, and gradual exposure to light and warmth, but the bowls should be protected a little from excessive wet.

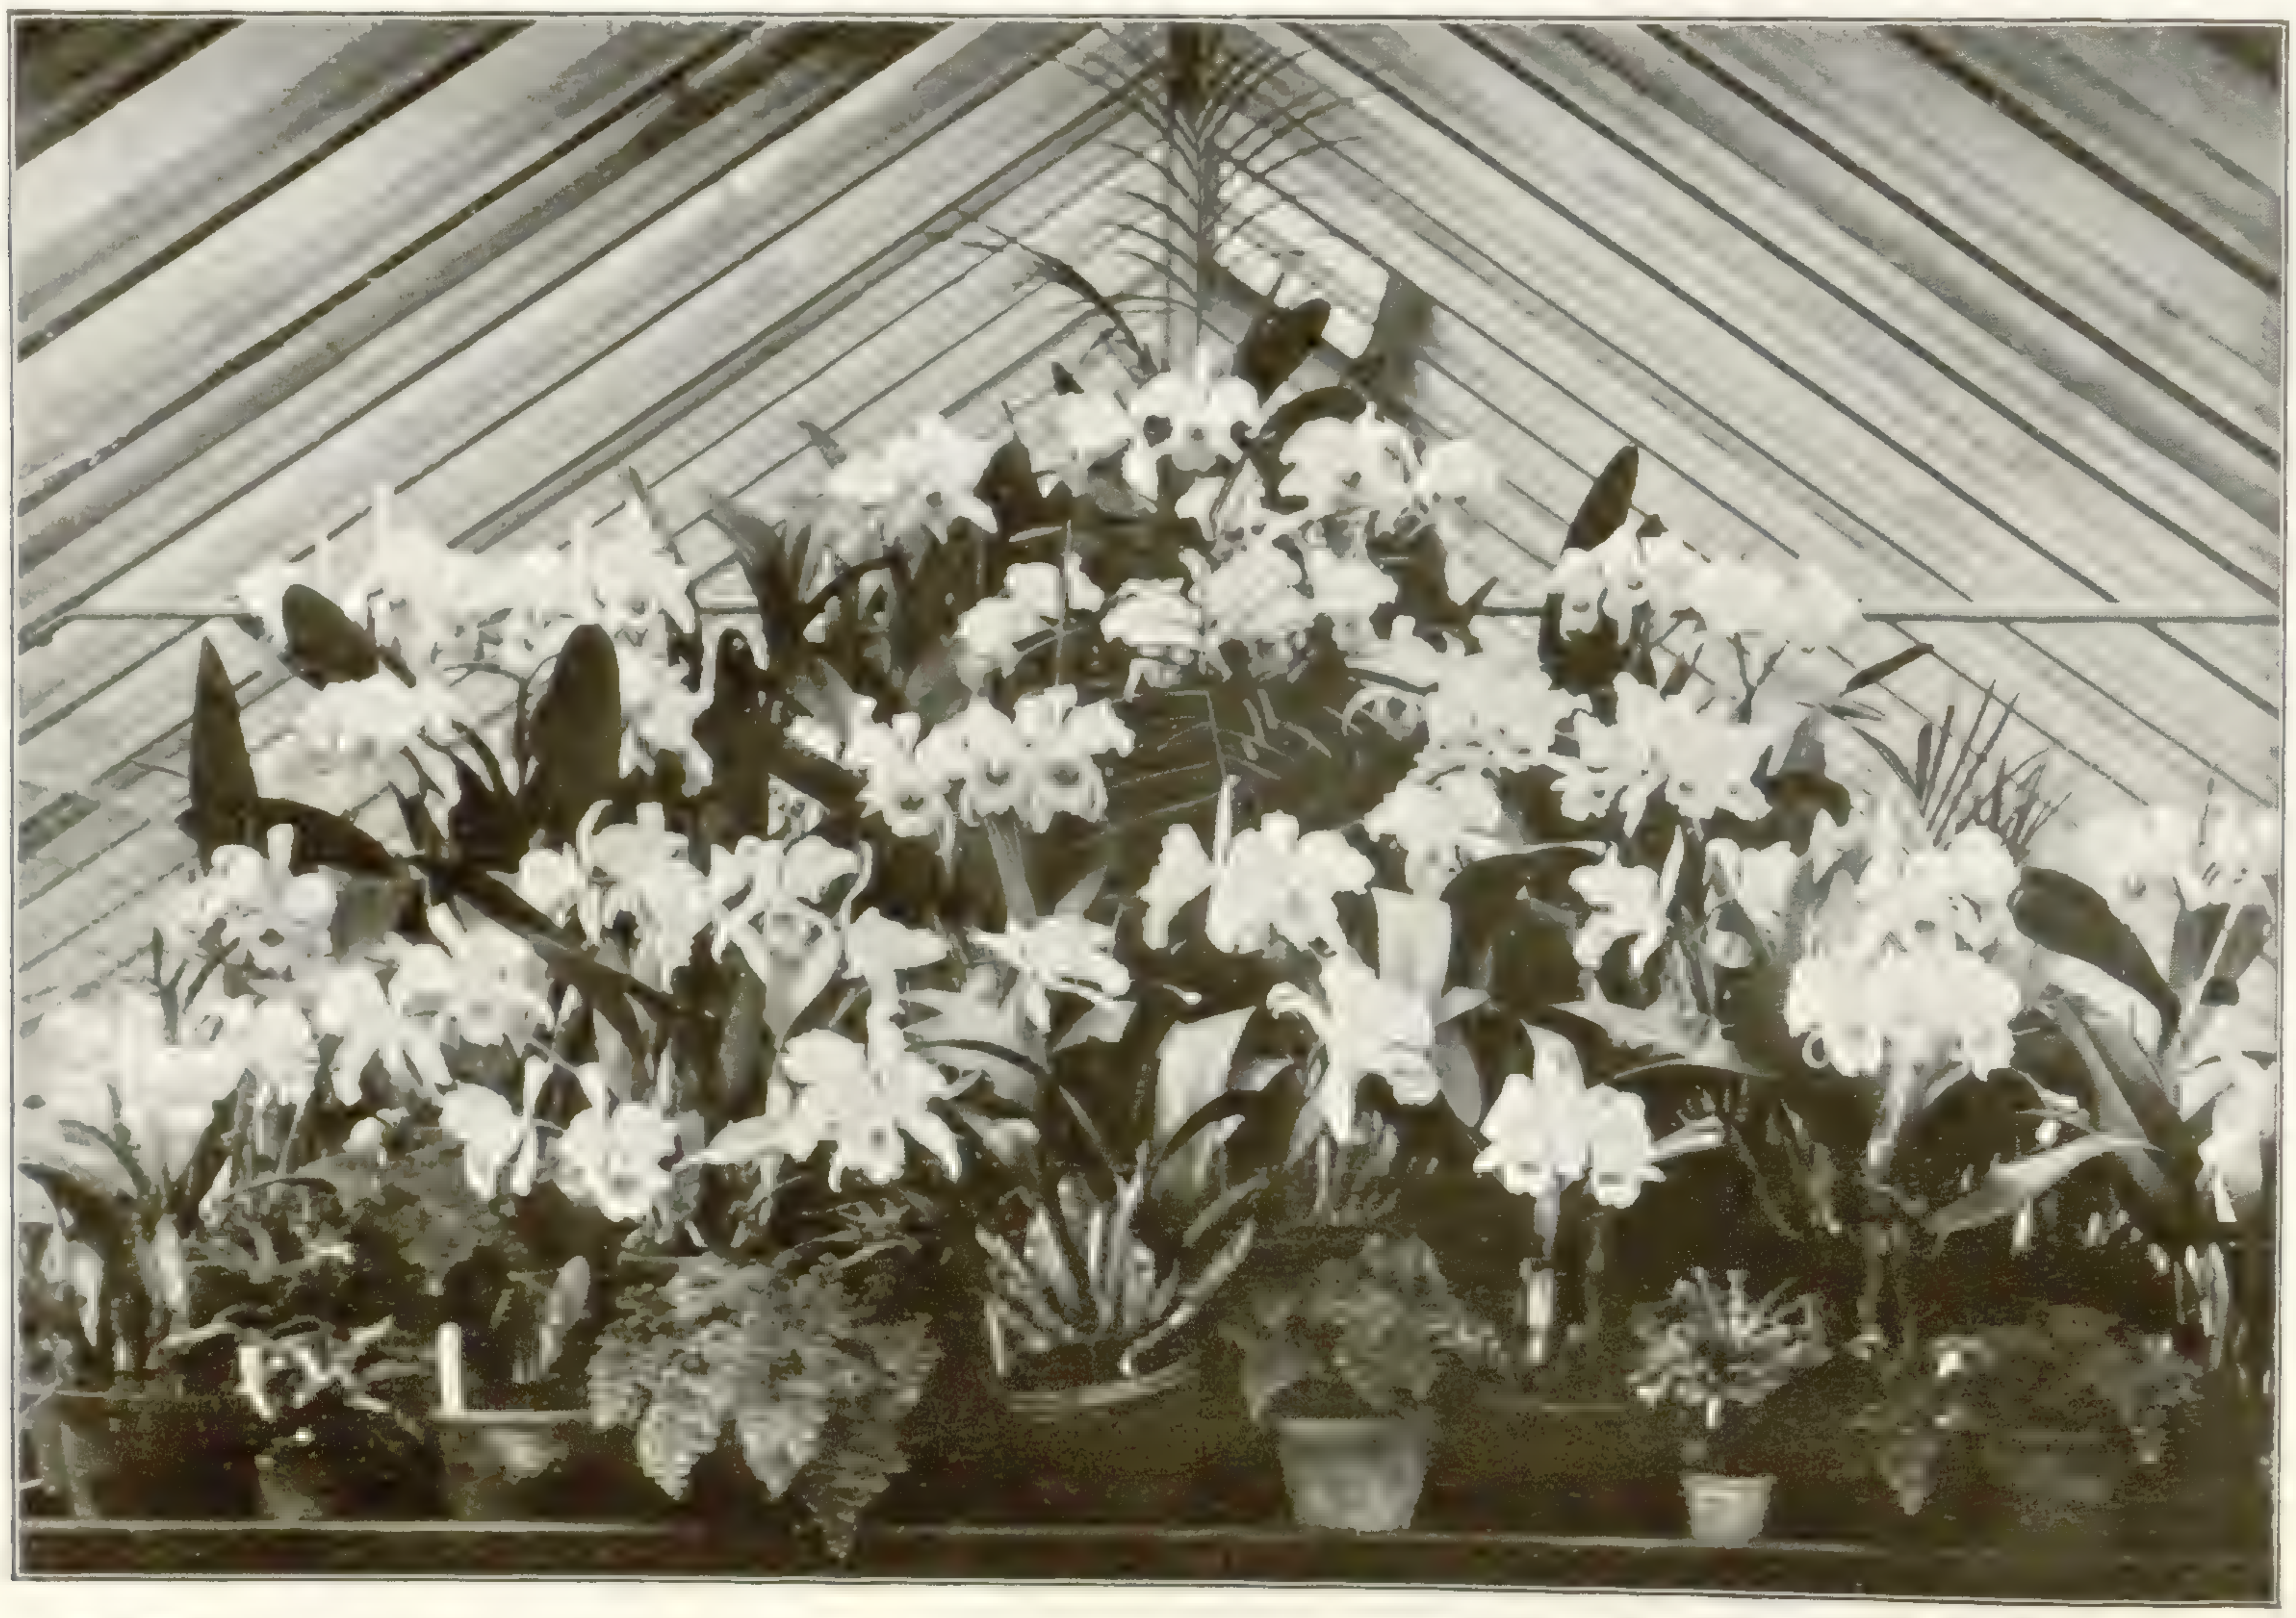
In forcing Roman hyacinths it should be borne in mind that they are not lovers of heat, and, consequently, should not be exposed to a greater temperature than 60 degrees if fine blooms are desired. Like the snowdrop and other winter and early spring flowers, the temperature for their optimum growth is a comparatively low one. After the leaves have become thoroughly green the pots may be watered with weak liquid manure once a week, and it will add to the healthy appearance of the leaves and to the size and substance of the flowers. The bulbs will be of little use for pots a second year, and may be planted out in sheltered shrubbery borders.

Alger Petts.

THE RAWDON ORCHIDS.

Rawdon, Yorkshire, although only half a dozen miles from either Leeds or Bradford, is so pleasantly situated that a visitor might well forget that on either hand are thickly populated hives of industry where great factory chimneys are unceasingly doing their utmost to pollute and poison the atmosphere. When told that it is midway between Leeds and Bradford that Messrs. Mansell and Hatcher's orchid nursery is situated, visions involuntarily arise of grimy glass and sickly growths; but these misgivings are quite unfounded, for Rawdon is a thoroughly delightful spot where the rush and tear of City life could be forgotten, where the air is clear and exhilarating, and the scenery around is grand.

The nursery nestles on the side of a steep but fertile hill, and that it is well sheltered will be evident from the remark that it is almost possible to walk around its boundaries without becoming aware of its existence. A nursery on a hill has its advantages and disadvantages, and Messrs. Mansell and Hatcher had certain difficulties to contend with in the erection of glasshouses on varying levels, but now that their compact block of some fourteen spacious houses is complete, it may be said that every house stands well. Full benefit from the sun is secured, and shelter from cold winds is afforded by the brow of the hill in the rear, a fact that greatly simplifies perfect ventilation. The whole block is heated by three of Foster and Pearson's Robin Hood boilers, of which Messrs. Mansell and Hatcher speak in eulogistic terms.



CATTLEYA HOUSE IN MESSRS. MANSELL AND HATCHER'S, LIM., NURSERIES, RAWDON.

We are scarcely prepared, after a tour of the houses, to say that Messrs. Mansell and Hatcher are exceptionally strong in any one family or section of orchids, for thereby a false impression might be conveyed that some sign of weakness is elsewhere evident. Truth to tell, the stock is particularly well balanced, showing that the aim is to cater for all who are interested in orchids. Thus it may be said that, while vandas and dendrobiums were plentiful and healthy, the cypripediums, cattleyas, and odontoglossums were deserving of equal compliments. It may nevertheless be said that the large numbers of hybrid orchids were particularly interesting, many rare and extremely beautiful things being in the firm's possession.

In the first house entered were splendid batches of vandas. Those who have seen the firm's exhibits at the Royal Horticultural Hall and elsewhere will recall the fact that Vanda cærulea, of a fine deep blue form, has played a prominent part in some of their best groups, and at the nurseries this exquisitely beautiful plant is largely grown. V. Kimballiana, V. Parishi, and, indeed, a representative collection of vandas here exists, and the vigour of the plants speaks well for the method of culture adopted. A fine lot of Renanthera Imschootiana was noteworthy. This very effective orchid was well shown at the Temple Show, and in the large exhibit staged at the recent Leeds Show, an illustration of which appeared in our issue for August 6. Cypripediums are a big and popular class, and consequently are an important feature at Rawdon. Such good things as Cypripedium insigne Sanderæ, C. Maudiæ, C. Venus, and C. Charlesworthi, are to be seen in quantities, a large batch of unflowered plants of the last-named being the centre of great hopes just now. Among phalænopsis, P. Schilleriana is the most prominent, but P. Rimestadiana and the rest of the family are also grown. The old, and very pretty Dendrobium superbiens, now somewhat scarce, was flowering well at the time of our visit.

One large house was well filled with Læliocattleya hybrids, several of which have proved to be of more than ordinary merit. Particular interest attaches to the seedling house, which was filled with pots of tiny seedlings in the first stages of growth. By the aid of a lens one discovered that what to the naked eye appeared to be a thin covering of lichen was in reality a dense mass of tiny plantlets, some of which may perchance in years to come cause a stir in orchid circles, and prove to be gems of the first water. Messrs. Mansell and Hatcher's clever hybridist and raiser, Mr. Banting, works among his charges with a rare enthusiasm, and as he has some beautiful batches of youngsters coming along from varied and interesting crosses, there is every prospect of reaping a good harvest in due time. Among the plants now developing seed-pods were a number of fine cattleyas, most of which have an infusion of C. gigas blood, and may certainly be looked upon as very valuable stock. Mr. Mansell is closely watching a remarkable batch of unflowered angræcums which presents very varied characters in foliage, and are expected to contain something out of the common.

Dendrobium Sanderæ, imported direct from the Phillipines, is of great interest. In the way of curious and uncommon species, and botanical orchids, there are plenty to be seen at Rawdon.

A peep behind the scenes was afforded when we were allowed to see the potting sheds and the store houses, where we found a vast quantity of osmunda fibre of the best possible quality. Messrs. Mansell and Hatcher have made good use of this excellent material, and have also made arrangements for direct importation of an exceptionally good grade. We were informed that not only was a good deal of their own success attributable to the use of this excellent potting material, but that over 3,000 sacks have been sent out from Rawdon to the principal trade and private growers in England and on the Continent. It is but four years since they took over the Rawdon Nursery, and the record of the progress and development of their business in this short time proves the policy of the firm to be sound, and their knowledge of orchid growing and dealing to be thorough. Both gentlemen are thoroughly in love with orchids.

Evidence of their activity and progressive methods is forthcoming in the fact that they have of late imported orchids in such quantities that a large new receiving house had to be erected. It is a spacious, airy shed, built with a double roof, the space between the outer and inner roofs being padded to minimise changes of temperature; large racks with trays of wire netting run around and across the building, and on these trays the newly imported plants are laid out. During last season a quarter of a million orchids passed through this shed, which will convey some idea of the extent of the firm's transactions.

STONE IN THE JAPANESE GARDEN.

It is somewhat difficult to consider the Japanese garden without its inevitable accompaniment of stone ornamentation. Stonework, in its varied phases, enters so largely into almost every garden scheme evolved by the Eastern mind, that to the average European it appears to be the foremost factor in Japanese gardening.

That this view is correct is proved by the care and attention that is given by the Japanese garden-maker to the selection and placing of certain stones.

In order to portray certain ideas and to arrest the eye by an appealing design, certain objects are placed in such positions that the eye rests involuntarily upon them, and realises that in these is a key to the whole scene. An old pine tree, with its gnarled, spreading branches, has a grey stone lantern resting beneath its shade, the combination giving a rare harmony in colouring. These stone lanterns, which are purely Japanese in origin, date far back in Japanese history; though for long centuries they were regarded as fit votive offerings for temple adornment, and it was not until the "great" days of Japanese landscape gardening that the clever exponents seized upon the idea of utilising these quaint ornamental lanterns to give tone and interest to their garden pictures.

There is a great diversity in these lanterns, and in design they are suited to the various situations in which they are required. They are usually of granite, and are often beautifully carved. By the waterside; on a ledge of water-lapped stone; beside the stone bridges; on a bank amid the glowing beauty of the azaleas; or in a jungled maze of bamboos, these quaint, old-world lanterns peep out and tone the surroundings with their "still greyness."

The question of stepping-stones deserves the fullest attention, for these same stepping-stones assist in the garden scheme immensely, besides furnishing a pleasantly diverse pathway for wandering through the garden. The use of stone for crossing the waterways interests me by reason of the quaint ideas embodied, and the surpassing charm of traversing a waterway by such means. Ofttimes stepping-stones will carry one through a fair-sized lake. In other places long stone slabs occur, overlapping each other, and resting upon short piles, or foot-stones, as the case may be. Or in more elaborate gardens one may have an ornamental stone bridge, with quaint stone side-rails and irregularly-paved foot-walk. It is interesting to note that these bridges, stepping-stones, etc., are not usually provided with the idea of furnishing a direct way across the pool or stream, the main object being to furnish one with the necessary means of viewing the water-scene, with its charming wealth of iris and lotus blossom. They are deftly arranged, so that one must needs linger over the scene, often taking the most devious route through or over the water, yet always enticing the visitor or onlooker with its charm and originality.

It is refreshing to enter a garden such as the Japanese garden artists created in their best days, where every stone, shrub, trellis, tree, and pool is replete with meaning. Little wonder that every stone has its own place, and gives by its form and appearance a natural effect in combination with its fellows. The selection of stone is a perfect study, and for a large garden the whole kingdom is searched for suitable specimens. Granite for steps, slabs, etc.; water-worn limestones for the large outstanding boulders, curious specimens of red jasper and green jade-like stones; the rarer blue limestone for certain positions; rocks o'er-run with lava from Fugi's slopes; and fretted and grooved sea-rocks for the water-sides—all are laid under contribution, picked and chosen by the garden-maker as if they were precious things for the formation of a diadem. From the largest rocks to the smallest, each represents the closest care of the garden-maker. Each stone of any importance has its particular use, and is dignified by a name of its own. Thus we get in the majority of gardens the Guardian Stone, the Stone of Contemplation, the Wave-receiving Stone, the Interviewing Stone, and a host of others, while the stepping-stones which wander through the pool are known as the Flying Stones or Scattered Islands.

It will certainly deepen the interest in Japanese gardens when the full import of the various ideas typified are more generally known. The Japanese are impressionists, and thus, if no water be at hand, they will picture, by the use of valley and pebbles, the idea of a dried-up water-course. Then, again, in many gardens quaint stone water-basins are to be met with. These, though usually simple in design, are modelled so as to be in harmony with the size and appearance of the garden; while rarer, but still not uncommon, are old stone well-heads, sometimes serving a useful purpose, at others giving merely the idea of something not in being, yet at the same time quite in accordance with the garden scheme.

P. S. Hayward.

COLLECTIONS OF HARDY FLOWERS AT THE SHREWSBURY SHOW.

These collections were arranged on a space with a 10ft. 6in. frontage, and, as stated in our report (August 20, page 645), formed one of the great features of the show. The successful competitors were Messrs. Gunn and Sons, first; Mr. F. Eames, second; Messrs. Harkness and Son, third; and Messrs. W. Artindale and Son, fourth. Mr. Went and Messrs. Gibson and Co. also exhibited fine collections.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

GENERAL REMARKS. — Many of the species and hybrids will now be maturing their growths. Owing to the small amount of sunlight during the months of June and July, the growths are in a more or less soft and sappy condition, and it is therefore desirable that every facility to aid the plants to properly ripen their growths should be given. It should constantly be borne in mind that it is equally as necessary to have orchid growths properly ripened as it is to procure ripened wood in fruit trees; without proper maturation we cannot obtain the best qualities in the flowers. The summer-growing cattleyas are, perhaps, the most difficult to deal with, especially where they have to be grown with other plants in the same house. Where houses are devoted to their culture, the difficulty of treatment is not so great, for we are then able to lower or raise the roof blinds at discretion without having to consider other subjects in the structure. A very considerable advantage in the ripening of growths is obtained when a light spraying of permanent shading is on the roof at this season of the year. This enables the blinds to be removed earlier in the afternoon, and a considerable amount of strong light is admitted without danger from scorching. In addition to admitting more light, the light shade greatly assists in drying up the excess of moisture in the atmosphere, and renders unnecessary a considerable amount of artificial heat at the present time.

DENDROBIUMS, of both the deciduous and the evergreen sections, will only require sufficient shade during the hottest parts of the day to prevent their foliage becoming scorched. Every encouragement must be given to assist the plants to finish their growths.

VANDAS, ÆRIDES, SACCOLABIUMS, and other occupants of the East Indian house will now have completed their growth, and the new roots will be developing. All these should have liberal treatment, until such time as the green portions of the roots have become sealed over. The small-growing angræcums should be suspended near the roof glass, as in this position they are not so liable to damp, spotting, and injury, which so frequently happens when they are placed on the stage. In all the warm divisions the night temperature must be maintained at its maximum height for summer until the middle of September; after this period the night and day temperatures should be gradually reduced until the low winter temperatures are reached. Care must be observed to place any plants that are in a backward state of growth at the present time, in positions where they will receive the most liberal encouragement. It is far better to give the necessary facilities now than to have to deal with undeveloped growth at a later season when the outside conditions are less favourable.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

PROPAGATION.—During the next week or two will be a very good time for propagating crotons, panax, and dracænas, and these will be valuable for the table late in spring and very early in summer, before the spring struck plants are sufficiently advanced for use. Moreover, they are more compact, stockier, and take on more colour than do those raised from cuttings in the New Year, more particularly the crotons. Thumb pots should be used, and quite small side growths be selected, as these usually make better shaped plants than stronger growing tops.

DRACÆNA cuttings should be the young growths from plants that have been cut down some time previously. Failing these, some of the older plants should be examined and the fleshy roots taken off and put in. After plunging the pots containing the cuttings in the frame, keep them lightly syringed, taking care not to overdo it, as at the slightest approach to stagnation the young plants will soon drop their leaves. A further batch of cuttings of panicums, tradescantias, and selaginellas may be put in, and many of the older plants that have done duty during the summer when these young ones come out of the frame may be destroyed.

STOVE CLIMBERS.—Many of these will now be going out of bloom, and any of them which are in pots should, if possible, be removed from the stove to a somewhat lower temperature, where they may mature the growth they have already made. A vinery or peach house from which the crop has been gathered would do quite well, taking care that the change should not be too great at first. Allamandas will continue blooming for some considerable time, but to allow as much light as possible to the plants growing underneath it will be wise to thin the growths a little and tie it in as much as possible. Bougainvilleas planted out that have passed the flowering stage will not need to be watered very liberally just now, unless there is some considerable space that requires covering with young growth, but even this should be done by this time. Aim at having the growth as well ripened as possible, and this is sometimes a difficult matter, as many of the other occupants of the stove require a considerable amount of heat and moisture, which keeps the climbers growing much longer than is necessary or beneficial.

CLERODENDRON FALLAX. — Early batches of plants, particularly those raised from cuttings, will now be coming into flower, and should, if possible, be removed to a slightly drier house where the blooms will last a much longer time. Later batches should be kept growing by giving liquid manure pretty freely. They should prove of great decorative value till well on into November.

CLEANING.—This being what we may term the slackest part of the year, every opportunity should be taken to give all the occupants of the stove a thorough cleaning, either by sponging or syringing, whichever may be necessary. The woodwork and glass should, in places, if not all over, be thoroughly cleaned, not forgetting to use a little whitewash on the walls wherever they may have become green or dirty. This will give the houses a smart and tidy appearance.—Thomas Stevenson, Addlestone.

FRUITS UNDER GLASS.

EARLY PERMANENT VINES. — Every available means should be taken to prepare vines of this description for their next fruiting season, and to this end, now that their young wood is sufficiently matured, it should be shortened to about two-thirds of its length, and the parts remaining on the vine be relieved of their sublateral growths, but in attending to this carefully preserve the principal leaves. In cases where thrips or red-spider is present, thoroughly wash the vines by the aid of a syringe with an efficient insecticide, such as a paraffin emulsion of suitable strength, repeating the operation if necessary. Should mildew have been troublesome, lightly syringe the vines with a solution of sulphide of potassium. Keep the house fully ventilated, and the borders properly supplied with water. If the latter are in an unsatisfactory condition, the present time is suitable for their renovation, but in cases where the roots have the run of both inside and outside borders, one only should be now attended to, and the other left for next year. In the first place, fresh compost should be used, and this may consist of good loam mixed in agreement with its texture, with more or less wood ashes, crushed mortar rubble, and finely-crushed bones. Failing this mixture, good fibrous loam alone will suffice, and should be procured and kept tolerably dry. Complete the work by lightly mulching the border with short litter, and watering it with tepid water. Subsequently until the vines show signs of recovering from the check, shade them from powerful sunshine, spray them occasionally with water, and keep the atmosphere of the house moderately close and moist.

SUCKERS OF QUEEN PINEAPPLES. — Suckers now fit to be taken from plants that ripened their fruit early in summer should be potted, using seven-inch pots. Select those which are sufficiently advanced to be brown in colour at their base, and have broad, sturdy leaves, and in preparing them for potting pull away the lower short leaves, and cleanly cut off the base. In potting use clean, well-drained pots, place the suckers deep enough in them to ensure firmness after the compost has been well rammed, and allow sufficient surface space for the convenience of watering. A compost formed of light fibrous loam, freed from fine particles, lightly mixed with soot, and used in a moderately moist state, will be in every way suitable.

WINTER-FRUITING PINEAPPLES. — Plants of Smooth Cayenne, Black Jamaica, or Charlotte Rothschild that have lately started, or are now starting into fruit, must on no account be allowed to suffer from dryness at the roots, and should also be regularly assisted with mild applications of manure. Maintain a tolerable dry atmosphere while the plants are in blossom, and a night temperature of 70 deg., with the usual day rises. Ventilate the house carefully, but early, on bright days, and once the flowering season is over increase the atmospheric moisture, and lightly spray overhead as soon as the house is closed.—T. Coomber, The Hendre Gardens.

THE KITCHEN GARDEN.

TOMATOES. — The weather has of late been more favourable to out-of-door-grown tomatoes. The plants are now carrying here a heavy crop of well-developed fruits, and, providing fine weather continues they will mature well by the autumn. Pay close attention by removing all side growths and unnecessary leaves which shade the clusters of fruit that they may have full exposure to the sun. Gather the fruits as they colour, and place them on wood-wool in boxes, when they can be placed on shelves in vineries, warm sheds, or even dwelling-rooms, as most convenient.

TOMATOES UNDER GLASS will need very little fire-heat, but in the case of those in full bearing, pay strict attention to the watering, otherwise the fruits will crack, and their keeping qualities be impaired. Give occasional stimulants and maintain a free circulation of air through the house night and day. Young plants for winter fruiting should now be shifted into the pots in which they are to fruit. Carefully guard against an excess of moisture at the roots. If wet and cold weather sets in employ a little artificial heat as a precaution against disease.

FRENCH BEANS.—Where warm pits are at command, make a sowing of these at about eighteen inches from the glass. Grow them on quite steadily, as the plants will thus be hardier and more productive. Ne Plus Ultra possesses a good constitution and is very fruitful.

ONIONS.—Those raised from seed sown in the open ground during March should now be sufficiently advanced to admit of bending down the tops. This process accelerates the ripening of the bulbs by exposing them to the sun and air, particularly if the tops are all bent on the one side. Within a fortnight the bulbs should be quite ready for lifting, and finally drying off by placing on hurdles, or in cold frames, where the lights should be removed in dry weather till the ripening process is completed. There is no better way of keeping them during the winter than by splitting hazel sticks to within four inches of the bottom, then tying the two portions together, and working the dried tops through the sticks each way, with an occasional tie. They can be hung up and stored in a very small space, and thus leave the shelves free for other purposes.

SPINACH.—The principal sowing of seed for the winter and spring supply should be made this month, followed by another sowing early in September. The sowing made in September will give a most useful supply if we have a fine late autumn. For this sowing choose the variety Long Standing

Prickly, and Perpetual or Spinach beet; the last-named may be transplanted at any time. If any seed of the summer kinds are on hand it should be sown at intervals during the next month.

TURNIPS.—Make good sowings of these on land that has previously been occupied with potatoes. Much will depend on the weather for future sowings, but it is possible in a good season to obtain here very good turnips from sowings as late as the middle of September. Therefore it is advisable to sow up to that date, as, should the bulbs fail to attain to a usable size before the winter sets in, the tops will be welcome during the spring months. For present sowing use Snowball and Golden Ball. Sow in drills eighteen inches apart, scattering burnt garden refuse along the drills, with regular dustings of soot over the tops during showery weather.

ENDIVE.—Later sowings should be speedily planted out for a continuous supply, and every available plot should be filled with them. During hard winter weather, when spinach cannot grow or be found, endive forms an excellent substitute for that vegetable, and it will only need the shelter of unheated frames.—GEORGE ELLWOOD, Swanmore Park Gardens.

OBITUARY.

MR. H. A. TRACY.

The many friends of Mr. H. A. Tracy will receive with much regret the announcement of his sudden death at his residence, Twickenham, on the evening of the 18th inst. Mr. Tracy, who as so well known, devoted his attention to the cultivation of orchids, was at the meeting held by the Royal Horticultural Society on the Tuesday previous to his death, and was then apparently in his usual state of health. It appeared he left his nursery in the Amyand Park Road at six o'clock on the 18th inst., and while in the garden of his residence, about an hour afterwards, he was stricken with paralysis, did not recover consciousness, and died in a few hours.

MR. FREDERICK WILLIAM FLIGHT.

It is with much regret that we have to record the death of this distinguished rosarian and chrysanthemum enthusiast, and estimable gentleman, which occurred at his residence, Cornstiles, Twyford, Winchester, on the 15th inst., in his seventy-sixth year. Mr. Flight, who was actively engaged in business, made a hobby of horticulture, and, as evidence of the interest that was taken by him in the promotion of horticulture in the district of which Winchester is the centre, we would mention that he was chairman of the Committee of the Winchester Horticultural Society. So admirably did he fill that position throughout this long period that there is a remarkable consensus of opinion among those who have had the pleasure of being associated with him, that a large measure of the success achieved by the society is due to his sympathy with gardening and business abilities. Mr. Flight was for many years a most successful exhibitor of chrysanthemums, more especially of the incurved varieties, for which he had a strong affection. Mr. Flight was also a large and successful grower and exhibitor of roses, and evinced much interest in novelties, annually buying a considerable proportion of the new varieties, and growing them alongside the established kinds with a view to determining their merits on scientific lines. One of the finest of the rambling roses that have been introduced within recent years was raised at Cornstiles, and will long serve to keep the memory of the raiser green in the minds of those who devote attention to garden roses. This was named Mrs. F. W. Flight, and is now in general cultivation. Mr. Flight was also a large grower of carnations, and raised several excellent varieties. He was a Fellow of the Royal Horticultural Society, a member of the National Chrysanthemum Society, and a liberal supporter of local societies.

THE NATIONAL VEGETABLE SOCIETY.

When the late Mr. W. E. Gladstone so strongly advocated the conversion of our stores of fruit into jam, because he was a great man in the nation, his advice was listened to, and acted upon, with the result that jam-making is with us now a huge industry, and as a consequence, all the year round, and in all places jam is cheap, and has thus become one of the foods of the million.

Just recently so important a personage as the Speaker of the House of Commons, Mr. J. W. Lowther, has been advocating the wider culture of vegetables as articles of human food. It is very possible that such advice may have a far-reaching effect, advice that would be all the more valuable did it beyond advocating wider culture, still further advise the wider consumption of vegetables as food.

Now, the special aim and object of the National Vegetable Society is to promote these two things. First, the wider culture of good wholesome vegetables, and second their wider consumption, not only because the best of all foods in the first instance, and the most healthful, but also because we have the best soil and climate in the world to grow them, and not least, their growth creates a greater demand for labour than does any other form of land culture.

Even beyond these considerations, there are the still greater ones in the fact that we have a vast population which must be well and amply fed, and we can produce such supplies of good vegetables at home as may in time of stress or of external shortage, render us as a people immune from scarcity or famine.

It is with these great anticipations and aspirations the National Vegetable Society has been formed, and its capacity for usefulness in such respects must depend on the support it may obtain in the community. The exhibition of vegetables the society will be holding in the Horticultural Hall, Vincent Square, on September 23 next, may be regarded as a minor object or means to an end. But universally has it been found that one of the most effective ways to propagate knowledge in relation to products is by presenting those products to the public view for inspection and criticism, as also to enable them to be popularised.

What gardening owes to exhibitions is incalculable, what it will owe to them in the future is also incalculable. With all our knowledge of horticulture, practical and scientific, we may yet be but on the threshold of such knowledge, for there remains a field for expansion and knowledge, of which so far, perhaps, few dream of. But of all the services horticulture can render to the nation at large, and they are indeed marvellous now, in few respects can such service be greater than would be the creation of a vegetable supply of the most perfect quality, such as would place us as a people in an absolutely independent and safe position in relation to a national supply of wholesome food.

The subject is not merely hygienic; it is of the highest economic importance. It is quite outside the range of party political warfare or clamour. It needs for its expansion no government aid or gratuity. All that is needed is free land for occupation, plenty of labour, and a profitable market. Given these things, and the supply will speedily follow. But to produce profit, by which in these days success is measured, there must be created a far greater demand for vegetables as food than now exists.

Whilst our family or domestic expenditure is some 30 per cent. for flesh meat and wheaten bread, and only from 5 to 10 per cent. for vegetables, the popular demand must be small. Could the latter percentage of household expenditure be changed to 20 per cent., what a vast demand for wholesome home-grown vegetables would arise, how many millions of acres of land would be thus profitably utilised.

Is not a society which has such great and noble economic objects in view well worthy national support?

ALEXANDER DEAN, V.M.H., Chairman.

EXHIBITIONS AND MEETINGS.

Lectures on Forestry.

A vacation course of lectures for foresters under the auspices of the University of Aberdeen and the Aberdeen and North of Scotland College of Agriculture, has just been opened in the University Buildings, Aberdeen. The course, which is the first for foresters that has been instituted so far north, is being held at this season of the year as the time most convenient for the attendance of foresters. The course will be of four weeks' duration, and the lectures will be given by Mr. William Dawson, B.Sc., lecturer in Forestry at the College of Agriculture. The expenses in connection with the foresters' attendance are being met by the proprietors of the estates on which the foresters are engaged. There was a good attendance.

Dr. George Adam Smith, Principal of the University of Aberdeen, presided at the inauguration of the course, and in a few words of welcome to the foresters, said he hoped that would be the first of many such courses under the auspices of Aberdeen University. Theirs was a gathering of a somewhat unique kind. A number of the principal foresters from some of the largest estates in Scotland began that day a course of four weeks' lectures and practical instruction under the lecturer in forestry, Mr. Dawson. Besides the instruction thus received, it was hoped the foresters would have opportunity of conference among themselves—of interchange of ideas and experiences by men of the same calling, but from different parts of the country. He was sure they would find before the four weeks were out that they had come to the right place, and to the right man in Mr. Dawson. The Principal then called on Mr. Sydney J. Gammell, of Drumtochty, and Countesswells, the president of the Aberdeen, Banff, and Kincardine Shires branch of the Royal Scottish Arboricultural Society, to say a few words.

Mr. Gammell, in the course of a most interesting speech, said no doubt his hearers might feel that it was somewhat like going back to school again for them to be there. But they were never done learning, and there was a great deal to be learned during such a course as that. He (Mr. Gammell) was always ready to go back to school, and there was no man who had the interests of his calling at heart but was glad to obtain all the information he could from the best source whenever he had the opportunity. As a governor of the College of Agriculture, and on behalf of the governors, he welcomed them all, and trusted the course begun that day would be fruitful in every good for forestry, and that it would be a very profitable, very pleasant, and very satisfactory course. The speeches of the Principal and Mr. Gammell were loudly applauded.

Mr. Dawson, in his opening remarks, said he would like, before touching on the business of the class, to say something regarding the class itself, and the objects of it. There had been a great deal of talk about forestry education. Hitherto their efforts had been directed to educating those who could spend a long period attending college during the winter months. To everyone such attendance was not possible. Expert foresters, however, were always desirous of knowing more about the work in which they were engaged. The men of greatest practical experience were the men who were inclined to listen to what some people were sceptically inclined to dismiss as theory. The forester dealt with a crop that took the best of a century to mature. If the gardener or farmer had a bad year that did not materially injure his prospects, because the next year might be a good one. They had their returns.

every year. The forester, however, had his returns a century hence, and therefore he must apply the greatest care in his work, and above all things, must remember that if he made a mistake to-day, it might take half a century to rectify it. It was obvious, therefore, that the forester could not know too much. Further, the science of forestry was so extensive that no single human life was long enough to gain by experience a knowledge of all the ways of the forest.

There were many scientific facts, hidden facts, secrets, connected with the life of the forest that foresters had no means of finding out, and which must be left to the trained scientist to discover. He hoped, through that class, there would be opportunity for conference. They would be able to put their experiences against those of their neighbours, and he would like to put before them the experiences of the practical and scientific experts both of this country and the Continent. That class was in no sense meant to be an attempt to teach them their business—that they must have learned elsewhere. But the forester who turned to his own experience was generally a very expensive person on the estate, and, in fact, there was no room for the forester who depended upon his own experience alone. They must remember that what was right in theory must admit of application in practice. The application of the broad principles of forestry depended upon knowledge of local conditions, and that could be obtained by practical experience alone.

Till now, Mr. Dawson said, forests had been regarded by the great body of the public as something very nice, but as something with which the owners alone were concerned. But forestry was not in any sense a class question. It affected everybody. Forestry had suffered neglect in this respect—that the natural potential resources of the country had been allowed to disappear, with only here and there a staying hand to resist the general tendency. This clearance of the forests had gone on at an alarming rate, and the area of this country which was covered with wood was much less than that of any other country in Europe, with the exception of Portugal. There was less than 4 per cent. of the land surface of this country under trees. The position Britain occupied in this respect was extraordinary when they considered that the climatic conditions were so suitable for the growth of trees. There was, however, an excuse for it. For one thing, coal was discovered at an early date in Britain, and they did not require to protect the forests in order to produce firewood to the same extent as other countries. Then, during the last sixty years, at the time the country was developing industrially, Britain could get an unlimited supply from foreign countries at a small price. That was no longer possible, however. The situation had entirely changed. Only 25 per cent. of the land of Scotland was used for agriculture, while about 65 per cent. grew nothing at all, and was mostly under heather and bracken. It behoved us, therefore, to be up and doing. The countries from which we obtained so much timber in past years were not now in a position to supply our needs. Sweden and Norway still gave us large supplies, but could not continue doing so for an indefinite period. Prices were rising enormously, and everything pointed to a still further rise. And when this occurred Britain stood to be the biggest sufferer, on account of being the biggest consumer and the smallest producer. Mr. Dawson then referred to the possibility of increasing the rural population by a scheme of afforestation, and to the direct benefit it would be to the nation from a financial point of view. In Germany, where the State owned a considerable extent of forest, there was a clear profit to the nation of £6,000,000 per annum, which was nearly 16s. per acre of forest, and something like £9,000,000 was spent in wages. Mr. Dawson referred to the Developments Act, and pointed out that nothing could be more harmful than to rush and hurry such matters. The fact that that Act provided funds for the development of forestry was quite enough in the meantime; the rest would follow in due course. Various interests had to be considered—sporting interests, sheep rights, etc.—but whatever developments forestry underwent, agricultural land would not be affected.

The foresters were delighted with the opening meeting, and, judging by the feeling then displayed, the course is likely to be a most successful one.

National Hardy Plant Society.

As briefly announced in our last issue, a meeting of growers and persons interested in hardy plants was held at the George Hotel, Shrewsbury, on the 17th inst. Most of the largest exhibitors being present. On the motion of Mr. John Harkness, seconded by Mr. Frank Bouskell, Mr. A. J. Macselt took the chair, and opened the meeting by explaining the objects and aims of the society. Mr. John Harkness followed in an able address on the advantages from a trade point of view. Mr. Frank Bouskell followed, dealing chiefly with the amateurs' point of view, and the wide field open to a society from the scientific side. He mentioned that he had heard from Mr. Irving, of Kew, who said, "I think, however, that it is quite time such a society was formed in the interests of hardy plants, and I shall have much pleasure in supporting your objects, and joining the society when formed." Mr. S. Arnott, Dumfries, had written him to say that he would be glad to render the society what assistance he could. He had been in favour of the formation of such a society for many years, and wished the movement a successful issue. He (the speaker) had received numerous other promises of support; in fact, the replies were very nearly unanimous on the question.

After further discussion, Mr. George Gibson moved, Mr. R. Went seconded, and it was resolved unanimously: "That a National Hardy Plant Society be formed for the encouragement, the extension, and the improvement of hardy plant culture, whether for the garden for decorative purposes, or for exhibition, and for the improvement of their nomenclature; and that this meeting pledges itself to use every endeavour to promote the same." The Chairman proposed, Mr. R. Went seconded, and it was resolved unanimously, "That Mr. Frank Bouskell be secretary." Mr. Brunton proposed, Mr. Gibson seconded, and it was resolved unanimously: "That Mr. Macself be chairman of the Provisional Committee." Mr. Harkness proposed, Mr. Hosier seconded, and it was resolved unanimously, "That Mr. J. S. Brunton be treasurer." It was proposed by Mr. Artindale, seconded by Mr. Harkness, "That Mr. R. T. Went be vice-chairman."

The following Provisional Committee was appointed: Mr. W. Irving, Kew; Mr. S. Arnott, Dumfries; Mr. J. Artindale, Sheffield; Mr. G. Gibson, Bedale; Mr. W. E. Clarke, Whitchurch, Cardiff; Mr. F. Eames, Frome; Mr. R W. Hosier (Messrs. Bakers), Wolverhampton: Mr. G. G. Blackbourn, King's Acre Nurseries; Mr. G. C. Mudge (Messrs. Barr), London; Mr. E. G. Quick, Covent Garden; Mr. C. E. Osborne, Hereford; Mr. D. Roberts (Messrs. Dicksons), Chester; Mr. A. J. Wommscott (Messrs. Hewitts), Solihull; Mr. W. J. Robertson, Worcester; Mr. N. Walker, Bedale; Mr. J. Harkness, Bedale; Mr. J. C. House, Westbury-on-Trym.

It was decided to hold the next meeting at the Edinburgh Show on September 7. The meeting concluded with a vote of thanks to the chairman and secretary.

Usk Horticultural Society.

AUGUST 18.

Much credit is due to the secretary, and his committee, for the enterprise they have exercised in working up their annual show to the point of local interest to which it has attained. The 124 classes in the schedule were mostly well filled with produce of very good quality.

OPEN CLASSES.

Two groups of plants, arranged for effect, were exhibited, one by Mrs. E. Lawrence, Tybrith, Usk, and the other by the Rev. W. M. Willett, The Halmean; the former secured leading honours, with creditably arranged, bright, well-grown plants, of which Campanula pyramidalis, fuchsias, begonias, eulalias, caladiums, Lilium lancifolium, surmounted by a good Cocos Weddeliana, and edged with blue lobelia and Panicum variegatum, were the chief subjects. Though the other exhibit was in some respects equal to the leading one, it possessed the defect of many of the plant pots being visible. For twelve ornamental-leaved and flowering plants, the Marquis de la Pasture, Cefn Ila, Usk, led with well-grown and flowered specimens, amongst which Hydrangea japonica, Campanula pyramidalis, fuchsias, pelargoniums, achimenes, and Diplacus (mimulus) aurantiacus were conspicuous. Mrs. E. Lawrence, Tybrith, Usk, was second. There were four exhibits of six zonal pelargoniums, and the Marquis de la Pasture was placed first with large specimens of single-flowered varieties; H. Freeman, Esq., Plas Newydd, second. Of two exhibitors of six dinner-table plants, H. Freeman, Esq., scored with nice plants of crotons, dracænas, pandanus, etc., Mr. E. C. Francis being a close second. The Rev. W. M. Willett was placed first in a class for six stove and greenhouse ferns, and staged large, fresh plants of Adiantum Farleyense, A. gracillimum, A. cuneatum, and A. grandiceps; Mrs. E. Lawrence followed, her best plants being Nephrolepis todeaoides and Gymnogramma tartareum. Gloxinias in six varieties were well shown by three exhibitors, the principal prizewinners being Mrs. E. Lawrence and H. L. Gustard, Esq. There were three sets staged in a class for six double tuberous begonias; H. L. Gustard, Esq., was first, and Mr. E. C. Francis second; while in a similar class for single-flowered varieties H. L. Gustard, Esq., again led, and was followed by H. Freeman, Esq. For four fuchsias H. L. Gustard, Esq., who showed medium-sized well-flowered specimens, was the only exhibitor.

CUT FLOWERS.

With twelve roses, not less than six varieties, H. Freeman, Esq., was placed first, closely followed by Mr. H. E. Messenger. Twelve cactus dahlias made a splendid class, there being six capital sets staged, the leading lot coming from Mr. J. T. Evans; the Rev. W. M. Willett, second. In a similar class for asters, for which there were ten competitors, the Rev. W. M. Willett took the lead, and was closely followed by Mr. A. Bowyer, each staging splendid examples. Twelve zinnias made another excellent class, six boards being staged; the chief one came from R. Rickard, Esq., who was closely followed by H. L. Gustard, Esq. R. Rickard, Esq. led amongst four competitors, who staged six spikes of gladioli; and for twelve blooms of double begonias H. Freeman, Esq., was first, and H. L. Gustard, Esq., second.

Sweet peas were staged in fine condition, and in the class for six varieties there were eight competitors, the lead being taken by Mr. C. James, who staged splendid large-developed blooms; R. Rickard, Esq., was a close second. For the best collection of eight varieties, for which Messrs. Webb and Sons, Stourbridge, offered prizes, the Rev. W. M. Willett scored with flowers of much merit.

Reading and District Gardeners' Association.

Over 100 members of the above association paid an evening visit, by the kind permission of Mrs. Noble, to Park Place, Henley-on-Thames, on August 16. The visitors were welcomed at Shiplake Station by Mr. T. J. Powell, the head gardener, who conducted them through the Bolney Court Estate to the river, where they were ferried over. Immediately on their arrival, the party were invited to partake of tea, kindly provided by the thoughtful generosity of Mrs. Noble.

Before proceeding on their tour of inspection, the vice-president, Mr. Leonard Sutton, expressed, on behalf of the president, his regret at being unable to accompany the

THE FLOWER GARDEN.

By T. W. SANDERS, F.L.S., Editor of "Amateur Gardening."

A Complete Guide to Planting and Management of the Flower Garden and the Cultivation of Flowers, Plants, Trees, &c., adapted for Outdoor Culture.

THE CONTENTS INCLUDE—

Fashioning the Garden.
Beds and Borders.
Walks and Paths.
Lawns and Tennis Courts.
Rockeries and Ferneries.
Arbours, Summerhouses, Arches, and Pergolas.
Edgings.
Walls and Fences.
Garden Practice.
Propagation.
Colour Arrangement.
Bedding.
Annuals and Biennials.
Bulbs.
Hardy and Tender Border Plants and Flowers.
Climbing Plants.
Trees and Shrubs.
Pests and Diseases.

480 PAGES, ILLUSTRATED BY 64 PLATES OF BEAUTIFUL GARDEN SCENES, PLANTS AND FLOWERS, AND MANY EXPLANATORY DIAGRAMS.

association, and asked Mr. Powell to convey to Mrs. Noble the warmest thanks of the members for not only so kindly entertaining the party on this occasion, but for the interest ever shown in gardeners and gardening in general. Mr. Powell then conducted the visitors through the "Happy Valley" to inspect the Chalk Caves. These having been fully examined, the beautiful trees, for which the place is so noted, came in for more than marked attention, to say nothing of the glorious views which can be obtained of the surrounding country. Space does not permit to mention all the lovely things seen, suffice it to say that the beautiful collection of foreign birds, climbing roses, flower beds, and borders all came in for their share of admiration, as also did the greenhouses, in which were a choice collection of flowering plants, ferns orchids, melons, tomatoes, citrons, grapes, and some retarded potatoes ready for planting. Mention must, too, be made of the new water garden, which, although only planted in the spring, was simply one mass of plants. The kitchen garden crops were also inspected, as was the orchard, where the scarcity of fruit was noted in some parts, but not in others. The time passed all too quickly, and the party had perforce to make their way to the station, but not before cheers had been raised for Mr. Percy Noble, who had joined the party in the garden, and also Mrs. Noble, whom the party regretted they were not able to meet. The station was soon reached, and hearty cheers having been accorded to Mr. Powell, the party returned home carrying with them happy recollections of their visit to Park Place.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

PRUNING PEACHES.—A. F. G., Hailsham: If the trees have been properly disbudded there will be two growths on each of the fruiting shoots, one at the extreme end to draw the sap along, and one as close to the base as possible. It is the latter that must be retained, and as soon as the fruits have been gathered the fruiting growths should be cut back close to the basal shoots. This is the general principal. Sometimes, to fill out wall space, more growths are left on a particular branch, and the branchlets are subsequently treated as suggested.

ASTER BLOOMS.—L. A. W., Manchester: The finest aster blooms are usually the terminal ones, i.e., the central and earliest flower on the plant. For show purposes this one is encouraged, and the lower side flowers suppressed or thinned out. For garden effect, however, the directly opposite plan proves the most successful, and the central bloom is cut out as soon as developed, or pinched out while still in the bud stage. This ensures a finer development of the many side flowers, and these come of good size and on long stems and make a brave show.

FAILURE WITH GRAPES.—E. W. M., Wellington: The failure is due to shanking, and shanking may be due to several causes. Very probably the vines are over-cropped; if the roots are in a cold, wet medium similar results will follow.

MUSCAT GRAPES SHANKING.—C. S., Stockbridge: The grapes will not ripen after they have shanked. Remove and burn all the shanked bunches and berries. See also answer to "E. W. M."

FUNGUS DISEASE IN MUSHROOMS.—F. W. A., Northampton: The primary cause of the mischief is a minute parasitic fungus, which when once introduced, spreads very quickly under the conditions of temperature and moisture essential for the rapid growth of mushrooms. Well-marked symptoms are evident from the earliest stages of disease, the mycelium of the parasite growing up with that of the mushroom. The latter, instead of gradually developing into a cap and stem, becomes an irregularly-shaped monstrous soft mass, which if allowed to grow, often exceeds in size that of a full-grown mushroom. Sometimes a small, deformed cap is present, but as a rule the entire mass of a diseased mushroom consists of a much swollen stem. After a time the parasite forms its spores on the surface of the diseased mass, appearing under the form of a snow-white, minutely velvety covering. After the spores are scattered the diseased mushroom rapidly decays, forming a putrid mass having a very disagreeable pungent smell. Numerous toadstools and other fungi suffering from the parasitism of different kinds of hypomyces are common in our woods and pastures every season, and spores are probably introduced into the mushroom bed along with the manure or road sweepings commonly used. The Board of Agriculture considers that: (1) In some instances it is certain that the spawn is infected before it is placed in the mushroom bed. In such cases, when the spawn commences to "run," the threads, instead of having a clear and sharp outline like white cord, present a fluffy appearance, due to the presence of the parasite on the surface of the strands; the branches are also much fewer in number than when the spawn is healthy and growing vigorously. Under such circumstances the entire bed should be removed before the parasite produces spores; otherwise, if the house becomes thoroughly infected, common experience has shown that the disease is exceedingly difficult to eradicate. (2) When infection occurs through the introduction of spores into the house by wind or other causes, the disease may be confined to certain portions of the bed, and the prompt removal of infected mushrooms as soon as the slightest symptoms are observed may check the disease from assuming the proportions of an epidemic. (3) After removing the soil and manure of an infected bed, great care should be taken in cleansing the tools, boots, and even clothing; otherwise there is great risk of infecting other beds. Rejected soil and manure should be at once removed from the neighbourhood of the mushroom beds. They may be applied to the land, as the contained spores, so far as is known, can only develop on some kind of fungus, and do not attack any other cultivated crop. (4) When a house or other structure in which mushrooms are grown has become infected, it should be completely emptied and thoroughly sprayed, both roof, walls, and floor, three times at intervals of ten days with a solution of sulphate of copper—one pound of sulphate to fifteen gallons of water. During this period of spraying the house should be kept warm and moist, for the purpose of favouring germination of the spores of the parasite, which are destroyed with greater certainty when growing than when in a resting condition.

BOOK ON STOVE PLANTS.—B. W., Walsall: Owing, in a large measure, to the decline in the popularity of stove plants, no book wholly devoted to the description of the finest kinds and their cultivation has been published of late years. The most recent book with which we are acquainted containing information on stove plants is "Greenhouse and Stove Plants," by the late Thomas Baines, who, as you may be aware, was for a long series of years one of the leading cultivators of these two classes of plants. The book was published in 1894 by Mr. John Murray, Albemarle Street, London. We are not quite certain about the price, probably about half-a-guinea, but you can readily obtain information upon this point from the publisher.

VIOLAS OR TUFTED PANSIES.—M. K. B., Dorset: The propagation of a stock of violas or tufted pansies for the embellishment of the flower garden during the summer of 1911 should be proceeded with at once to ensure the plants being well rooted and strong before the end of the autumn. The article which appears on another page of the current issue, from the pen of Mr. T. Smith, will afford you all the information you require, both with regard to the selection of varieties, and raising a stock of young plants.

EARLY - FLOWERING BULBOUS PLANTS.—F. M. H., Lancashire: The most useful of the bulbous plants for producing large quantities of flowers for decorative purposes in a cut state are Early White Roman hyacinths, Scarlet and White Van Thol tulips, and Early Paper White and Early Double Roman polyantha narcissi. They are all comparatively cheap, and if potted at once, or put in boxes in accordance with the practice that obtains in market gardens, and when well rooted, placed in a house or pit, where they will have the assistance of a temperature of about 60 deg. flowers will be obtained in December. As you require the flowers wholly for use in a cut state, growing the bulbs in boxes will be preferable, because of the larger number that can be grown in a given space.

ASTILBES.—W. S., Herts: The most useful of these for growing in quantities are Astilbe astilboides, A. japonica compacta multiflora, and A. Alexandra, the last-named being especially useful for decorations late in spring.

TRADE NOTE.

We are requested to state that the British and British Colonial Agency for the Vermorel Spraying Machines is now in the hands of Messrs. Cooper, Pegler, and Co., 24 and 26, Christopher Street, Finsbury Square, having been transferred to them on the decease of Mr. Chas. Clark and the close of the business of Messrs. Charles Clark and Co., of Bevis Marks.

Lettuce.—Continue to transplant the plants raised from the late July sowing in sheltered quarters. Also put a certain number in frames, where the lights can eventually be placed over them in unfavourable weather. They will heart nicely during the winter months. Others can be lifted with balls, and placed rather thickly in frames during October.—G. ELLWOOD.

FORTHCOMING ENGAGEMENTS.

SATURDAY, August 27.—Hawick Horticultural Society.

TUESDAY, August 30.—Royal Horticultural Society Committees meet at 12 o'clock; lecture on "The Effects of Overhead Electrical Discharges upon Plant Growth," at 3 o'clock, by Mr. J. H. Priestley, B.Sc.; Scientific Committee, 4 o'clock.

WEDNESDAY, August 31.—Glasgow Horticultural Society.

Carlisle Flower Show; two days.

South Shields Flower Show; two days.

Chester Agricultural Society, Horticultural Section.

SATURDAY, September 3.—French Horticultural Society of London.

TUESDAY, September 6.—Scottish Horticultural Association.

WEDNESDAY, September 7.—Royal Caledonian Horticultural Society's Autumn Show; two days.

National Hardy Plant Society meet at Edinburgh, 8 p.m.

MONDAY, September 12.—United Horticultural Benefit and Provident Society, Committee meeting.

TUESDAY, September 13.—Royal Horticultural Society; Committees meet at 12 o'clock; lecture at 3 p.m. on "Roses," by Mr. George Paul, jun.; Scientific Committee at 4 o'clock.

British Gardeners' Association, Council Meeting.

THURSDAY, September 15.—National Rose Society's Autumn Exhibition at the Royal Horticultural Hall.

CATALOGUES RECEIVED.

R. HALLIDAY AND CO., MIDDLETON, MANCHESTER.—An abridged list of conservatory and other designs executed in recent years by this firm, together with frames and other horticultural buildings.

W. CLARK, 90, LONDON STREET, READING.—Illustrations and particulars of conservatories, corridors, plant and forcing houses, fruit houses, etc., furnished with Clark's patent rustless metal system of glazing. Drip and many other troubles are avoided by the adoption of this method of glazing.

JAMES DOUGLAS, EDENSIDE, GREAT BOOKHAM, SURREY.—An illustrated and descriptive list of show, border and tree carnations, picotees, auriculas, and choice daffodils.

E. H. KRELAGE AND SON, HAARLEM, HOLLAND.—A comprehensive general catalogue of bulbs, in which hyacinths and tulips are given great prominence. New hyacinths, tulips, daffodils, and iris, are listed and described.

Situations Wanted.

HER GRACE THE DUCHESS of DEVONSHIRE wishes to recommend J. THOMPSON to any Lady or Gentleman requiring the services of a HEAD GARDENER, where several are kept; 20 years' experience in all branches. Holker Gardens, Cark-in-Cartmel, Lancs.

MR. J. DOWNIE, Head Gardener, Castleford, Chepstow, will be pleased to recommend J. MILLS as GARDENER (Kitchen, or Inside and Out); good references. Apply above.

H. WHATELEY, Esq., The Spring, Kenilworth, Warwickshire, recommends a GARDENER (Head); well experienced all kinds of Fruit, Plants under Glass, including Orchids, and Kitchen and Flower Gardens. For particulars apply above.

GARDENER (Head); life experience all branches, Inside and Out; Grapes, Peaches, Melons, Stove and Greenhouse Plants, Orchids, Malmaison and Tree Carnations, Landscape and Rock Garden; Vegetables and Hardy Fruit; nearly 8 years as head; age 35; excellent references. F. SMITH, 4, Mellish's Terrace, Morden, Surrey.

GARDENER (Head, where two or three are kept); highly recommended; would be pleased to forward particulars to any Lady or Gentleman. CLARK, 19, Tanfield Road, Birkby, Huddersfield.

GARDENER (Head of two or three, or good Second); age 28, married; life experience in all branches, Inside and Out; Carnations speciality; highest references from good places. H. LYTH, 7, Bronaber Terrace, Barmouth, N. Wales.

GARDENER (Head); life experience in growing all kinds of fruit and plants, including orchids; also kitchen and flower garden; can be highly recommended. W. LAMBERT, The Common, Kenilworth, Warwickshire.

GARDENER (Head Working or good Single-handed); life experience; 11 years' reference from last situation; married, no family; disengaged. W. HARTNUP, 61, Nichol Lane, Bromley, Kent.

GARDENER (Head Working, where one or two more kept, or good Single-handed); experienced Inside and Out; good references, and recommended; age 27; married when suited. W. CROUCHER, 11, North Terrace, Hythe, Kent.

GARDENER (Head Working, where two or more are kept); thoroughly experienced; 7 and 12 years' good references as Head; age 45; active; 2 in family, youngest, lad, 15; disengaged. HUNT, [illegible] Bridewell Street, Devizes.

GARDENER (Head Working).—Well up in all branches; excellent characters; 5 years' present situation; married; age 40. E. BEARDSLEY, The Finches, Ifield, Crawley, Sussex.

GARDENER (Head Working); age 44; life experience; 21 years' excellent references from first-class establishments; thorough knowledge in all branches; prize winner; leaving own request; no young children; youngest 14. W. BLOOMFIELD, Staplehurst, Kent.

GARDENER (Head Working, where two or more are kept); good all-round; can be well recommended; married when suited; age 36. PEARCE, Ridley, near Wrotham, Kent.

GARDENER (Head Working); experienced in the Cultivation of Fruit, Plants, Flowers under Glass, Flower and Kitchen Garden, Forcing, etc.; also Hardy Fruit culture; good references; married, no family. W. S., 16, Warwick Place, Maidstone, Kent.

GARDENER (Head Working where two or more are kept); life experience in all branches; age 42; 7 years in present place as head. STEVENS, 197, Blackstock Road, Finsbury Park, N.

GARDENER (Head Working).—Mr. WATSON can highly recommend C. WALLIS, where two or three are kept; been here 5½ years as Second of five; age 30; married, one child. The Gardens, Bushey Down, Tooting Common.

GARDENER (Head Working or good Single-handed); life experience in all branches; good references from present and previous employers as to ability and trustworthiness; no family. GARDENER, 28, Martell Road West, Dulwich, S.E.

GARDENER (Head Working); experienced Inside and Out; good references; age 36; married, two children, youngest 9; disengaged in September. G. BROAD, The Gardens, Braydon Hall, Minety, Wilts.

GARDENER (Head Working); good practical experience in all branches, Inside and Out; Early and Late Forcing; excellent references. H. TURNER, Regal Cottage, Kentford, Newmarket.

GENTLEMAN recommends GARDENER (Head of two or three); life experience in all branches; understands formation of new or renovating old gardens; married, one boy 10 years; age 45. PENNELLS, Phœnix Green, Winchfield, Hants.

MESSRS. ROWLAND, Wavertree Nurseries, Liverpool, can highly recommend first-class GARDENER (Head); many years' experience in growing Fruit and Plants under Glass, including Carnations, Kitchen and Flower Garden. For particulars apply above.

GARDENER (Single-handed or with help); life experience; highly recommended; age 28; married when suited. WM. MARTIN, Higham, Nuneaton.

GARDENER (Working or Good Single-handed), Re-engagement wanted by middle-age, married Man, no family, with practical experience with Fruit, Flowers, and Vegetables, Inside and Out; 5½ years' good character from last place. J. B., 8, Mead Cottages, Mead Row, Farncombe, Surrey.

GARDENER (Single-handed or otherwise); experienced, Inside and Out; good references; age 27; married, one child; abstainer; gentleman's recommendations; disengaged. W. HOLNESS, Ripple Court, near Dover, Kent.

GARDENER (Single-handed); married; age 27, seeks SITUATION; experienced Inside and Out; 5½ years' excellent reference last situation. Apply W. G. CONN, 7, Coombe Road, Sydenham.

GARDENER (Single-handed or with help); age 28; experienced Inside and Out; married when suited; good references. A. RAYFIELD, 130, Lavenham Road, Southfields, Surrey.

GARDENER (Single-handed) seeks SITUATION; 12 years' good experience; good reference. Address, A. DODD, 64, Northfield End, Henley-on-Thames.

GARDENER (Single-handed or otherwise); good all-round man in all branches, or handy man on gentleman's estate; good at either; willing to be useful; active and reliable; good character; age 45; married, one child. OSBORNE, 48, Bradshaw Road, Watford.

GARDENER, Second, where four or five are kept; 9 years' experience; 5 years' good reference; single. Apply, GOWER, Scaynes Hill, Haywards Heath.

GARDENER (Second), age 24; experienced Fruit and Plant Houses; well recommended; leaving through death. A. SMITH, Abbey Manor Gardens, Evesham.

ADVERTISER, with 30 years' experience, grower for Covent Garden Market under glass, is seeking engagement for same as Foreman or Manager. Would be a useful man to one starting, as could give sound advice as to erection of glass-houses, working up stock, etc. ROSE, 224, Kingston Road, Hampton Wick.

JOURNEYMAN (First, Inside or Inside and Out) by Young Man, 21; 2 years' excellent reference present situation, four previous. F. TURNER, Strelly Hall Gardens, Nottingham.

MR. J. SHELTON, Wildernesse Gardens, Sevenoaks, Kent, will be pleased to recommend A. BOOKER as JOURNEYMAN (Inside); age 21; 4 years' experience. Apply as above.

GARDENER (Under, where three or four are kept); 6 years' experience; 6 years last situation; Bothy preferred; total abstainer. H. SHIPWORTH, Utterby, Louth.

LADY highly recommends Young Man as GARDENER (Under); honest, hard-working, and sober; 6 years' reference. Mrs. DOUSE, 93, Parliament Hill Mansions, Highgate Road, N.

A. HUNWICH, age 20, seeks situation as GARDENER (Under); five years' experience in private gardens; well recommended. Hanover Square, Kelvedon, Feering, Essex.

YOUNG MAN (24 years of age) with highest references and 10 years' experience in all branches of indoor work, seeks SITUATION in good nursery of private place; well up in orchids, stove plants, ferns, bedding stuff, tomatoes, cucumbers, chrysanthemums, etc., etc. Speaks French and German fluently (Englishman). BARRETT, Apiaries, Old Bath Road, Cheltenham.

YOUNG MAN, aged 21, as IMPROVER in Nursery; Inside or Out; near or in Portsmouth preferred. C. H. LOADER, 162, Chichester Road, Portsmouth.

ESTATE JOINER requires SITUATION; can undertake to keep Property in thorough repair and to collect rents if required; best references. W. E. S., 18, Carrs Hill, Gateshead-on-Tyne.

A LAD age 16 seeks a SITUATION to Clean Knives and Boots, and help in Garden and make himself generally useful; good character. Apply W. NEW, Chewton, Mendip, near Bath.

MARRIED MAN seeks SITUATION; life experience in general gardening. G. ARNOLD, Hockley, Essex.

Situations Vacant.

REQUIRED experienced active Single-Handed GARDENER (help given), mid-September, well up in greenhouse and outside work, flowers (roses, etc.), fruit and vegetables, to take charge of a garden of about 1 acre; age not less than 27, married; references must be good. Apply by letter only to Mr. F. A. WELLS, Dovedale, Chelmsford, Essex.

WANTED, UNDER GARDENER; thoroughly practical experience in Herbaceous Plants and Borders, and to assist Inside and Out; must be well recommended; not under 25 years of age. Address T. SHARPE, The Knowle, Woodcote Road, Caversham.

WANTED.—FOREMAN for under glass, House and Table Decoration, Vines, Peaches, Melons, Chrysanthemums, Plants, etc. Wages £1 per week; Bothy and Vegetables; duty alternate Sundays. Apply Mr. PICKER, The Gardens, Hesslewood, Hull.

WANTED, MARRIED COUPLE, without family; Man as Gardener and Grower of Tomatoes, etc., for sale, and Wife to do housework for a single gentleman. FULLER, Hollydene, Yateley, Hants.

Nether Green Nursery, Sheffield.

THE FIRST AND ONLY PURE WHITE DELPHINIUM.

TWO STARTLING NOVELTIES.

THESE two new varieties, which are now offered for the first time. Both grow 5—6ft. high, and produce enormous flower stems with large flowers, and the branches, which are produced in enormous quantity at the base of the central spike, are longer than of any other variety, several measuring over 2½ft. This makes both these varieties the best for cutting purposes, as they flower from June till late in summer.

DELPHINIUM HYBR. MOERHEIMI, has large flowers of the purest white, and not the slightest shade of creamy, bluish or greenish, like the so-called "white" Delphiniums, which have been introduced the last few years, and to which it cannot be compared. **It is doubtless the best hardy perennial introduced in the last ten years.** Award of Merit R.H.S. July, 1909. **10/6** each. (Only a limited quantity will be sold and orders are requested at once.)

DELPHINIUM HYBR. CAPRI, of quite the same growth as "Moerheimi," being a counterpiece of same it much resembles in colour to "Persimmon," but is in every respect an improvement of this variety; the flowers are larger and the spikes longer and of a more branching habit. We consider it as the **best sky blue single Delphinium** in commerce **10/6** each.

Our Catalogue of 200 pages will be posted free on application

THE GARDENERS' MAGAZINE.

NOTE OF THE WEEK.

Flower and Fruit.

When we consider the marvellous abundance of flowers, large and small, brilliant or modest, and the equal diversity of the fruits of which they are the preliminaries, and also reflect upon the material and even vital part which these latter play in the maintenance of the animal creation in the way of food, it is difficult to picture to ourselves a vast world of vegetation devoid both of flowers and fruits, and yet, undoubtedly, accompanied by an animal world of extremely diverse character. If, however, we are at the seaside we may even now obtain a glimpse of such a world, for it is on the land alone that the vast diversity of beautiful bloom and nutritious fruit exists. In the ocean, undoubtedly the birthplace of both the animal and the vegetable, the old order of things has survived; its vegetation bears no flowers, but is reproduced by spores and germs in innumerable ways, and its inhabitants live either directly or indirectly upon the vegetation therein, not as land animals do, on the fruit it produces, but solely upon its foliage. Strictly speaking perhaps, regarding the spore as a fruit—since all fruits are reproductive bodies and spores are so also—we must include many of the minute hosts of the spore-devouring animalculæ as fruit eaters, but as we are treating the matter on popular lines and according to popular ideas, we leave this point to the hair-splitters. In any case in the ocean we see a world which in this respect presents a remarkable contrast to the land. This is owing to the fact that the environment is practically alike everywhere, save such minor modifications as occur between tide marks on the coasts in temperature according to the equatorial or arctic climatal conditions, or the many grades between them, and in modifications in the water itself where rivers discharge their streams of fresh water laden with material for the rocks of the future. The land on the other hand is infinitely diversified. Its occupants it is true are universally bathed in the same ocean of air as the denizens of the sea in the ocean of water, but its surface is broken up into mountain and hill, valley and ravine, alluvial plain and sandy desert, and its composition is also varied according to the nature of the rocks and other matters which form its superficial soils. Its vegetation is not, as in the ocean, merely anchored to the rocks, but has been evolved to penetrate the soil by means of its roots and to extract therefrom a material portion of its nourishment. In the struggle for existence it has become modified in all ways, in size from the gigantic trees like the sequoias, eucalyptus, and banyans, down to the minutest mosses, or the still more minute fungi, and since the inequality of the surface means varied aspects and exposure, and all grades of humidity, from water-logged bogs to the driest of sands, this diversity has led to the evolution of incalculable varieties of plants adapted to fit them all. Now it is in the direction of adaptation to these varied aerial conditions that the evolution of flowers and fruits was brought about.

MR. LEWIS SMITH.

In the ocean, the seaweeds, which form its subaqueous forests, are all dependent upon actual immersion for their spores to reproduce their kind, and thus as land vegetation took on new forms it became essential for its reproduction and dissemination that the "seed" should, as it were, be invented. To this end the swimming antherozoid, or fertilising body, became modified so as to be conveyed by the transportable pollen grain to its destination in the ovary or seed vessel, in its turn a modification of the fixed germ of the seaweed. These two then became associated in a primary simple flower; but this was not enough, since this meant constant inbreeding, and the great and providential law of cross-fertilisation decreed that this should be brought about mainly by the insect world. Hence the inconspicuous flowers were doubtless first provided with nectaries or pleasant flavours or perfumes; and as any accidental or fortuitous increase in conspicuousness, greater size or brighter colour, attracted more insects, and consequently by the greater transfer of pollen from one flower to another not only increased the seed yield but invigorated the plants, the survival of the fittest always meant progress, and this has continued from æon to æon until we possess the marvellous floral wealth of to-day, man coming in at last to enormously expedite the march. During this evolution not only were the flowers increased in attractiveness, but their seeds became modified and provided with attractive lures, soft and luscious pulps associated with indigestible seeds ensuring wide dissemination by devouring birds or animals, while man took up the unattractive grasses, and finding the originally small seeds nutritious, improved them by cultivation until some of them have become the very "staff of life" itself, and provides the bread of hundreds of millions. He it is, too, who has been mainly instrumental in transforming the hips and haws of the rose tribe into our wealth of delicious apples, pears, plums, etc., and coaxing the acrid husk of the almond into the luscious pulp of the peach, nectarine, and apricot, to say nothing of a myriad other triumphs of the same kind, one and all the outcome of possibilities implanted in the primary germs of the primeval ocean.

Mr. Lewis Smith, who has charge of one of the many fine gardens within a short distance of Norwich, has, by reason of his ability and geniality of temperament, obtained for himself a prominent position among the highly skilled gardeners who are so numerous in Norfolk. A Devonshire man by birth, Mr. Smith commenced his gardening career at Medland House, and after spending a few years in some of the best gardens in the country, he went to Clarence House, Weston-super-Mare, as foreman, where stove and greenhouse plants and carpet bedding were great features. After occupying this position three years he was appointed head gardener to H. J. Gurdon Rebow, Esq., with whom he stayed until the lease expired and his employer went abroad. Mr. Smith's next appointment was as head gardener at Shotesham Park, Norwich, the fine seat of R. Fellowes, Esq. That was nine years ago, and during the period which has elapsed he has endeavoured, with the assistance and encouragement of Mr. Fellowes and the Misses Fellowes, to maintain the interest, attractions, and usefulness of the gardens at a high level. Special features are made of hardy perennials, sweet peas, orchids, and roses, and for some years past the exhibits from the Shotesham Gardens have been staged at the spring, summer, and autumn exhibitions of the Norwich Horticultural Society, and have enabled Mr. Smith to win a full share of the prizes. It is not necessary to recount the number of prizes, but the premier awards for hardy spring and summer flowers, iris, anemones, flowers of exotic plants, and orchids, have been more than sufficient to show how fully entitled Mr. Smith is to a foremost position among the cultivators in the district. The competition in the class for collections of hardy perennials at the Norwich summer shows is a good test of cultural skill, for forty-eight bunches of distinct varieties have to be staged. In this class Mr. Smith has been first on several occasions, and in July last he not only secured the first prize, but in addition was awarded the Royal Horticultural Society's silver-gilt Banksian medal for the best exhibit in the show. Mr. Smith not only grows sweet peas largely and well, but he has devoted considerable attention to cross-fertilisation, and has secured several promising new varieties that are under trial. The fine collection of orchids has also been enriched by numerous seedlings. To avoid any misapprehension we would add that the Shotesham Park gardens are not less remarkable for the success achieved within them in the production of fruits under glass, and in the open, than for the various kinds of plants mentioned. Mr. Smith has for some years been a member of the East Anglian Horticultural Society, one of the most flourishing organisations in Great Britain, and at the last annual meeting he was elected vice-president for the year, and next year he will, it may be assumed, be given a still higher position by his fellow members.

Presentation of Norfolk Park to Sheffield.—On Saturday, the 27th ult., Norfolk Park, one of the most noteworthy of the open spaces in Sheffield, was formally presented to the city, and has now become the property of the Corporation. The park, which has an area of about sixty acres, was the property of the Duke of Norfolk, who has for many years permitted the public to use it with no more restriction than has been necessary for the maintenance of proper order. Mr. H. Coverdale, who presented the deed of gift on behalf of the Duke of Norfolk, stated that the Duke thought that, in the event of the estate ever coming into the hands of trustees, they might be advised to cut up the beautiful park for building purposes, and it was in order to avert that risk and to secure the park to the public for ever he decided to offer it to the Corporation. This gift increases to upwards of one hundred and fifty acres the land which the Duke of Norfolk has given to Sheffield, and the Lord Mayor, Lord Fitzwilliam, in accepting the deed of gift on behalf of the citizens, expressed his hearty thanks to the donor for his generosity.

The Lindley Library Trust.—The Charity Commissioners have made an order establishing a scheme for the regulation of the Lindley Library Trust. The powers and duties of trustee are now transferred, on the application of the trustees, to the Royal Horticultural Society, acting through its council, and the endowment of the charity, consisting of £1,516 3 per cent. preference railway stock, is to be invested in the name of the Official Trustee of Charitable Funds. All the books and portraits belonging to the charity are to be housed at the offices of the society, and the society's own collection of books on horticultural, botanical, and allied subjects is henceforth to form part of the charity. The income arising from the endowment is to be applied towards the cost of management, the preservation and improvement of the library, and its extension by purchase of books and otherwise. The Lindley Library is the outcome of the International Horticultural Exhibition, held at South Kensington in 1865. At this time the botanical library of Dr. John Lindley was for sale, and the committee of the exhibition wisely resolved to devote a part of the profits to its purchase. This resolution had practical effect given to it, and the library was placed in charge of trustees, and housed in the offices of the Royal Horticultural Society. The library was called the Lindley Library, in memory of Dr. Lindley, who was the first Professor of Botany in the London University, the author of numerous botanical works, and for some years Secretary of the Royal Horticultural Society, and Editor of its "Journal."

An Attractive Chippenham Garden.—Mr. G. A. H. White, who achieved much distinction at the recent flower show at Chippenham, sends us a set of photographs which admirably indicate the varied attractions of his garden. Mr. White was successful in taking the premier awards for collections of annuals, hardy perennials, and sweet peas, the success being all the more noteworthy from the fact that the competition was very keen, and that Mr. White's garden suffers much from the smoke from the chimneys of factories and other buildings.

Gardening Under Difficulties.—A few days since an exhibition was held at the Christ Church Schools, Cubitt Town, that was of much interest as evidence of the possibilities of gardening under conditions that are by no means favourable. The exhibition was that of the Millwall and Cubitt Town Horticultural Society, which was formed for the purpose of providing men with recreation at once useful and pleasant. It appears that in different parts of the district embraced by the operations of the society land which for some time had been lying vacant was leased and broken up into fifty allotments of about twenty rods each. The rent of 6d. per plot a week was charged, and the tenants set to work to clear the ground. They had a difficult task, for the soil was covered with scrap iron, bricks, and refuse generally, but they were successful. During the winter months the allotment holders attended lectures on horticulture. After the day's work the men cultivate their plots, and on Sundays their wives and children accompany them to gather flowers for the adornment of the home. The flowers and vegetables exhibited were remarkably good, considering the unfavourable conditions under which they had been grown.

National Dahlia Society's Exhibition at the Crystal Palace on Thursday and Friday next has the promise of proving considerably above the average of the past few years, and as the schedule contains several new classes, the exhibition should be of exceptional interest.

Preservation of Borrowdale.—We are much gratified to learn that the National Trust for Places of Historic Interest or Natural Beauty are making good progress with its appeal to the public for the preservation of Borrowdale. As stated in these pages a few weeks since, the intention is to preserve this beauty spot as a memorial to King Edward. When we directed attention to what was being done, with a view to the acquisition of the property, the balance necessary to complete the purchase was £750. During the interval the sum of £550 has been received, leaving the further amount of £200 to be raised, and this should be quickly forthcoming.

Basic Slag for Continental Vineyards.—Grape growers in this country can hardy fail to be interested in the fact that basic slag has within recent years attained to a high degree of popularity on the Continent as a manurial agent for grape vines. Large quantities are being shipped from Ellesmere Port to France, Italy, Spain, and other countries in which the cultivation of the vine is carried out on a large scale. This slag is a bye-product in the manufacture of steel in accordance with the Bessemer process, and has for some years been regarded with much favour as a fertiliser for grass lands and certain crops which do not require a very quick-acting manure.

Gladioli from Langport.—We have received from Messrs. Kelway and Son, of Langport, a box of remarkably fine gladioli, which for length of spike, size of individual blooms, and charm of colouring are so meritorious as to testify to the splendid work the firm is doing in the development of these fine border flowers. Specially noteworthy among the fine varieties before us are Orby, rich scarlet, flaked with crimson; Lady Madds, delicate flesh-colour; and Prince of Orange, rich yellow. Countess of Kenmare and Jewel may also be mentioned for their high quality and attractive colouring.

Hindhead Common.—In return for permission to make a road across a narrow strip of Weydown Common, Lord Pirrie, of Witley Park, Haslemere, has dedicated several footpaths contiguous to Hindhead Common to public use, and has conveyed to the National Trust the larch wood on the knoll adjoining the fir woods and that part of Hindhead Common known as High Inval. The larch wood commands views of great beauty, and its conveyance to the National Trust increases by several acres the area open to the public.

ROYAL HORTICULTURAL SOCIETY.

The usual fortnightly meeting was held in the Hall, Vincent Square, on Tuesday last, when a fine display was made, chiefly of dahlias, which were seen in large quantity, while the exhibit of hardy Chinese shrubs from the Hon. Vicary Gibbs was a splendid feature, and no doubt of great value to all lovers of hardy shrubs and trees.

Messrs. Bakers, Wolverhampton, had an entire table of asters, arranged in tall bamboo stands, with a collection of dwarf varieties arranged on the table as lifted plants. The season must have blessed the firm to the detriment of other parts of the country, for the flowers were simply splendid. The Ostrich Plume section, in all colours, were very fine, as were also the Comet varieties; while the dwarf bedding varieties, arranged in masses of colour, were really charming.

was generally admired. The shades of colour were beautifully blended, while the individual plants gave every evidence of cultural skill. The same firm also staged a collection of hardy fuchsias with the variegated variety Sunray, grown as standards, also a full table of hardy ericas, which attracted much attention. A few of the most prominent forms were E. vulgaris alba, E. vagans alba, E. fl.-pl., and E. rigida, the whole forming a most interesting bank.

Mr. F. Brazier, Hardy Plant Nurseries, Caterham, occupied a corner of the hall with a fine exhibit of phloxes, pentstemons, and other flowers. In the former were noted Dutrie, Clara Bluz, Crepuscule, Dr. Charcot, and Grappenkonigin. The pentstemons were excellent, though seedlings, while a few vases of early-flowering chrysanthemums reminded one of the autumn period. From Mr. Amos Perry, Hardy Plant Farm, Enfield, came a fine group of delphiniums, presumably secondary spikes. The flowers were arranged in three large bays, while masses of Artemisia lactiflora made a fine foil. A few of the most striking of the delphiniums were Sir Geo. Newnes, Lizzie Van Veen, Mrs. Creighton, Amos Perry, Lamartin, and Carmen.

From Messrs. Barr and Sons, Covent Garden, came a bright collection of phloxes, Lobelia Queen Victoria, and L. Sam Barlow, both exceedingly bright and attractive; asters in variety, with some fine delphiniums and gladioli.

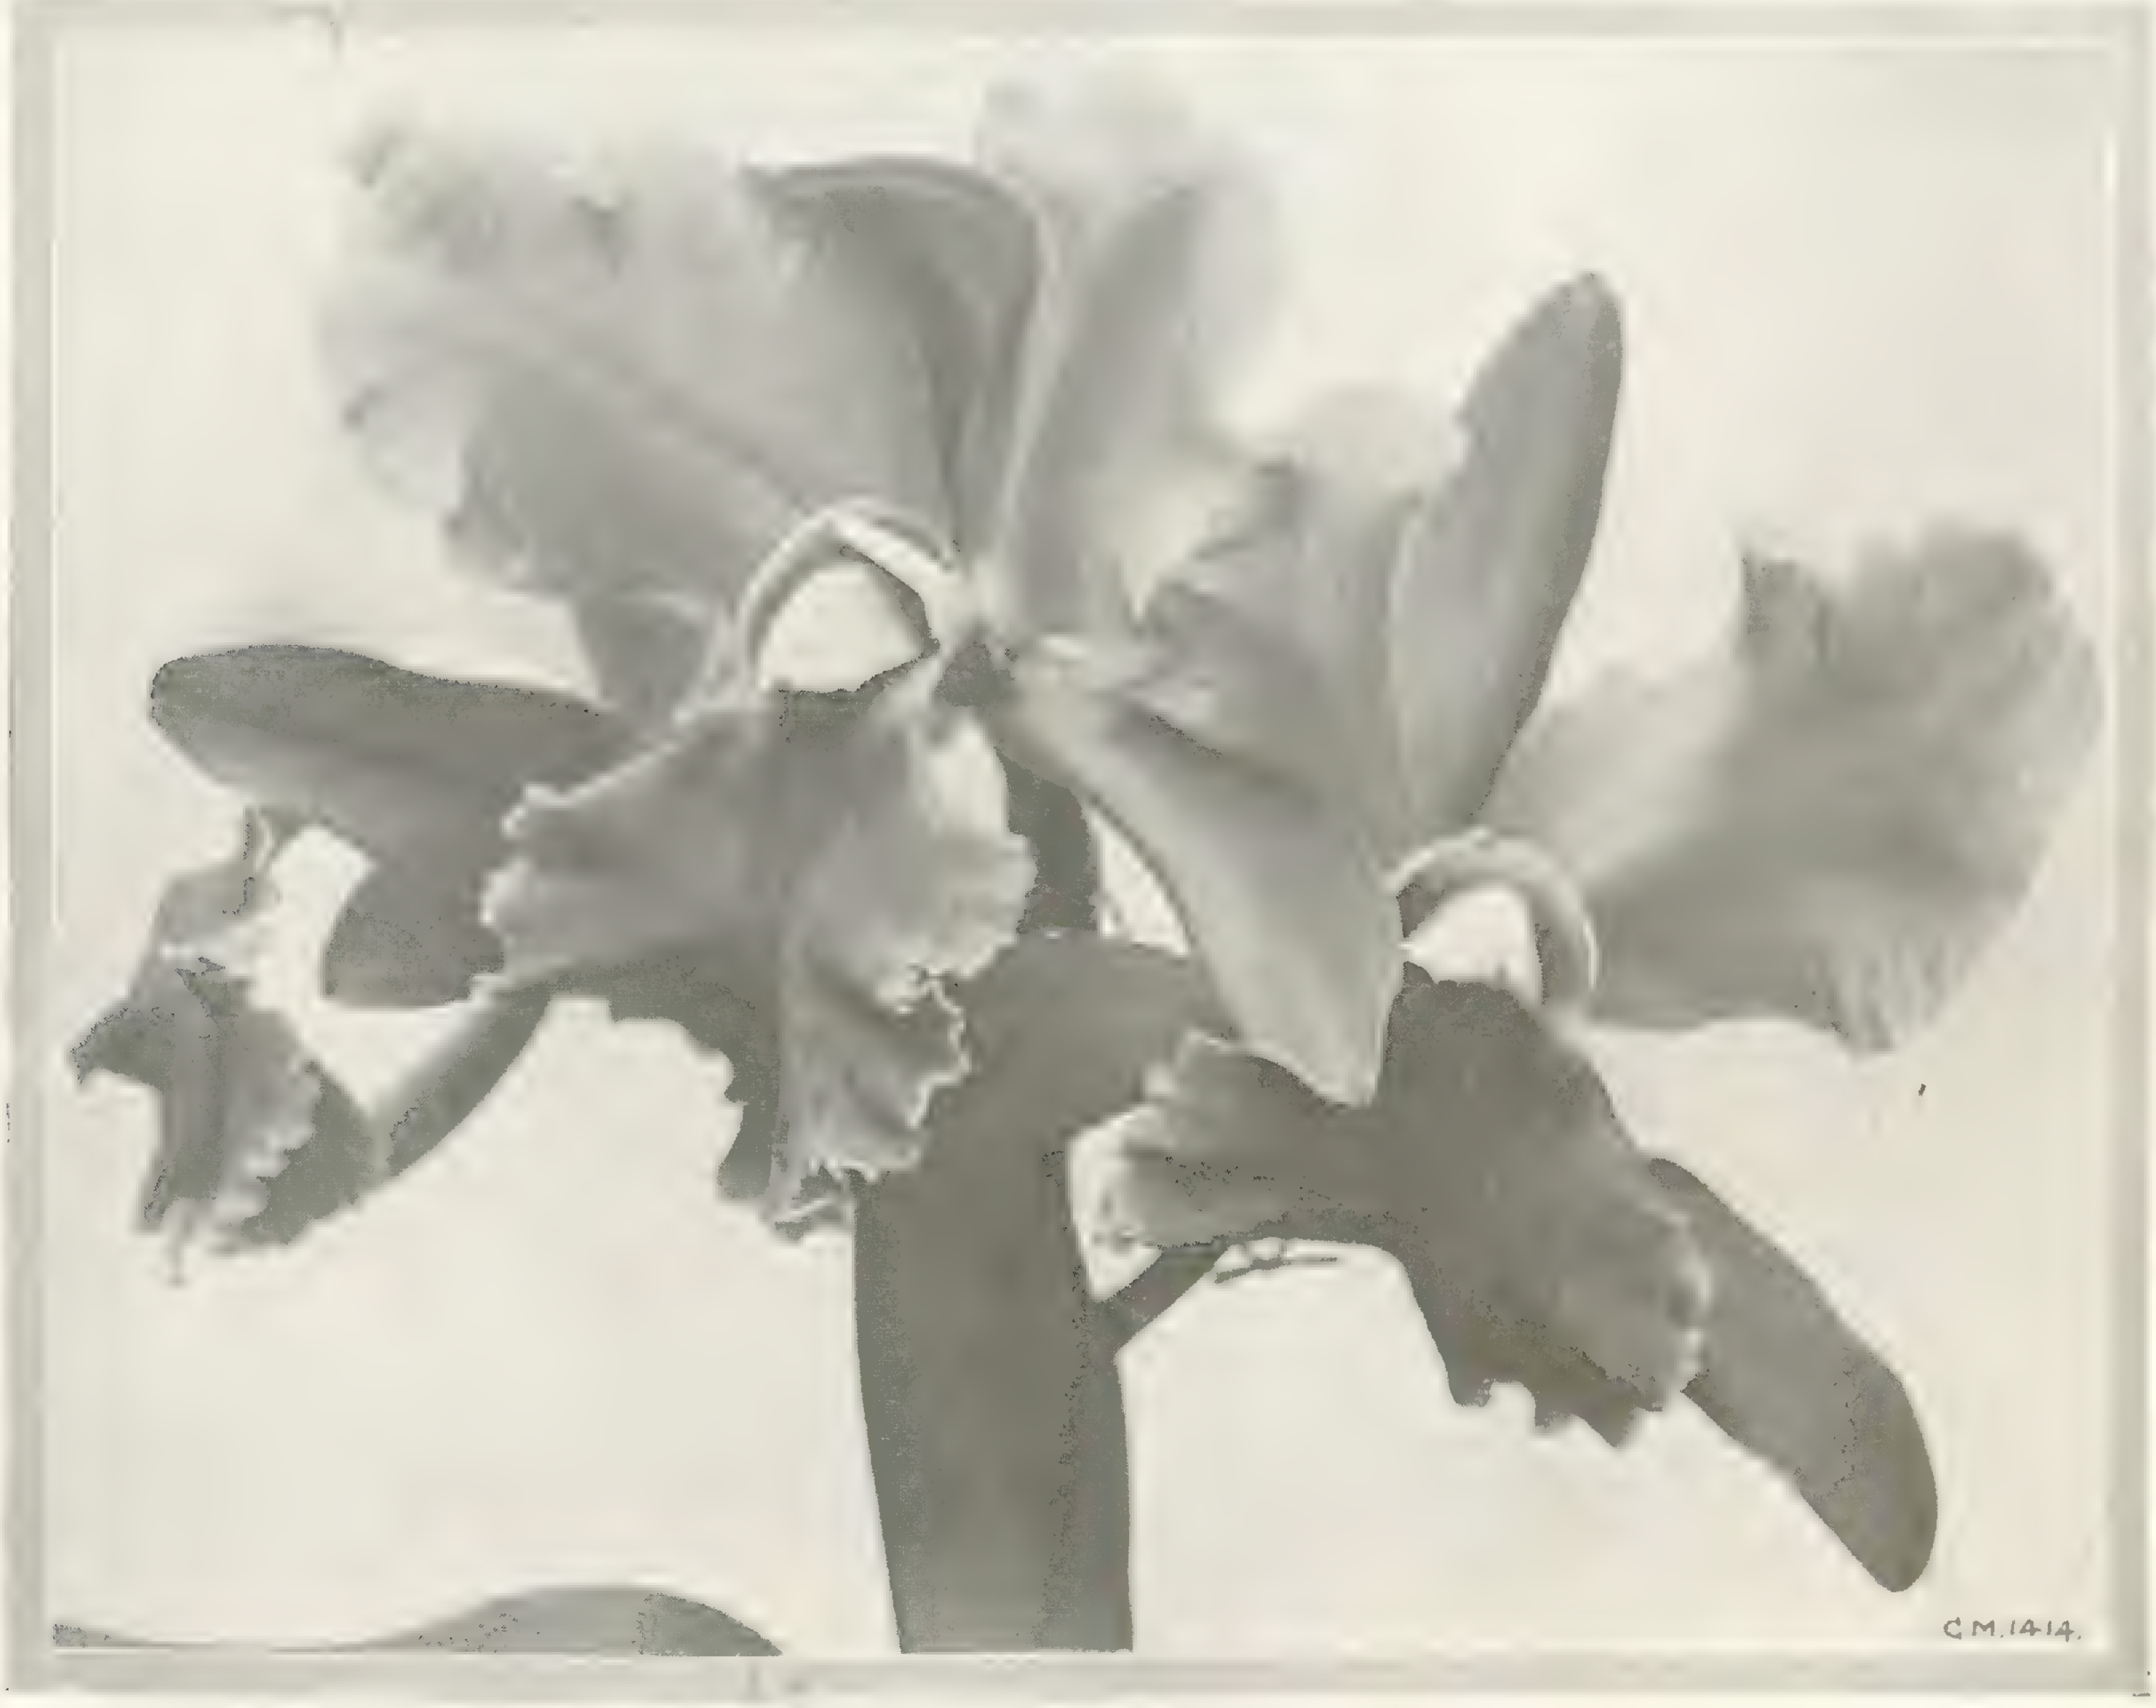
Messrs. Chas. Dowson, Middlesborough-on-Tees, exhibited a border carnation in a group, named The Dowson, a yellow-ground flaked with crimson. They were arranged in vases with appropriate foliage.

From Messrs. Carter Page and Co., London Wall, E.C., came a huge exhibit of dahlias in all sections that occupied the end of the hall. The chief features were the masses of cactus varieties, pæonies, pompons, and singles. The whole collection was most artistically displayed in mounds, baskets, and vases, all arranged with appropriate setting.

Hardy flowers from Mr. G. Reuthe, Hardy Plant Nursery, Keston, were most attractive. Montbretias in variety, liliums, astilbes, gaillardias, and Clematis Davidiana forming the best features.

The Guildford Hardy Plant Company had an attractive exhibit of hardy flowers, which were lightly arranged in vases. The lobelias included L. syphilitica Princess, L. s. niveus, L. s. Pink Bedder, and L. Salamander; also the quaint Salvia turkestanicus, phloxes, gladioli, and Rudbeckia subtomentosa.

Messrs. Whitelegg and Page, Chislehurst, staged a table of liliums, which were chiefly marked by some fine examples of L. Wallichianum sulphureum, and L. auratum, with fine vases of Pentstemon Southgate Gem, a few delphiniums, and Gladioli Brenchleyensis.



CATTLEYA ADULA VALE BRIDGE VARIETY.

A fine form of C. Adula, which was raised from a cross between C. bicolor and C. Hardyana. The flowers are large, and the petals and sepals are brown tinted purple, and the lip royal purple. A.M., R.H.S., August 30. Mr. E. V. Low, Haywards Heath.

The same firm also staged a large collection of pæony-flowered dahlias, arranged in masses of colour. A few of the most prominent were Mrs. A. McKellar, Colonel J. St. G. Wolseley, Lady Saville, The Warrior, W. H. Morter, and Mrs. W. Keer.

From the Hon. Vicary Gibbs, Aldenham House, Elstree (gardener, Mr. E. Beckett), came a magnificent display of Chinese shrubs, which were perfectly grown, and doubtless one of the most interesting exhibits of these plants ever staged in this country. The background was formed with huge specimens of rubus in variety, loniceras, clematises, acers, with names still to follow, cotoneasters in variety, with many other hardy shrubs. The whole collection of trees were raised from seed sown during the last thirty-two months, which was collected by Mr E. H. Wilson, in China. Mr. L. R. Russell, Richmond, arranged a group of celosias on the floor of the hall, which

From Messrs. W. and J. Brown, Stamford, came an attractive display of decorative roses, which were arranged in large masses of colour. A few of the most conspicuous were Corallina, Lyon, Earl of Warwick, Harry Kirk, and Queen Mab. Mr. H. Dixon, Spencer Park Nursery, Wandsworth, had a small exhibit of gladioli, which included several vases of the violet Baron Hulot and America.

Messrs. W. Wells and Co., Lim., Merstham, staged a large exhibit of phloxes, pentstemons, with other hardy flowers, also a fine display of early-flowering chrysanthemums. The latter included fine examples of Nina Blick, Touraine, Grosvenor, La Garronne, Roi des Blancs, and Leslie. The phloxes were very fine, as were also the pentstemons, with other hardy flowers.

Messrs. Jas. Veitch and Sons, Lim., Chelsea, occupied an entire table with a varied collection of plants in pots. The hybrid

Java jasminiflorum rhododendrons were most striking; while some boxes of streptocarpus were simply splendid, the flowers being large in size and varied in colour. A collection of cannas were most attractive, the plants being dwarf with magnificent heads of flower. Bouvardias in variety were also well done, as were the plants of Crowea latifolia.

Messrs. T. S. Ware, Lim., Feltham, were represented by a display of dahlias, backed with hardy flowers; in the former were noted Brigadier, Conquest, Glory of Wilts, Echo, and Mary Purrier. The pæony-flowered varieties were also well represented, among them being Mrs. George Gordon, a white variety of much merit.

Pæony-flowered dahlias, from Mr. C. Turner, Slough, were a feature. The flowers were arranged in vases with some suitable foliage and berries. The most attractive were Geisha, Attraction, Duke Henry, and a large number of promising seedlings.

Messrs. Paul and Son, Cheshunt, contributed a fine display of phloxes and helianthus in variety. These included vases of Helianthus mollis, H. strumosus, H. majus plenus, H. multiflorus major, and Miss Mellish; also tritomas and liliums in variety.

Messrs. Stuart Low and Co., Bush Hill Park, had a small miscellaneous display of greenhouse plants, which included plants of Rochea falcata in splendid form, Grevillea Preisi, and some well-grown ferns with a variety of decorative plants.

Messrs. H. B. May and Sons, Upper Edmonton, had a nice exhibit of ferns, chiefly of a decorative size, in which were noted fine examples of Dicksonia squarrosa, Polypodium neriifolium cristata, Davallia tenuifolia Veitchi, Polypodium Knightæ, and a good selection of nephrolepis.

A large exhibit of dahlias came from Messrs. H. Cannell and Sons, Swanley, which comprised most sections. The most striking cactus varieties were Bessie Palliser, Australian, Gondola, Flora, Harold Peerman, and Ruby Grinstead. The giant single variety Cannell's Favourite was most distinct, while the best of the pæony-flowered varieties were South Pole, The Geisha, and Leveller. The giant decorative varieties were also well represented.

From Messrs. G. Bolton and Son, Buntingford, Herts, came a pretty table of phloxes in variety, with some well-grown examples of pentstemons and statices, also decorative roses and tritomas.

A group of roses from Messrs. F. Cant and Co., Colchester, were much admired, especially the varieties Madame Melanie Soupert, Edu Meyer, Dean Hole, Mrs. H. Brocklebank, Mrs. A. Tate, and Countess of Gosford. Messrs. J. Cheal and Sons, Crawley, had a splendid exhibit of dahlias. The singles were particularly beautiful, especially Amy, Elaine, Leander, Mikado, and Kitty. The collection of cactus varieties, too, were good, as were also the collections of pompons and pæony-flowered varieties.

Mr. S. Mortimer, Rowledge, Farnham, staged new seedling pompon and show dahlias. In the latter Model and Prince Edward appeared the most promising.

A box of new cactus dahlias was staged by Messrs. Jas. Stredwick and Son which attracted much attention. The most distinct were Mrs. Douglas Fleming, Crystal, Beauty of Sussex, and New York; while Mr. H. Shoesmith, Woking, sent a fine box of Prima Donna, and a number of promising seedlings.

Phloxes from Messrs. Gunn and Sons, Oulton, were very fine and beautifully arranged. The most conspicuous varieties were Marguerite, Hercule, Countess of Shrewsbury, Grace Darling, Lady Peel, and Le Madhi. The baskets employed in the foreground were most appropriate, while a white trelliswork behind added to the decorative effect.

Mr. Jas. Box, Lindfield, also had a large display of phloxes, which were well-developed and nicely arranged; also hardy plants, in which the gladioli and delphiniums were the chief features.

FRUIT COMMITTEE.

Messrs. S. Spooner and Sons, Hounslow, contributed a fine table of apples, arranged in baskets. The fruits were very good for the early period, though somewhat lacking in colour. The finest were Cellini, Lord Grosvenor, Lady Sudeley, William's Favourite, Early Victoria, and Pott's Seedling. A nice basket of Monarch plums was also noted.

Mr. G. W. Miller, Clarkson Nurseries, Wisbech, had an exhibit of apple Red Victoria, which was very fine, the fruit being a wonderful colour for such a deadly dull season.

A collection of capsicums from Messrs. Jas. Veitch and Sons, Lim., Chelsea, was most interesting. They were grown chiefly in five-inch pots, and included Long Red, Chinese, Early dwarf red Squash, Early Bell, Mammoth Yellow, and its red companion, all being well fruited.

A fine collection of melons came from Lord Northcliffe, Guildford (gardener, Mr. J. Goatley). The fruits were of good colour, and some of extra large size. The varieties were: Universal, large enough to suit anybody, The Peer, and Hero of Lockinge, the last-named being in splendid condition.

From J. A. Nix, Esq. (gardener, Mr. G. Neal), Tilgate, Crawley, came a dozen bunches of Black Hambro grapes, all handsome clusters of good colour, though rather small berries, while the finish left little to be desired.

ORCHID COMMITTEE.

Messrs. S. Low and Co. made a nice bank of orchids, which included splendid examples of Oncidium Marshallianum, O. Lanceanum, Miltonia vexillaria Leopoldi, Cattleya Hardyana, a splendid form, the quaint Masdevallia Infracta, and odontoglossums in variety.

Messrs. Charlesworth and Co., Haywards Heath, arranged a nice exhibit, in which the chief features were some very fine plants of Vanda cærulea, Odontoglossum Phœbe, with a fine spike; Burlingtonia fragrans was good with five spikes, as were also Miltonia Cogniauxiæ, Cattleya adula, and a few choice odontoglossums. This firm also exhibited a new bigeneric hybrid under the name of Oncidioda. This was raised from a cross between Oncidium incurvum and Cochlioda Noetzliana, and produces tall spikes of rose-red flowers.

Mons. Maurice Mertens, Mont St. Amand, Ghent, staged some fine plants of miltonia, hybrid odontoglossums, and a cypripedium.

A pretty group came from H. S. Goodson, Esq., Putney (gardener, Mr. G. E. Day). The chief features were the cattleyas, miltonias, and cypripediums. Perhaps the most noticeable were C. Gaskelliana alba, C. Rhoda Fairlawn var., and Cypripedium Schillianum with nine good flowers.

Mr. de Barri Crawshay, Rosefield, Sevenoaks (gardener, Mr. W. J. Stables), had plants of O. crispum Mrs. de Barri Crawshay, a variety of fine proportions, just marked on the lip with a brown spot; also well-flowered plants of Odontioda Bradshawiæ and O. Theodora.

From Sir Jeremiah Coleman, Bart., Gatton Park (gardener, Mr. J. Collier), came a small but interesting group, which included Masdevallia Chimæra with its quaintly spotted flowers, Lælia monophylla, and Cryptophyaranthus Dayanus.

Mr. Edward V. Low, Haywards Heath, sent a small, but attractive, exhibit of Cattleyas, which included C. adula, C. Dowiana granulosa, and C. Atalanta; also some fine examples of cypripediums, and C. Hardyana Holford's var., a splendid variety, the lip being broad, fimbriated, rich rosy purple with a golden-veined throat of rare substance.

From F. A. Wellesley, Esq. (gardener, Mr. W. Hopkins), Westfield, Woking, came examples of Cattleya Mrs. Phillip Henriques, a splendid form with a rich rosy-purple lip and deep mauve sepals and petals; also L.-c. Mrs. Phayre, and C. Lady Chaney.

The trustees of the late E. Rogerson, Esq., Oakdene, Didsbury, Manchester, staged beautiful plants of Miltonia Rogersi, M. hybrid, and M. Bluiana, all in splendid condition and well-flowered.

Lieut.-Colonel Sir Geo. Holford, K.C.V.O. (grower, Mr. Alexander), Tetbury, sent Lælio-cattleya magnifica, a splendid form with a fine crimped lip; also L.-c. Charlesworthi, a hybrid carrying a splendid spike of six flowers.

Messrs. Sander and Sons, St. Albans, staged a few choice plants, which included some good plants of Dendrobium Sanderæ, all carrying good clean flowers, Odontioda Devossiana, Lælio-cattleya Henry Greenwood, L.-c. Gaston Dion, also Vanda amœna, a natural hybrid.

MEDALS.

Gold Medal.—The Hon. Vicary Gibbs, for Chinese shrubs.

Silver-Gilt Flora.—To Messrs. Bakers, for asters and dahlias; to Messrs. Carter Page and Co., for dahlias; to Mr. L. R. Russell, for hardy ericas

Silver-Gilt Banksian.—To Messrs. Gunn, for phloxes; to Messrs. H. B. May and Sons, for ferns; to Messrs. S. Spooner and Sons, for apples.

Silver Flora.—To Mr. Jas. Box, for hardy plants; to Mr. F. Brazier, for phloxes and pentstemons; to Messrs. H. Cannell and Sons, for dahlias; to Messrs. F. Cant and Co., for roses; to Messrs. J. Cheal and Sons, for dahlias; to Messrs. Jas. Veitch and Sons, for greenhouse plants; to Mr. A. Perry, for delphiniums; to Mr. H. S. Goodson, for orchids; to Messrs. Stuart Low and Co., for orchids; to Messrs. Charlesworth and Co., for orchids.

Silver Knightian. — To Mr. Nix, for grapes; to Lord Northcliffe, for melons.

Silver Banksian.—To Mr. E. V. Low, for orchids; to Messrs. Barr and Sons, for hardy plants; to Messrs. Jas. Veitch and Sons, for capsicums.

Bronze Flora. — To Messrs. W. and J. Brown, for roses; to Messrs. Paul and Son, Cheshunt, for herbaceous plants; to Mr. G. Reuthe, for herbaceous plants; to Mr. Chas. Turner, for dahlias; to Messrs. T. S. Ware, Lim., for herbaceous plants and dahlias; to Messrs. W. Wells and Co., Lim., for chrysanthemums and phloxes.

AWARDS.

First-Class Certificate.—To Cattleya Rhoda, Fairlawn var., from Mr. H. S. Goodson, Fairlawn, Putney.

Award of Merit.—To Cattleya adula, Vale Bridge variety, from Mr. E. V. Low, Hayward's Heath; to Cattleya Hardyana Holford's var., from Sir Geo. Holford; to Lælio-cattleya Golden Oriole, var. tigrina, from Sir Geo. Holford; to Gladiolus Safrano, from Messrs. Vilmorin, Paris; to Gladiolus La Luna, from Messrs. Barr and Sons; to Single Dahlia Leander, from Messrs. J. Cheal and Sons; to Lobelia Sam Barlow, from Messrs. Barr and Sons; to Phlox Elizabeth Campbell, from Messrs. W. Wells and Co.; to Rose Daphne, from the Rev. J. H. Pemberton; to Pompon dahlia Guinevere, from Mr. Chas. Turner; to Cactus Dahlia Theresa, from the same exhibitor; to Cactus Dahlia Mrs. Douglas Fleming, from Messrs. Jas. Stredwick and Son; to Cactus Dahlia Crystal, from Messrs. Jas. Stredwick and Son; to Buddleia variabilis gigantea, from the Hon. Vicary Gibbs; to Garden Cactus Dahlia Garden Yellow, from Mr. H. Shoesmith.

Award of Merit.—To Mr. Balch, Girvan, for Tomatoes Ailsa Craig, Carrick, and Ayrshire.

Syringa japonica.—Some of the lilacs bear a certain amount of resemblance to the privets, and this is one of them. It flowers after all the ordinary lilacs are past, and on this account is particularly noteworthy. In habit it is tree-like, though it blooms freely when from 8ft. to 10ft. in height. The creamy-white blossoms are individually small, but borne in large branching panicles.—W. T.

Itea virginica. — This little-known North American shrub is almost as attractive to butterflies, especially those of the Vanessa section, as Sedum spectabile. The itea is a compact, freely-branched deciduous shrub, seldom more than 4ft. to 5ft. in height. It is not unlike a privet, while the small whitish flowers are borne in dense spikes, rather suggestive of a veronica. It needs a fairly cool moist spot for its successful culture.—W. T.

WOODSIDE GARDENS.

Villages remarkable for the beauty of their surroundings, the picturesque grouping of the cottages, and the sense of comfort that is evident on all sides are plentiful in the English counties, and there would be no difficulty in mentioning a goodly number that are veritable beauty spots. Yet, large as is the number that have left a deep impression on the mind, not one can be called to remembrance that can be referred to as quite equal to Chenies, the delightful Buckinghamshire village that has for so long a period been closely associated with the great House of Russell. Within the God's Acre, in which stands the interesting village church, is the last resting-place of past generations of the members of the house, among them being a considerable number who, in affairs of state, rendered such splendid services as to have contributed in no small degree to the high position which England occupies at the present day. Others there are who, if they did not devote any considerable share of their attention to political matters, and attain foremost positions as statesmen, showed a full appreciation of their responsibilities, and made strenuous endeavours to bring their widely-extended estates to a high state of development, and to amply provide for the comfort of the many workers engaged on them. We have abundant evidence in the village of Chenies of what has been accomplished in the provision of cottages—on which so much of the comfort of the working classes depends—that are pleasing in design, substantially built, and roomy. There are no long rows of cottages painful in their bareness and lacking in accommodation, but they are mostly arranged in groups of three. All have gardens around them, and they show a considerable diversity in design.

The object, however, of these brief notes is not to give a sketch of the work of those members of the Russell family who in their day laboured so assiduously in the cause of their country, or to dwell upon the charms of the Chenies village. On the contrary, the object is to give a short account of the highly interesting and beautiful gardens of Woodside, the residence of Adeline Duchess of Bedford, whose interest in gardening is great, and whose taste in matters floricultural, as well as in other things, is widely known. The mansion is situated about two miles distant from Chorley Wood Station on the main line of the Great Central Railway, and to reach it one has to pass through the village and take the road which turns to the right, and proceeds on the northern side of the lofty hill that forms so conspicuous a feature of the landscape. The slope of the hill is at this point rather sharp, and as the mansion occupies a position on the lower side, its proportions suffer somewhat viewed from the highway. But entering by the gate, which is seen to the left in the first of the several illustrations, and walking through the gardens, a much better idea is formed of the architectural features of the mansion, which is of red brick, and presents a charming appearance in its setting of splendidly developed trees of various kinds.

The approach to the mansion is distinct in character, and highly attractive. Entering by the gateway mentioned the visitor has on his right a breadth of lawn enclosed by a wall of some height, and a portion of this is devoted to weeping standard roses, chiefly Dorothy Perkins, in a high state of development. These have stems about eight feet high, and large, well-furnished heads, and they annually produce a very fine display of flowers. There are also specimen bays in tubs which, arranged near the entrance, contribute, as will be seen from a glance at the illustration, materially to the attractions of the scene. On the other, or west, side is a fine specimen of the Cedar of Lebanon, which, if it has not occupied its present position a sufficient length of time to assume a picturesque appearance, it has been long enough there to attain to a great height, and to show how beautiful is this fine tree when it has reached its full development. Beyond the cedar is a spacious lawn, surrounded by tall handsome trees on three sides, with a dovecote at the far end, and in the centre a paved area which affords facilities for the enjoyment of outdoor life at times when, owing to rains or heavy dews, it would not be prudent to remain for any length of time on the grass. This area is furnished with chairs and tables adapted to outdoor life, and is liberally embellished with specimen plants suited to the season. At one time Mr. Dickson, the head gardener, has large specimens of the Madonna lily, which is very attractive grown in tubs, and at another time may be seen examples of Azalea mollis, which, bearing a profusion of finely developed trusses of richly coloured flowers, are not less effective.

Proceeding down the grounds by way of the broad walk, leading from the lawn, with its paved area, one has not to go far to recognise the fact that the gardens are not exactly like those previously visited elsewhere, and that they are immensely interesting and extremely beautiful. They certainly do not belong to the class of which a view of the whole area can be obtained from the front door, or from one of the principal windows.

There is no want of breadth, but the features, and they are many, are so arranged as to form, if not exactly a succession of surprises, a series of extremely beautiful scenes, in which Nature and art have been happily combined. The broad walk referred to is flanked on either side by a border of bold-growing hardy perennials, and at the termination of these is a square space on which stands a sun-dial of a quite distinct character, bearing in Greek the motto of the family, which, freely translated, is, "What I say must be done." Around the dial are four vases, which, in the spring, were filled with forget-me-nots, and as these had grown so well as to produce large masses of flowers, the effect was remarkably good. Lower down the walk Mr. Dickson uses well-flowered hydrangeas with good effect during the summer months. Still lower down is a garden of a quite distinct design, enclosed with finely-clipped hedges of yew, containing a lily pool and flower beds. Around the pool are elegant crossed arches, over which rambling roses fling their slender growths, and in the bays of the enclosing hedges are raised stone seats. The beds are filled during the spring months with early tulips in variety, and the summer occupants were this year the best of the zonal pelargoniums for the flower garden. The enclosing hedges of

WOODSIDE—ENTRANCE TO MANSION AND GARDENS.

this section of the gardens are well deserving of special mention, for they produce a distinct effect from all parts of the grounds from which they can be seen, and concentrate the bright colours with which the enclosure is usually embellished. and prevents their detracting from the charm of quietly coloured alpines growing near at hand.

The rock and water garden, which closely adjoins the last-named feature, is especially interesting, for the rockery has been designed on simple lines with a view to the successful cultivation of plants from the Alps, rather than to display skill in piling up huge masses of rock. As may be anticipated, it answers its purposes so admirably that a large collection of alpines are flourishing upon it. A corner of one portion of the rockery is herewith illustrated, and a better idea of its characteristic feature, and the admirable manner with which it is furnished, will be obtained from the picture than from a lengthy description. At the time when the photograph was taken the rockery was immensely attractive with aubrietias, primulas, hardy cypripediums, and many species of saxifrages, and there are also several good groups of the handsome Meconopsis cambrica. The island, which is conspicuous in the part of this garden devoted to moisture-loving subjects, contains a fine specimen of the graceful Arundinaria Metake, and on the margin of the water are masses of funkias, spiraeas, mossy saxifrages, and other subjects that flourish in the neighbourhood of water. The skill with which the bare ground for some distance round the trunk of a venerable Cedar of Lebanon has been treated is deserving of special mention, as it exemplifies the possibility of clothing bare spaces found under cedar trees of great age that have lost their lower branches with flowering plants possessing much beauty. Around the trunk of the tree was formed a bed of soil, about two feet deep at the back, and sloping towards the circumference, with sufficient stones arranged to keep the soil in place, and suggest a rocky bank. Numerous rock plants were planted; they have all done well, and the effect is remarkably good.

The lower part of the grounds is intersected by a trout stream, which, by judicious planting, has been made to contribute liberally to the many attractions of the gardens. Leaving the rock garden, and proceeding in a southerly direction down the stream, we soon reach a semi-wild part of the grounds known as the spring garden. Here every spring is produced a surprisingly beautiful display of polyanthuses, in the cultivation of which Mr. Dickson has achieved a high degree of success. Near at hand is the rivulet which is annually made beautiful with Primula obconica, and was illustrated in these pages a short time since. As was then stated, Mr. Dickson has for some years past been endeavouring to improve this well-known and beautiful primula, and his endeavours have been attended with much success. He has improved the habit and increased the flower production, but his greatest achievement has, perhaps, been the development of new colours. We find in the collection the purest of whites, the richest of purples, and shades of pink and rose innumerable, and the most brilliant of crimsons. The crimson hues are, indeed, so surprising in their brightness that there is no occasion to place them by the side of the usual crimson varieties for the purpose of determining how great has been the progress made in the development of high colours. These primulas make a fine display under glass during the duller months of the year, and in April the plants that have not reached the high standard set up are planted on the banks of the rivulet, where they bloom throughout the summer and in the autumn, until such time as the frost is of sufficient severity to kill them. Still further southward, and reaching down to the banks of the trout stream, is the wild garden, which may be described as a large tract of open woodland containing many thousands of bulbs of daffodils in variety and other subjects that can be successfully grown in the grass. In the shrubberies that skirt the path alongside the trout stream are many specimen berberis, lilacs, philadelphus, and other shrubs remarkable for the beauty of their flowers.

On the other side of the stream is a broad grass walk flanked by a belt of Penzance briars, and beyond are a rose garden, beds and borders of hardy flowers, and open lawns. The Penzance briars, it should be stated, include all the finest varieties, and the practice adopted in their culture differs somewhat from that which usually obtains. The shoots are not pegged down, but a wire trellis is fixed two feet from the ground, and the growths are trained to it. The object in providing the trellis is to keep the surface of the ground free, and thus enable a rake to be readily passed under the briars for the purpose of removing from the area dead leaves and rubbish generally. On the margin of the water are day lilies, Kæmpfer's iris, the variegated iris, and several other plants that bloom during the summer months. The banks are also planted with forget-me-nots, aubrietias, and arabis, the first-named predominating, and the effect when the spring flowers are at their best is such as to form a veritable surprise, the charm being greatly enhanced by the reflection of the pale blue flowers of the forget-me-nots in the stream.

Hardy border plants constitute a strong feature. There are two large borders devoted to them not far distant from the rock garden, and a portion of one of them is herewith illustrated. There are fine masses in the borders surrounding the lawns on the same side of the stream as the Penzance briars and there is a border on each side of the principal walk that runs through the kitchen garden, the attractions of the last-named being materially increased by the arches clothed with rambling roses that span the pathway. Violas are largely used in association with the dwarf and standard roses in the beds on the lawn contiguous to the trout stream, and the results are, we need hardly say, eminently satisfactory.

Under glass the plants of special interest are the stock of Primula obconica, to which reference has already been made, and of the beautiful Gesnera Orange King, which was illustrated in these pages some time ago. This fine gesnera has rich dark velvety leaves, and brilliant orange-coloured flowers, and it has the great merit that it can be successfully cultivated during the greater part of the season of growth in an unheated frame.

G. G.

Azaleas.—These are forming their flower buds, and should receive some manurial assistance; but care in selecting the stimulant is very necessary, and if liquid manure is used it should be weak and clear, and made from sheep droppings. Should the liquid become thick, the addition of a piece of unslaked lime will clarify it. Liquid manure may well be alternated with a light surface dressing of some approved chemical manure. The plants should be heavily syringed twice daily in fine weather as a check against insect pests—W. Staward.

SOILS AND MANURES IN RELATION TO PLANT GROWTH.

(Continued from page 651.)

Soils consist of a collection of fragments of rocks of different sizes. When a soil has become the seat of vegetation the chemical agents of decomposition gain in power; the carbonic acid in the soil is much increased and is assisted in its work by the humic acids and by the nitric acid which appear on the scene; the solvent action of plant roots must also be taken into account.

Potential Plant Food.

As a result of the careful study of soils it has been ascertained that plant food exists in three forms; one is a form incapable of being dissolved by rainwater or other solvent, and the possibility of its being of any use to the growing plant is so remote, that it is spoken of as "non-available." Next we have plant food which is called "potential" plant-food, that is, plant food existing in the soil which will not be immediately available to the plant, but which the operations of tillage and cultivation may in the future render assimilable to it; it is not at the present moment capable of being dissolved by rainwater or by the acid exudation of the roots of the growing plants, but is capable by tillage operations of being converted into a form which can in the future be dissolved.

Available Plant Food.

The third kind of plant food is what is called "available" plant food, that is to say, the amount of the various materials in the soil essential as plant food, which the plant either by means of rainwater impregnated with carbonic acid, or by the acid exudation of the rootlets of the growing plant itself is able to pass into solution and use at once as plant food.

Exhaustion of Plant Food.

It is well known that no soil can be entirely exhausted. At Rothamsted there is one plot of land, half-an-acre in extent, which has grown a wheat crop without an ounce of manure of any kind for sixty-seven years in succession, it has given an average of 13 bushels of corn per acre and 10½ cwt. of straw. The present year's (1910) crop will be about eight bushels per acre. After a drop in production during the first few years the yield has been practically constant for the last forty years, fluctuating only with the season, and showing no immediate prospect of declining.

The proportion of plant food present in soils is very small even when the soil is extremely fertile, the bulk of the soil serving chiefly as a support and as a sponge to hold water.

A good arable soil may contain 0.15 per cent. of nitrogen, 0.15 per cent. of phosphoric acid, 0.20 per cent. of potash and 0.50 per cent. of lime; much larger quantities may, of course, occasionally be present, as in very old kitchen garden soils.

Quantity of Plant Food per Acre.

Inasmuch as the results of soil analysis are generally recorded in percentages it is rather puzzling to gardeners to calculate what they mean. In order to get over the difficulty we need simply to consider this thorough tillage very rarely goes below a depth of nine inches, and, therefore, for the purpose of finding out to what depth a plant is likely to feed, we need merely confine ourselves to the depth to which tillage operations and oxidation from the air and nitrification of the soil takes place, namely nine inches. Now we find that nine inches depth of arable loamy clay will weigh when perfectly dry about 3,000,000 pounds per acre.

A pasture soil or a kitchen-garden soil containing much root-fibre, and therefore humus matter, will be lighter, the first nine inches weighing when dried about 2,250,000 pounds per acre. Supposing, therefore, a dry soil to contain 0.10 per cent. of nitrogen, potash, or phosphoric acid, the quantity in nine inches of soil will be from 2,250 to 3,000 pounds per acre.

Locked up Plant Food.

A large part of the ingredients of plant food contained in soils is, as we have already pointed out, in such a condition that plants are unable to make use of it. An acre of soil may contain many thousand pounds of nitrogen, phosphoric acid, or potash, and yet be in a poor condition. When we say these ingredients are lacking, we do not mean that the soil does not contain them, but that it does not supply the growing plants with as much as they need. It is not so much because horticultural soils have been worn out of plant food, but rather because the food is locked up in such combinations that the roots cannot get at and use it that an artificial supply of soluble food in manure becomes necessary.

When a soil is tilled or cultivated it is loosened, the particles are separated from one another, and the capillary interstices is destroyed until the soil is again more or less consolidated. Sandy soils being so much more permeable to both water and air do not require the same amount of tillage as clay soils, and after tillage may actually require consolidation by rolling.

Harpenden. J. J. Willis.

(To be continued.)

HOUSING PERPETUAL CARNATIONS.

Time has changed our ideas about housing perpetual carnations as much as it has our ideas in other cultural details, and few, if any of us, leave our plants out, as of yore, until late in September, to be bathed in the heavy dews of autumn. Of course, there are still points in favour of late housing, and a carnation house with insufficient ventilation is about the strongest, otherwise August had better see all plants housed away in their winter quarters.

The heavy growth made by plants left out of doors with the increased dews of autumn is too often looked upon as an assistance to them for winter flowering, but experience has proved that this is not so, but that it is simply an autumn growth, created by nature to enable the plant to withstand the winter in a dormant state, and not to enable it to continue work, or rather grow and pay rent. If your plants are put in an airy house in August, the summer growth is continued, and the gradual acclimatising process begun, so that there is no undue exciting of the growth compared to the late September housing, when the plants receive a greater change, and do not produce nearly so high a grade of flowers until spring.

Some will think that I have lost count of the hot days early in September, but with a circulation of air and good light no ill-effect will take place if the thermometer does run up high during the day. It is unnecessary for me to point out the great necessity of having the house perfectly sweet and clean before housing the plants. It is also a mistaken idea that perpetual carnations require shading in the autumn, the few early blooms had much better be allowed to spoil than the plants weakened. The plants should be sprayed twice on bright days and the houses damped down, but no moisture should be allowed to hang upon the foliage, or, indeed, in the house at night. Supporting the growths with stakes and raffia before housing them is quite a heavy task with some, others use the patent plant supports and make light of it.

Autumn feeding is, as a rule, best left alone. Personally, I have not done it to any great extent without regretting it in mid-winter, and many of the market growers will support this view. If, as at times, it is almost essential to feed them, then only do so in a mild form and with organic manures for preference.

The positions of the varieties in your house should be studied, and all non-fading colours, such as white, crimson, red, etc., should be placed where they will be freely exposed to the sun, whilst the delicate pinks, etc., are best placed in the more shaded positions. Such varieties as Lawson, Winsor, Beacon, White Perfection, Lady Bountiful, etc., and all British-raised varieties, should be placed in the hottest part of the house, whilst in the cooler situations place Enchantress and its sports, Chas. Knopf, etc. Montagu C. Allwood.

Bush Hill Park.

SUN-DIAL GARDEN, WOODSIDE.

Spiræa Anthony Waterer.—This is one of the most delightful of all our low-growing shrubs, a great point in its favour being the fact that it continues to flower throughout the entire summer. In the rich crimson colour of its blossoms it also stands out practically alone. This spiræa is, as with many others, greatly benefited if the old flower heads are cut off directly they are past their best, as fresh blooms then quickly develop. Botanically this spiræa is a form of S. Bumalda which, in its turn, is regarded as a variety of S. japonica, more commonly known as S. callosa. Spiræa Anthony Waterer was given a First-Class Certificate by the Royal Horticultural Society seventeen years ago.—W. T.

BULBS.—A practical treatise on the cultivation of hardy, hothouse and greenhouse bulbous and tuberous rooted plants is "Bulbs and their Cultivation," by T. W. Sanders, price 2s. 6d. net, or by post 2s. 10d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

GOOSEBERRIES.

Gooseberries are not suitable for every garden in the South of England, as the climate is often too dry for their successful cultivation. During the past two years, however, owing, no doubt, to the unusual humidity of the climate, the crop has flourished very successfully in the southern districts, as evidenced by the robust and healthy appearance of young plantations. Even older trees appear more than usually robust and prolific, extraordinarily heavy crops of excellent fruit having been gathered. In soils naturally suited for their growth gooseberries require very little attention other than that of pruning, and where it is desired to increase the stock of plants this can be very easily accomplished by taking cuttings or layering the growths of older bushes. In gardens where there is a small extent of wall surface one often finds gooseberries trained to great advantage on low walls as single or double cordons. As in the case of many other fruits, gooseberries bear on young and old wood alike, but, nevertheless, it will be noticed that the best fruit is always borne on young healthy spurs, and for this reason the bush should be kept in a healthy state by systematic pruning, so that no really old wood of more than five or six years' growth is left other than that composing the main stems of the bush. There is no better plan than to regulate the bush so that it contains a given number of leading branches, the laterals of which are kept spurred back to the main stem.

A CORNER OF THE ROCK GARDEN AT WOODSIDE.

Varieties.

To make a selection of suitable varieties of gooseberries is no easy task, either for the amateur grower or the professional gardener. There are so many, some for general culture, some specially adapted for early picking, and some for exhibition, that one is often puzzled to know which to grow. When gooseberries are grown for home consumption it is essential to have the best. When making a plantation of gooseberries the grower may be well advised to inspect the trees personally in the nursery garden while they are fruiting; this often saves a deal of worry and expense, and renders the selection of suitable varieties a much easier matter. Plants that have been hard cut back for a number of years should never be purchased; this is a practice adopted by some nurserymen in order to check growth and prevent the bushes getting too large for sale. Although these bushes appear to be strong and healthy at first sight, they never make a free growth when planted in their permanent quarters. Generally speaking, not a thought is given to the choice of varieties until the time arrives for planting, when one has little opportunity for making a careful selection.

The best varieties suitable for early picking include Whinham's Industry; this is one of the best gooseberries in cultivation, producing a prolific crop of dark red medium-sized fruits. Keepsake is the earliest cropping variety, and is often grown for early supplies in conjunction with Berry's Early Kent. The last-mentioned variety and Lancashire Lad are two gooseberries of somewhat similar habit of growth. Lancashire Lad is a tree fruiting gooseberry, and an old favourite red. The varieties May Duke and Crown Bob are also good early croppers. For ordinary cultivation Whinham's Industry, Keepsake, and Golden Drop are difficult to beat; Whitesmith, Crown Bob, Massington, Lord Derby, and Pitmaston Gage, are also good general varieties. Exhibition gooseberries comprise Dan's Mistake and Speedwell, red; Antagonist, white; Leveller and Coiner, yellow; Soutar Johnny and Thumper, green.

Pruning and Training.

The most common method of growing gooseberries is in the form of bushes, and for general culture this method is by far the best. For exhibition culture triple cordons are usually grown, this being the form of tree on which fruits of the largest size and best quality are obtained. The "oblique" cordon is also grown in some cases, the plants consisting of two stems only. An intelligent appreciation of the habit of growth of gooseberries and their individual constitutions is necessary in order to prune them correctly. The object in the first place should be to produce the greatest possible amount of fruiting wood, all other being useless and unnecessary, except where it consists of the main stem and laterals attached thereto, and, of course, every method of pruning should be designed to encourage the production of the young growths, as it is upon these growths that the best fruit is borne. The next great essential is to keep the head of the bush open to air and sunshine.

The majority of gooseberry bushes that one observes in the gardens of amateurs are simply masses of tangled interlacing growths, which not only prevent the wood from ripening properly, but also make it very difficult to gather the fruit. Undoubtedly the best way of growing gooseberries is to regulate the bushes so that they contain a given number of branches, the laterals of which are kept spurred back to the main stems; the young wood is produced on these young branches in the form of side shoots. This method of training may be likened to the fan training of wall fruits, but it is less easy of application, as the natural habit of gooseberries is opposed to such a form of training. Pruning should be commenced early in late summer, and soon after the fruit has been gathered. If left until a later period the results will rarely be so satisfactory as in the case of early autumn pruning, as the growths will, in the latter case, have an opportunity of becoming thoroughly ripened by the extra amount of sunshine and air which is admitted to them. This ensures an abundant supply of properly ripened fruit in the ensuing season.

Individual Habit.

Of course, the individual habit of different varieties will have to be studied very carefully to gain the most satisfactory results. Some kinds, for instance, bear fruit on the young growths to a greater extent than anywhere else, hence it will be necessary to encourage these growths constantly. In other cases fruit is borne principally on the spurs, which will admit of the younger growths being kept spurred back to the laterals from which they extend. Varieties of prolific growth, such as Red Warrington, need to be treated very judiciously, as the more they are cut the more wood they produce, and the thinning out of the shoots has a like effect. These should be pruned as lightly as possible. It will also be observed that some kinds, such as Langley Beauty, grow more erectly than others, some drooping over like a wild blackberry bush. In such cases it is necessary always to cut the former upright-growing trees to an outside bud, so as to prevent too close a habit, and to cut the latter always to an upward bud, so as to check this undesirable pendulous habit of growth.

Gooseberry Mildew.

This is a disease which plays havoc with gooseberry bushes; in appearance it may be easily recognised in the form of patches of delicate white powdery substance covering both the fruit and the leaves. The berries, the leaves, and the young shoots are all affected in turn, and subsequently the whitish powder thickens and changes colour from white to brown. There is no cure for the disease, and gooseberry bushes affected with this mildew must be grubbed up and burnt immediately. Prevention consists of spraying with potassium sulphide (liver of sulphur); five ounces of this substance dissolved in ten gallons of water should be sprayed on to the bushes with a garden syringe or sprayer in early summer. Care must be exercised in handling the potassium sulphide, as it rapidly decomposes on exposure to the air.

Gooseberry Sawfly.

During the past season the larvæ of the gooseberry sawfly have been very troublesome in some districts, having attacked the leaves to a truly alarming extent. Some years ago I treated this pest very successfully by forking a light dressing of gas lime into the surface soil in spring, followed by dustings of flowers of sulphur when the foliage was damp. Where no attempt has been made to arrest the attack before autumn, the surface soil should be raked away and burnt on a rubbish heap as this soil usually contains a great number of cocoons.

J. C. Newsham.

Old Basing.

A PRETTY WATER SCENE WITH PENZANCE BRIARS AT WOODSIDE.

CRINUM CAPENSE.

This handsome crinum is decidedly worth cultivating outside, if a position on a south border can be given it. When established it grows vigorously, and fine spikes of flowers are produced, the umbels of blooms vary in number, and the flowers may be used singly for small glasses, or the entire spike may be cut when several blooms are open; they are useful in this way for medium-size trumpet glasses. The colour is pleasing, being a delicate pink.

In planting give the bulbs a well-drained position, and plant fairly deep as a protection from frost. In very severe weather the surface of the border should be covered with long litter or cocoanut fibre refuse, to prevent frost penetrating very deeply in the soil.

T. H. Slade.

LATE SUMMER IN THE ROCK GARDEN.

The end of summer is usually regarded as a dull time for the rock garden, and many who have rock gardens bewail the fact of an insufficiency of blossom at this season. It is usual, I know, for planters to choose heavily among the spring and early summer-flowering subjects when planting up a rock garden, and then to give scant attention to later-flowering subjects, so that the rock garden in August is not in the same category as the rock garden in April. We need more enthusiasm for some of the late-flowering subjects, in our endeavour to add to the season of beauty.

A more general appreciation of hardy pentstemons is desirable, especially as it is possible to get so many haunting shades of blue amongst them. P. heterophyllus is hardy enough for the majority of English rock gardens, and furnishes a wondrous picture of metallic blues which, in some plants, almost reaches a rosy-purple colour. It is a delightful plant for gemming the rock ledges. P. glaber and its varieties, with their dwarf, sturdy growth and well-filled spikes, are also of service, but I would further recommend the dainty light-growing P. azureus, the delightfully free P. pubescens, the dainty P. glaucus, together with P. cæruleus, P. Menziesi, P. humilis, and P. Halli, the majority of which (though perhaps less known) are even more pleasing than the forms of P. glaber.

Onosmas are valuable by reason of their continuity of blossom, and a glowing mass of the Golden Drop (O. echioides or O. taurica) suggests a freer use of the varied forms. O. nanum, O. pyramidale, O. arenarium, and several others could be introduced. I have noticed, too, how well the violas are throwing up a succession of blossom, especially such sterling gems as V. papilio, V. gracilis, V. reniforme, etc. The little Italian Snapdragon, Antirrhinum asarina, is still producing its large sulphur and white blossoms, while the Spanish A. glutinosum is equally useful where it thrives. The white cups of Nierembergia rivularis are profuse and charming in the cool ground on the lower levels, and near by one notes the lavender-blue Nepeta Mussini, roving through a drift with a myriad blossoms, a valuable subject, though such a free and well-known one.

The tiny potentillas, such as P. alba, the exquisite P. nitida, and the rich-hued P. Tonguei, still carry a multitude of flowers, while in the half-shady corners some of the phloxes of the stellaria and subulata type are promising a second crop of blossom. Campanulas are gay, those of the C. muralis and C. garganica sections being still in flower, while C. erinus, C. pusilla, C. pusilla alba, the many forms of C. turbinata, and C. carpatica, as well as C. Profusion, C. amabilis, and others are exceedingly delightful. One can hardly overplant campanulas in the rock garden, for they embrace telling shades (especially among the blues), and are so pleasing in growth that one does not easily tire of them.

The sedums, again, are of great value for creating sheets of blossom. In flower at the present moment are Sedum sexangulare, a study in gold; the varied forms of S. stoloniferum; the rich red S. ibericum; S. album, with its masses of white blossoms; S. Ewersi, a glaucous foliaged pale pink form; the taller growing S. purpurascens, and S. Maximowiczi, while the bold masses of S. spectabile are just beginning to take on their showy colourings. These large sedums are splendid in a bold rock garden, and make quite an important feature in late summer. Statices, or sea lavenders, should also be given a place in the rock garden. A few large masses of S. latifolia and its varieties produce a telling effect, while S. incana, S. incana rosea, S. limonium, and S. tartarica, to say nothing of the tinier forms, such as S. gongetiana, S. minuta, and S. bellidifolia, are all serviceable for prolonging the floral display.

A mention of veronicas will bring thoughts of the tall, well-flowered, dark blue spikes of V. subsessilis, of the dainty form and paler hue of V. exaltata, the useful varieties of V. spicata, the silvery forms of V. incana, and V. cæspitosa, as well as many dwarfer species in flower at this season. The "shrubby" veronicas will also furnish a wealth of material, and many of them are more beautiful in foliage than in blossom.

I might go on to tell of the beauty of several of the linarias, including the rock-clinging L. cymbalaria, which is now studded with a myriad tiny opal blossoms, and the ever-pleasing forms of L. alpina and L. pallida. Plenty of blossoms still jewel the Linum narbonense, L. perenne, L. perenne album, and L. arboreum. Hosts of golden cups betoken the presence of the dwarfer œnotheras, among which Œ. missouriensis, Œ. Fraseri, Œ. Youngi, Œ. pumila, and Œ. fruticosa, show very brightly. Then, again, this is the season of the ericas, and a heath-clad slope in the larger rock garden is ever a place of interest. The bulk of the heaths flower at this season, and among them I may mention the forms of the Cornish Heath, E. vagans, in white, flesh, and rose-red; the pretty cross-leaved Mountain Bell, E. tetralix; the wide variety of E. vulgaris, including the pretty colour forms aurea, cuprea, and argentea; and the sterling E. Hammondi, E. Searlei, E. Foxi, E. alba plena, and several others. Erica ciliaris and the forms of E. cinerea should also be included in planting schemes, for the heaths are wonderfully good for furnishing slopes, and should be planted in variety.

A further glance reveals a few blossoms upon the helianthemums, a promise of abundant beauty among the late-flowered gentians, here and there a few geums, geraniums, and erigerons. The pretty yellow Dianthus Knappi is now in full beauty, and several other dianthuses are still in blossom, and some of the achilleas are offering up belated flower heads, while the little pink-flowered Erythea Massoni is just at the climax of its beauty. Many more plants might be added to the foregoing, but my purpose will be served if the reader will take up the idea that the rock garden in August need not be flowerless. In the making of rock gardens many plants must of necessity be left out of planting schemes. Where there are so many to choose from it must ever be so, though in many cases a closer study of the requirements of one's garden will reveal many openings for improvement in the way of new plants and varied groupings as time goes on. P. S. Hayward.

COSMOS BIPINNATUS.

The Mexican aster is an annual which is grown comparatively little, and yet it is useful for certain purposes, and has more to recommend it than some which are better known. It is a plant of very graceful growth, attaining a height of from three to six feet, according to variety, soil, and season, very freely branched so as to form large bushes, while the foliage is large, and so finely divided as to be almost feathered. The flowers are somewhat like single dahlias, and come at the same time, the colours being various shades of crimson, rose, and white, with yellow centres. Though the lateness of its period of flowering is an objection to it, yet, on the other hand, the foliage and the character of the growth is so ornamental that it contributes to the attraction of the flower garden from early June till it is cut off by frost.

It is of great importance to obtain seed of early-flowering varieties, as some of the large-growing American varieties will hardly come into bloom in this country before the frost comes, unless it is a very hot and prolonged summer. Even the early-flowering varieties are quite late enough, and it is essential to raise them early in heat, or in a cold frame, and grow them on in small pots, so as to have nice-sized plants to put out at the end of May. They make grand subjects for sub-tropical bedding, while as screen plants on a mixed border, to hide the gaps caused by masses of delphiniums, and the like, they are invaluable. As regards soil, cosmos will grow in anything if it is not too dry, though it does best in a deep- well-cultivated soil, but it is important that it should be in as sunny a position as possible, as it is a plant of the Southern States.

Alger Petts.

Pea Masterpiece.—Those who are in want of a really desirable pea for a full supply of well-filled pods of capital flavour should grow Webb's Masterpiece. In height it reaches 5ft., is most productive, and the pods are four inches long, and each contains eight or nine quite large peas, deep green in colour, and of fine flavour. This variety is quite free from mildew in a bad season, when many others are quite checked in their growth owing to the prevalence of this fungoid disease.—E. Molyneux.

NATIONAL VEGETABLE SOCIETY'S TRIALS.

◆

Trial of Autumn-sown Onions at Twickenham and Sutton Green, 1909-1910.

Seventy-two stocks were kindly sent to the society for trial as autumn-sown onions by nineteen distinct seedsmen, all of whose names were mentioned in the Cabbage Trial Report. The respective stocks of seeds were equally divided, and sent to the care of Mr. W. Poupart, Marsh Farm, Twickenham, and Mr. C. Foster, "The Times" Experimental Station, Sutton Green, Surrey, under number only. The instructions given in each case were for the seeds to be sown in drills twelve inches apart on August 20, 1909, but in each case an adjoining drill was to be left, to lift plants from each stock and to plant into it, to test the effect of such transplanting. These instructions in each case were rigidly adhered to. One contingency, however, could not well be foreseen: this was the mild-growing nature of the late autumn weather, which had the effect of stimulating unduly rapid growth, which again in the spring led to much undue bolting off to flower on the part of the onions. This feature was more marked, however, on the warm sand at Sutton Green, especially on the transplanted plants, than at Twickenham, where the cooler soil and very exposed position, while keeping the plants robust, were less conducive to this premature bolting. It is well to remark here that the primary estimate of the merits of the various stocks was made from the Twickenham trial.

The final inspection of the onions was made by a large committee on July 19, when the following awards were made:

Awards of Three Marks.

Messrs. James Carter and Co., Record; Messrs. Daniels Brothers, Golden Rocca; Messrs. Dickson, Brown, and Tait, Excelsior, Giant Rocca, and Red Italian; Messrs. Dickson and Robinson, Premier and Giant Tripoli; Messrs. Pearson and Sons, Trebons and Red Italian Tripoli; Messrs. Sutton and Sons, A1; Messrs. James Veitch and Sons, Cranston's Excelsior; Messrs. Webb and Sons, Giant White Tripoli; Messrs. Hurst and Sons, Ailsa Craig, Red Italian Tripoli, and Giant Rocca; Messrs. Vilmorin-Andrieux and Co., Vanguard (very early white); and Messrs. Watkins and Simpson, Wroxton Globe.

Awards of Two Marks.

Messrs. Daniels, Allan's Reliance; Messrs. Dickson and Robinson, Flat Mammoth; Messrs. Dickson (Belfast), Wroxton Globe; Messrs. Pearson, Ailsa Craig and Giant Rocca; Messrs. Sutton and Sons, Perfection; Messrs. James Veitch and Sons, Giant Zittau; Messrs. Vilmorin, Short Pale Red; Messrs. Watkins and Simpson, Cranston's Excelsior; and Messrs. W. W. Johnson and Co., Giant London Rocca.

The following, while not so well bulbed, were regarded as excellent or true stocks: Messrs. Austin and McAslan, Trebons and Excelsior; Messrs. James Carter, Tennis Ball and Early Wonder; Messrs. Daniels, Improved White Spanish; Messrs. Yates (Evesham), Giant White Tripoli; Messrs. Watkins and Simpson, Ailsa Craig; Messrs. Vilmorin, Blood Red; Messrs. Hurst, White Italian Tripoli; Messrs. Webb, Giant Rocca; Messrs. James Veitch, Main Crop; Messrs. Sutton, Globe and Improved Reading; Messrs. W. W. Johnson, Globe; Messrs. Dickson (Belfast), Lord Keeper; Messrs. Dobbie, Golden Globe, Giant Rocca, Trebons, and White Tripoli; and Messrs. Dickson and Robinson, Paragon.

It is thus seen that the best of the more globular and keeping onions for autumn sowing seem to be Ailsa Craig, Cranston's Excelsior, Wroxton Globe, Record, and Trebons; and of the Italian or Tripoli section, Giant Rocca, Lemon or Golden Rocca, and Red and White Italian Tripoli are the best.

The committee's warmest thanks are due to Mr. Poupart and to Mr. C. Foster for great kindness in providing ground and conducting the trials so admirably.

Trial of Early Potatoes.

This was conducted at Sutton Green, Surrey, under Mr. C. Foster, "The Times" Experimental Station, 1910.

The tubers for planting were kindly furnished by numerous seedsmen and merchants, and were grown solely at this centre. Planting was done on April 20 in rows thirty inches apart, the sets being eighteen inches apart in the rows. The soil is of deep sand, and for this trial was very moderately manured, the culture being that of the open field. The inspection by members of the committee took place on July 29, several roots at each end of the respective rows being lifted for examination. Generally the crops were excellent and clean, but in few cases were the tubers large. The trial was an admirable one, and was conducted with all that care and impartiality which characterises whatever is undertaken by Mr. Foster.

PORTION OF BORDER OF HARDY PERENNIALS AT WOODSIDE.

Awards of Three Marks.

Messrs. R. Veitch and Sons, Exeter, Lady Llewelyn; Messrs. Pennell, Lincoln, Sharpe's Victor; Messrs. C. Fidler and Sons, Reading, Sharpe's Victor; Mr. J. W. Cross, Wisbech, Sharpe's Victor; Messrs. C. Sharpe and Co., Sleaford, Sharpe's Express; Mr. J. F. Williamson, Mallow, Sharpe's Express; Messrs. E. Sydenham, Birmingham, Sharpe's Express; Messrs. Dobbie and Co., Edinburgh, Alpha; Mr. A. Dickson, Belfast, Mile-Cross Early; Mr. G. Sharpe, Perthshire, Craigie Early; Messrs. James Veitch and Sons, Chelsea, New English Beauty; Messrs. Webb and Sons, Wordsley, First Crop; Messrs. Sutton and Sons, Reading, May Queen; Mr. A. Dickson, Belfast, May Queen; Messrs. James Carter and Co., Holborn, Advance; Messrs. Dobbie and Co., Edinburgh, Midlothian Early; Messrs. Scarlett and Co., Edinburgh, Midlothian Early; Mr. J. F. Williamson, Mallow, Midlothian Early; Mr. Harris, Blackpill, Seedling White Kidney; and Messrs. Hogg and Robertson, Dublin, New Coloured Kidney (Hebron type).

Awards of Two Marks.

Messrs. Scarlett and Co., Edinburgh, Eclipse; Messrs. Hogg and Robertson, Dublin, Seedling No. 2 and Seedling No. 3, Yellow-fleshed Kidney.

Epicure (Messrs. Sutton and Sons, Reading), both from Scotch-grown and own-saved seed planted in the trial, gave in each case a superb crop of fine ware tubers.

New English Beauty, of the Ashleaf type, gave a remarkable crop of tubers, though not large.

First Crop and Lady Llewelyn very closely resembled each other from seed.

The committee desire to tender to Mr. Foster their sincere thanks for his admirable conduct of the trial and finding ground and requisite labour.

ALEXANDER DEAN,
(Chairman of the Committee).

Lobelia tenuior.—This lobelia, with which we have been made familiar of late years, forms a delightful summer feature in the greenhouse, either grown in pots or in suspended baskets. The comparatively large size of the blossoms, and their charming cobalt blue colour, gains the admiration of everyone. Flowers of other tints are to be met with among this lobelia, but I much prefer that just named.—W. T.

Phlox Frau Von Lassberg.—Of all white-flowering phloxes of the decussata type, none are superior to this. I have grown most of the leading white varieties, as, for example, Mrs. Jenkyns, Amazone, Tapis Blanc, Fiancée, and Diadem, but I do not consider any of them to equal it. The plant grows to a height of 2ft., produces huge panicles of pure white blossoms, which are sufficiently wide apart for the individual blooms to stand clear of each other, although they measure 1¾ inches in diameter. The white is of the purest, and in every respect this phlox is highly meritorious. —E. MOLYNEUX.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

COOL HOUSE ORCHIDS.—With the moist, cool conditions prevailing outside recently the plants of odontoglossums have made good progress, and where repotting is necessary the plants will now require attention. There is always a possibility of the plants becoming unduly shrivelled when they are potted at a time when warm, dry conditions prevail outside. It is, therefore, somewhat risky to recommend the general potting of the cool house orchids until such time as more favourable outside conditions are to be anticipated. By this I do not mean to suggest that danger is to be feared from potting plants at unfavourable seasons of the year; when we consider that we have plants flowering in all periods, it must necessarily follow that they cannot all be in the most suitable condition for repotting purposes at one particular time. As I have pointed out in this column for many years past, the best time to repot the cool house orchids is at the season when they commence to produce new roots from the base of the developing growth or recently developed pseudo-bulbs, irrespective of what the season of the year may be; and I am sure that if this rule be followed there will be little difficulty in the plants becoming re-established without having been unduly distressed. The reason why the autumn months are recommended for a general repotting of the odontoglossums is because at that season the bulk of the plants have reached the stage of growth when they produce their new roots. When the potting is completed an excellent opportunity is provided for a general clean down of the roofs (inside and out), stagings, pots, etc.

TOP-DRESSING.—I do not make it a practice to so-call top-dress our odontoglossums. If a plant wants attention at all I prefer to repot, and as the labour required for repotting orchids cannot be compared with the repotting of other plants, I think we cannot begrudge attention to odontoglossums once a year. It is more satisfactory to those in charge to have a good idea of the condition of the potting material. If top-dressing is practised it is not always an easy matter to determine the state of the old material when there is a thin layer of chopped sphagnum or other material on the surface. The watering of odontoglossums is undoubtedly one of the chief points in successful culture, even under the most favourable conditions, and should be sufficient in itself to emphasise the fact that nothing should be permitted to remain about the roots of the plants that may have a tendency to become misleading.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

ZONAL PELARGONIUMS.—The pots containing plants for autumn flowering should be well filled with roots, and if this be the case frequent waterings with liquid manure are necessary. By the end of September the plants should be placed in a warm airy greenhouse with a southern aspect, in order that they may receive all the sunlight available during the dull days in winter.

BEGONIAS.—The earliest batch of these will now be passing out of bloom, and water should be gradually withheld from their roots. They should be placed on a light airy shelf, so as to ensure the ripening of the tubers. When the shoots have died down they should be removed, and the pots placed on their sides in a structure in which the temperature will not fall below 45 deg. Any dry place is suitable for them, and the tubers must be kept perfectly dry all through the winter.

FUCHSIAS TRAINED TO RAFTERS.—These plants are not seen to better advantage than when growing trained to the rafters of a greenhouse or a conservatory. Cuttings for raising plants for this purpose should be rooted forthwith, and be kept growing all through the winter. They must not have their leading shoots removed, but all side growths should be taken away as they appear. This suppression of the side growths must be continued until the plants have reached the lower part of the rafters, and after this stage is reached side growth should be encouraged.

HUMEA ELEGANS. — Sow seeds of this elegant subject in gentle heat, and as soon as the seedlings make their appearance above the surface remove to an unheated frame, and place the pots close to the glass, and shade from bright sunshine. The soil should be moistened by a light watering before the seeds are sown, and these latter be covered lightly with finely-sifted soil. Immediately the seedlings are large enough to handle, pot them off singly, using three-inch pots. An excellent compost is one consisting of good loam, leaf-mould, and sand, adding a little manure from a spent mushroom bed.

CALCEOLARIAS.—Prick off seedlings as soon as they can be handled, in pots filled with equal quantities of sifted loam and leaf-soil, adding plenty of silver sand to keep the compost open. Press the soil firmly, and take care not to bruise the tiny plants. Afterwards place them in a frame or pit, where they may have plenty of light and free ventilation.

CALLAS OR RICHARDIAS. — These will now be commencing to grow freely, those planted outside will be ready for lifting and potting, using good loam, leaf-soil, and sand with some soot and ground bones added. When doing this it is advisable to pot rather firmly. To increase the stock, this is the best time, as large plants can be pulled to pieces and every crown potted. These plants should, after they have been potted up—six-inch pots being the most useful—be placed in a shady position out of doors till new roots are pushing freely into the new soil. A spraying overhead twice daily will be beneficial.

LILIUMS. — Directly bulbs are received from the nurseryman they should be potted, as there is a risk of them deteriorating if they are kept out of the soil for any great length of time. To obtain flowers of Lilium Harrisi at Christmas potting early in autumn is imperative. The bulbs should be placed low down in the pots to provide ample space for future top-dressings. Plunge the pots out of doors in cocoanut-fibre or ashes, where the later varieties may remain till spring.—W. Staward, Belford Hall Gardens.

THE FLOWER GARDEN.

HERBACEOUS BORDERS are yet gay with Japanese anemones, phloxes, achilleas, gladiolus, asters, and other late summer-flowering plants, but the gayest part of the season is now a thing of the past, many of the earlier flowering subjects now have a decidedly seedy appearance, and, although a cared-for appearance in the borders at this season of the year is desirable, yet too much trimming up must not be indulged in for a while. The hasty removal of half-ripened stems or foliage have a decidedly weakening effect upon the maturation of the crowns. It is far better to endure a little untidiness for a while than, by a reckless use of the pruning knife or shears, to destroy the prospects of another year. The careful tying up or bringing within bounds any straggling growths, will aid in keeping things presentable until a general clean up takes place.

NEW BORDERS.—In the making of new borders, the general condition of the natural soil and sub-soil will largely determine the amount of preparation needed, and, although it may seem somewhat early in the season to speak of this kind of work being done, it is wiser to have matters well in hand before the season is far advanced. On heavy clay soils the addition of road grit, coarse sand, charred vegetable refuse, or anything of a kindred nature, will greatly aid in the general improvement of the soil. Unfortunately, on many soils trenching cannot be done, but where this is possible it should certainly be carried out, forking in plenty of the above-mentioned ingredients, with the addition of well-decayed manure. Heavy applications of the latter, however, need not be made, unless the soil is in a worn-out condition. Planting may be carried out either in the spring or autumn, preferably the latter, unless the locality is exceptionally cold or wet during the winter months, or protection can be given, in any case, by planting the hardiest kinds early in the autumn months, these have an opportunity of becoming semi-established before severe weather sets in.

GARDEN PINKS. — Although considered out of date by some persons, garden pinks are, by others, valued on account of their fragrance, and rightly so. Clumps, or edgings, formed of these, ought now to be examined. Plants that have been left undisturbed for three or four seasons will need trimming or dividing; in most instances a careful division of the old plants and the transplanting of the best pieces, with roots attached, will suffice, especially on sandy soils, but the best way is to propagate by cuttings early in the season; these make strong, serviceable plants by the autumn.

DAHLIAS and other tall-growing plants must be kept securely tied to stakes, or be given other means of support, and plants of all descriptions that are seeding freely should have the pods or vessels removed, or the flowering period of the plant will soon terminate. Sweet peas showing signs of exhaustion should receive help in the way of frequent waterings of liquid manure, or the washing into the soil of an approved artificial fertiliser. The flowering season of the plants from the earlier sowings are over in most gardens, but the flowering period of the later, or mid-season batches, might be considerably extended by carefully following out the above treatment.—W. Hedley Warren, Aston Clinton Gardens.

HARDY FRUITS.

THE FRUIT ROOM. — In a few weeks hence large quantities of many varieties of apples and pears will require to be carefully gathered, and stored in the fruit room. If not already done, preparations should at once be made to thoroughly cleanse the walls and shelves. All the wood work should be well washed over with hot soapy water, and the ceiling and walls should receive a good coat of lime-wash. Afterwards admit air freely by opening wide the door and windows, to dry and sweeten the place prior to any fruit being placed upon the shelves. On no account should hay or straw be placed on the shelves under the fruit; this is a common practice in many places, and one that should be heartily condemned. The best method to adopt is to place the apples and pears on the bare wood, which must necessarily be thoroughly clean, and, where space permits, the fruits should be placed in a single or double layer on the shelves. Where possible, the fruit room should be constructed on the ground floor, with adequate means for plenty of ventilation when required, and also necessary precautions must be taken not to allow frost to actually penetrate inside the walls. The maximum temperature for a fruit room should not exceed 50 to 55 deg. Fahr., and the minimum 40deg. Fahr.

WALL TREES.—Carefully turn aside the leaves that shade the peaches and nectarines, so that they may be exposed to the direct rays of the sun. Continue to tie in, and train the current season's growths, and carefully examine all the ties, removing those which have been tied too tightly. Special attention must be paid to the main branches, as at this season of the year they swell away very freely, and serious damage may be caused if the ligatures are allowed to grow into the bark. Apple and pear trees on walls will still require the removal of secondary growths, and the fruit allowed to obtain as much sun as possible. Examine the soil in borders under walls, and maintain a proper degree of moisture to the roots by the application of clean water or liquid manure. Strict attention must be paid to the gathering of all fruit when ripe. Keep a sharp look-out for ants and woodlice, or many fruits will be completely spoiled. Owing to the showery weather we have experienced here, snails have been troublesome to the fruits of nectarines growing on walls, which has necessitated the careful examination of the trees late at night with a lantern, when these depredators have been caught and destroyed.

RASPBERRIES AND LOGANBERRIES.—The old fruiting canes should be cut away, and the young growths thinned out by pulling them up. The side growths of loganberries will require to be severely thinned by cutting them back to within four or five leaves. The current season's growth will be greatly benefited by the frequent application of liquid farmyard manure to the roots. Keep the surface soil free from weeds, using the Dutch hoe freely in and around the plants.—Henry R. Farmer, Cardiff Castle Gardens.

Begonia Corbeille de Feu. — This begonia, sent out some years ago by M. Lemoine, of Nancy, is a decidedly valuable variety, both for bedding purposes and for the decoration of the greenhouse or conservatory throughout the greater part of the year. It is a hybrid between B. fuchsioides and B. semperflorens, and forms a freely-branched bushy specimen clothed with shining green leaves. The flowers, borne in loose clusters, are of a bright coral-red colour.—W. T.

Mitraria coccinea.—Gesneraceous plants of a decidedly woody texture are very limited in number. Among them, however, must be included this mitraria, which is both interesting and highly ornamental. It is a native of the Island of Chiloe, off the mainland of Chili. Like most plants from that region, it succeeds best with a liberal amount of atmospheric moisture. Owing to this, it does particularly well in the South-West of England and in Ireland. It is of a semi-scandent character, and is well worth growing as a pillar plant in the greenhouse. The leaves are small, ovate, and deep green in colour, while the bright scarlet flowers are of an inflated tubular shape, and a little over an inch long.—W. T.

THE FOUR NORTHERN COUNTIES, FRUIT CONGRESS and SHOW, HEXHAM, 20-22 October, 1910. Particulars of space for Trade Exhibits from the General Secretary, Rev. J. BERNARD HALL, Hon. F.R.H.S., Dalston, Cumberland.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

Glasgow and West of Scotland.

TABLE OF FLORAL ARRANGEMENTS AT THE GLASGOW FLOWER SHOW.
Exhibited by Messrs. Smith and Simons, 36 and 38, West George Street, Glasgow.

This society held its annual flower show in the St. Andrew's Halls on August 31 and September 1. Our Northern friends are to be warmly congratulated on gathering together a really fine display of flowers, in spite of the extremely bad weather experienced throughout Scotland of late, and the whole show may be voted a distinct success. Florists' flowers were shown in great numbers; vegetables were a strong section, the table decorations and other examples of artistic floral work, added charm to the show, and there were also a number of fine trade exhibits. Mr. Hugh M. Mackie, C.A., proved himself the personification of courtesy, energy, and organising ability, and he was ably assisted by a band of genial and enthusiastic workers.

PLANTS.

Prizes were offered for a table of plants 8ft. by 4ft., Mr. Andrew Kelly, gardener to Wm. Beattie, Esq., Dineiddrig, Milngavie, securing leading honours. His table included blue hydrangeas, caladiums, coleus, and a few small crotons, with grasses, etc., to give lightness. Mr. Thos. Muir, gardener to T. Macdonald, Esq., Beechwood, Bearsdon, followed with crotons, alocasias, pandanus, etc., surmounted by a good palm. Lack of flowering plants was the weak point in this table, which was well arranged. For three palms the first prize was awarded Mr. J. Templeton, gardener to Mrs. Alex. Rose, Richmond House, Glasgow, and for one specimen palm the same exhibitor scored with a splendid Kentia; Mr. A. D. Hughes, gardener to J. R. Cochrane, Esq., Calder Glen, Blantyre, taking second. Mr. David Allen, gardener to John Tennent, Esq., Bredenhill, Bothwell, had the best three house plants, showing Acalypha Sanderiana, Yucca variegata, and Clerodendron fallax; Mr. A. D. Hughes, Calder Glen, Blantyre, came second with Pancratium excelsum, Oncidium flexuosum, and a croton; Mr. J. Templeton, third.

CUT FLOWERS.

Hardy perennials made a brave display, the competition being keen. For a bank of flowers, cut from the open, and occupying 8ft. by 4ft., Mr. Jas. Muir, gardener to Mrs. T. H. Walker, Crosbie Tower, Troon, was accounted winner among five competitors. He had bright montbretias, fine lilies, and gladioli, and some good early chrysanthemums; roses, and carnations were also included. Mr. Robert McLelland, gardener to Alex. Murray, Esq., Duncryne-by-Alexandria, was a good second, but there was a mixing of subjects in the vases that is quite different from what is generally seen at Southern shows. In one vase we counted as many as ten distinct species. Mr. James Miller, gardener to W. C. S. Stuart, Esq., Castlewalk, Rutherglen, took third place. Mr. John Smellie, Pansy Gardens, Busby, won for twenty-four show and fancy dahlias, staging large even flowers of good old favourites. Messrs. M. Campbell and Sons, High Blantyre, took second, and Mr. Wm. McLaughlin, Kirn, third. In the class for twelve blooms, Mr. Wm. Jenkins, Lightburn, Cambuslang, scored with a very nice stand, his follower being Mr. P. Cannon, gardener to Jas. Ferguson, Esq., Ardfillayne, Dunoon. Cactus dahlias were shown in vases of six blooms each, the best nine vases being put up by Mr. Smellie, of Busby, whose flowers were of good size and beautifully built. Mr. J. Paul, Drumbeg, Killearn, took second, and Messrs. Campbell and Son third.

Messrs. Geo. Mair and Son, Prestwick, staged twenty-four spikes of gladioli that would be very hard to beat. Some of the spikes carried a dozen huge blossoms, and the varieties were of the choicest. Unfortunately, the stand on which they were shown did not admit of each spike being brought into full view. Nobody competed against Messrs. Mair, but the first prize was worthily awarded. Mr. Alexander Ollar, Kilkerraw Floral Gardens, Campbeltown, scored for twelve sprays of violas, the flowers being about as good as we have seen this season. Every variety was a gem, and size and substance was remarkable. Mr. A. Brown, Baronhill, Blantyre, second. Six vases of montbretias were staged by Mr. J. Muir, Crosbie Tower, Troon, which won first prize.

ROSES

were well shown for the time of year, the winning thirty-six blooms being staged by Messrs. J. Cocker and Sons, Aberdeen; Lyon, Horace Vernet, Mme. M. Soupert, Marchioness of Londonderry, and C. J. Grahame were among the best blooms. Mr. W. Ferguson, Brucefield, Dunfermline, were placed second, and Mr. Hugh Dickson, Belfast, third. Mr. H. Dickson scored in the class for twenty-four, Marquise de Sinety, Pharisaer, and Countess of Caledon being well shown. In the amateurs' and gardeners' class, Mr. Peter Kenyon, gardener to J. O. M. Clark, Esq., Southbar, Troon, had the best dozen blooms, the second going to Mr. J. Kerr, Westmount, Stewarton.

Great enthusiasm prevailed among the gathering of florists, whose attention was riveted on the pansies, violas, and carnations, which are always a great feature at Scottish shows. Mr. Alexander Ollar was first in the classes for twenty-four and twelve blooms for show and fancy pansies and violas. Mr. Jas. Nicol, Darnley, Mitchell, had some capital flowers in his twelve vases of carnations and picotees, with which he secured first honours; Messrs. Campbell and Son were the second prize winners. Mr. John Smellie won easily for twelve vases of early chrysanthemums, his blooms being finely grown, and the varieties good

Pompon dahlias were shown in large numbers, the exhibits filling a great length of tabling. Mr. Jas. Paul, Drumbeg, Killearn, was, after careful scrutiny, adjudged winner in the nine vase class, Mr. Smellie and Messrs. Campbell and Son following. Mr. Wm. Jenkins, Lightburn, Cambuslang, led for six vases, showing some very neat little flowers; Mr. P. Cannon, Ardfillayne, Dunoon, received second; and Mr. P. McCowan, gardener to A. Colville, Esq., Arngomery, Kippen, third. Sweet peas were a trifle weather-beaten, but there was evidence that, under more favourable conditions, we should have seen some grand flowers. Mr. Smellie led the way for twelve vases, the blooms being large, and borne on substantial stems; Mr. Paul, Killearn, was second; and in the six vase class Mr. Donald McMillan, gardener to John Wilson, Esq., Carbeth, Guthrie, Blanefield, was the leader.

EFFECTIVELY-ARRANGED GROUP OF PLANTS AT THE GLASGOW FLOWER SHOW.
Exhibited by Messrs. Austin and McAslan, 189, Mitchell Street, Glasgow.

FRUIT.

Grapes of more than ordinary quality were shown, although we have seen larger bunches at Scottish shows. For four bunches Mr. Jas. Dixon, gardener to A. Cameron Corbett, Esq., M.P., Rowallan, Kilmaurs, was awarded first prize, his Madresfield Court, Muscat Hamburgh, Muscat Alexandria, and Black Hamburgh being shapely bunches, well finished. Mr. D. Halliday, gardener to Miss J. H. Campbell, Rothesay, was a capital second. Mr. Jas. Muir, gardener to Mrs. T. H. Walker, Crosbie Tower, Troon, was placed third. Mr. John Finnie had two beautifully coloured bunches of White Muscats, for which first prize was awarded, and for two bunches Black Hamburgh. Mr. Hugh McSkimming, gardener to P. Maclellan, Esq., Auckenault, Helensburgh, took the lead in a class of fourteen capital entries. The second going to Mr. Donald McKerrache, gardener to J. B Montgomery Fleming, Esq., Kelvinside, Glasgow; and third to Mr. J. Pinnie, gardener to A. R. Brown, Esq., Summershill, Shandon.

Three collections of twelve dishes of fruit were staged, the successful exhibitor being Mr. Jas. Brown, gardener to A. A. Speirs, Esq., Houston. Peaches and nectarines were fine, and good grapes backed up the dishes. Mr. Robt. Greenlaw, gardener to H. D. Younger, Esq., Beumores, Kilnum, was second, and Mr. Finlay Macrae, gardener to J. A. Clyde, Esq., Limbank, Fossoway, Kinross, third. Mr. John Finnie led for six dishes with splendid grapes, melon, nectarines, and peaches. The single dish classes were filled well, and the quality of the fruit almost substantiated a remark we heard that weather and season had no hand in the productions of Scottish gardeners.

VEGETABLES.

To do justice to the vegetables which occupied a large hall to themselves would require treble the space we are able to give, for from the principal collections down to the pots of parsley, everything was of very high quality. Mr. Jas. Brown, of Houston, won for a collection of thirteen varieties, there being six entries in the class. The leeks and celery were remarkable, onions, cauliflowers, peas, beans, and, indeed, all thirteen dishes were good. Mr. Wm. B. Bell was a worthy second, his parsnips and onions being especially good.

NON-COMPETITIVE EXHIBITS.

Messrs. Sutton and Sons, Reading, made a bright and attractive display of choice vegetables, melons, and cut flowers, including choice single and double asters, pentstemons, Agapanthus umbellatus, and groups of begonias, gloxinias, gesneras, and celosias in pots. The produce was of high quality, and the tasteful arrangement of the exhibit was most pleasing. The whole front of the orchestra in the larger hall was occupied by Messrs. Austin and McAslan, Mitchell Street, Glasgow, who arranged an effective group of flowering and foliage plants.

A table of skilfully devised floral designs was exhibited by Messrs. Smith and Simons, West George Street, Glasgow. A vase constructed of scarlet pelargoniums and filled with white chrysanthemums, a butterfly in antirrhinums, were supplemented by ladies' muffs, hats, and some choice bouquets. Messrs. Blackmore and Langdon, Twerton Hill Nurseries, Bath, showed a lovely lot of cut blooms of double and single begonias,

Messrs. E. Webb and Sons, Wordsley, Stourbridge, staged an extensive and meritorious exhibit of vegetables, the stand being beautifully decorated with cut flowers, among which lilies, carnations, and sweet peas were prominent; a quantity of large, well-grown melons were another feature of this exhibit. Messrs. Dobbie and Co., Edinburgh, put up a nice lot of early-flowering chrysanthemums. A grand exhibit of roses came from Messrs. J. Cocker and Sons, Aberdeen, Lyon making a bold central column. The Alpha Extinguisher, Lim., brought their excellent spraying machines, and evidently the northern gardeners were much interested in the various patterns and attachments shown.

GOLD MEDAL.

Messrs. Austin and McAslan, Glasgow, for group of flowering and foliage plants; Messrs. Smith and Simons, Glasgow, for floral designs; Messrs. Sutton and Sons, for display of melons, vegetables, and floral decorations; Messrs. E. Webb and Sons, for melons, vegetables, and flowers; Messrs. Malcolm Campbell, Lim., for miscellaneous collection of plants and flowers.

All parts are numbered ready for easy re-erection by any handy man.

Dundee Horticultural Society.

AUGUST 25, 26, and 27.

Never did Magdalen Green, on which this society's annual exhibition was held, show a prettier sight than on the above dates. The display was quite up to the average, and in the competition for prizes for groups of plants for the Dundee Corporation Cup, and in the classes for fruit and vegetables, a distinct advance must be recorded.

PLANTS.

There was a spirited contest for the Dundee Corporation handsome challenge cup for groups of plants. The groups from Mr. James Beats, gardener, Binrock, and Mr. James Bethel, gardener, Grange, Monifieth, were very close in point of merit, and after considerable deliberation, the judges awarded the cup to Mr. Beats, his collection being very effectively arranged, lightness and airiness, and a beautiful blending of colours, being prominent features. The collection shown from the Grange gardens included some exquisitely-grown specimens. Overcrowding, however, and a little weakness in arrangement were Mr. Bethel's undoing. Nevertheless, both groups were magnificent, and both exhibitors may be highly complimented on their handiwork. For six stove or greenhouse plants, distinct, three foliage and three in flower, Mr. James Kinnear, gardener, Fernbrae, was a capital first with very fine and well-grown specimens. Mr. George Reid, Invertay, won finely in the class for the best table of stove and greenhouse plants, arranged for effect. His entry included some finely-coloured crotons, set off with ornamental asparagus. Ferns were very attractive, and Mr. Reid, Invertay, had a very fine collection. Mr. Beats had also some fine maidenhair ferns, which worthily won first place. Begonias, liliums, crotons, and dracænas were all finely shown, the leaders in the respective classes being Mr. George Scott, Seathwood; Mr. Beats, Mr. James Kinnear, and Mr. R. B. Saunders, Lismore, Broughty Ferry. Pelargoniums made a good display, and here Mr. George Scott had matters pretty much his own way with excellent specimens. For Lilium auratum and three coleus, Mr. Beats again scored. The other leading winners, of whom mention should be made, included Mr. Thomas C. Brown, Balcairn; Mr. William Grieve, Hazelwood; Mr. Robert Birse, Carmichael Street, Dundee; Mr. James Bethel, The Grange; and Mr. Birse.

CUT FLOWERS.

The display of cut flowers was a specially fine one. Mr. James Beats led in the class for a collection of cut flowers in vases. His arrangement—a very prominent feature in this gardener's qualifications — was very artistic, including as it did some splendid carnations, dahlias, and liliums. Mr. Scott, Seathwood, was not very far behind in this contest. As elsewhere in Scotland, the display of sweet peas was a fine one. Here Mr. Reid, Invertay, scored handsomely with a very fine entry. Mr. R. W. Saunders was first for twelve bunches of flowers of stove and greenhouse plants. They were really fine, and worthily deserved their place. Chrysanthemums were well shown, the premier honours being taken by Mr. Scott, Seathwood. Roses were also well staged, Mr. William Grieve, Hazelwood, West Ferry, leading in two classes, while Mr. David Keillor, Seabourne Gardens, Broughty Ferry, was first for tea or noisettes. Dahlias proved very attractive, Mr. Charles Shaw, Boquhan, Kippen, leading for cactus dahlias (decorative varieties excluded) and six varieties cactus dahlias in bunches; while Mr. John S. Summers, Ashcliff, Dundee, won for pompone dahlias. Carnations proved a very fine entry, chief honours going to Mr. David Halley, Roycroft, Broughty Ferry, and Mr. James Beisant, Castle Huntly. Begonias were well shown, Mr. H. Rutherford, Brechin, taking first place. Asters were good, as were also annuals and herbaceous flowers, the leaders being Mr. W. Cook, Duncraig; Mr. Scott, Seathwood; and Mr. George Reid, Invertay.

FRUIT AND VEGETABLES.

Visitors invariably find the tent devoted to these sections very attractive, but it was especially so this year, the entries being numerous and of excellent quality. Than the display of grapes, nothing finer has ever been seen at a Dundee Show. And it was made by a new-comer, Mr. James Dixon, gardener to Mr. A. Cameron Corbett, M.P., Rowallan, Ayrshire. Mr. Dixon took in all five first prizes in this section. In the section for six bunches of not less than four varieties, he gained 48 points out of 55, and again for four bunches he was awarded chief honours. Others who showed grapes well included Mr. Scott, Seathwood; Mr. Beats, Binrock; Mr. James Beisant, Castle Huntly; and Mr. James Kinnear, Fernbrae. Apples were an exceedingly large display, there being some twelve or fourteen different sections. Mention must be made of the fine fruit staged by Mr. Scott, Seathwood; Mr. R. Kirkwood, Pinegrove; Mr. W. Goodall, Errol; Mr. James Kinnear, Fernbrae; Mr. W. Black, The Croft, Errol; Mr. W. Harper, Tulliebelton, Perthshire; Mr. Harry Tait, Errol; Mr. W. Benvie, Errol; and Mr. Thomas Butchart, Braeknowe Lodge, Dundee, all of whom carried off premier honours. Melons were of high quality. Mr. Kinnear and Mr. John G. Clark, Elmslea Gardens, were among the prize-winners. For peaches, nectarines, and apricots, Mr. McGlyn, Helenslea; Mr. Beisant, and Mr. D. A. Miln, Linlathen, led the way. For collections of hardy fruits, the entries for which were very good, Mr. James Birrell, Braco Castle Gardens, was a capital first, and Mr. Scott, Seathwood, obtained premier honours for orchard house fruit. Plums were best shown by Mr. W. Nicoll, West Park Gardens, Dundee, and Mr. Wm. Benvie, Errol. Pears made a brave show, Mr. Simpson, Panmure Gardens; Mr. Benvie; and Mr. George Reid, Invertay, being the most successful exhibitors.

Vegetables were a really meritorious display, and reflected no little credit on the growers. Mr. Charles Shaw, a new competitor, and gardener to Mr. Stephen Mitchell, Boquhan, Kippen, proved a surprise in this section, his exhibit of twelve kinds of vegetables being of exceptional merit, and worthily gaining him leading place. Mr. Kinnear, Fernbrae, was a close second. For leeks, cauliflowers, and kidney beans, Mr. William Harper, Tulliebelton, scored.

Aberdeen Flower Show.

AUGUST 25, 26, and 27.

Amidst the most charming surroundings, the annual show of this society was held in the Duthie Public Park, Aberdeen. As a whole the display was one of the finest yet seen in Aberdeen, and was therefore remarkable for its excellence.

PLANTS.

These, although not quite so numerous as have been seen at Aberdeen, were a very meritorious display, all being well-grown. For the best specimen plant in flower, Mr. Alex. Brebner, gardener, Dalhebity, scored worthily with an exquisitely grown Disa grandiflora. Mr. J. Leggat, gardener, Balgownie House, was a good second, with a fine Statice profusa. Specimen foliage plants, if not numerous, were good. Mr. John Elder, gardener, Norwood, had a capital first and second here. Palms were a small entry, Mr. Elder and Mr. Douglas, gardener, Kepplestone House, sharing the honours. For best four ferns there was good competition. Mr. Alex. Brebner, Dalhebity had Adiantum cuneatum, A. Victoriæ, and A. gracillimum in splendid order. Zonal pelargoniums were not so good as last year, but those staged were very healthy and well-flowered. Mr. J. W. Brechin, gardener, Ardoe, Belhelvie, did capitally here. Show pelargoniums were somewhat poorly flowered, but the season is past for these flowers. All the same, Mr. Brechin's fine entry well earned him premier place. Begonias and petunias could only be characterised as fair, compared with what has been seen at this show in former years. Mr. J. D. Smith, Union Grove, and Mr. Brechin, Ardoe, shared the honours here. For the best six plants for dinner table decoration, Mr. John Petrie, gardener, Crathes Castle, had a really good set. For the second time, Mr. George Maitland, Woodside, gained the society's challenge silver cup for the best table of greenhouse plants.

CUT FLOWERS.

In this division lay unquestionably the finest features of the show. For twenty-four roses, H.P. and H.T., or either, named, distinct varieties, for which the chairman of the society gave a substantial prize, Mr. Douglas, Kepplestone House, had a splendid win. For twelve blooms—same conditions—Mr. Alex. Brebner, Dalhebity, gained the society's silver medal. Mr. John Elder, Norwood, gained a similar award for an exceptionally fine stand of tea or noisette roses. The season has not been particularly favourable for dahlias, being rather cold, but these who saw the fine specimens sent in by Mr. Brechin, Ardoe, would not have thought so. They were a very meritorious lot. Throughout this division Mr. Brechin exhibited well, taking leading honours for gladioli and asters. The latter were very good, and there was a numerous entry. Marigolds were large, but we have seen them much more distinctly marked. Mr. John Grieve, Woodside, who was first, well deserved the honours he obtained. The entries for best collection of twenty varieties cut flowers and fine foliage bedding plants, including annuals, on a space three feet by three feet, proved a delightful feature. Mr. Douglas, Kepplestone House, and Mr. William Scorgie, gardener, Springhill, divided the honours. The twelve cut trusses of zonal geraniums were a good feature. For these Mr. Brebner, Dalhebity, had things pretty much his own way. For the best six bunches of flowers of stove or greenhouse plants, Mr. Alex. Duncan, gardener, Rubislaw Den House, was a capital first. Orchids made a charming display, and included fine specimens of Miltonia spectabilis, Cattleya labiata, Cypripedium Lawrenceanum, and C. Veitchi. Pansies, both show and fancy, owing to the cool season which so admirably suits these flowers, made a fine display, and proved a source of much attraction. Mr. J. M. Dunn, Nellfield, and Mr. G. C. Minty, Hilton, worthily shared the honours here. The violas sent by Mr. James McLennan, gardener, Elden House, Banffshire, were also very fine. Sweet peas were undoubtedly the predominating feature in the cut marquee. Mr. John A. Grigor, gardener, Seapark, Forres, had really a magnificent entry, and well deserved his place. Bouquets, sprays, baskets of flowers, and button-holes formed a fine display, Mr. J. D. Smith, Union Grove; Mr. Alex. Cumming, Granite Hill; and Mr. Strachan, Aberdeen Botanic Gardens, sharing the principal honours.

FRUIT.

The display made here well sustained the reputation of the Aberdeen Society. Hardy fruits were highly meritorious, an outstanding feature being the fine collection of gooseberries. Langley Green, considered in the north one of the best dessert fruit, was prominent. For the best collection of hardy fruit, six dishes, not more than two dishes of any kind, Mr. John A. Grigor, Seapark, led the way. Strawberries were very good, Mr. John Selbie, Morken, taking first place. Cherries and raspberries were good, Mr. Petrie, Crathes Castle, leading the way. Gooseberries, as stated, were highly meritorious, Mr. George Taylor, Cults; Mr. Petrie, and Mr. H. B. Smith, Burdshaugh, Forres, taking the lead. Grapes were a specially fine entry, Mr. W. Campbell, gardener, Brahan Castle, Ross-shire, having capital wins in both white and black classes. Black Morocco, Alicante, and Muscat of Alexandria were chiefly shown. Melons, peaches, nectarines, apples, pears, plums, and tomatoes were finely shown, the leading exhibitors being Mr. Scorgie, Springhill; Mr. Campbell, Brahan Castle; Mr. Leggat, Balgownie House; Mr. H. B. Smith, Burdshaugh.

MARKET GARDENERS.

The displays made by the market gardeners of fruit and vegetables were exceedingly good. For the best collection of hardy fruits, Mr. John Kinnaird, Burnieboozle, took first place with a very meritorious entry. Mr. William Ellis, Raeden Gardens, Aberdeen, carried off the premier honours for best collection of vegetables, comprising nine varieties.

NURSERYMEN AND FLORISTS.

Leading the way in this section were the Messrs. Cocker, Aberdeen. They were first for thirty-six, which included Frau Karl Druschki, Lyon Rose, and Madame Ravary, Hugh Dickson, Caroline Testout, and Madame Abel Chatenay. Messrs. Adam and Craigmile, Rubislaw Nurseries, were first for twenty-four tea or noisettes with a greatly admired entry. There was some exquisite floral work shown in this section, chief honours going to Mr. Alex. Burns, jun., New Market, Aberdeen, and his daughter, Miss Alice Burns.

NON-COMPETITIVE CONTRIBUTIONS.

These were numerous and of much merit, and contributed materially to the interest and attractions of the exhibition. Roses, carnations, dahlias, begonias, hardy flowers, and floral decorations were particularly noteworthy, and did much credit to the skill of the exhibitors.

Oxford.

AUGUST 23.

Unfavourable weather attended the holding of the eighty-first late summer show of the Royal Oxfordshire Horticultural Society, convened, as on many previous occasions, in the spacious leafy shades of Worcester College Gardens, which possess lawns of the richest green and softest velvet grass shadowed by ancient trees — a sweet, quiet, sacred, stately seclusion.

The College occupies a site upon which, since the early part of the twelfth century till 1714, was the home of an order of Benedictine monks. The gardens lie west of the buildings, and at the west end a semicircular lake adds a charm to the place. Among the trees are giant chestnuts, walnuts, and ailanthus, a fine copper beech and other ornamental trees fill up intervals; and some time since an ancient mulberry was blown down which was known to have been standing 250 years.

The flower show was one of the largest the society has had in August, there being fully 130 exhibits of plants and blooms, and nearly 500 separate exhibits of fruit and vegetables; of the latter section Oxford County can hold its own. To aid the display, Mr. J. S. Chidlow, gardener to Mrs. H. Morrell, Headington Hill Hall, arranged a very fine group of flowering and foliage plants, covering fully an area of 350 square feet. The design had a central pyramidal mound crowned by a wide-spreading palm (Kentia Belmoreana), some eight lesser mounds with two dozen hillocks filling up the design. Seven varieties of crotons were used as dot plants, and richly-coloured acalyphas, liliums, etc., were utilised; the groundwork being ferns in variety, a very fine batch of cockscombs, and streptocarpus, with numerous examples of the Belvedere cypress (Kochia) and Acalypha Sanderiana. A gold medal was awarded. A large artistically arranged display of flowers and vegetables, covering nearly 100 square feet space, was exhibited by Messrs. E. Webb and Sons, Stourbridge. In the arrangement there were eleven varieties of melons, and about eighty vases of sweet peas, seedling carnations, Bermuda lilies, gladioli, and other flowers, relieved by cucumbers, tomatoes, and melons sent out by the firm. A back line of yellow and crimson celosias and Hydrangea paniculata grandiflora proved a foil to the three-tier stage. A gold medal was deservedly awarded. A silver medal was awarded to Mr. John Mattock, New Headington, for a most effective display of roses on fifty feet space; and a bronze medal fell to Messrs. R. Tucker and Sons, George Street, Oxford, and Brookside Nursery, Headington Hill.

In the competition the British ferns of Mr. H. Mount, superintendent of the University Parks, and Mr. W. F. Cross, Chilswell, Iffley Road, Oxford, were equal to anything exhibited in the provinces. Mr. Cross had a premier for a very finely grown specimen of Fuchsia Ladd's Double, coral red with white corolla; he also was premier in the class for a foliage plant with a tall specimen of Yucca aloifolia. Specimen plants were few, but the fuchsias, statice, etc., were fairly good. There were no zonal pelargoniums in the first division, the best four in the amateur section were double forms. Exotic ferns were fair; and the groups of begonias made a bright display of colour, Messrs. West and Sons, Oxford Market and Headington, leading.

Cut flowers were plentiful; Mr. John Johnson, Garsington Nursery, secured the champion award for a fine collection of herbaceous perennials, staging about six dozen varieties; Mr. John Walker, Thame, led in the classes for asters, gladioli, zinnias, splendid forms, and the three classes for dahlias. His cactus varieties were in triplets, and among others were Aviator, Prima Donna, Indomitable, Jupiter, Red Admiral, Iolanthe, Mrs. A. Dyer, Mrs. F. Grinstead, Ruby Grinstead, Snowstown, and Mrs. B. Brousson; the show and fancy collection included perfect, well-balanced forms of Mrs. C. Noyes, light fawn; Hero (self), lilac; Dr. Keynes, buff; H. Keith, rosy purple; W. Girdlestone, yellow; Blush Gem, rose; Mabel, lilac; The Reverend, buff; John Walker, white; J. T. West, yellow; J. Hickling, yellow; Duchess of Albany, orange; R. Dean, purple; Mrs. Saunders, golden yellow; J. Bennett, yellow; Golden Gem, deep yellow; Rev. Gooday, maroon; Lord Salisbury, fawn; S. Mortimer, pink flaked; R. T. Rawlings, yellow; Hero, striped purple; Mr. Glascock, purple; and Tom Jones, cream edged purple. Pompons were a very fine show set up in triplets. Roses were good full-sized blooms for late in the season. Mr. J. Mattock led for eighteen, his stand having four or five newish introductions; Mr. W. T. Mattock was placed second for a charming lot of blooms, he also put up three dozen as an extra, which secured an award of merit.

Fruit was an average display, although the classes for grapes did not attract much competition. Mr. S. Brown, Aynho Park Gardens, led for white and black (Hamburgh excluded), peaches, and nectarines. All the prizes went to white-flesh melons. The premier peaches were Dymond; the nectarines, Pineapple; dessert plums, were Kirke's and Victoria; the heaviest culinary being Pond's Seedling. Lady Sudeley and Beauty of Bath apples found favour as dessert kinds, the heaviest cooking apples being Peasgood's Nonsuch.

Vegetables proved a very extensive section and of excellent quality; the onions, tomatoes, celery, beet, carrots, and peas leaving nothing to be desired. The Gladstone pea secured the prizes all through, and the runner beans were fully up to the Oxford standard—thirteen inches long, and ten beans in a pod. Ailsa Craig was the heaviest of the onions, but there was some large bulbs of Walker's Exhibition. The collections of twelve kinds were fair tests of skill. Messrs. R. Wadham, gardener to Mrs. Bradshaw, Steeple Aston, and J. Holton, gardener to Rev. the Provost of Worcester, ran very close for first place; Mr. Holton, however, proved the champion for four dishes of potatoes. One special feature on this occasion was the addition of thirteen classes of vegetables, "open to any member of a horticultural or an allotment association," resulting in nearly 140 exhibits of really fine produce.

Horticultural Trades' Association.

ANNUAL MEETING.

The gathering which took place in London on August 22 and three following days was one of the most successful, and the most numerously attended of the series. Nearly a hundred nurserymen and seedsmen from all parts of Great Britain were present, several journeying from Scotland in order to take place in the proceedings. The excursion on the 23rd was to Woking and Wisley. Woking is well known as a centre of the nursery industry, the soil and climate being especially suited to the culture of conifers and other shrubs and trees. Messrs. Jackman and Sons, and Mr. Charles Slocock, who kindly entertained the party at lunch and tea, have between them some 500 acres under nursery, and the time was all too short to allow of thorough inspection of the immense stocks of all kinds of shrubs, trees, roses, etc., contained. The visit to Wisley was also much enjoyed, and great interest taken in the trials being carried on. The second day was purely a pleasure one, some 90 members joining in a trip up the Thames, landing at Cliveden for lunch (permission having been kindly given by Mr. Astor), and spending the afternoon amid the glorious scenery there. Some of the more energetic of the members crossed over to Dropmore and inspected the famous collection of conifers, and felt abundantly rewarded for their walk.

The evenings were taken up by the election of officers for the ensuing year, and the discussion of matters of trade interest, such as land taxation and valuation, gooseberry mildew, etc., etc. Mr. Peter Veitch (the head of the Exeter firm) was elected president for the coming year.

NATIONAL HARDY PLANT SOCIETY.

There are one or two points raised in your extremely interesting leading article on this new venture upon which I beg leave to make a few remarks. I entirely agree with your opinion that no new society should be formed unless a real and urgent need exists, but I am firmly of opinion—and the enthusiasm with which the proposal was received at Shrewsbury testifies that I am not alone in this—that there is a need (as real and urgent as has been felt prior to the formation of any existing and flourishing society) for a powerful organisation that shall look to the wide and important interests of hardy plants. The promoters of the scheme fully realise that difficulties will have to be met, but nothing can be achieved without effort, and although the society is not as yet fully established, I can assure you the chief points you raise have been under consideration. We who have had the matter in mind for several years are setting ourselves to the task with great hopes of making this new society justify its existence. To say definitely at this stage what shall be the range or limits of the society's operations would be premature. We have no desire to encroach upon the domains of other societies, but we do intend that the National Hardy Plant Society shall be worthy of its title.

The organisation of independent exhibitions, the maintenance of extensive trial grounds, may be developments of the future, but in the meantime we hope to effect improvements in the conditions under which hardy flowers are exhibited, to arrange new and interesting classes at existing flower shows, to deal with the nomenclature of garden varieties of plants that do not come within the sphere of Kew, and to disseminate information on practical and scientific matters relating to hardy plant culture. The measure of support obtained must govern the volume and value of the work accomplished, and it is hoped that all who are interested in hardy plant culture will give their support to the movement.

A. J. Macself.
Chairman of the Provisional Committee.

OBITUARY.

◆

MR. WILLIAM BOXALL, V.M.H.

We much regret to record the death of Mr. William Boxall, V.M.H., which occurred at his residence at Clapton on the 29th ult., in his sixty-sixth year. Mr. Boxall for a considerable period occupied a prominent position among plant collectors, and we owe to his enterprise many of the most beautiful of the occupants of our plant houses, among them being Cymbidium Lowianum and Dendrobium Wardianum. Mr. Boxall was throughout his career associated with Messrs. Hugh Low and Co., and was held in high respect.

THE GARDENER AND POULTRY KEEPERS GUIDE
THE GARDENER AND POULTRY KEEPERS GUIDE
THE GARDENER AND POULTRY KEEPERS GUIDE

The most Complete Work on Gardening and Poultry Keeping, Dogs, Rabbits, Pigeons, &c., ever written. No matter what you require to know about any one of these subjects, you will find the information in this book written in plain, non-technical language, there being 640 pages telling and illustrating everything on the above subjects. The result is

THE GREATEST BOOK EVER PUBLISHED ON GARDENING AND POULTRY KEEPING.

100,000 BOOKS TO BE DISTRIBUTED FREE.

From the opening to the last line it is interestingly written. The price of the Book is **2/6**, but the Author has decided to give away **100,000 Copies Free,** one to each applicant who writes for a copy.

COST OF PRODUCTION AND DISTRIBUTION OVER £7,500.

The distribution and production of this Book will cost over £7,500, but a Free Copy will be sent, post free, on receipt of 6d. in stamps (simply for postage and package). As the distribution of every one of these books is an initial loss to the Author, he asks that each recipient, after reading it, if having no further use for same, will favour him by kindly lending it or giving it for perusal to some friend or relative interested in the above-mentioned matters.

☛ SEND FOR YOUR COPY TO-DAY. ☚

WHAT YOU WILL RECEIVE.

Send 6d. in Stamps, and you will receive Post Free by return, the New Book for Gardeners and Poultry Keepers consisting of 640 pages, Fully Illustrated and Bound in Cloth. A Help, Guide, and a Necessity to every Amateur.

Address: WILLIAM COOPER (Book Department),
761, Old Kent Road, London, S.E.

The Gardener & his Family must have Dry, Comfortable, Easy Going BOOTS.

THE Gardener in whatever capacity must have foot comfort, the first necessity of an active mind and body. If the feet are wrong then all's wrong. We recommend our special footwear to old and young for outdoor wear.

The Stout Chrome Calf Greenhouse wear **11/9** | The Nailed Gardener Boot **10/6**

We make special quality Boots for the whole family. Write for free illustrated price list No. 14 and select what you fancy. We know you'll come again and again.

ANSWERS TO CORRESPONDENTS.

GARDEN STUDENTS. — Young Gardener: The Royal Gardens, Kew, and the Royal Horticultural Society's Gardens, Wisley, are both excellent establishments, and we suggest that you write to the Director of the Royal Gardens, Kew, and the Secretary of the R.H.S., Vincent Square, Westminster, S.W., for particulars as to the admission, etc., of students to the respective gardens.

POT ROSES. — T. T., Faversham: The varieties you mention are naturally of dwarf growth, and therefore cannot be grown into large specimens, as you suggest. If you really require varieties that will make good-sized bushes we suggest that you plant Baby Dorothy, and the other variety belonging to the same class, in the beds in the garden, and make a selection from the hybrid teas. If you decide to continue to grow the dwarf polyanthas in pots, your best course, as they are not in a very flourishing condition, will be to turn them out of the pots, remove the drainage, and as much of the soil as can be taken away without injury to the roots. Slightly shorten the long roots, and then repot, using clean pots of the same size as those in which they are now growing. The compost should consist of good turfy loam and well-rotted manure in the proportion of four to one. It is not advisable to use a large proportion of manure in the compost, and it is really not necessary, as the plants can be readily assisted during the season of growth with liquid manure or top-dressings of one of the many good artificial fertilisers now available. The pots must be efficiently drained, and the soil made firm with the aid of a potting stick. As they are potted place them on a bed of ashes outside, and syringe them overhead in the evening, when the weather is dry, for a fortnight or so after the repotting. Prune them rather hard back towards the end of November or early in December. Do not start them into growth until February is well advanced, for they have not the strength essential to success in early forcing.

PENTSTEMONS.—M. B., Lancashire: On your low-lying and comparatively cold soils, the best course will be to winter the seedlings you have raised in an unheated frame. We advise you make up a bed of light sandy soil in a one or two-light frame, according to the number of plants for which space is required, to a depth of ten or twelve inches. In a few weeks hence dibble the seedlings over the bed at a distance of about two and a-half inches apart each way. Well water them, and subsequently keep the soil moderately moist. The frame should be freely ventilated at all times, excepting in severe or wet weather, as it is essential the plants should not be coddled. Plant in beds and borders in April next.

BROWN SCALE ON PEACH TREES.—R. B.: It is evident that your peach trees are badly infested with the Brown Scale (Lecanium persicæ), and it is important you should make strenuous efforts to free the trees from the pest. Not only is this scale insect very injurious to the trees when present in large numbers, as in your case, but it impairs the appearance of the fruit. As the leaves as well as the shoots are infested, your first step will be to gather them up as they fall, and burn them, and thus destroy the insects located on them. When the trees are at rest, say, early in January, paint the whole of the branches and shoots with the Woburn Wash, which is the outcome of the investigation made by Mr. Spencer Pickering, F.R.S. This wash is prepared as follows: Soft soap, 2oz.; paraffin, 1¼ pints; caustic soda, ½lb.; and water, 9 quarts. The soft soap is first dissolved in the water, which may be either hot or cold; then pour in the paraffin, which must be well churned up with the syringe, and this having been done, shake in the caustic soda. Both the soap and the paraffin have a tendency to rise, and therefore the mixture must be kept well stirred when it is being used. Care must be taken to avoid injury to the buds, but the painting must be so thoroughly done that but few, if any, of the insects escape. It will be better to lose a considerable number of buds than to allow a sufficient number of the insects to escape and infest the trees during the following summer.

PLANTING BORDER CARNATIONS.—Amateur: For some long period there was a considerable difference of opinion as to whether carnations should be planted in beds and borders in September or in March, but now there is a general agreement among growers that, excepting where the soil is naturally heavy, the best results are obtained from autumn planting. On your soil it would unquestionably be advantageous to plant before the end of the present month. Rooted layers of both new and old varieties are available in the nurseries about the middle of the month, and we strongly advise you to buy the varieties you require as soon as layers are ready, and plant them with as little delay as possible.

MILDEW ON ONIONS.—S. W. F.: Your crop of onions has been damaged by an attack of mildew, which, happily, has not been severe. It is now, of course, too late to adopt repressive measures, but you can do something now to mitigate, if not prevent, attacks next year. As far as you can possibly do so, collect and burn all the onions that are seen to be diseased. If the diseased onions are allowed to remain in the bed and decay, there will, in all probability, be a recurrence of the disease next year. It is also important not to throw the infected bulbs on the manure heap, as when this is done, the spores of the fungus remain unchanged until the following season, and may be conveyed with the manure to other parts of the garden, and infect onions growing in the quarters to which the manure has been applied.

DECAYING MUSCAT GRAPES.—T. S., Yorkshire: It would appear from the number of specimens that have reached us of late that the decay of white grapes, as in the case of your Muscat of Alexandria, is quite common this season. The trouble has not arisen from what is known as shanking, as in that the stalks of the berries decay. We have closely examined the bunch, and cannot find one of the stalks injured. The decay at the base of the berries is due to the temperature being too low, and the ventilation insufficient. This form of decay is common in cool, dull seasons, but is practically unknown in summers in which the amount of bright sunshine and the temperature are equal to the average.

NAMES OF PLANTS.

Orchidist.—1, Miltonia spectabilis Moreliana; 2, Oncidium ampliatum majus.

W. H.—1, Nepenthes Wrigleyana; 2, Hookeriana elongata; 3, Pistia stratiotes.

Amateur Horticulturists. — The begonias are: 1, Weltoniensis; 2, Dregei; and 3, Corbeille de Feu.

F. H. S.—1, Rhus glabra lacinata; 2, Olearia Haasti; 3, Ligustrum japonicum macrophyllum; 4, specimen not sufficient for identification.

R. B. — We cannot undertake to name florists' flowers. The blooms sent are out of character, and many of them shed their petals in coming through the post.

FORTHCOMING ENGAGEMENTS.

TUESDAY, September 6.—Scottish Horticultural Association.

WEDNESDAY, September 7.—Royal Caledonian Horticultural Society's Autumn Show; two days.

National Hardy Plant Society meets at Edinburgh, 8 p.m.

THURSDAY, September 8.—National Dahlia Society's Exhibition at the Crystal Palace; two days.

MONDAY, September 12.—United Horticultural Benefit and Provident Society, Committee meeting.

TUESDAY, September 13.—Royal Horticultural Society; Committees meet at 12 o'clock; lecture at 3 p.m. on "Roses," by Mr. George Paul, jun.; Scientific Committee at 4 o'clock.

British Gardeners' Association, Council Meeting.

THURSDAY, September 15.—National Rose Society's Autumn Exhibition at the Royal Horticultural Hall.

Situations Wanted.

HER GRACE THE DUCHESS of DEVONSHIRE wishes to recommend J. THOMPSON to any Lady or Gentleman requiring the services of a HEAD GARDENER, where several are kept; 20 years' experience in all branches. Holker Gardens, Cark-in-Cartmel, Lancs.

H. WHATELEY, Esq., The Spring, Kenilworth, Warwickshire, recommends a GARDENER (Head); well experienced all kinds of Fruit, Plants under Glass, including Orchids, and Kitchen and Flower Gardens. For particulars apply above.

GARDENER (Head); life experience all branches, Inside and Out; Grapes, Peaches, Melons, Stove and Greenhouse Plants, Orchids, Malmaison and Tree Carnations, Landscape and Rock Garden; Vegetables and Hardy Fruit; nearly 8 years as head; age 35; excellent references. F. SMITH, 4, Mellish's Terrace, Morden, Surrey.

GARDENER (Head, where two or three are kept); highly recommended; would be pleased to forward particulars to any Lady or Gentleman. CLARK, 19, Tanfield Road, Birkby, Huddersfield.

GARDENER (Head); life experience in growing all kinds of fruit and plants, including orchids; also kitchen and flower garden; can be highly recommended. W. LAMBERT, The Common, Kenilworth, Warwickshire.

GARDENER (Head Working, where one or two more kept, or good Single-handed); experienced Inside and Out; good references, and recommended; age 27; married when suited. W. CROUCHER, 11, North Terrace, Hythe, Kent.

GARDENER (Head Working, where two or more are kept); thoroughly experienced; 7 and 12 years' good references as Head; age 45; active; 2 in family, youngest, lad, 15; disengaged. HUNT, 9a, Bridewell Street, Devizes.

GARDENER (Head Working).—Well up in all branches; excellent characters; 5 years' present situation; married; age 40. E. BEARDSLEY, The Finches, Ifield, Crawley, Sussex.

GARDENER (Head Working).—Mr. A. FYFE, Locksheath, near Southampton, wishes to highly recommend to any Lady or Gentleman a thorough practical Man as above, [illegible] experience all branches gained in first-class establishments; excellent references; five years Head; married; age 33.

GARDENER (Head Working); age 44; life experience; 21 years' excellent references from first-class establishments; thorough knowledge in all branches; prize winner; leaving own request; no young children; youngest 14. W. BLOOMFIELD, Staplehurst, Kent.

GARDENER (Head Working).—Mr. WATSON can highly recommend C. WALLIS, where two or three are kept; been here 5½ years as Second of five; age 30; married, one child. The Gardens, Bushey Down, Tooting Common.

GARDENER (Head Working); experienced in the Cultivation of Fruit, Plants, Flowers under Glass, Flower and Kitchen Garden, Forcing, etc.; also Hardy Fruit culture; good references; married, no family. W. S., 16, Warwick Place, Maidstone, Kent.

GARDENER (Head Working) seeks RE-ENGAGEMENT; can be highly recommended by Lord ABERDARE, whom the applicant has served for the last 16 years; life experience; age [illegible]; married, no family. MUSCOTT, Grosvenor Villa, Resolven, S. Wales.

GARDENER (Head Working where two or more are kept); life experience in all branches; age 42; 7 years in present place as head. STEVENS, 197, Blackstock Road, Finsbury Park, N.

GARDENER (Head Working or good Single-handed); life experience in all branches; good references from present and previous employers as to ability and trustworthiness; no family. GARDENER, 28, Martell Road West, Dulwich, S.E.

GARDENER (Head Working, where two or more are kept); good all-round; can be well recommended; married when suited; age [illegible]. PEARCE, Ridley, near Wrotham, Kent.

GARDENER (Head Working); good practical experience in all branches, Inside and Out; Early and Late Forcing; excellent references. H. TURNER, Regal Cottage, Kentford, Newmarket.

GENTLEMAN recommends GARDENER (Head of two or three); life experience in all branches, and [illegible] formation of new or renovating old gardens; married, one boy 10 years; age 45. PENNELLS, Phœnix Green, Winchfield, Hants.

W. H. PROPHET seeks SITUATION as HEAD WORKING GARDENER, where two or more are kept; Gold and Silver Medallist, National Sweet Pea Society, London, 1909 and 1910; over 20 years' experience; married; age 35; highest of references from present employer. Par, Cornwall.

MESSRS. ROWLAND, Wavertree Nurseries, Liverpool, can highly recommend first-class GARDENER (Head); many years' experience in growing Fruit and Plants under Glass, including Carnations, Kitchen and Flower Garden. For particulars apply above.

GARDENER (Working or Good Single-handed), Re-engagement wanted by middle-age, married Man, no family, with practical experience with Fruit, Flowers, and Vegetables, Inside and Out; 5½ years' good character from last place. J. B., 8, Mead Cottages, Mead Row, Farncombe, Surrey.

GARDENER (Single-handed or otherwise); experienced, Inside and Out; good references; age 27; married, one child; abstainer; gentleman's recommendations; disengaged. W. HOLNESS, Ripple Court, near Dover, Kent.

GARDENER (Single-handed or otherwise); good all-round man in all branches, or handy man on gentleman's estate; good at either; willing to be useful; sober and reliable; good character; age 45; married, one child. OSBORNE, 45, Bradshaw Road, Watford.

GARDENER (Single-handed) seeks SITUATION; 12 years' good experience; good reference. Address A. DODD, 64, Northfield End, Henley-on-Thames.

GARDENER (Single-handed); married; age 27, seeks SITUATION; experienced Inside and Out; 5½ years' excellent reference last situation. Apply W. G. CONN, 7, Coombe Road, Sydenham.

GARDENER (Single-handed or with help); age 28; experienced Inside and Out; married when suited; good references. A. RAYFIELD, 130, Lavenham Road, Southfields, Surrey.

GARDENER (Second).—YOUNG MAN, age [illegible], seeks SITUATION; [illegible] years' experience Inside and Out; left through death; excellent references. G. DALMON, [illegible] Hill, Pulborough, Sussex.

JOURNEYMAN.—Inside or Inside and Out; experience in Stove and Greenhouse Plants; age 23; good references; well recommended; disengaged Sept. 10. Address T. J. MILLER, Higher [illegible].

MR. J. HILSON, Flixton Hall Gardens, Bungay, Suffolk, highly recommends F. W. Mason as JOURNEYMAN (Inside); age 21; 7 years' experience; good references; [illegible] years in present place. Apply as above.

YOUTH seeks SITUATION as IMPROVER, Inside or Inside and Out; age 18; 3½ years' experience; Bothy preferred. Apply ALFRED POND, Hemingford Abbots, St. Ives, Hunts.

YOUNG MAN, aged 21, as IMPROVER in Nursery; Inside or Out; near or in Portsmouth preferred. C. H. LOADER, 162, Chichester Road, Portsmouth.

ESTATE JOINER requires SITUATION; can undertake to keep Property in thorough repair and to collect rents if required; best references. W. E. S., 18, Carrs Hill, Gateshead-on-Tyne.

A LAD age 16 seeks a SITUATION to Clean Knives and Boots, and help in Garden and make himself generally useful; good character. Apply W. NEW, Chewton, Mendip, near Bath.

MARRIED MAN seeks SITUATION; life experience in general gardening. G. ARNOLD, Hockley, Essex.

YOUNG MAN seeks SITUATION as Inside or Inside and Out; age 23; 6 years' good reference; bothy preferred. E. FARMER, Lambdens Farm, Beenham, near Reading.

Situations Vacant.

WANTED, GARDENER (Head Working), for old gardens and grounds on coast of Central Wales. State age, family, experience, and wages required. Apply 8,337, Office of this Paper.

WANTED.—FOREMAN for under glass, House and Table Decoration, Vines, Peaches, Melons, Chrysanthemums, Plants, etc. Wages £1 per week, Bothy and Vegetables, [illegible]. Apply Mr. PICKER, The Gardens, Hesslewood, Hull.

Messrs. WM. ARTINDALE & SON,

Nether Green Nursery, Sheffield.

THE FIRST AND ONLY PURE WHITE DELPHINIUM.

Two Startling Novelties.

THESE two new varieties, which are now offered for the first time. Both grow 5—6ft. high, and produce enormous flower stems with large flowers, and the branches, which are produced in enormous quantity at the base of the central spike, are longer than of any other variety, several measuring over 2½ft. This makes both these varieties the best for cutting purposes, as they flower from June till late in summer.

DELPHINIUM HYBR. MOERHEIMI, has large flowers of the purest white, and not the slightest shade of creamy, bluish or greenish, like the so called "white" Delphiniums, which have been introduced the last few years, and to which it cannot be compared. **It is doubtless the best hardy perennial introduced in the last ten years.** Award of Merit R.H.S. July, 1909. **10/6** each. (Only a limited quantity will be sold and orders are requested at once.)

DELPHINIUM HYBR. CAPRI, of quite the same growth as "Moerheimi," being a counterpiece of same it much resembles in colour to "Persimmon," but is in every respect an improvement of this variety; the flowers are larger and the spikes longer and of a more branching habit. We consider it as the **best sky blue single Delphinium** in commerce **10/6** each.

Our Catalogue of 200 pages will be posted free on application.

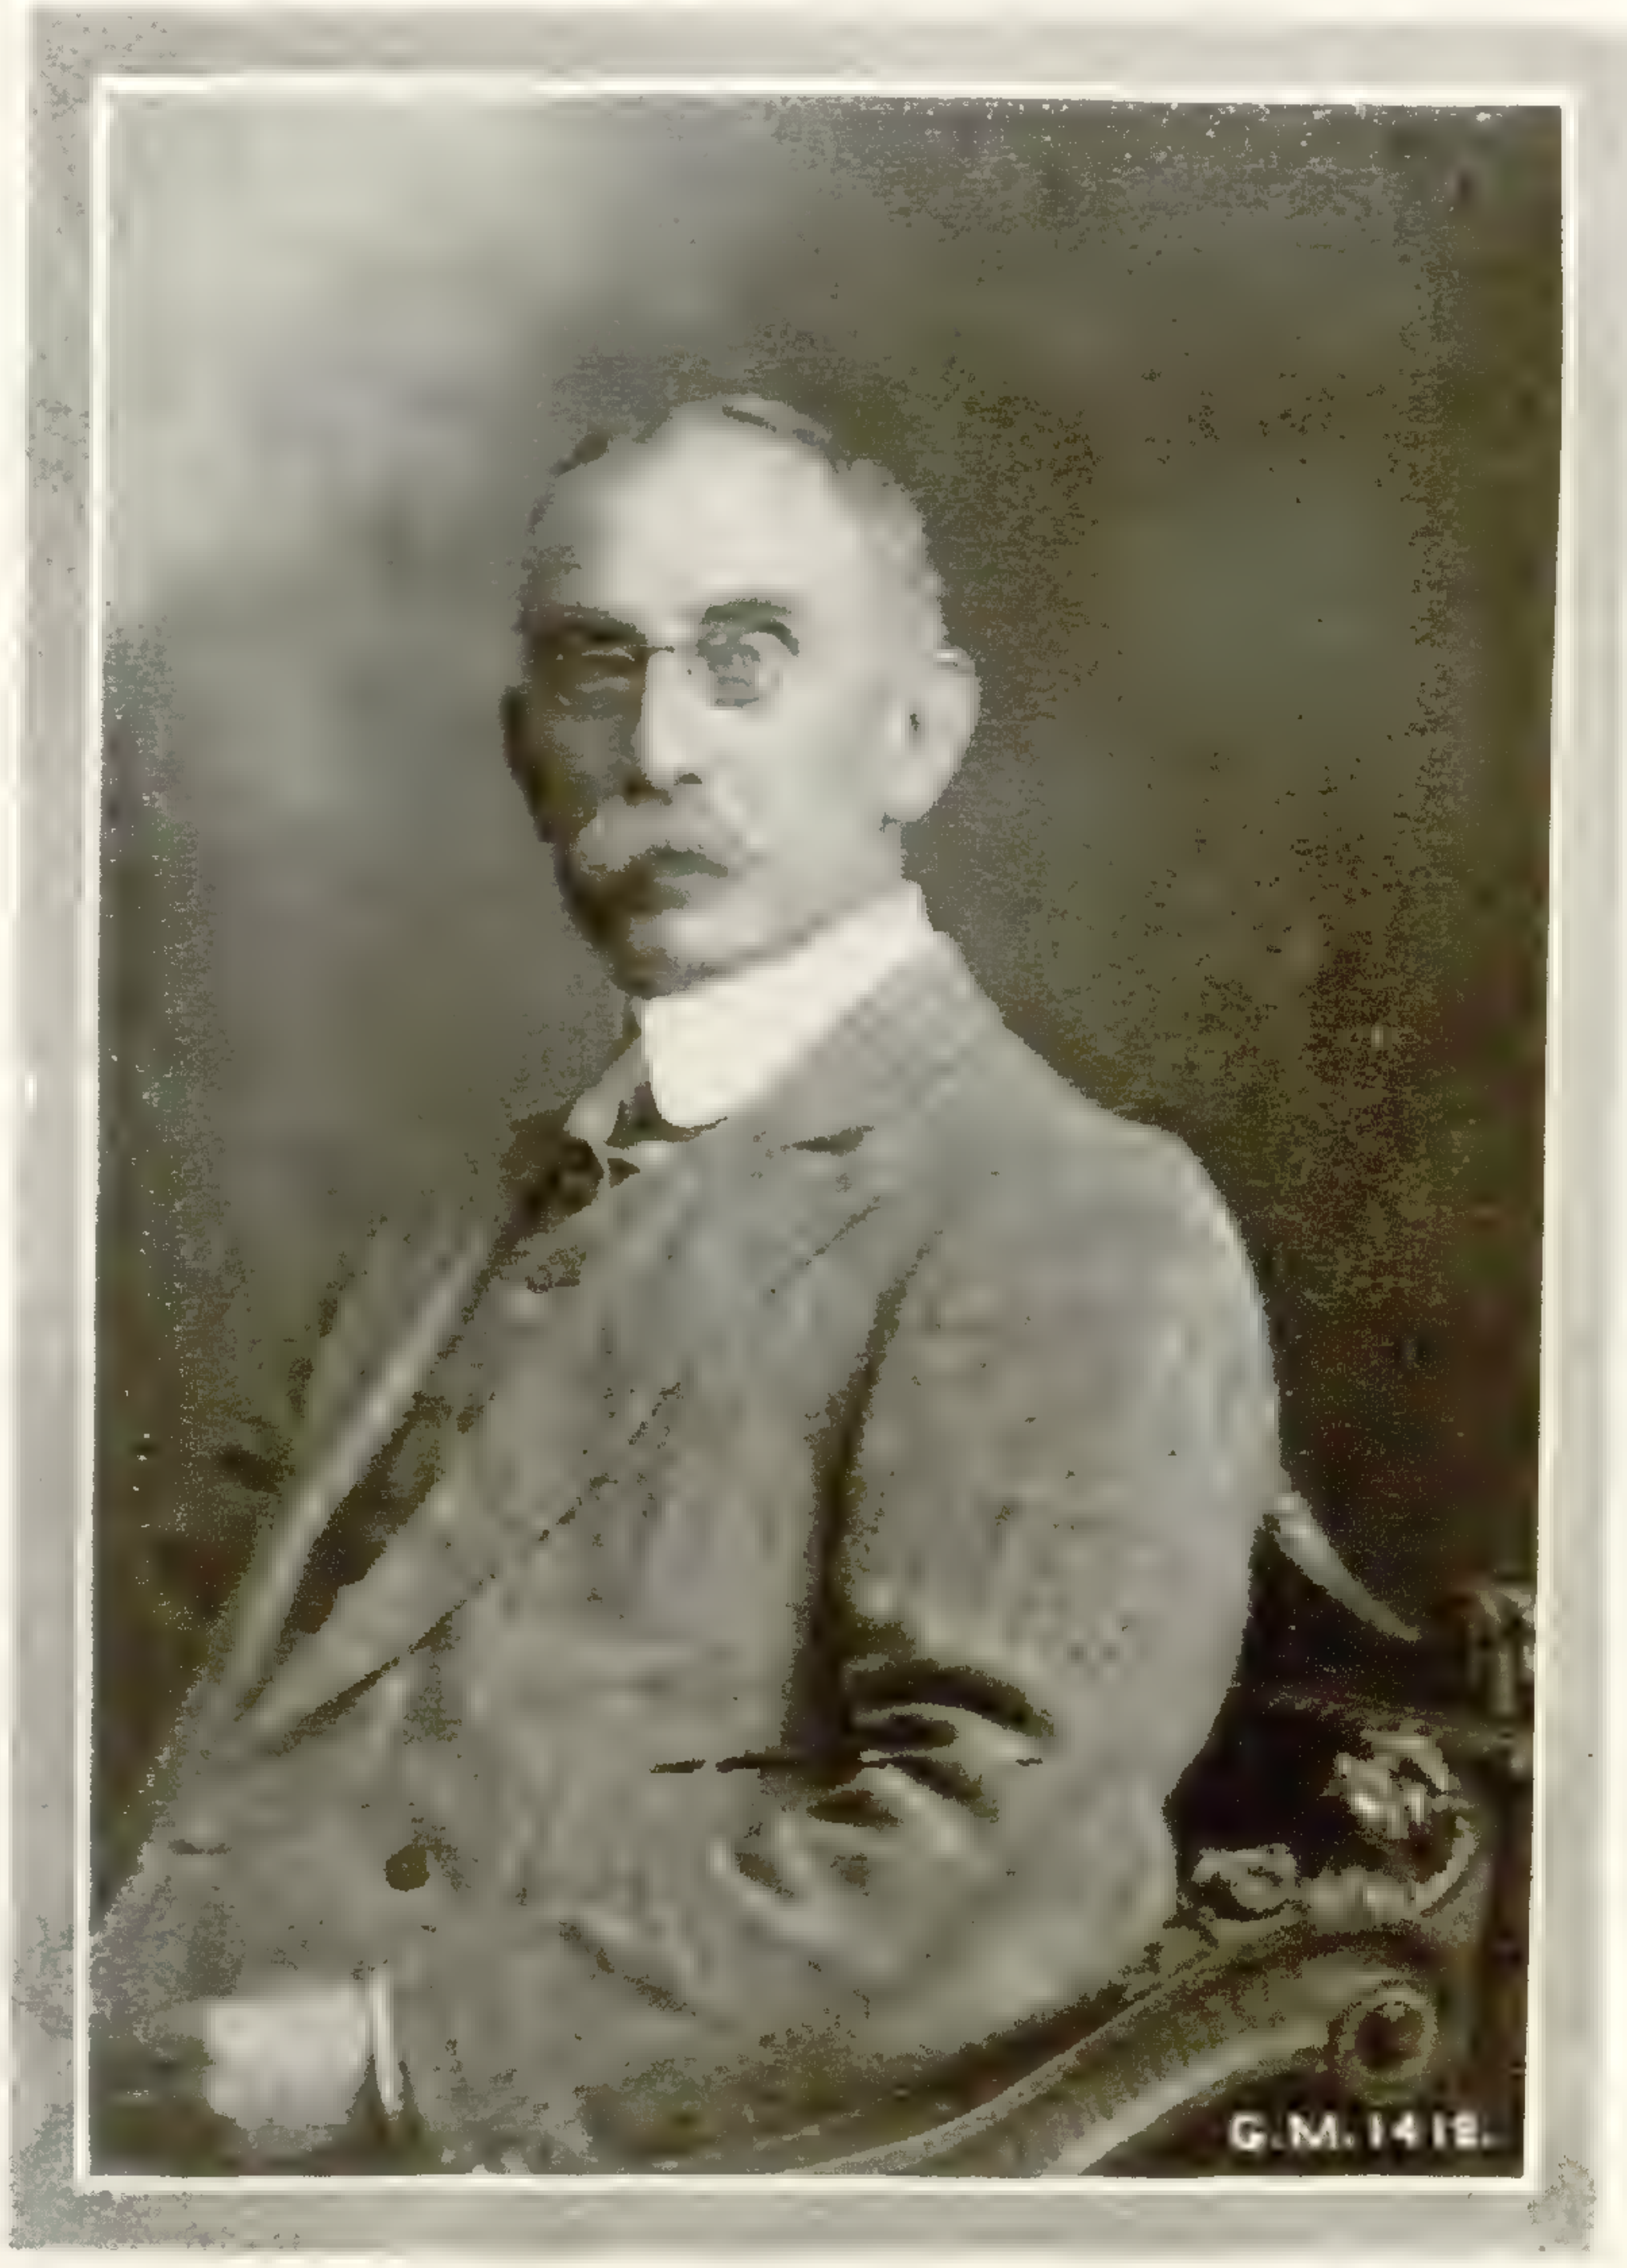
Sun and Shade.

Although in these enlightened days it is recognised that the beneficent light of the sun is the direct or indirect cause and inspiration of all vital phenomena, and, indeed, all other phenomena on this wonderful little world of ours. It must also be recognised that shade, or partial protection from its fervent beams, is essential to the preservation of many forms of life, particularly in the vegetable world. In the process of evolution and the clothing of so much of the earth's surface with vegetation, and also in the process of shaping that surface itself, an infinite number of conditions have been brought about and infinite adaptations have been evolved to fit them. the result being that plants exist of two very different capacities. Thus, disregarding the intermediate links between the extremes, we have innumerable plants so constituted as to be able to bear the undiluted blaze of the sun, and by virtue of this to thrive in situations where heat and drought combined would appear at first glance to render vegetable life, with its invariable need of water, an impossibility. In such environment we find the weirdest specimens of plant life, the cacti bristling with formidable spines, with no apparent foliage at all, like heaps of cannon balls, utterly eclipsing the hedgehog itself with their protective spiky armour; or of the snaky persuasion, equally protected on finer and more insidious lines; or resembling gigantic branched and ridged cucumbers of tree-like dimensions, to cite but a few of the types which these sun defiers adopt, and by virtue of which they thrive and multiply as freely as the denizens of shady moist groves, the homes of the sun shunners. Plants of one and the same order or even genus may belong to both categories, their progenitors of æons ago having diverged to fit varied environments, so that even among the cacti we may have fairly leafy forms, and while, as against the equally weird and spiky forms of the euphorbias, we see many of the same tribe with leafy capacities fully developed, and even the weirdest have not yet lost the faculty of producing short-lived leaves among their spines as a proof of their relationship, a habit the cacti have grown out of. Turning now to the shade lovers, which undoubtedly embrace the most beautiful forms, we find in these in many cases an amplitude of foliage, often dissected on most elaborate lines. In the struggle for existence, the shadows thrown by the over-topping trees and rampant creepers of primeval forests have so diluted the essential sunlight, direct or diffused, that the plants beneath have had to develop extra leafiness in order to catch enough of this to keep them going, and hence we see such plants as the caladiums, the ferns, and innumerable other soft foliaged plants flourishing under shady conditions, while if transferred to dry and sunny ones they would perish at once. One reason for this, of course, lies in another factor of plant existence which governs foliar area, and that is that the greater such area the greater is the need for an ample supply of water to the roots. The work of plant development is effected largely by transpiration through the pores or stomata, which exists in incalculable numbers on the leaves and undoubtedly exercises a sort of pumping influence throughout the plant, which enables fresh supplies of sap to be drawn up by the roots and transmitted from them throughout the plant system, on the same principle, but in a different way, as the blood circulation of animals. Consequently, the greater the foliar area the greater the transpiration and the need of water from below to keep up the supply. It is this law which determines the lack of conspicuous leaves on the cacti, euphorbias, etc.; they could not, in the dry habitats they have been shaped to fit, maintain them if they had them, and hence the vital work has been concentrated in the thick green stems, contracted to the utmost, both as regards their superficial area, and as a consequence, the number of stomata or pores and the transpiration they permit of. Between such extremes however as we have treated of, there are innumerable links. Given an ample water supply at the roots, we may see an enormously developed foliage, capable of existing in the very eye of the sun. The Victoria water lily for instance, with its immense leaves floating on the water itself, is a notable example, and the familiar huge-leaved gunneras of our gardens, with their roots practically in the water, are another, and many similar cases might be cited. In every case, however, foliar development is found to depend upon a fine adaptation of means to the end, with little moisture available in the soil and plenty of sunshine it is contracted to fit, while with a liberal supply of water at the roots the area will be amplified, and as a general rule will be more extended and developed under shady conditions than under exposed ones.



MR. MAURICE BAILEY,
Secretary of the Cardiff Horticultural Society.

Mr. A. Maurice Bailey, the secretary of the Cardiff and County Horticultural Society, has a genius for secretarial work that eminently fits him for the position he holds in the horticultural world and for the duties that make up his business life. He has a great love for flowers and for flower shows, and for several years he was on the Executive Committee of the Winchcombe (Glos.) Horticultural Society. Mr. Bailey lives at Penarth, just outside Cardiff, and has been largely instrumental in founding the young and vigorous Penarth Horticultural Society. He is not afraid of a bit of rough work, for in the small hours of the morning, on the occasion of the Penarth Show on July 6 last, when heavy rain and wind brought down one of the large tents, he was one of a little band of workers that pulled the tent into position again, and set matters right for the exhibitors. In 1893 he was elected to a seat on the General Committee of the Cardiff Society; five years later he was placed on the executive committee, and in 1908 was made secretary. He has given a large amount of time, thought, and labour to the society, and the three exhibitions he has had charge of have shown in a marked manner the result of his activities. The success of the society's twenty-first show, in 1909, when the Royal Horticultural Society sent a deputation down to the celebration, will be long remembered, while the high level of quality and competition seen at the exhibition in July last, augurs well for the future of the Cardiff Society. We first made Mr. Bailey's acquaintance in a railway carriage, when travelling from Shrewsbury Show to South Wales. Mr. Bailey had been to Shrewsbury for the purpose of obtaining new ideas for the benefit of his own society. Mr. Bailey's modesty is on a par with his ability; he will talk about his society, committee, officers, schedule, and show, but it is the hardest thing possible to get him to say anything about the secretary.

The Gardeners' Royal Benevolent Institution.—The King has been graciously pleased to become patron of The Gardeners' Royal Benevolent Institution, of which his Majesty, as Prince of Wales, was president. Queen Mary has also been graciously pleased to continue the patronage, which, as Duchess of York, and Princess of Wales, her Majesty accorded to the same institution.

National Hardy Plant Society.—Mr. A. J. Macself has received the following letter from Messrs. J. Kelway and Son, dated September 6: We heartily congratulate you on the result of the efforts made to form a National Hardy Plant Society. We shall be pleased to give any support to the society which may be possible, and shall be glad to hear from you on this point. The aims are admirable.

August in the North.—The nature of the weather experienced in August, writes our Aberdeen correspondent, sometimes produces remarkable results. History reminds us that it was the weather experienced during August, 1845, that blighted the potato crop in Ireland, and caused the dreadful famine which drove the Government to repeal the Corn Laws. In the year following, 1846, the blight, which had not been felt seriously the previous year in the North of Scotland, all but universally destroyed the potato crop. This, too, happened in the month of August. And now in this year of grace 1910, we have experienced an August that must long be memorable to the husbandman. Fortunately, the North escaped the heavy torrents which did so much damage in other parts of Scotland. Even then, however, our rainfall has been above the average of the last 40 years, amounting to about three and a-half inches. But what of other districts—especially the Midlands of Scotland—where the torrential rains have beaten the crops into a condition which it is heartrending to see. In the North the month was exceedingly favourable for the turnip crop, which is looking exceedingly well. On the last day of the month barley was generally ripe, but oats were still green, or just turning in colour. From some districts I hear reports of potato disease, but, taken all over, the crop is still fine and healthy in the foliage, and should turn out well. Our winds during the month were mostly south-easterly, next in order coming north-westerly breezes. In force the wind was invariably gentle or quiet.

Fixation of Nitrogen by Plants.—Two papers on this interesting subject were contributed to the Agriculture Sub-section of the British Association. One was by Professor W. B. Bottomley, who gave the results of some experiments he had carried out in the use of mixed cultures of bacteria. He stated that his experiments showed that species of the azotobacter and pseudomonas fixed more nitrogen per unit of carbohydrate when in association than when grown separately. The other paper was by Mr. John Golding, who dealt with the "Nature of Nitrogen Fixation in the Root Nodules of Leguminous Plants." He stated that while it was well known that leguminous plants were able to assimilate free nitrogen of the atmosphere, but little was known of what takes place in the root nodule. From numerous researches he had arrived at the following conclusions: (1) That the plant is able to obtain all its nitrogen from the air of the soil, and that the quantity fixed is very large; (2) that the nodule is the seat of the process; (3) that fixation is accompanied with a change in the form of the organism, which invades the root hair as an infection thread, passed through a rod-shaped stage, and finally assumed the bacteroid form; (4) that practically each plant has its own nodule organism, and though the differences seldom amounted to a difference of species, it takes considerable time for the nodule organism of one plant to become adapted to another plant, and when so adapted it is not capable of infecting the plant from which it was first taken; (5) that this adaptation to a particular kind of plant is retained by the organism in the soil for a considerable period. It was also suggested that the reaction of the medium plays an important rôle in nitrogen-fixation.

Grand Prize at the Japan-British Exhibition.—Messrs. J. Kelway and Son inform us that they have received a communication from the secretary of the Superior Jury of the Japan-British Exhibition, informing them that the Superior Jury, in consultation with the head gardeners of the exhibition, have unanimously decided to award Messrs. J. Kelway and Son the Grand Prize. This award has been given for hardy plants planted by the Langport firm in the grounds of the Exhibition at Shepherd's Bush.

Florence Internaticnal Horticultural Exhibition, 1911.—During the first fortnight of May next an International Horticultural Exhibition will be held in the city of Florence, in celebration of the fiftieth anniversary of the proclamation of the kingdom of Italy. The exhibition is being organised by the city of Florence and the Horticultural Society of Tuscany, and the Italian Government is, we are informed, giving moral and financial support. The schedule is of a comprehensive character, and it includes over 450 classes. The literature and history of horticulture, and the educational aspects of gardening have a prominent place in the schedule. Particulars may be obtained of the Executive Committee of the International Horticultural Exhibition, Florence; Italy.

Honours to Botanists.—On Tuesday last the University of Sheffield held a congregation at which Mr. W. H. Bateson and Mr. Francis Darwin had the degree of Doctor of Science conferred upon them.

British Association Meetings.—The meetings of the British Association during the next three years will be held as follows: 1911, Portsmouth, August 30 to September 6, when Sir William Ramsey will occupy the presidential chair; 1912, Dundee; and 1913, in the capital cities of Australia. It is suggested that the association shall, during its visit to Australia, spend a few days each in Adelaide, Melbourne, and Brisbane. In view of the heavy cost of travelling the Federal Government has voted £10,000 for the sea journey, and the contributions of the several Colonies will include free railway travelling.

Children in Public Parks.—While it is important children should have sufficient liberty when visiting public parks and gardens to enable them to fully enjoy their varied attractions, it is desirable they should not be allowed to convert the parks and gardens open to them into bear gardens. It appears to be overlooked in some cases that both adults and children resort to open spaces in and near towns, and that while there should be no interference with the enjoyment of children, the feelings of adults, especially the aged and invalids should be respected. A reminder should therefore be of service, and we welcome the timely leader on the subject which has recently appeared in "The Times." The following extract is well deserving of the most careful consideration from those responsible for the control of open spaces. "Any one who sits by one of the chief park entrances on any but the wettest day in August or September may watch a steady stream of children arriving for a day's outing, often from a long distance. Since the leader and protector of these parties is often not more than seven or eight years old, it is obviously fair to their interests to set apart special enclosures and playgrounds for children only, where they cannot be molested by the incursion of cricket and football parties of older boys, or by deliberate interference or bullying. But justice between small children and their elders does not lie all on one side, and age is not necessarily crabbed because it dislikes screaming and romping at too close quarters. The larger parks give a fair amount of room for both interests; but there is a good deal of truth in the complaints which have been made against the way in which the smaller open spaces in the more central parts of London are turned into juvenile bear-gardens. In many once prosperous but shabby London neighbourhoods the churchyards have been transformed into small public gardens which make a welcome refuge among the dull though populous streets. But the rest which they would otherwise provide for the old and sickly is too often destroyed by the noise and disturbance of the young. Even a few square yards set apart in a sheltered corner would be a great blessing to invalids and old people; and, if such enclosures, for grown-up persons only, were once instituted, children could soon be made to feel that they had no business inside them."

Kew Bulletin.—The interest of this publication is well maintained in No. 7 for the current year. The principal contents are: an illustrated article by Dr. Stapf, on Epacris heteronema, which appears to have greatly perplexed botanists from the time of its discovery by Labillardière in Recherche Bay, Tasmania, at the commencement of last century until the present day; a description, by Mr. J. S. Gamble, on new Lauraceæ, from the Malayan region; Notes on Forestry in the Highlands of Scotland, by Mr. W. Dallimore; and a description, by Mr. G. Masse, of twelve new exotic fungi that have been received at Kew.

ROYAL CALEDONIAN HORTICULTURAL SOCIETY.

Waverley Market was once more the venue of the Royal Caledonian Society's autumn exhibition—Scotland's premier flower show—and on Wednesday and Thursday, September 7 and 8, such a display of choice products of the garden was made as well maintained the fame and honour of this Northern fixture. Scotsmen support their show right heartily, and, it may be added, Englishmen are evidently alive to the fact that the show at Edinburgh is worth attending, for they were much in evidence, Southern firms bringing of their best, and doing their utmost to render a good account of themselves and their specialities. It was the general opinion that this year's show was, in some respects at any rate, far superior to the last, and all through the quality of the exhibits was very good. The vegetables and fruit from Welbeck, the grapes from Wisley, and the fine displays of roses from Scottish growers were centres of great attraction.

SCOTTISH CHALLENGE GRAPE CLASS AT EDINBURGH.
To the left is Mr. Jas. Dixon's first prize set; Mr. T. Ireland's third prize set occupies the middle position; and Mr. J. H. Goodacre's second prize set is on the extreme right.

PLANTS.

Some very good stove and greenhouse plants were shown, although it cannot be said that this is a strong section at Edinburgh. Four stove plants brought two entries, the best being from Mr. Duncan Mackay, gardener to Charles Dickson, Esq., Viewbank, Lasswade, who had Clerodendron fallax, Rondeletia speciosa, Acalypha Sanderi, and a well-flowered statice. Mr. McKinna, gardener to Sir R. Usher, Bart., Ratho, was second. The same exhibitor won for one greenhouse plant with a good statice. Mr. Duncan Mackay had the best four orchids, and also the best single specimen. Mr. Knight, gardener to Sir Wilfred Lawson, Brayton Hall, Carlisle, secured first for six foliage plants, and again for two crotons.

Mr. Duncan Mackay put up two very good fuchsias, which received first prize, and the three winning zonals were those of Mr. Geo. McKinna, Norton, Ratho. Some very fine liliums were shown, Mr. Mackay winning for three. Mr. John Fraser, gardener to Gordon Caldwell, Esq., Old Manse, Inverkeithing, for two; and Mr. T. Galloway, gardener to Mrs. Dewar, Drylaw House, Edinburgh, for one, a magnificent L. auratum, with a large number of well-developed blooms. Begonias were shown in good numbers, the winning half-dozen singles being staged by Mr. Robert Brown, Union Villa, Dalkeith, whose blooms were of great size and good colours. Mr. Brown also led for three doubles and for one specimen.

Hardy ferns are always an interesting class at Edinburgh, and on this occasion some choice varieties and forms were shown. Mr. John McKenzie, Newbridge, Ratho, scored for nine dwarf hardy ferns, showing some finely crested athyriums, aspleniums, and crested Royal ferns. Mr. Jarvie, Burn Brae House, Falkirk, was a good second, with crested scolopendriums, Asplenium trichomanes incisum, Asplenium fontanum, and other choice things. Mr. J. C. Brown, 25, Waterloo Place, Edinburgh, was third. Six scolopendriums were another interesting class, in which Mr. John McKenzie again scored. S. vulgare ramo marginatum was one of the most distinct amongst a choice set. Mr. Brown was second in this class also, some of his plants being wonderfully tasselled and divided.

GRAPES.

Keen interest was taken in the Scottish Challenge Trophy class for eight bunches of grapes. Three capital entries were forthcoming, and it may well be said that every bunch in the class was very good. The winner was Mr. Jas. Dixon, gardener to A. Cameron Corbett, Esq., M.P., Kilmaurs, Ayr. Madresfield Court and Black Hamburgh were shown as finely as they have been seen for many years, and Muscat of Alexandria could not be brought to a better quality and colour. Madresfield Court was given 8½ out of a possible 9 points, Muscat Alexandria 8¼ out of 10, and Muscat Hamburgh 7½ out of 9. The total points for the eight bunches was 64. Mr. J. H. Goodacre came second, scoring 52 points out of a possible 73, his highest being reached by Black Hamburgh of great size. Mr. T. Ireland, gardener to Miss Webb, Newstead Abbey, Notts, reached 44½ points out of a possible 72, and was awarded third prize.

Mr. D. Kidd, gardener to Lord Elphinstone, Carberry Tower, scored for four bunches of grapes, with Canon Hall Muscat, Alicante, Gros Maroc, and Muscat of Alexandria. Mr. John Highgate, gardener to the Marquis of Tweeddale, K.T., Yester, was second. Six growers competed in the class for two bunches of Muscat of Alexandria, the winner being Mr. Wm. J. Buchanan, gardener to the Right Hon. Earl of Mar and Kellie, Alloa Park, Alloa; Mr. T. Lunt, Keir, Dunblane, was second. Two bunches of Black Hamburgh brought eight entries, the judges' selection being Mr. Buchanan, first; Mr. D. G. McKerracher, gardener to Mrs. Montgomery Fleming, Kelvinside, Glasgow, second; and Mr. Jas. Menzies, gardener to J. A. Harvey Brown, Esq., Dumpace House, Larbert, third. Mr. T. Lunt had the best single bunch of Muscat, and Mr. Jas. Dixon, the best Black Hamburgh. Mr. Wm. Smith, gardener to N. E. D. Menzies, Esq., Dumfries, had an enormous bunch of Alicante, which took first in its class, and for one bunch Lady Downes, Mr. Thos. McPhail, Archerfield, scored. Mr. Jas. Dixon again came out top with Madresfield Court, the general opinion being that no finer grapes could be wished for. Cooper's Black was the winning variety in the any other black class, staged by Mr. T. Lunt, and in the whites Mr. Jas. Gibson scored with Buckland Sweet Water.

FRUIT.

A class that is always full of interest, and was on this occasion the centre of keen competition, was that for a table of dessert fruit decorated with plants or flowers. Four entries were forthcoming, in none of which pot plants were used, but choice cut flowers were utilised to great advantage. The premier award was made in favour of Mr. James Gibson, gardener to the Duke of Portland, K.G., Welbeck. It was a capital table, the bunches of Madresfield Court, Prince of Wales, Muscat of Alexandria, and Muscat Hamburgh grapes being well supported by splendid pears, peaches, melons, figs, and apples. The decorations were carried out with lilies, and trails of selaginella; 101 points were given to the fruit, and 21½ for decoration. The second prize went to Mr. J. H. Goodacre, gardener to the Earl of Haddington, Elvaston Castle, who received 97½ points for his fruit and 23 for decoration. Thus the special prize for decoration went to this exhibit. Montbretias were the material used most effectively, three tall vases down the centre of the table being supplemented by eight small specimen glasses at the sides. The Muscat of Alexandria grapes were good, but Black Hamburgh was not up to high water mark. Some huge apples and peaches were put up, as well as good plums. Mr. George Mackinlay, gardener to the American Ambassador, Wrest Park, Beds, took third place.

In the class for a collection of twelve dishes of fruit Mr. Jas. Gibson, Welbeck, was again successful. His Gascoyne's Scarlet apples were splendid, and the Barrington peaches and Souvenir de Congres pears were also grand. Mr. J. H. Goodacre was second, his Peasgood's apples being of immense size. The black grapes were weaker than Mr. Gibson's, but the collection was very choice. Third prize went to Mr. Wm. Galloway, gardener to the Earl of Wemyss, Gosford.

Mr. Gibson repeated his success in the collection of twelve dishes, excluding grapes, with some most beautiful apples, nectarines, plums, and figs. Mr. Goodacre was once more close upon the winner, his second prize lot including cherries, plums, and figs. Mr. Geo. Mackinlay brought up the rear with some good fruit, which, however, was scarcely so ripe as his competitors'.

Wonderful quality was seen in all the single dish classes, but it is impossible to give details of so extensive a classification as was provided. Mr. Gibson easily led for a collection of twelve varieties of pears. Four competitors came forward for six varieties of pears, grown in Scotland, the victor being Mr. Chas. Traill, gardener to Colonel Fergusson, Buchanan, Auchintorlie. The varieties were Durondeau, Pitmaston Duchess, Conseiller de la Cour, Conference, and Marguerite Marrilat; Mr. R. Greenlaw, gardener to H. J. Younger, Esq., Kilmun, was second; Mr. William Galloway, third. Four dishes, orchard house grown, made a nice class, Mr. P. K. Hills, gardener to Sir G. Bullough, Kinlah, Castle-by-Oban, winning with well-ripened Louise Bonne of Jersey, Marguerite Marillat, Marie Louise, and Pitmaston Duchess. Mr. E. Caddick, Caradoc, Ross, was wonderfully successful with apples, winning quite a large number of firsts, both for collections and single dishes, his fruit in all cases being of splendid quality.

CUT FLOWERS.

Edinburgh has for many years been famous for its fine displays of hardy perennials, and on this occasion the classes provided were well filled with choice flowers. A class for a collection of hardy perennials was arranged in a novel manner, the exhibits each being accommodated on a round table, the flowers being built up in pyramidal form. The three entries were all exceedingly good, the winning stand being put up by Mr. A. Brydon, Tweedbank, Innerleithen. Among a very choice collection Mr. Brydon had Eucomis punctata, Statice eximea, Astilbe Davidi, Lobelia Queen Victoria, and some beautiful gladioli, liliums, and phloxes. Mr. A. Dickson, gardener to M. G. Thorburn, Esq., Glenmoriston, was second with a lightly arranged group, in which liliums and gladioli figured strongly, together with montbretias. The third stand was from Mr. Wm. Young, gardener to Mrs. Fleming Hamilton, Kirkcowan.

Gladioli came up in fine form, Mr. A. Brydon winning well for twelve spikes. Carmelite, Marie Therese, and Andre del Sarto were among the best. Second prize went to Mr. J. C. Fordy, Warkworth, Northumberland; and third to Mr. A. Bennett, Tile House, Tweedmouth. Mr. Bennett led for six spikes with beautiful flowers, the other prizes going to Mr. Fordy and Mr. Brydon.

Phloxes were shown in single trusses, the winning six coming from Mr. J. Richardson, School House Manor, whose trusses were deep, well-developed, and good all round; Mr. E. Pickwell, Drumearn Gardens, Comrie, was second; and Mr. A. Brydon, third. Early chrysanthemums were another effective class, Mr. Robert Sutherland, Auld Aisle, Kirkintilloch, being winner for twelve and six vases. In the open class for a collection of gladioli, Messrs. G. Mair and Sons, Prestwick, put up a marvellous lot, which won easily. Nothing finer could be wished for than the grand spikes of beautifully-coloured blooms on this stand. Mr. J. C. Fordy, Warkworth, was second.

Twenty-four bunches of Cactus dahlias brought two capital entries, the first prize lot being shown by Mr. J. Paul, Drumbeg, Killearn; Rev. A. Bridge, Clincher, Etruria, Snowdon, and other of the best varieties were in fine form; Mr. John Smellie, Busby, was second. Messrs. M. Campbell and Sons, High Blantyre, were awarded first for a collection of dahlias, artistically arranged, and embracing all sections. Mr. Alex. Ollar, Campbelltown, once more beat all-comers with violas, showing in grand style. There were also some very fair sweet peas, although the weather of the past week had left its mark upon the flowers.

ROSES.

These were shown in great quantity, and of superb quality. Messrs. J. Cocker and Sons, Aberdeen, were victors in the big collection arranged for effect. Tall pillars of such varieties as Hugh Dickson, Lyon, and Joseph Low were used at the back, with boxes of grand specimens in front. Mr. Wm. Ferguson, Brucefield, Dunfermline, was second with beautiful flowers of Frau Karl Druschki, Wm. Shean, Mrs. W. J. Grant, and many other good varieties, all nicely arranged. Messrs. Cocker and Sons won for twelve crimson flowers with Hugh Dickson, Mr. Ferguson winning in the white class with Frau Karl Druschki, and Messrs. Croll, Dundee, in the pink class with Mrs. W. J. Grant. Messrs. Cocker again led for twelve vases, showing handsomely. The firm also maintained their success in the class for thirty-six blooms with a capital stand: Mr. Hugh Dickson was second in this class, his flowers also being good.

Mr. Dickson led for eighteen blooms, second going to Messrs. J. Fairlie and Co., Cairneyhill, Fife, and third to Messrs. D. and W. Croll. In the amateur's class a cup, value fifteen guineas, was offered by Mr. Hugh Dickson for twenty-four blooms. The successful competitor was Mr. Wm. Parlane, gardener to Mrs. Dennistown, Rossla Row, who also won for twelve blooms, showing well in both classes. Mr. J. Russell, Rose Garth, Newton Mearns, took second for the twenty-four, and Mr. J. Simpson, Carnoustie, for the twelve blooms. Messrs. Campbell and Sons, High Blantyre, were winne-

ROCK CRESSES.

The aubrietia, named after M. Aubriet, a famous French botanical draughtsman, has produced a large number of varieties that have become distinctly popular owing to their usefulness in a variety of ways for the embellishment of the garden in spring. They are also highly esteemed for the ease with which they can be cultivated, as well as for the diversity of colour their flowers afford. Like all other popular plants, the varieties of rock cress have increased rapidly during the last ten years, and with desirable results, not merely in a question of multiplicity of names, but really in desirable colours, freedom of growth, and abundant production of flowers.

There are several ways in which aubrietias can be employed in the garden. First on the rockery, where extended variety in colour adds greater interest to that part of the garden. Secondly, for spring bedding, where masses of distinct colours are appreciated; and, thirdly, as edgings to garden paths, where they can be employed with good effect to creep over and among edging stones, which are at times desirable at the foot of a wide herbaceous border, or elsewhere.

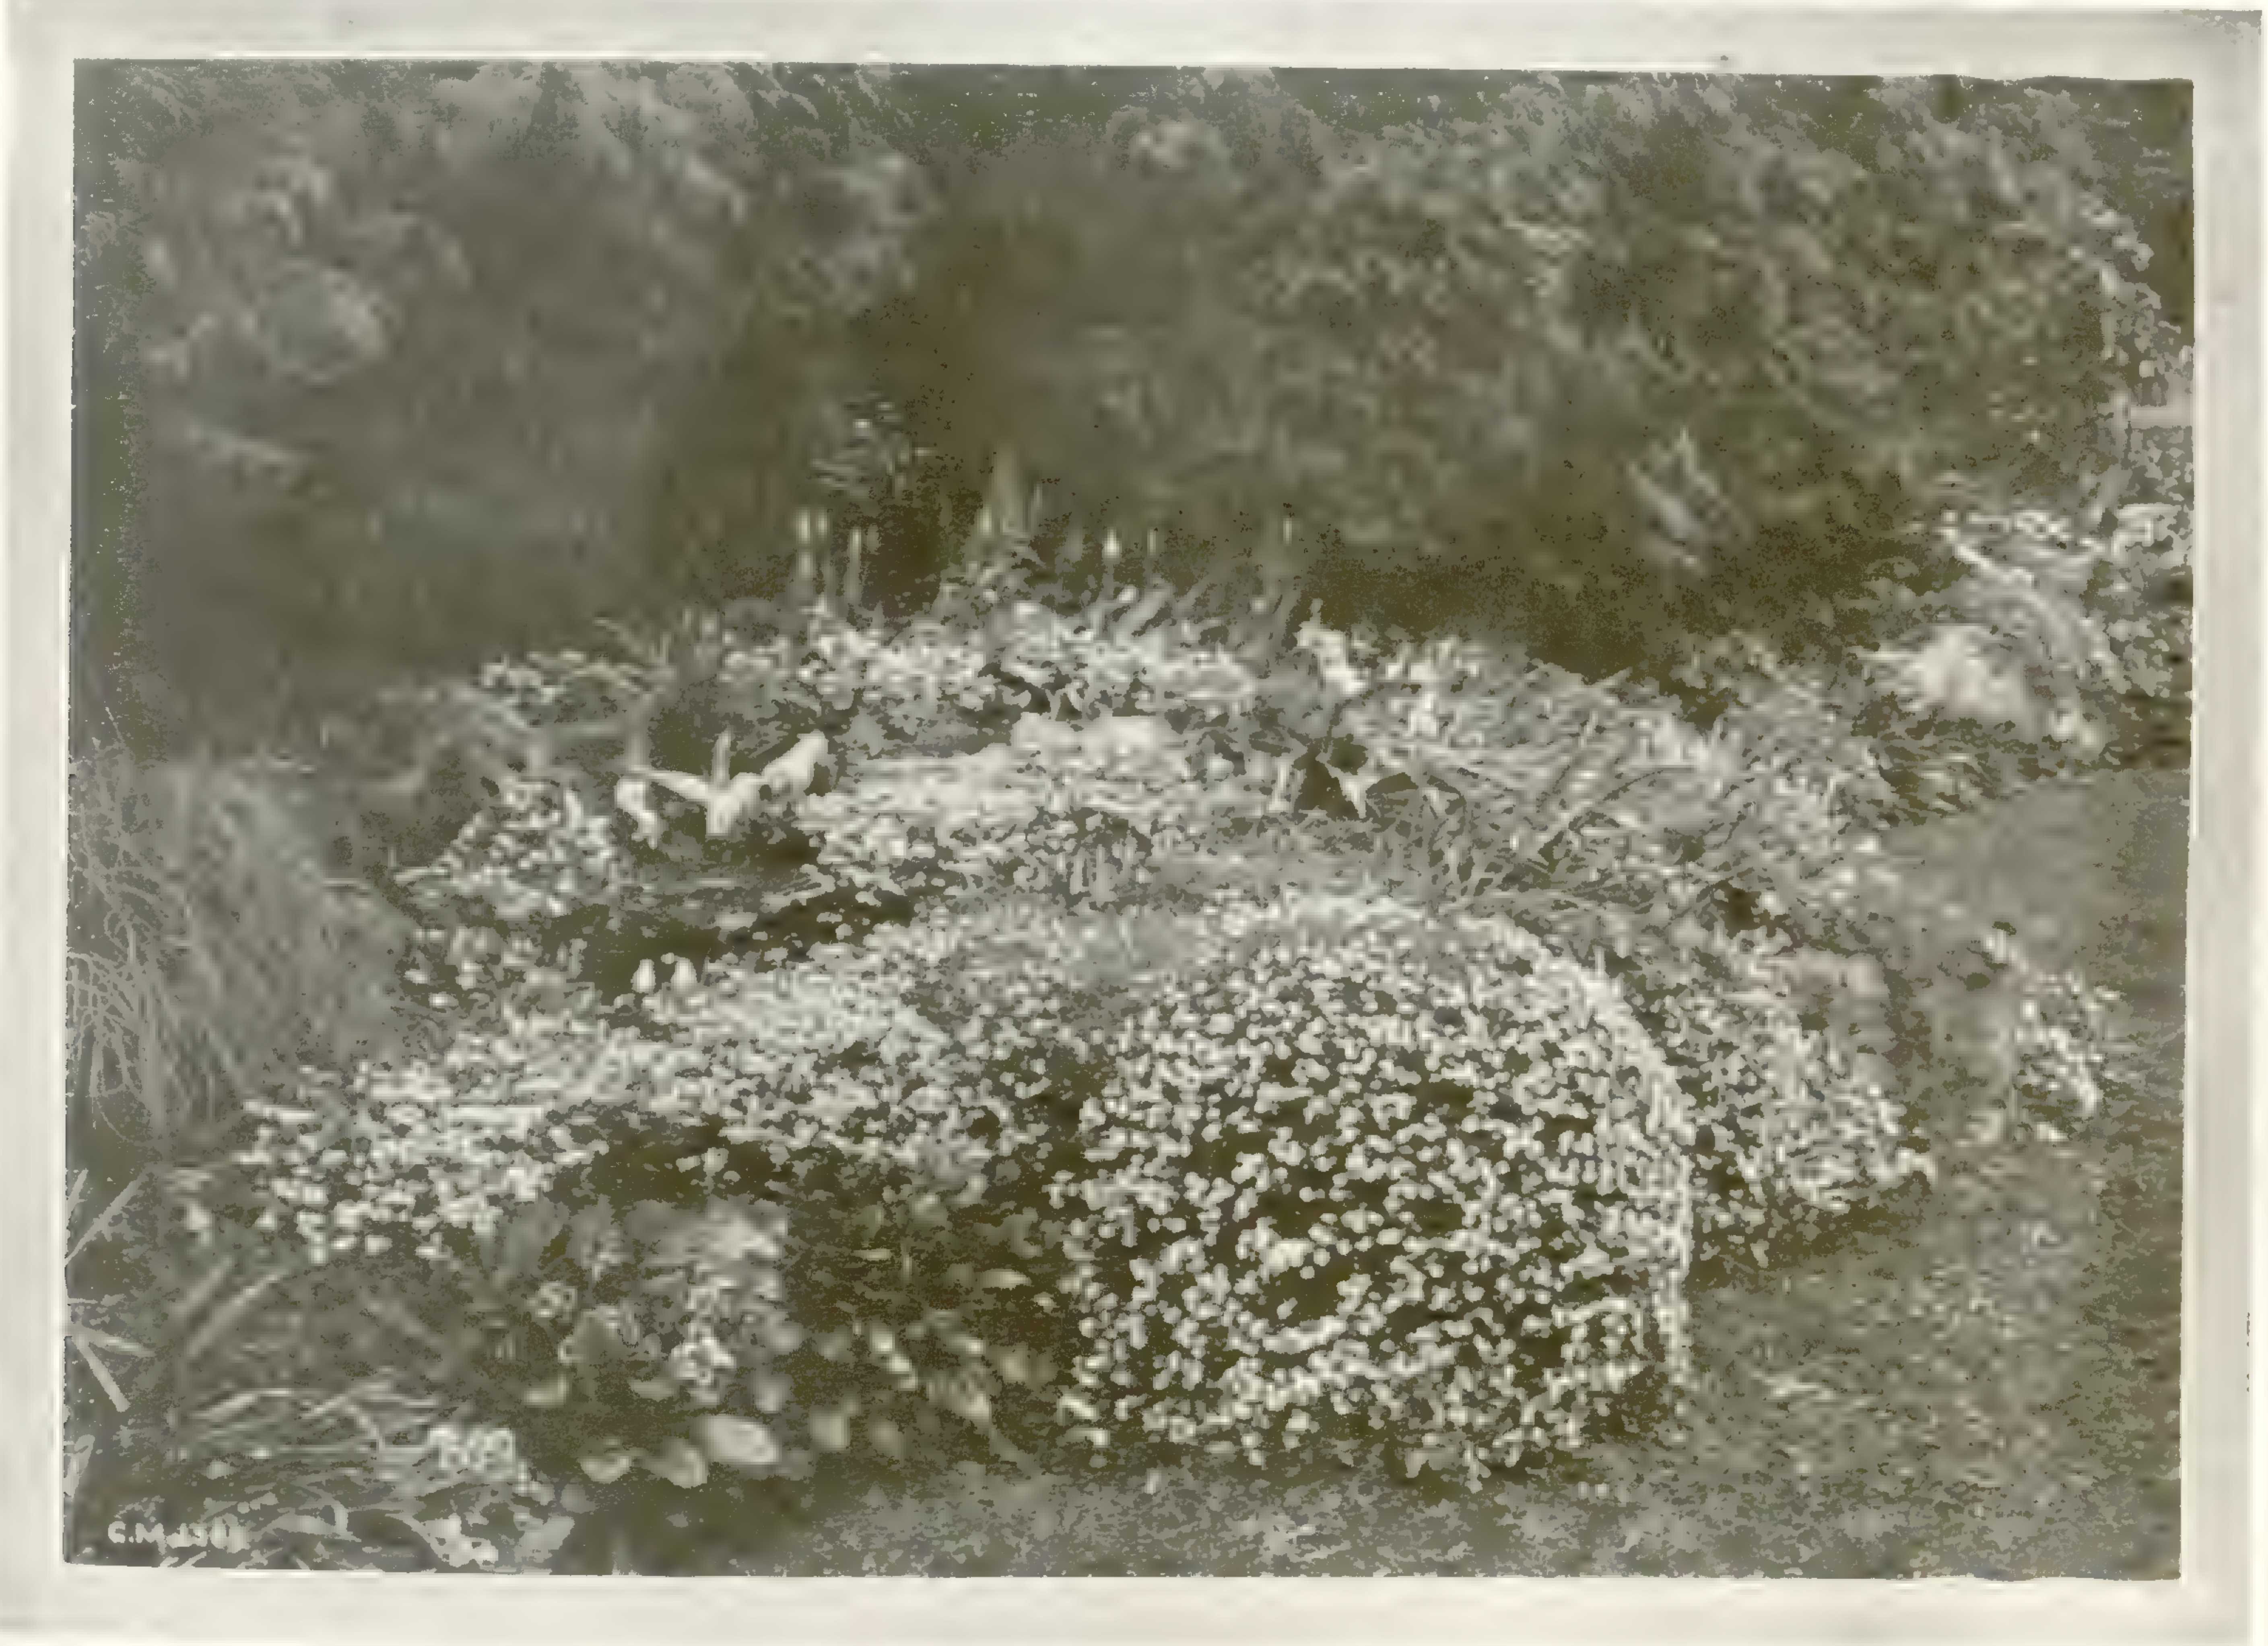
The illustration herewith shows a fine mass of the variety A. Campbelli growing on the rockery at Swanmore Park, which proves to demonstration its value as a spring-flowering subject. The culture of aubrietias is a quite simple matter. They will grow in almost any kind of soil, that which is of a sandy character being the best suited to their requirements, and if to this is added a small portion of well-decomposed manure or old potting soil, to promote greater luxuriance of growth, it is surprising how long a time the plants will in the same site grow vigorously, and annually give a full display of flowers. Especially will there be occasion for surprise if the surface soil is replaced, or has added to it some rich compost, and the plants encouraged to make new growth by the removal of the old, after the season of flowering is past.

The treatment of the plants for spring bedding entails more labour, naturally, because they need replanting twice yearly, namely, at the close of the spring and early in the autumn. When the flowering season is over lift the plants, remove the bulk of the growth, and divide the tufts, and plant in rows on a north or west border, if possible, as shade is beneficial during the summer months. Otherwise, artificial shade will be necessary to ensure a quick start into growth, remembering that the more free this is during the summer the better will be the display of flowers in the following spring. Planting early in October is a distinct gain, as, should the autumn be wet and cold, the growth is interfered with, and the result cannot be so good.

Propagation is simple; in the ordinary way dividing the roots is sufficient, but where plants of special varieties are scarce each piece two inches long taken off, and dibbled in sandy soil in an unheated frame will quickly make root. These, if potted when rooted, soon make stout plants, and from pots are more easily transferred to where they are required than from the open ground.

The following are the most desirable: A. deltoidea is the species from which the greater number of the newer varieties have originated. This species was introduced in 1710. The flowers are purple, and freely produced, and they give a mass of colour. A. Campbelli (syn. Hendersoni) is more vigorous in constitution than the type. In colour it is violet-blue. A. Dr. Mules, rich deep violet-purple, quite the richest and deepest colour of all aubrietias. A. Prichard's A1 has perhaps the largest flowers of all, and it has a strong habit of growth; the colour is dark purple. A. Mrs. E. M. Crosfield is a quite new variety, with large purple-blue flowers, distinct, and desirable. A. Lavender, as its name implies, has lavender-coloured flowers, is new, and quite desirable, giving a distinct shade of colour, which for massing in spring bedding will be an advantage. A. Leichtlini, bright rose, very showy, and distinct. A. Fire King has flowers of a glowing crimson hue. A. Moerheimi is a showy variety, with flowers of a deep rose colour. A. Bridesmaid, soft blush, very distinct and beautiful. A. Souvenir de Wm. Ingram has rose-pink flowers, which pass to pale lilac, somewhat detracting from its value. A. Crimson King, a fine dark red variety, quite one of the best of its colour.

E. MOLYNEUX.



AN EFFECTIVE ARRANGEMENT OF ROCK CRESSES
In the gardens of Swanmore Park, the seat of W. H. Myers, Esq.

H.T. Rose Queen of Spain.—I have not had this rose in better form in the open than it is the present season. Queen of Spain was introduced by Messrs. S. Bide and Sons, of Farnham. It gained a Card of Commendation from the National Rose Society in 1906, and the Gold Medal when exhibited the following year. Hitherto I had looked upon this variety as only suited for pot culture, or as an exhibitor's flower; but my present blooms in the open prove it a fairly good bedder. The weight of the blossoms causes them to droop rather, but they are very lasting; pale flesh with deeper centre, the flowers full, and carried on stout stems. It is related to Bessie Brown, but is not quite so strong a grower with me. Never free and vigorous, but of stout and robust habit, I have found it much subject to mildew; in fact, it has been attacked more than Bessie Brown; but I do not find Queen of Spain comes so constricted under the calyx as Bessie Brown. Both are good under glass.—A. P.

EARLY COOKING APPLES FOR SCOTLAND.

The value of a culinary apple that possesses the attributes of high quality and size, that enables it to be used early in August can hardly be overestimated. At this time the supply of small fruits—strawberries, currants, raspberries—is on the wane, or quite past; and, moreover, the appreciation of them is in the same ratio, and one anticipates the advent of the apple crop with considerable favour.

Lord Suffield.

Where this grand variety grows freely and remains for a few years, at least, free from canker, it may be justly termed the champion of the apples for earliness and general usefulness. Unfortunately, in the north country a really healthy tree, free from this fell disease, and of ten years or more of age, is very seldom met with.

On the other hand, scraggy specimens, from which a considerable amount of dead and withering shoots are yearly pruned away, are the rule rather than the exception. Even in this decrepit state such is the natural fruitfulness of the variety that fruits are produced quite freely upon every branch that has a fair amount of foliage. Whether this apple is worth cultivating at present in districts where the canker trouble is known to be much in evidence is worthy of the consideration of intending planters, especially so as there are now several others that very closely resemble it in all its most desirable points, and are less addicted to its weak ones. The varieties named hereafter are all of the clear-skinned type, and in form, size, and quality partake largely of Lord Suffield, while, so far as can be judged from the comparatively short time they have been under cultivation, they are not seriously affected by canker.

James Welsh.

This is a hardy, free-bearing variety, sent out some years ago by Messrs. Dickson and Co., Edinburgh, and it is now pretty well distributed throughout Scotland. The fruits, according to my experience, do not attain to the size of Lord Suffield, but they are sufficiently large for ordinary purposes, and if well thinned in their early stages might possibly equal the last-named in this respect. The tree is a medium grower, and remains quite healthy for a long time if care be taken that it does not become exhausted by overcropping, as it is a free and regular bearer, and the fruits are ready for use from July onwards. This must not be confounded with the dessert variety James Grieve, distributed by the same firm, which is a totally different apple. In Scotland and the North of England James Welsh should be given a place wherever early apples are much appreciated.

Early Victoria.

This apple, introduced but recently by Messrs. Bunyard and Co., Maidstone, promises to be, when better known, one of the most popular early fruits. It is large in size, very shapely, with a clear skin, becoming almost yellow in colour as the fruit matures. In this way it will, in due course, be much prized as an exhibition fruit. For kitchen use it is unsurpassed, especially for baking whole; the thickness of the skin seems to prevent bursting, as with ordinary care in the process a number submitted to the necessary heat will, on removal from the oven when cooking is completed, present the same regular outlines they possessed at the outset. Quite small trees of this bear freely, but it is impossible, owing to the short time it has been under cultivation, to give from personal knowledge any correct idea of the healthiness or disease-resisting powers of the tree.

Early Rivers.

Another of the same type, which differs from the foregoing but slightly. In shape it is rather more conical than the last-named, and is very much drawn in about the eye, which, indeed, is the principal distinction between them. This is also a very well-formed fruit, sufficiently large for any purpose, and of excellent quality when cooked. It is perhaps needless to remark that the two last-named are quite new apples which are destined to be much sought after in future, but, as already stated, it would be unsafe at present to enlarge upon their merits further than the proof of this afforded by quite young trees, but, to all appearance, as to healthiness and free cropping, as well as the quality of the fruit when served at table, they leave little, if anything, to be desired.

James Day.

Galloway House, Wigtownshire.

SPRING DELLS.

Gardeners who are planning out new grounds, or proposing extensive alterations in old ones, would do well to remember that a dell of spring-blooming plants, to be succeeded by others, of course, may be made one of the most exquisite of all features. There are numerous reasons for hollowing out a site. Directly the earth is penetrated to a depth of nine to twelve feet or more thorough acquaintance is made with the nature of the soil, as far as that portion of the land is concerned, and the knowledge gained often proves of utmost service in dealing with the requirements of special plants. Then, by growing plants far below the surface level heat is concentrated, and, given adequate drainage, cold is avoided, while devastating gales are quite escaped.

There will besides be several different aspects obtained by this artificial method: the inner sides of a round dell must face different points of the compass, and the climate, so to speak, will be several degrees warmer on the south, south-west, and south-east slopes than if these aspects had been obtained by throwing up banks on the level. As, needless to prove, the more climates we possess in one garden the greater are our opportunities to cultivate various plants, and also to have them at several seasons, or in extra long succession, the gardener finds himself greatly assisted in achieving floral triumphs.

One utilitarian reason for making a large dell on a gravel soil, especially in a new garden, is that all the material needed for the paths will be obtained upon the spot, saving much expense and labour.

The dimensions of a dell must be determined by the size of the garden, but where two or more acres are to be laid out the width of forty feet would be none too great: the sides should shelve gradually, not with steep incline, and the base should be a gravel, turf, tiled, or concreted space, with a seat at the end, or perhaps two seats with different aspects. In the exact centre might be any kind of ornament that was fancied, a fine stone vase, small fountain, a sunk basin forming a pool, a rockery hillock, rustic urn, or a pillar climbed by Pyrus japonica and Clematis montana together, which would be certain to result in early bloom.

The method of entering a dell should be carefully thought out. Probably the best appearance results from a grassy slope leading to a grass base, the green turf showing off the gay tints of the flowers that are sure to be present in great masses. When the level plot is of gravel or pavement, however, the slope should be cut into broad steps, and paved with large flagstones, or else gravelled and held up by sunk wood slabs and posts driven in between. By the sides and in the crevices of the steps a great variety of ferns, sedums, saxifrages, and tiny plants can be cultivated with picturesque results. In the case of an immense dell, in which the base is literally a sunk garden in itself, there will be space to make winding, sloping narrow walks, with unexpected turns, and steps here and there throughout the sides, leading the visitor gradually, instead of directly, to the bottom plateau. A charming effect can be thus gained, but the plan would be ridiculous on a small scale.

The top of the dell must always be safely fenced or hedged round, but it is a matter for taste whether rustic woodwork shall be used, wire-netting and stout stakes merely as a foundation for a hedge or climbers, or a rock wall. The last is admirable, and if it is six feet high, artistically yet firmly constructed, with quite irregular summit line, and heaps of old stones here and there against it, offering plenty of gaps and pockets in which rock plants will luxuriate, then the feature, after two or three years have passed, will indeed be a thing of beauty. Rocks should appear also up the dell sides, being necessary to hold up the soil, though this can be materially assisted by sunk, hidden lengths of stout wood. The lavish employment of small stones has a mean look in such a case; large boulders are best, rising boldly up, or laid flat, some jutting out corner-wise, with only a scattering of smaller pieces between.

Spring flowers will be amazingly early in this dell. I have known polyanthuses and Anemone fulgens glorious in January; Anemone sylvestris plena, the double white Woodland Wind flower, and Anemone pulsatilla, the Purple Pasque flower, come in March; hepaticas begin to open soon after New Year's Day, and if tubers of Anemone coronaria are planted in extra rich spots of soil in September and October, their many-tinted buds will not fail to show during December. Christmas roses, yellow aconite, snowdrops, the various lovely winter irises, Van Thol and other early tulips, chionodoxa, scillas of many kinds, autumn, winter, and spring crocuses, Polyanthus narcissi and others, hyacinths, stately Crown Imperials, ixias, sparaxis, leucojums, and alliums are but a few of the fair flowers that should be enjoyed in vast quantity.

Snapdragons can be a feature to blossom early and late, aubrietias and liliums, pæonies, columbines, violets, primroses, myosotis, lupins, arabises, doronicums, megaseas, pulmonarias, rock pinks, maiden pinks, with wallflowers of all known colours. Evergreen foliage plants are of especial value in this garden. Preparation of the soil should be thorough; the difficulties are greatest when the ground is heavy, and wet land will need adequate draining; the addition of suitable manures must be carried out on a generous scale, while vegetable ashes and lime are required for such a depth of ground that has never before been cultivated.

Summer must have its full mead of blossom; autumn also; but it is essentially as a sheltered nook, bringing flowers in seasons when elevated land is bare of colour, that the spring dell is most precious.

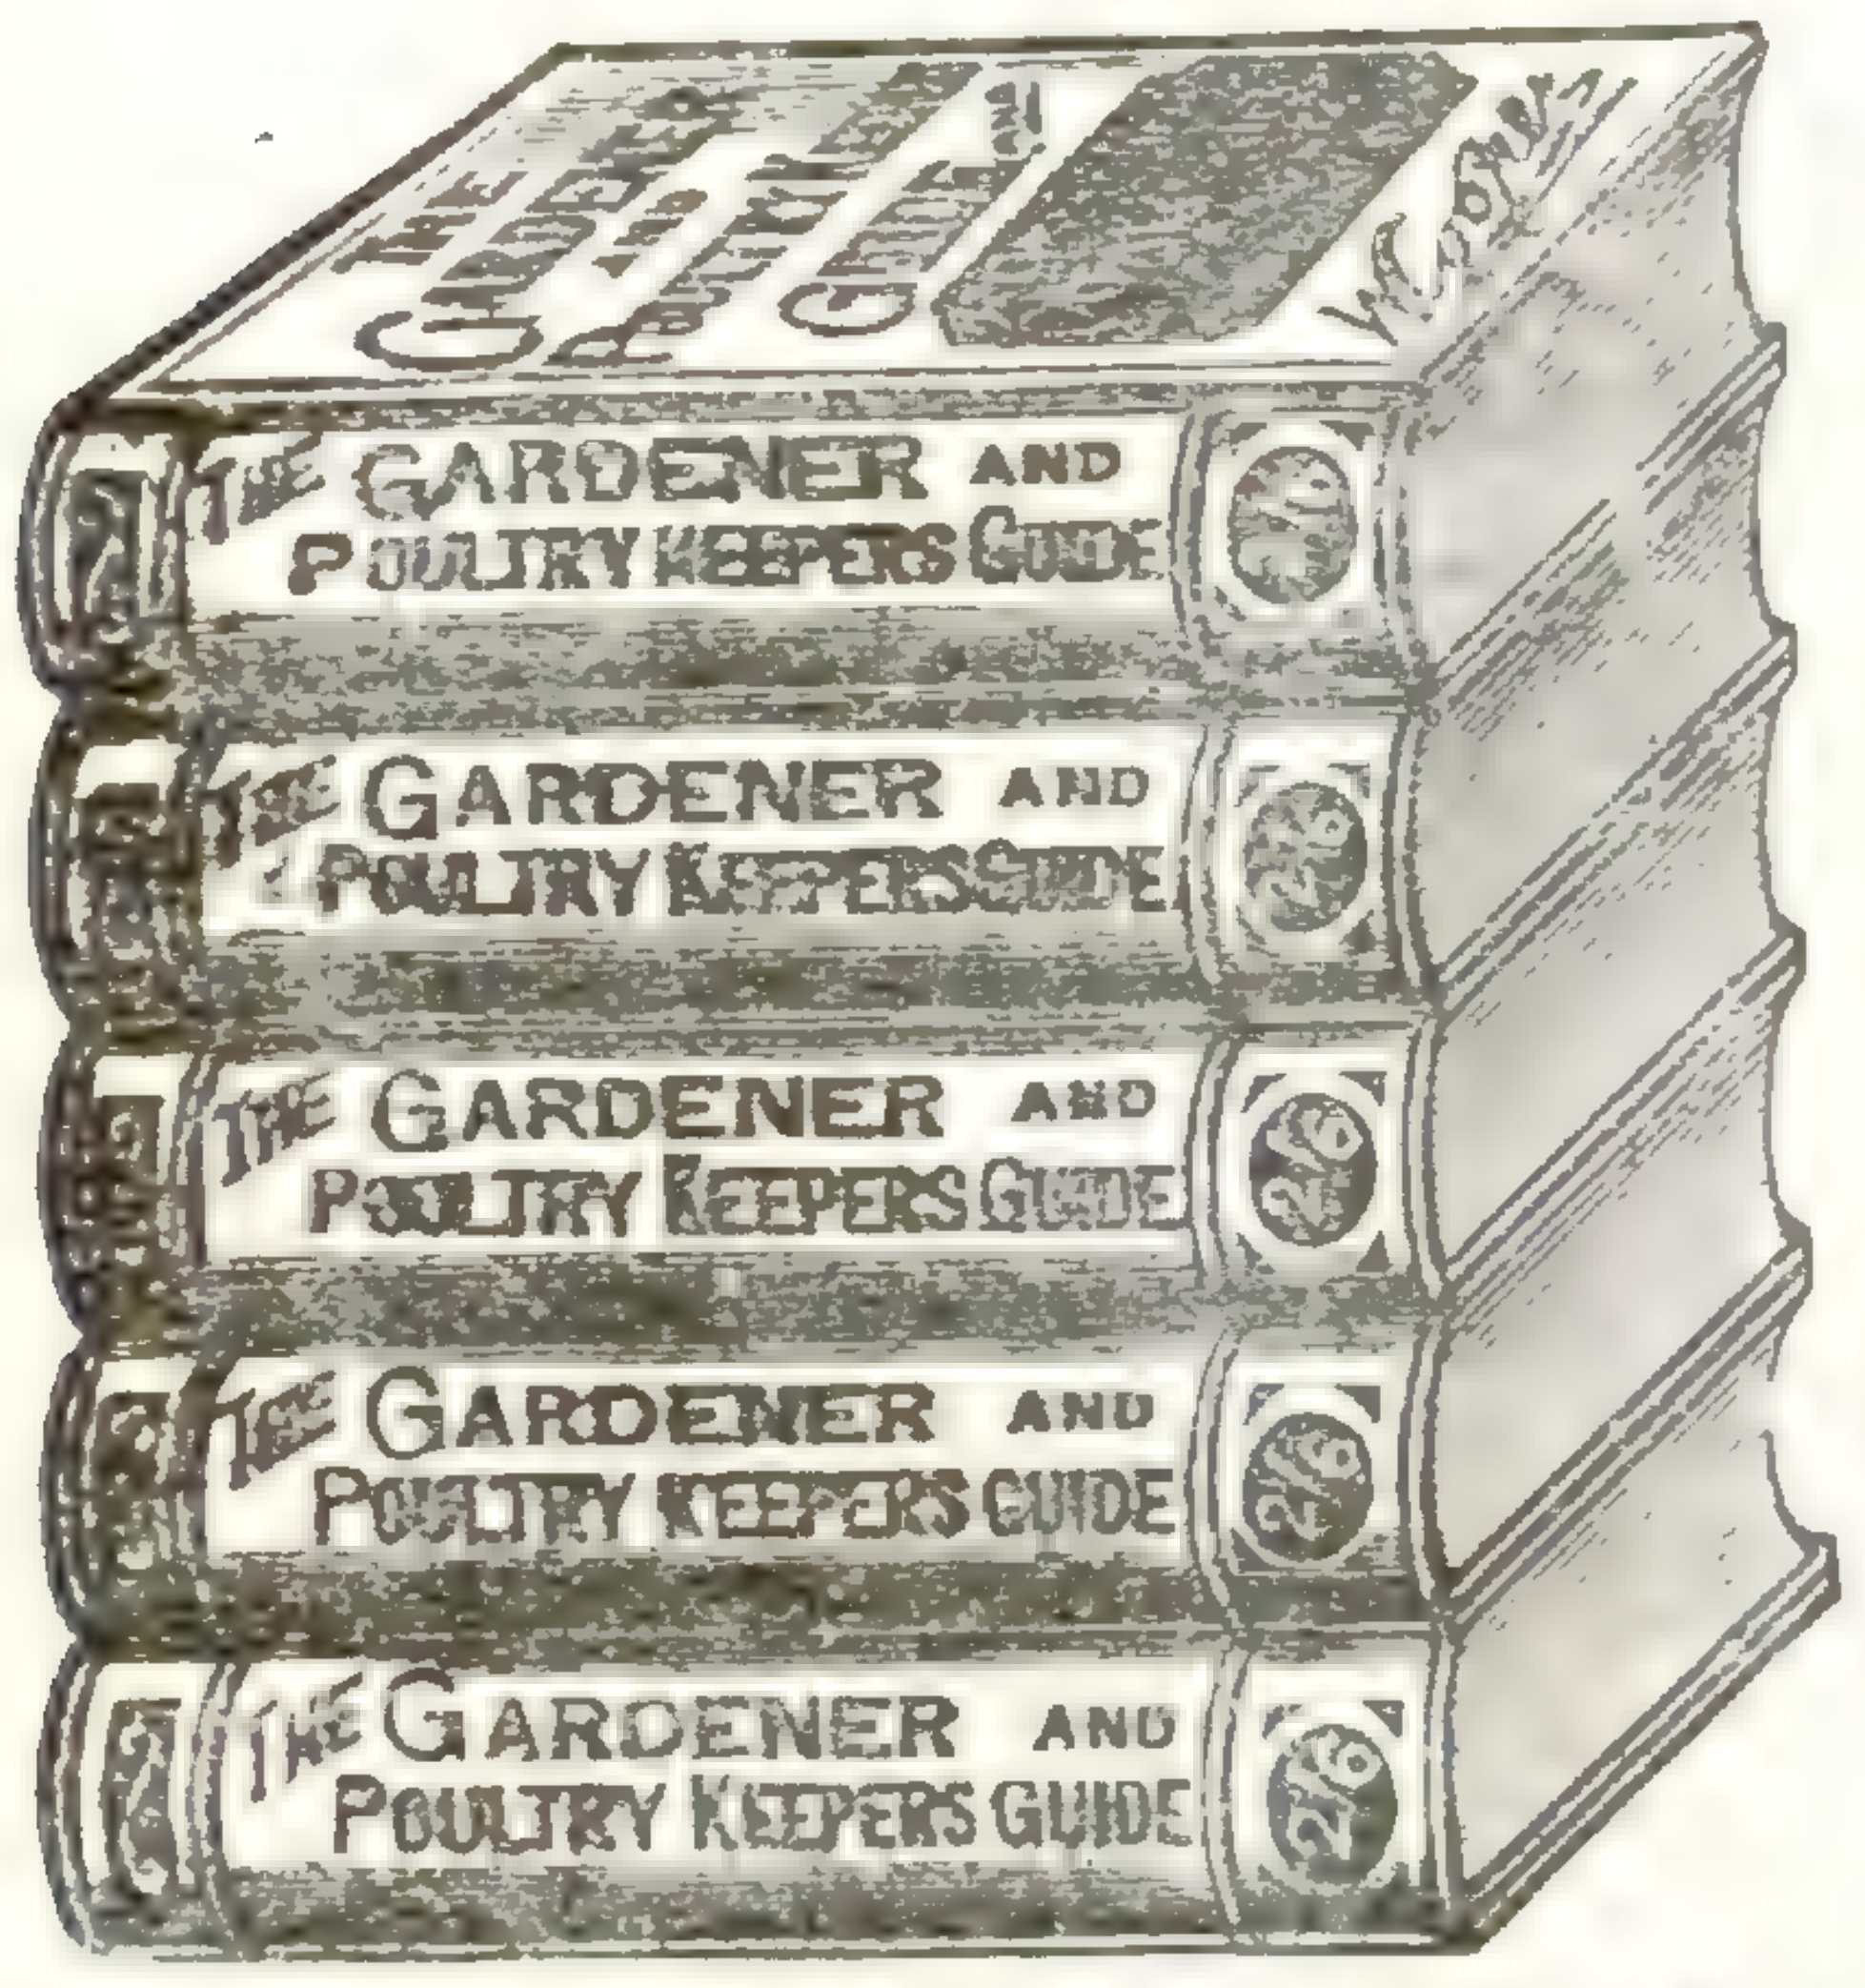
Illustrated Catalogue of Goods Manufactured and Supplied By WILLIAM COOPER.



THE GARDENER AND POULTRY KEEPERS GUIDE
2/6
W. COOPER

640 Pages. 1000 Illustrations. Bound in Cloth.

The most Complete Work on Gardening and Poultry-Keeping, Dogs, Rabbits, Pigeons, &c., ever written. No matter what you require to know about any one of these subjects, you will find the information in this book written in plain, non-technical language, there being 640 pages telling and illustrating everything on the above subjects. The result is

The Greatest Book Ever Published on Gardening and Poultry-Keeping.

100,000 BOOKS TO BE DISTRIBUTED FREE.

From the opening to the last line it is interestingly written. The price of the Book is **2/6**, but the Author has decided to give away **100,000 COPIES, FREE**, one to each applicant who writes for a copy.

COST of PRODUCTION and DISTRIBUTION OVER £7,500.

The distribution and production of this Book will cost over £7,500, but a Free Copy will be sent, post free, on receipt of sixpence in stamps (simply for postage and package). As the distribution of every one of these Books is an initial loss to the Author, he asks that each recipient, after reading it, if having no further use for same, will favour him by kindly lending it or giving it for perusal to some friend or relative interested in the above-mentioned matters.

SEND FOR YOUR COPY TO-DAY.

WHAT YOU WILL RECEIVE.

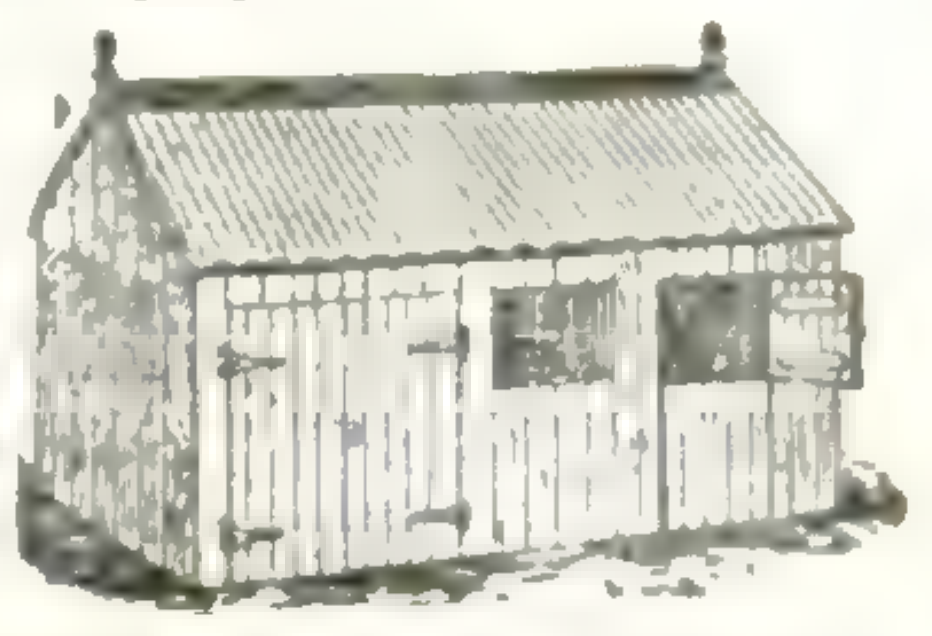
Send Sixpence in Stamps and you will receive, Post Free by return, the New Book for Gardeners and Poultry-Keepers, consisting of 640 pages, Fully Illustrated and Bound in Cloth. A Help, Guide, and a Necessity to every Amateur.

PORTABLE BUILDINGS.

Soundly constructed of good strong material. The sides and ends are covered with tongued, grooved, and beaded boarding, on strong framing; the roof of stout boards, and covered with felt. All complete in sections.

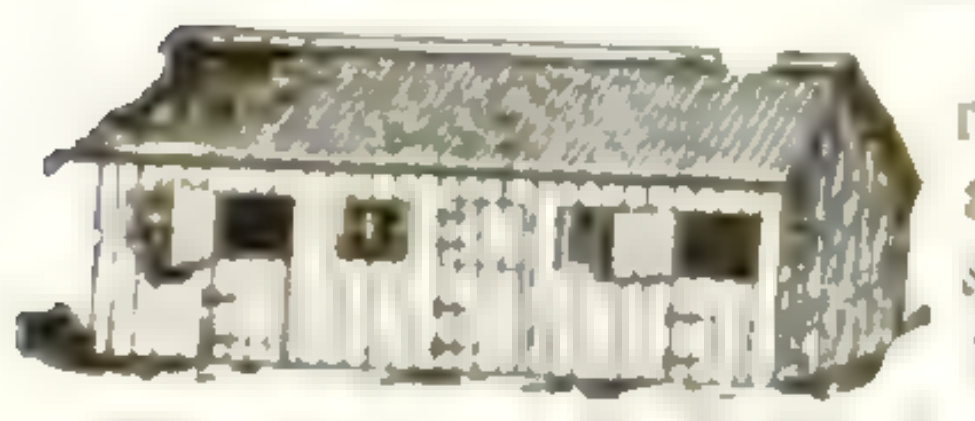
PORTABLE STABLE, COACH, and HARNESS HOUSE.

No. 265.



Suitable for 1 pony and trap: 14ft. long by 10ft. wide £9 10s. For 1 horse and trap: 15ft. long by 12ft. wide, £12. For 2 horses and trap: 20ft. long by 12ft. wide, £15.

No. 264.



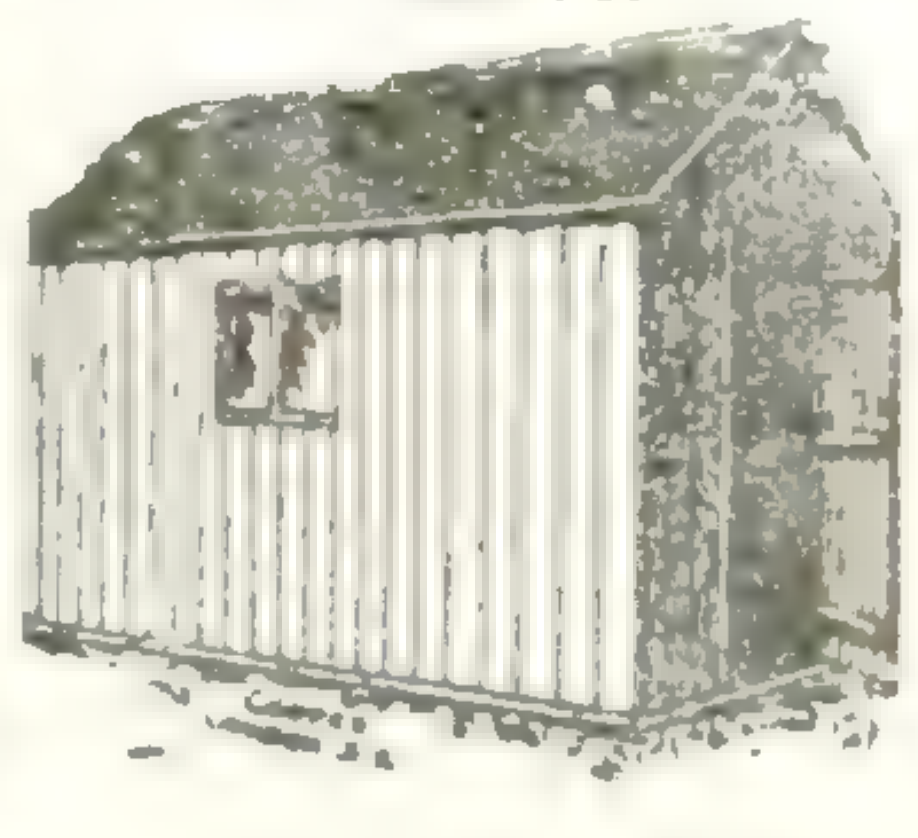
SPAN-ROOF LOOSE BOXES.

The illustration shows a range of three boxes, manger and hayrack to each In sections in readiness for erection. Any size made.

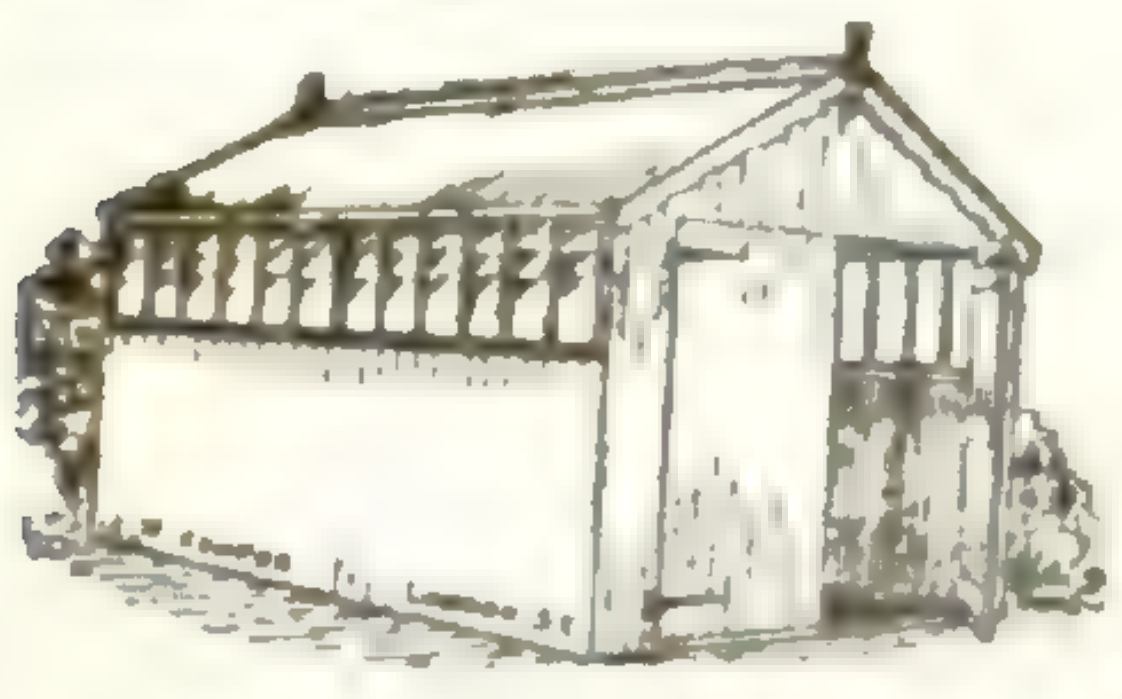
Size over all, 21ft. by 9ft., 10ft. high to ridge, and 7ft. 6in. high to eaves; £18 10s.

PORTABLE HUT.

No. 76.



Can be used for Poultry, or as Cycle Houses, Workshops, Dark Rooms, Tool and Potting Sheds, and numerous other purposes. Outside painted rot-proof composition. 6ft. by 4ft., 38s. 6d.; 7ft. by 5ft., 52s. 6d.; 9ft. by 6ft., 62s. 6d. If complete with a Good Stout Floor on strong joists, 4s. 6d., 7s., 10s. extra, respectively.



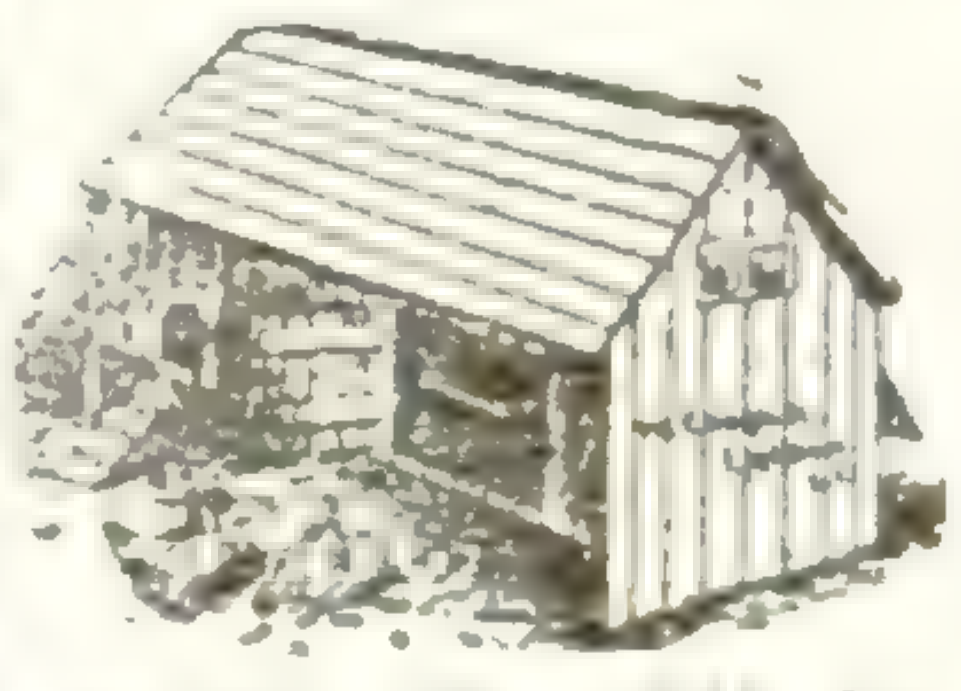
PORTABLE MOTOR CAR SHEDS.

No. 268.

10ft. by 8ft., £6; 12ft. by 8ft., £7 10s.; 15ft. by 10ft., £9 15s.; 20ft. by 12ft., £14 10s.; 30ft. by 14ft., £22; 35ft. by 14ft., £26.

THE "FAVOURITE" POULTRY HOUSE.

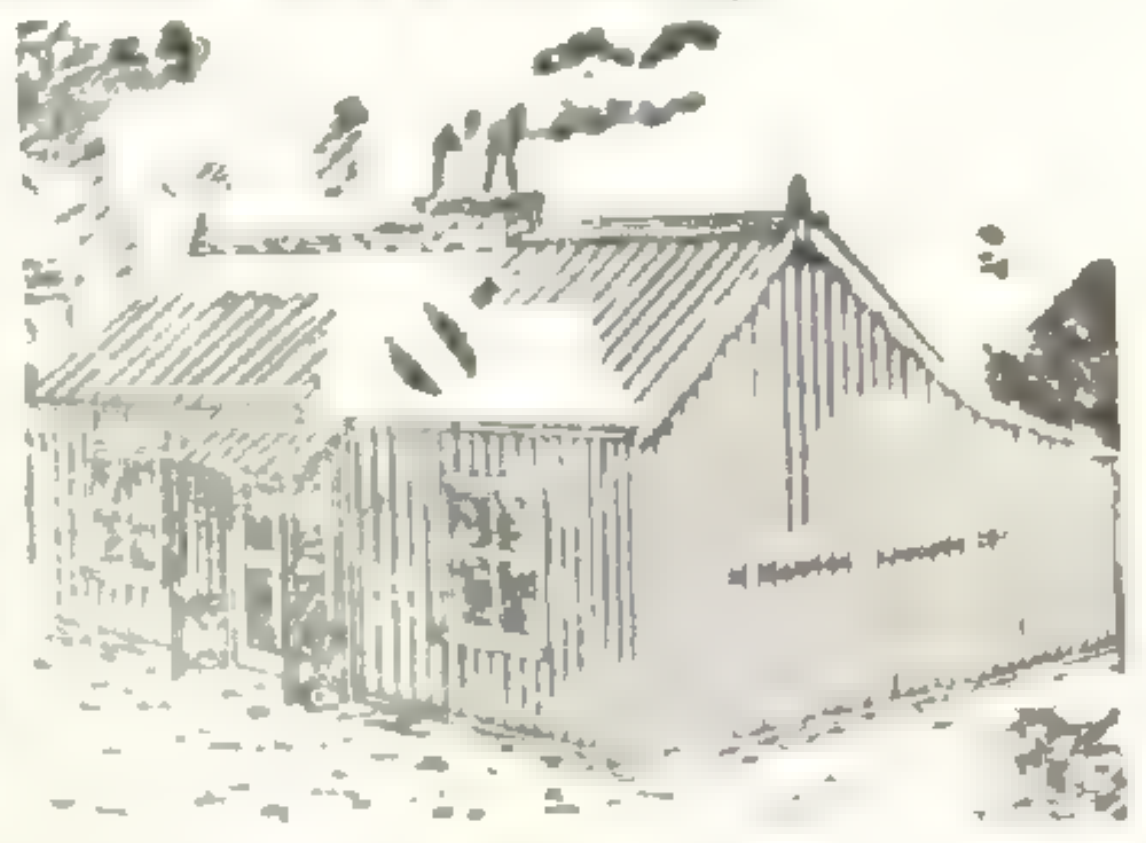
No. 71.



Made in sections, simply screwed together. A raised floor, about 2ft. from ground, so as to form a dry run underneath nest. With perch, ladder, nest boxes, etc., painted with our patent Rot-proof Composition outside, complete, 3ft. by 2ft. 6in., 17s. 6d.; 4ft. by 4ft., 24s.; 5ft. by 4ft., 27s. 6d.; 6ft. by 4ft., 32s.; 7ft. by 5ft., 40s.; 8ft. by 6ft., 47s. 6d. For numerous other designs and everything required by the Poultry Keeper, see List.

PORTABLE IRON COTTAGE.

No. 632.



Containing two Bedrooms, 9ft. by 7ft.; Sitting-room, 13ft. by 14ft.; and Kitchen, 13ft. by 7ft. Put free on Rail or Wharf, £45. Iron Buildings, from £5 See catalogue for numerous other designs.

HORTICULTURAL GLASS.

Careful packing and quality guaranteed. The under mentioned sizes in stock. All 4/21oz., 200ft. Boxes.

8in. by 6in., 9in. by 7in., 12s.; 10in. by 8in., 14s. 9d.; 12in. by 8in., 16s.; 11in., 12in., 13in., 14in. by 9in., 17s.; 11in., 12in., 13in., 14in., 15in., 16in. by 10in., 19s.; 12in., 13in., 14in., 15in., 16in. by 11in., 20s.; 12in., 13in., 14in., 16in., 18in., 20in., 22in., 24in. by 12in., 22s.; 17in., 20in. by 13in., 22s. 6d.; 16in., 18in., 20in., 24in. by 14in., 22s. 9d.; 20in., 22in., 24in. by 15in., 23s.; 18in., 20in., 22in., 24in. by 16in., 23s. 6d.; 20in., 22in., 24in. by 18in., 24s. 100ft. Boxes, half above prices and 1s. extra. Special price for large quantities. Large cases for cutting up, 28s. 200ft.

GLAZIERS' DIAMONDS.—Finest quality. New sheet perfect. Superior make and finish, 5s., 7s. 6d., and 10s. 6d. each.

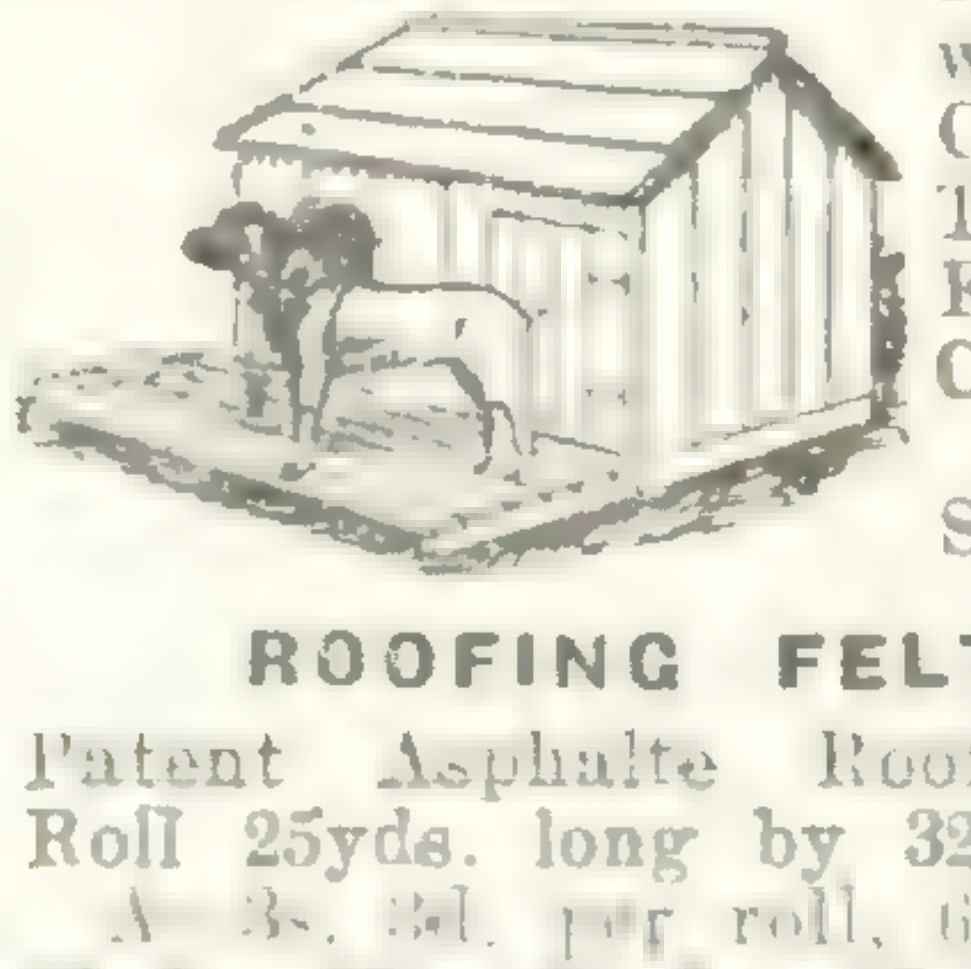
HORTICULTURAL TIMBER, etc.

Sash-bars, 1½in., 3s. 6d.; 2in., 4s. 6d.; 2½in., 5s. 3d.; 3in., 5s. 6d. per 100ft. Half-glass Door, 5ft. 6in. by 2ft. 6in., 6s. each. Half-glass Door, 6ft. by 2ft. 6in., 7s. each. Matchboards, ½in., 7s.; ¾in., 9s. 6d.; 1in., 13s. per square. Inch Floor-boards, 12s. 6d. per 100 square feet. Feather-edged boards, 7s. 6d. per square. Unplaned Battens, ¾in. by 1in., 1s. 3d.; ¾in. by 2in., 1s. 9d.; ¾in. by 3in., 2s. 6d.; 1in. by 4in., 4s. 6d.; 1in. by 5in., 6s.; 2in. by 2in., 5s. 6d.; 2in. by 3in., 8s.; 2in. by 4in., 10s. 6d.; 2in. by 5in., 12s. 6d. per 100ft. run.

Special quotations for quantities.

PORTABLE DOG KENNELS.

With Platform.
No. 209.



Soundly made, with door at side for cleaning. Painted with our Patent Rot-Proof Composition.

Terrier's size	10s. 6d.
For large Terrier	12s. 6d.
Collie and Retriever's size	15s. 0d.
St. Bernard's size	25s. 0d.

ROOFING FELT.

No. 176.

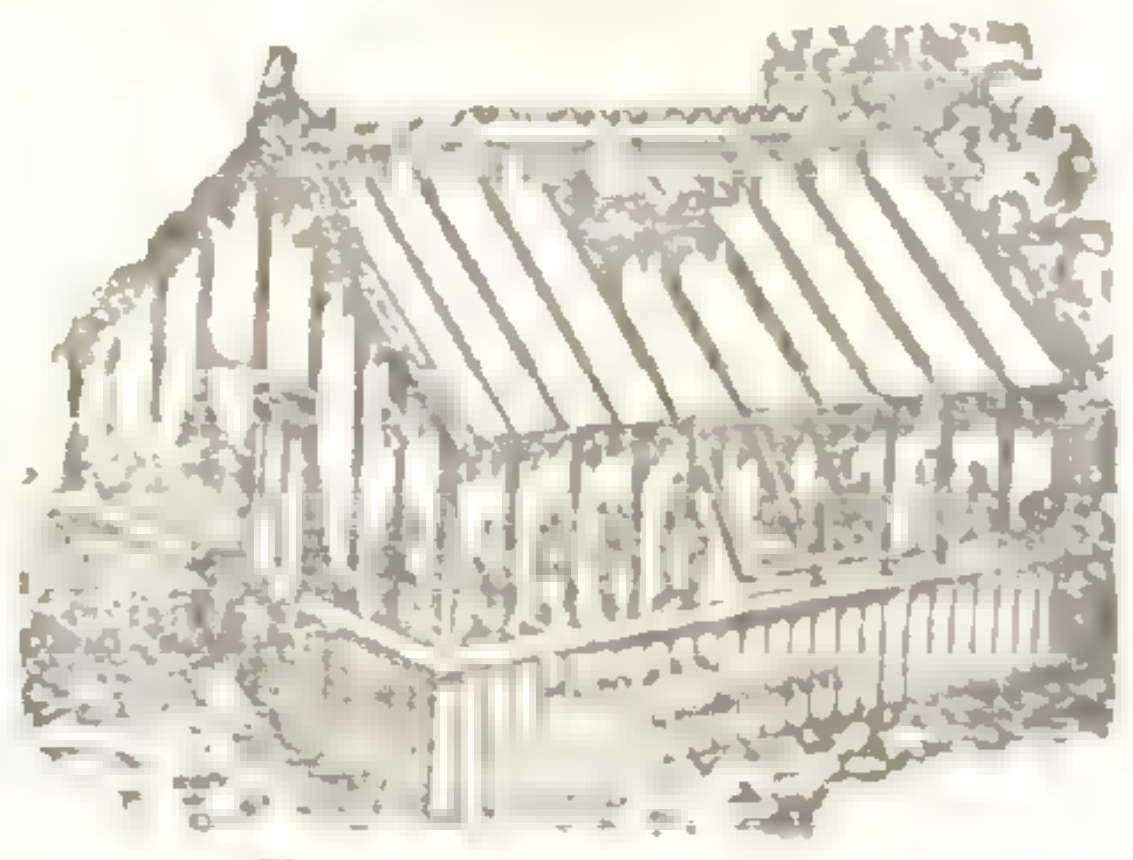
COOPER LONDON S.E.

Patent Asphalte Roofing Felt Roll 25yds. long by 32in. wide.

A—3s. 3d. per roll, 6 for 1[illegible]s., 12 for 37s., 50 for £7 10s.

B—4s. [illegible]d. per roll, 6 for 2[illegible]s., 12 for 4[illegible]s., 50 for £9 10s.

SPAN-ROOF GREENHOUSES.

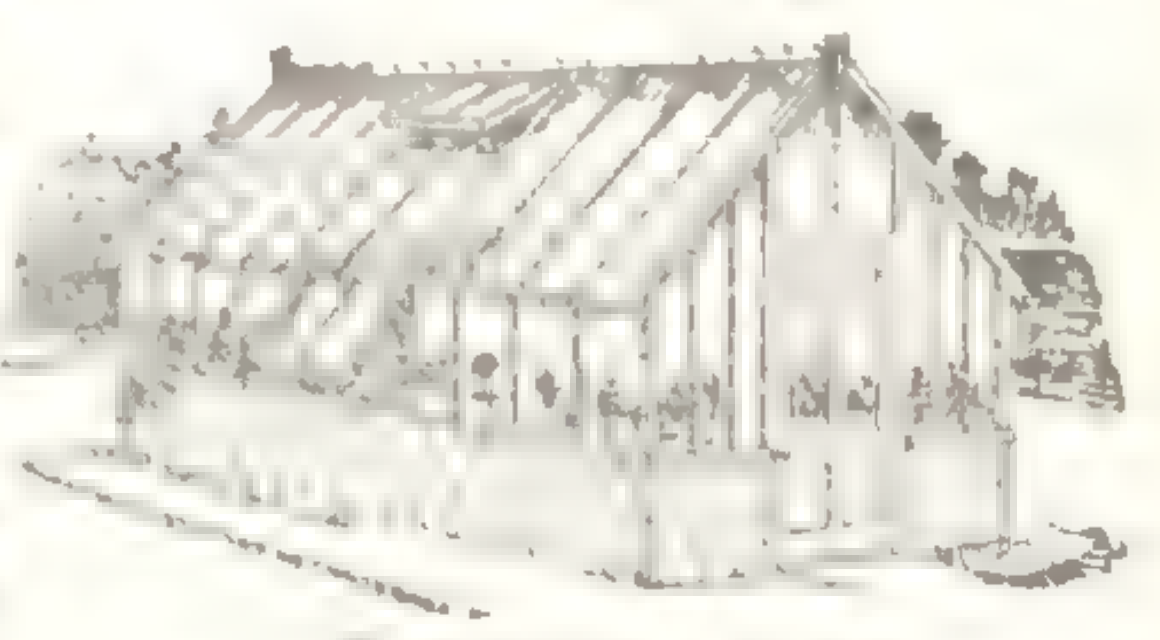


GREENHOUSE.

No. 4.

We guarantee every Greenhouse well and soundly made of thoroughly seasoned timbers. The size of framework is in proportion to the size of the house, the lower part being filled in with tongued and grooved boards. Each house is fitted with half-glass door, complete with lock and brass furniture, ventilators in the sides and roof, according to the size house, with all necessary ironwork for opening same. The whole painted one coat. Strong latticed staging for plants, each side entire length. The sections screwed together, and every part marked and numbered ready for erection on arrival. Best 21oz. glass throughout. The whole put on rail at our works. Conservatory has diagonal panels, gutters, down-pipes, and footpath.

No. 8.



CONSERVATORY.

No. 2.

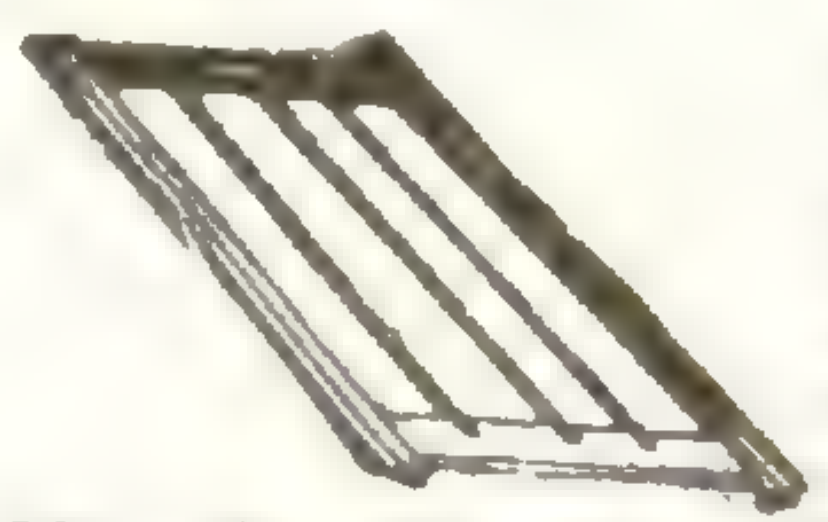
Tarred sleepers to erect these houses on 3d. per ft. run. See list for numerous other designs.

GARDEN LIGHTS.

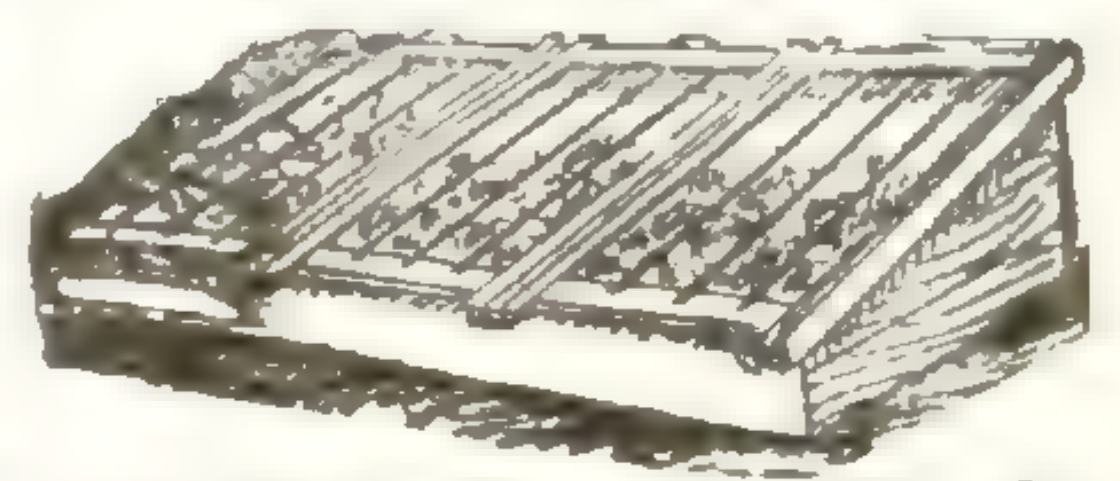
No. 43.



Well-seasoned stiles, 2in. by 2in., mortised and pinned to tenoned rails properly rabbeted for the glass, and fitted with 2in. sash-bars. Unglazed, 6ft. by 4ft., 3s.; 5ft. by 3ft. 6in., 2s. 9d.; 4ft. by 3ft., 2s. 6d; 3ft. by 2ft., 1s. 8d. Glazed, 21oz., 6ft. by 4ft., 9s.; 5ft. by 3ft. 6in., 7s. 6d.; 4ft. by 3ft., 6s.

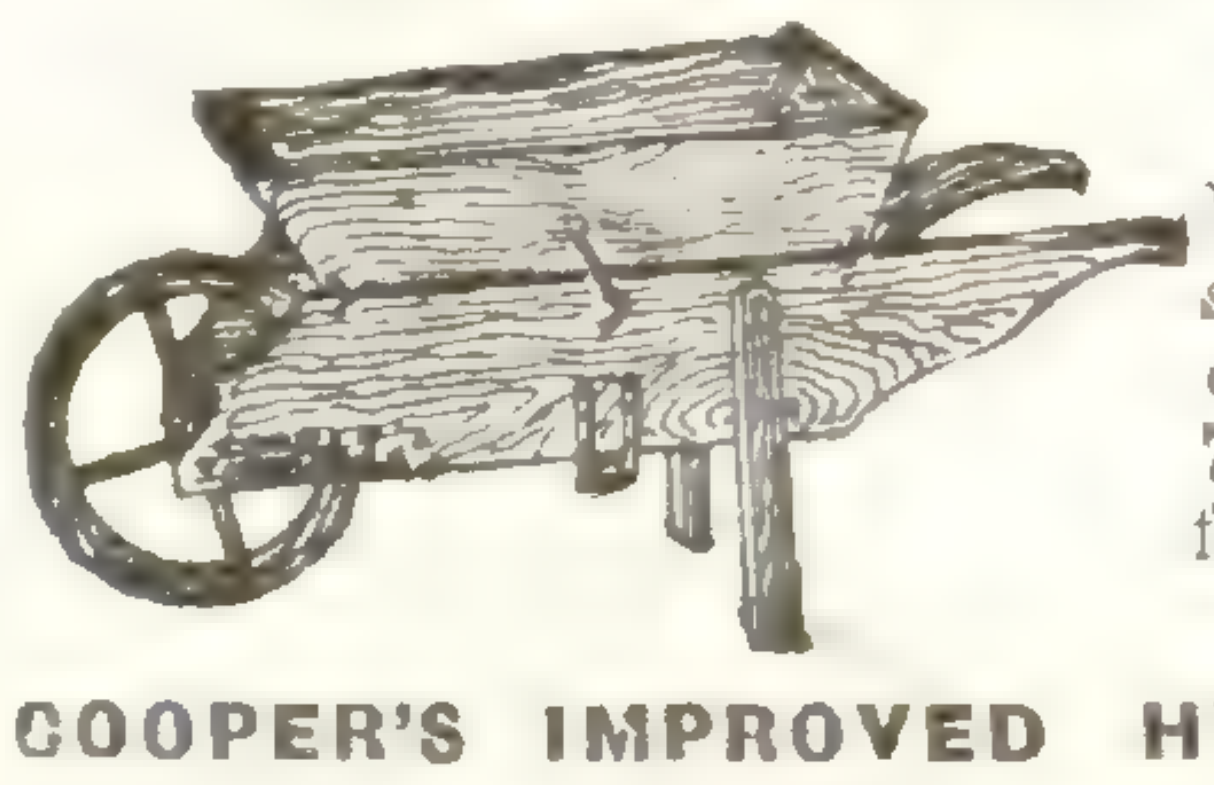
CUCUMBER FRAMES.

No. 44.



Made in 1¼in. well-seasoned tongued and grooved boards, with 2in. lights, painted and glazed 21oz. glass. 1-light Frames, 4ft. by 3ft., 16s.; 6ft. by 4ft., 24s.; 2-light Frames, 6ft. by 4ft., 26s.; 8ft. by 6ft., 42s.

BOX GARDEN BARROWS.

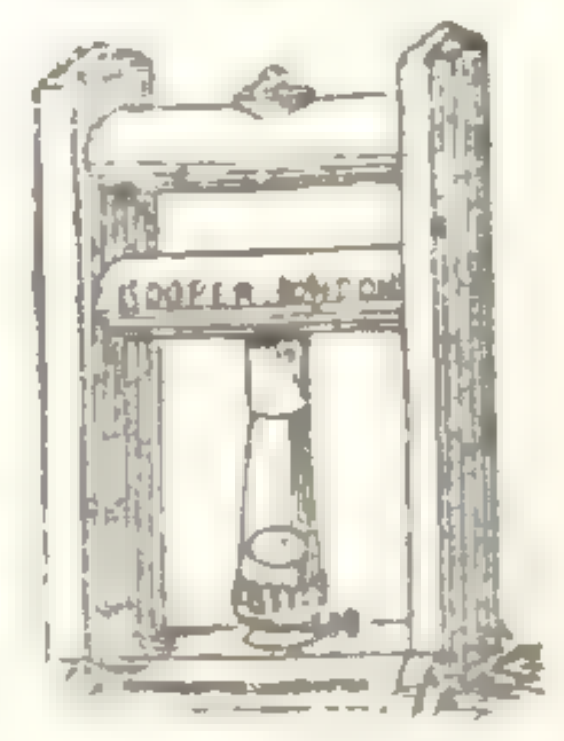


No. 915.

Without movable top, strongly made, 17s. 6d. each. Shifting top, 7s. 6d. extra. See list for other designs.

COOPER'S IMPROVED HYGIENIC HEATERS.

No. 387

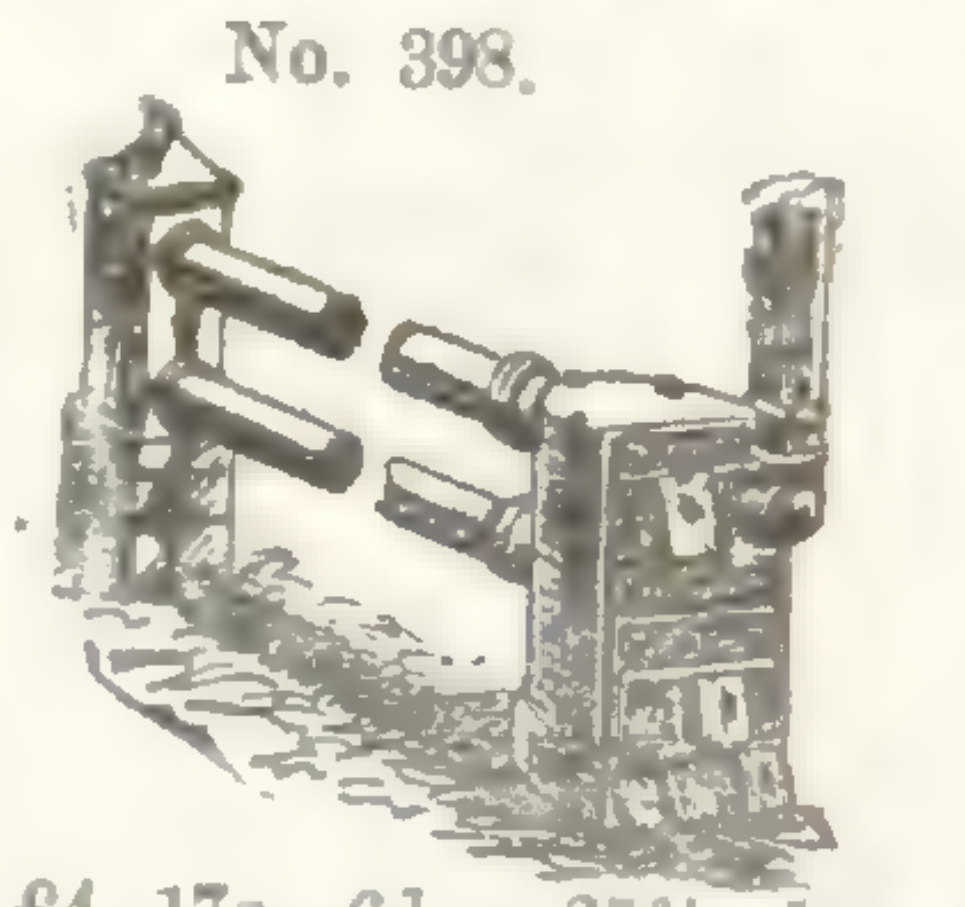


For Burning Paraffin, Oil, or Gas, without Smoke or Smell. These stoves give off neither smoke nor smell, and will keep a greenhouse from 15deg. to 40deg. above outside temperature. Portable and complete. Nothing to break. The object of the present improved stove is to give increased heat in the upper part, hitherto not obtained.

To Heat House 7ft. by 5ft., 15s.; 9ft. by 6ft., 22s. 6d.; 12ft. by 8ft., 35s.; 15ft. by 9ft., 50s.

"INVINCIBLE" HOT WATER APPARATUS.

No. 398.



Most efficient and cheapest in existence. Will last all night without attention Anyone can fix it. Success guaranteed.

To Heat House 7ft. by 5ft., £2 12s. 6d.; 9ft. by 6ft., £2 17s. 6d.; 10ft. by 7ft., £3; 12ft. by 8ft., £3 2s. 6d.; 15ft. by 9ft., £3 17s. 6d.; 20ft. by 10ft., £4 17s. 6d.; 25ft. by 10ft., £5 12s. 6d. Estimates for large quantities free on application. Every make of boiler supplied.

GALVANISED CORRUGATED IRON.

Long	3ft.	4ft.	5ft.	6ft.	7ft.	8ft.	9ft.	10ft.
Each	11d.	1 3	1/7	1 10	2 2	2 5	2 10	3 4

All Prime Sheets. Special Quotations for quantities.

Estimates for Every Description of Horticultural Wood and Iron Buildings, Heating Apparatus, and Poultry Appliances, Free.

SURVEYS BY APPOINTMENT.—When required, we shall be pleased for one of our representatives to wait upon ladies or gentlemen at their residences in any part of the country to take all necessary particulars, give advice, etc., and submit Plans and Estimates in accordance with his report. We also undertake repairs and alterations of or additions to existing houses or heating apparatus.

Ordinary Illustrated Catalogue Post Free.

W. COOPER, Ltd., 761, Old Kent Road, London, S.E.

Business Hours from 9 a.m. to 6 p.m. Saturdays Included. Trams from all the Bridges Pass the Door.

NEW PLANTS, ETC.

CATTLEYA RHODA FAIRLAWN VAR.

A beautiful form, remarkable for its rich colouring; the sepals and petals red-purple and the lip bright claret, marked with lines of gold. F.C.C., R.H.S., August 30; H. S. Goodson, Esq. (gardener, Mr. G. E. Day), Fairlawn, Putney.

LÆLIO-CATTLEYA GOLDEN ORIEL TIGRINA.

A brilliantly-coloured hybrid; the sepals and petals orange-red; the lip deep crimson with golden lines at the base. Remarkable for the number of flowers produced on one spike, and its effectiveness. A.M., R.H.S., August 30; Sir George L. Holford (orchid grower, Mr. H. G. Alexander), Westonbirt, Tetbury.

CATTLEYA HARDYANA HOLFORD'S VARIETY.

A distinct and attractive form. The flowers are large, the sepals and petals rose-lilac, the lip bright crimson. A.M., R.H.S., August 30; Sir George L. Holford.

CATTLEYA ADULA VALE BRIDGE VARIETY.

A beautiful variety; the flowers large with broad petals and sepals, which are brownish, suffused bright rose-purple, the lip royal purple. A.M., R.H.S., August 30; Mr. E. V. Low, Vale Bridge Nursery, Haywards Heath. (See illustration, page 683, of last week's issue).

LOBELIA SAM BARLOW.

A beautiful variety, belonging to the L. cardinalis section. The plant is vigorous, and produces finely-developed spikes of flowers, which are of a bright carmine hue. A valuable addition to the section. A.M., R.H.S., August 30; Messrs. Barr and Sons, King Street, Covent Garden, W.C.

BUDDLEIA VARIABILIS GIGANTEA.

A handsome form, bearing large inflorescences of lavender-blue flowers. A.M., R.H.S., August 30; the Hon. Vicary Gibbs (gardener, Mr. E. Beckett), Aldenham House, Elstree.

ROSE DAPHNE.

A charming polyantha that is free and perpetual in flowering, and described as mildew-proof. The blush-pink flowers are semi-double, and produced in large clusters, and have a fragrance, resembling that of the Musk rose. The variety, we understand, grows to a height of seven or eight feet. A.M., R.H.S., August 30; Rev. J. H. Pemberton, Havering, Essex.

PHLOX ELIZABETH CAMPBELL.

A dwarf-growing and late-flowering variety of the most attractive character. The flowers are large and of fine form; the colour soft salmon-pink. A.M., R.H.S., August 30; Messrs. W. Wells and Co., Lim., Merstham.

DAHLIAS.

Mrs. Douglas Fleming.—An elegant cactus variety; the blooms large and of high quality; creamy white. A.M., R.H.S., August 30; Messrs. J. Stredwick and Son, St. Leonard's.

Crystal.—A beautiful cactus variety, the flowers of full size and fine form; the colour rich pink, passing to white at the points of the florets. A.M., R.H.S., August 30; Messrs. J. Stredwick and Son.

Leander.—A richly-coloured single variety, the flowers perfect in form, the florets deep maroon, with broad, well-defined margin of bright crimson. A.M., R.H.S., August 30; Messrs. J. Cheal and Sons, Crawley.

Garden Yellow.—A yellow cactus variety that is evidently of much value, both for the garden and the exhibition stage. The flowers are of full size and fine form, and have long stiff stalks. A.M., R.H.S., August 30; Mr. H. Shoesmith, Woking.

Theresa.—An elegant cactus variety, the blooms of full size, and delicately tinted rose on a cream-white ground; the blooms have long, stiff stalks. A.M., R.H.S., August 30; Mr. Charles Turner, Slough.

Guinevere.—An exquisitely-formed pompon remarkable for its distinct colouring, which may best be described as a combination of rose and salmon. A.M., R.H.S., August 30; Mr. C. Turner.

GLADIOLI.

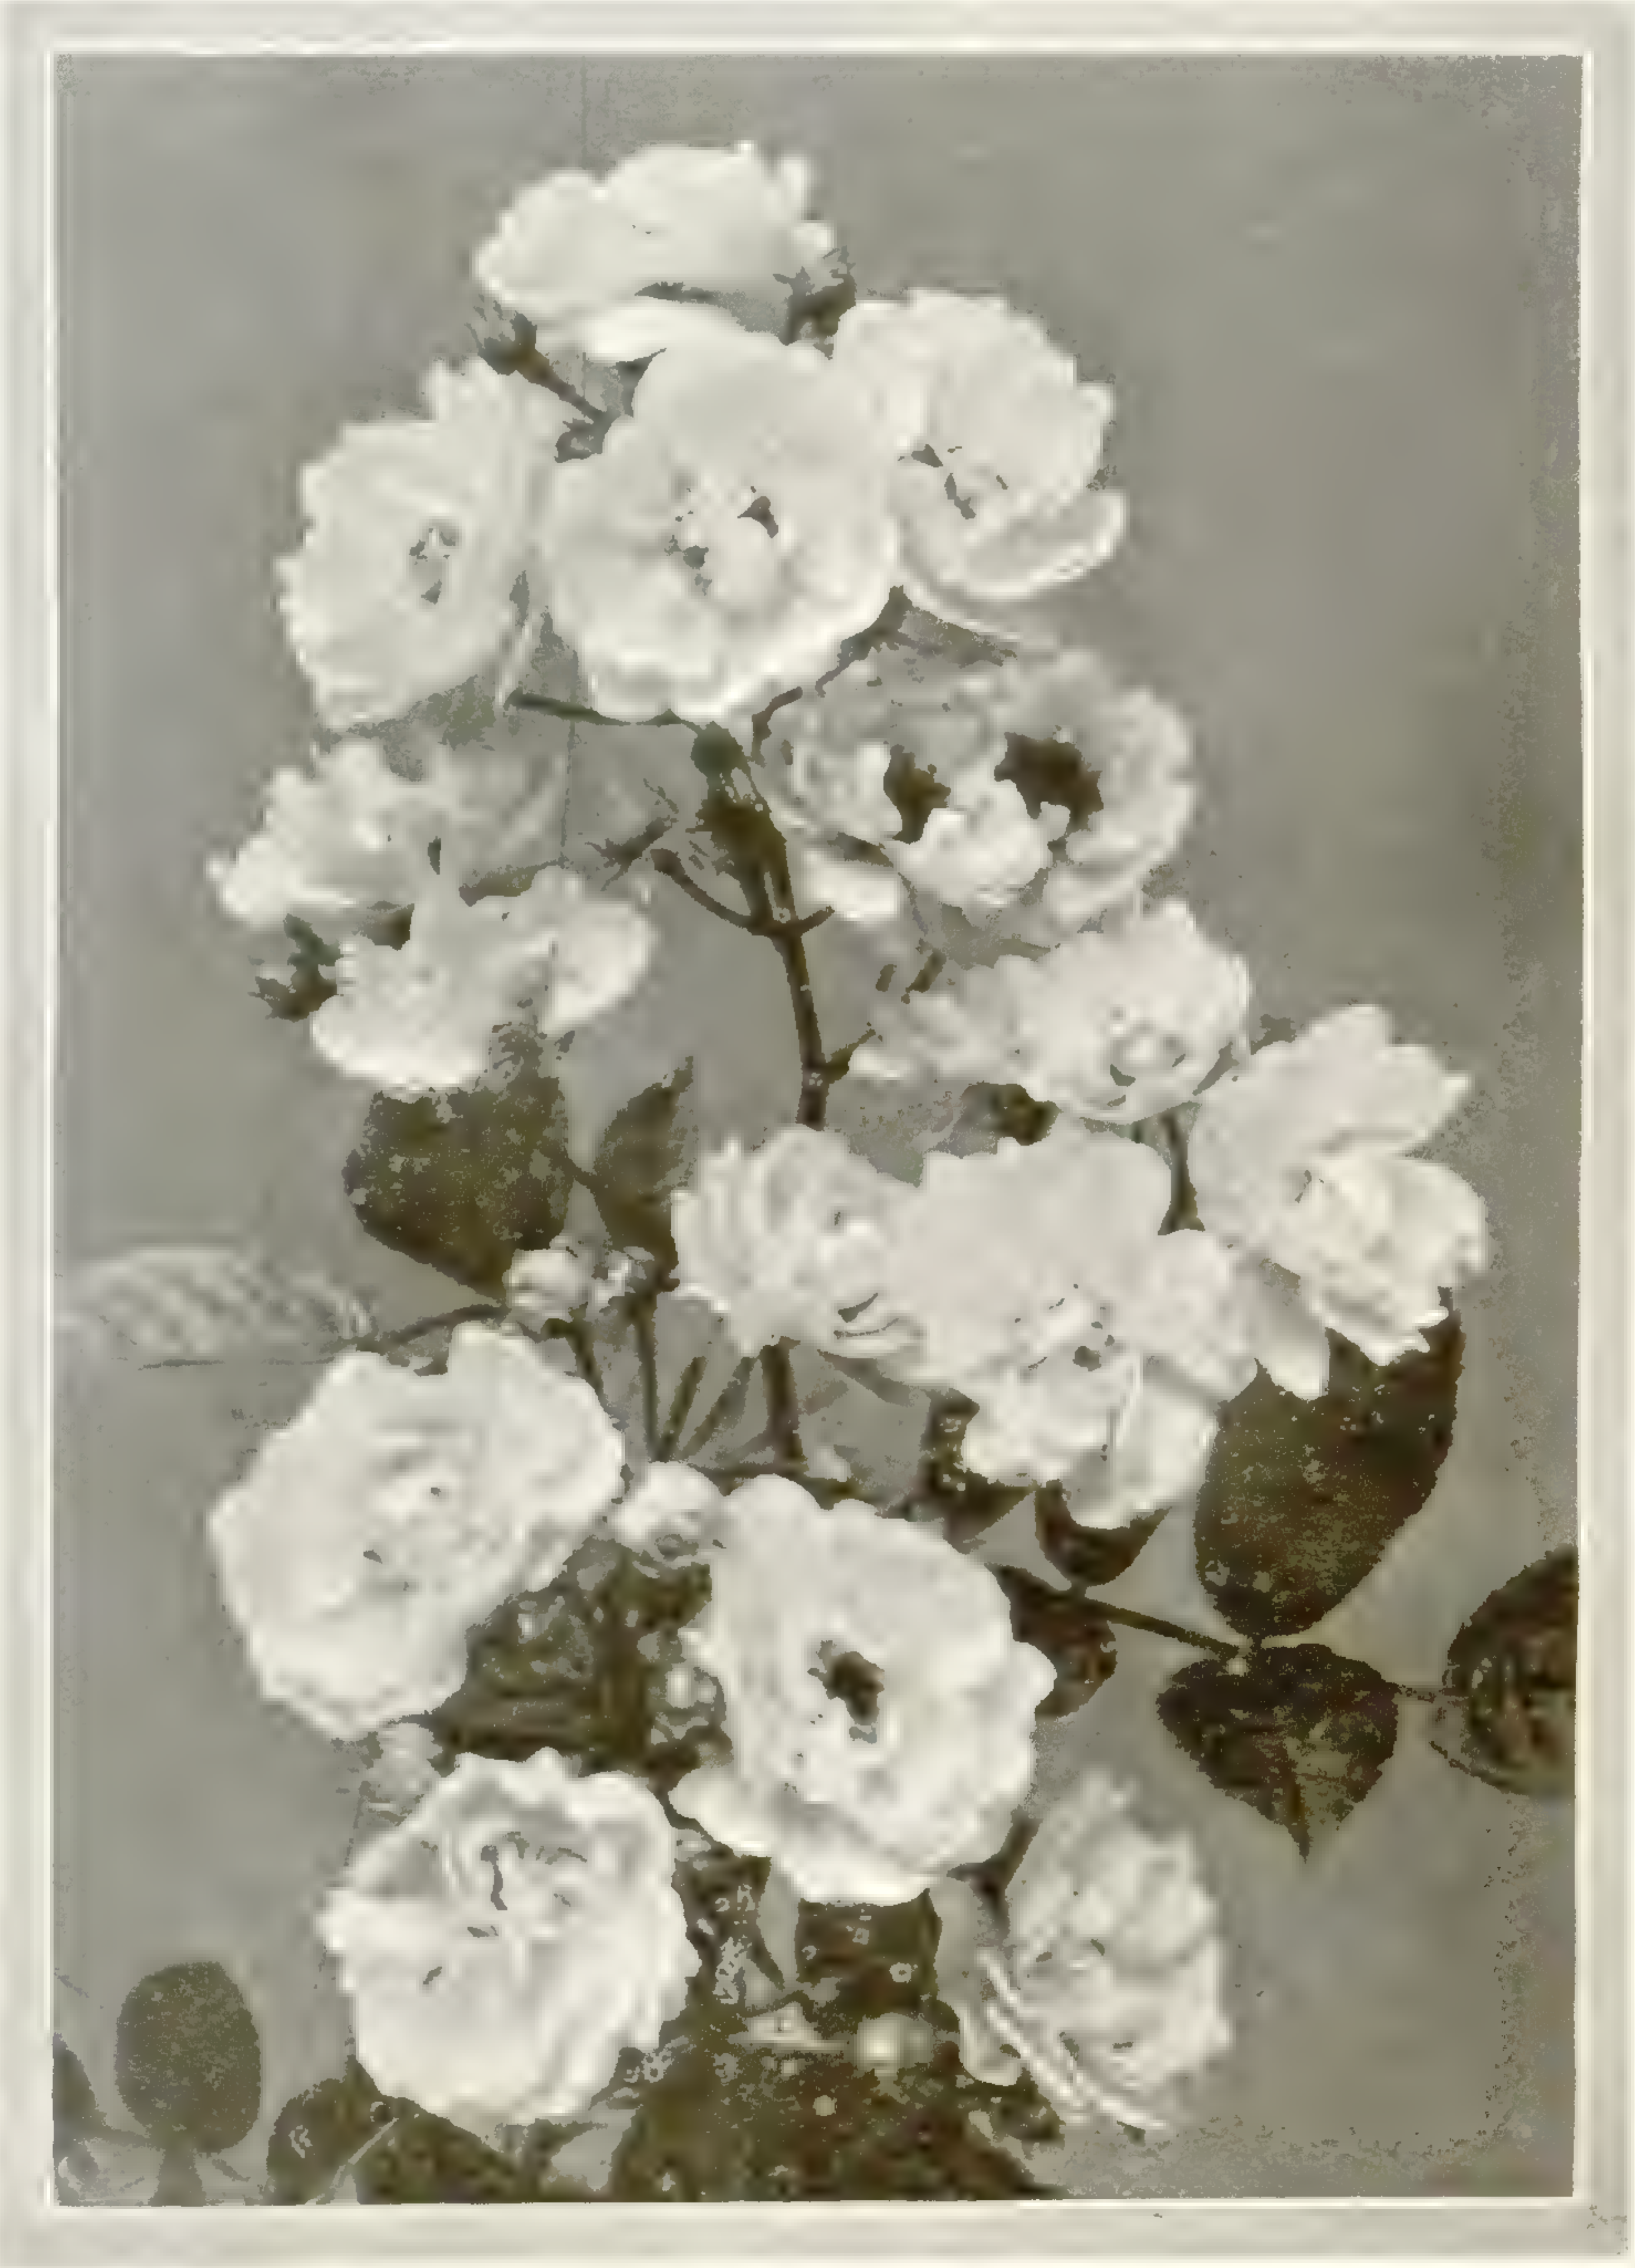
Le Luna.—An attractively-coloured variety belonging to the Nancieanus section. The flowers are of large size, and borne in good spikes, and are marked with crimson and rose on a rich cream-coloured ground. A.M., R.H.S., August 30; Messrs. Barr and Sons.

Safrano.—A handsome variety; the flowers large, with segments frilled at the margin; the colour yellow, tinted buff, and marked with crimson. A.M., R.H.S., August 30; Messrs. Vilmorin and Co., Paris.

PASSIFLORA CÆRULEA.

This climber will succeed well in a partially sheltered position on an open wall in nearly all the southern counties. Not only does it bear flowers in profusion, but fruits also in the early part of the autumn.

For many years I have observed one particularly fine specimen growing in the open in a south-west aspect, and each autumn a large number of handsome fruits of varying shades of yellow and orange depend gracefully from its branches. The specimen is growing in a light sandy soil, and in dry summers the latter becomes very hot, and quickly dries, but at the end of such a season the fruits are more plentiful than after an ordinary summer, or one that has been rather wet. This passion flower is not naturally a good climber; indeed, the shoots rarely creep upwards even where wires are provided, they fall, but cling to each other, forming a dense mass. So it is advisable to tie up the young shoots as they grow, then the flowers will be more evenly disposed all over the plant, and, of course, the resultant fruits also. I would strongly advise inexperienced cultivators to take every care of old specimens, as they generally fruit much more freely than young ones. B.



NEW POLYANTHA ROSE DAPHNE.
Flowers blush-pink and reduced to about half natural size. A.M., R.H.S., August 30.
Rev. J. H. Pemberton.

Freesias.—Now that the time has come around for the potting of these pretty bulbous plants, attention may with advantage be directed to the fact that very frequently the bulbs supplied by some dealers as F. refracta alba produce flowers of a poor, undecided yellowish tinge. Such being the case, purchasers should always insist upon the true F. refracta alba being supplied, that is, where this form is needed.—W. T.

Fuchsia Sylvia.—Fuchsias so seldom now receive any recognition from the Floral Committee of the Royal Horticultural Society that it is interesting to note this variety was recently given an Award of Merit. As shown, it appears to be exceedingly floriferous in a small state, and one that is no doubt destined to become more popular. The tube and sepals are of a bright-red colour, while the double corolla is of unusual length, and in colour white.—W. T.

BEST PLANTS FOR GREENHOUSE.—Nearly 300 pages are devoted to the description, propagation, and culture of the best flowers and plants for the greenhouse in The Amateur's Greenhouse, by T. W. Sanders, price 5s. net, or by post 5s. 6d., from W. H. and L. Collingridge, 148, Aldersgate Street, London.

ROSE NOTES.

In spite of the oft-repeated advice to thoroughly prepare the ground or border for climbing roses, do we not frequently come across a grand plant or two to which such attentions had never been paid? One such case came before me to-day. In this instance a plant of Gloire de Dijon had been set in by a cottager some eight or nine years back. A narrow brick path runs by the side of the house, connecting itself with the house wall, except where three bricks were removed to allow of the rose roots being placed in the quite unprepared soil, and in a most perfunctory manner. It was a small and weakly plant, and yet it has flourished from the first in such a manner as might well surprise one had the tree been paid every attention. That this is by no means a solitary instance any observant person will bear out, for do we not often find upon cottages, where it is obvious the plant had had scarcely any attention, a grand specimen? Not of roses only, but other climbers.

LOBELIA SAM BARLOW.

Flowers bright carmine. A.M., R.H.S., August 30. Messrs. Barr and Sons.

It is not my aim to depreciate the better culture advised, but the mistake of laying down hard and fast rules upon any form of culture has been borne upon me frequently of late, and this example heightened it. But how can we account for it? Where does the need for high cultivation come in? When we think a little it seems wonderful where the plants procured their sustenance for such rampant growth as one frequently sees with Banksians and others in similar positions. Warmth from the wall may aid the roots to an extent, but my opinion is the plants just happened to succeed, and to push some of their roots away into suitable soil. One often finds roots of such a long way from the base of the plant, and deeper in the ground than would be disturbed by ordinary culture beyond the narrow footway. But I have in mind a cobble-paved stable yard where some roses are also doing remarkably well, and this seems to confirm my remark about no hard and fast rules being necessary. Nor can roses in such positions be fed with liquid manure; while I know for a fact, in many cases, they have no attention after planting. Nor is it invariably the extra-strong growers which thrive in this way, for I have seen Narcisse and Madame Falcot in similar condition.

There is considerable work to be done among pot roses now, if we are to secure early winter flowers. Drain and repot where necessary, while almost all will benefit from a slight mulch of quite fresh compost. The earliest will need pruning, but might well stay in the open for a time longer. I would avoid, as far as possible, any waterlogging or excessive saturation of the soil from autumnal rains, and have sometimes laid the pots on their sides for a time to prevent this. Under glass, too, the wood wants thinning, and all light and air possible admitted to complete the ripening. Much may be done in this way by the removal of superfluous wood and fully matured or falling leaves.

The present is also a good time to root cuttings of ripened wood of the strongest growers in the open. We prefer any position rather than a dry and scorching south border; while it is better to insert the cuttings deeper than most practice. One, or at most two, eyes above the ground are ample. A clean sandy loam alone is preferable to any mixture, and manures should be avoided entirely.

Recently I mentioned how free our roses were from mildew. They are so still; but I am sorry to note signs of this disease, especially upon Queen of Spain and Her Majesty. At the time of writing the show of blossom upon the teas and their hybrids, also polyanthas (dwarfs), and Chinas, are as full as at any time, and promise to continue. Indeed, I feel I could write much in praise of the dwarf polyanthas and such grand Chinas as Eugene Resal and Comtesse de Cayla. They please more and more each season one grows them, and I do not call to mind once when they failed.

A. Piler.

LILIUM CANDIDUM.

In some gardens these lovely flowers are very satisfactory, but in others they are almost a failure. Even in the same garden bulbs may do well in one border and not in another. When I took charge of one garden the liliums in question were in a very unsatisfactory condition. Each year, for some time past, the strength of the stems and size of the blooms had been diminishing. I do not know how they had been treated, but they certainly did not improve when I gave them rich top dressings of rotted manure and fibrous loam, so I decided to lift and replant the bulbs in another part of the garden. Directly the stems would part readily from the bulbs the latter were lifted, but, in the meantime, a new border was prepared, the soil being trenched about thirty inches deep. Some new loam was freely mixed with the original soil, and rotted manure also. The bulbs were lifted, and replanted without the least delay, the largest specimens in one quarter and the smaller ones in another. The bulbs certainly suffer if exposed to the air for a long time after being dug up.

For several years afterwards the lilies did remarkably well, producing strong stems and bearing a good complement of flowers of large size, and the leaves faded naturally. Then they began to deteriorate again, and so I lifted them, separated the large from the small bulbs, and replanted in other borders in prepared soil. I tried growing the bulbs in several different parts of the garden—a vegetable and fruit garden six acres in extent, which afforded ample opportunity for change—but always with the same poor result. Some bulbs, when lifted, were washed, others were not.

Geo. Garner.

Hypericum calycinum.—To the selection of hypericums given on page 574 no exception can be taken, except that this, one of the finest members of the genus, is omitted. True, it is the commonest of all, but is at the same time a delightful low-growing shrub. The flowers are among the largest of all the hypericums; they are borne over a considerable period, and are of a beautiful rich yellow colour. This hypericum has been before now referred to as the Rose of Sharon, a name also sometimes given to Hibiscus syriacus.—W. T.

CHILDREN'S WILD FLOWER COMPETITIONS.

Since Nature study has become so prominent a subject in the elementary school curriculum there is an awakening interest associated with the summer horticultural shows. At some of these prizes are specially set apart for school children, and at several shows that we have visited there have been hundreds of entries. Such enterprise cannot be other than conducive to the children's good, because in holiday periods there is pleasant occupation in seeking out the more beautiful and rare species.

The naming of the individual specimens should be insisted upon, because it not only instructs the children themselves, but adds to the interest of the exhibition to the general body of visitors. Bunches of mixed wild flowers are very well in themselves, but the finding of the rarer species raises a real and intelligent tone of intellect unaffected by the gathering and bunching of common wayside kinds. School teachers, we find, in spare time take their classes of boys and girls into the lanes, and along field hedges, and, where possible, on open plains, in search of choice kinds, and such trips cannot be otherwise than helpful to children and teachers alike. At the Trowbridge Horticultural Society's show—one continued for the long uninterrupted span of sixty-one years—there has been for two or three seasons a separate tent allotted to the children's wild flower exhibits which embrace several classes and characteristics. The main object in encouraging these exhibits is to make the competition instructive and entertaining to the children and the community at large. Prizes in kind, mostly in well-chosen books, are those provided by the donors, varying, of course, in value according to the subject for which the awards are made. Public presentations of prizes add still more to the pleasures of the scheme, the more popular winners giving occasion for an exciting cheer as they present themselves at the bidding of the superintendent.

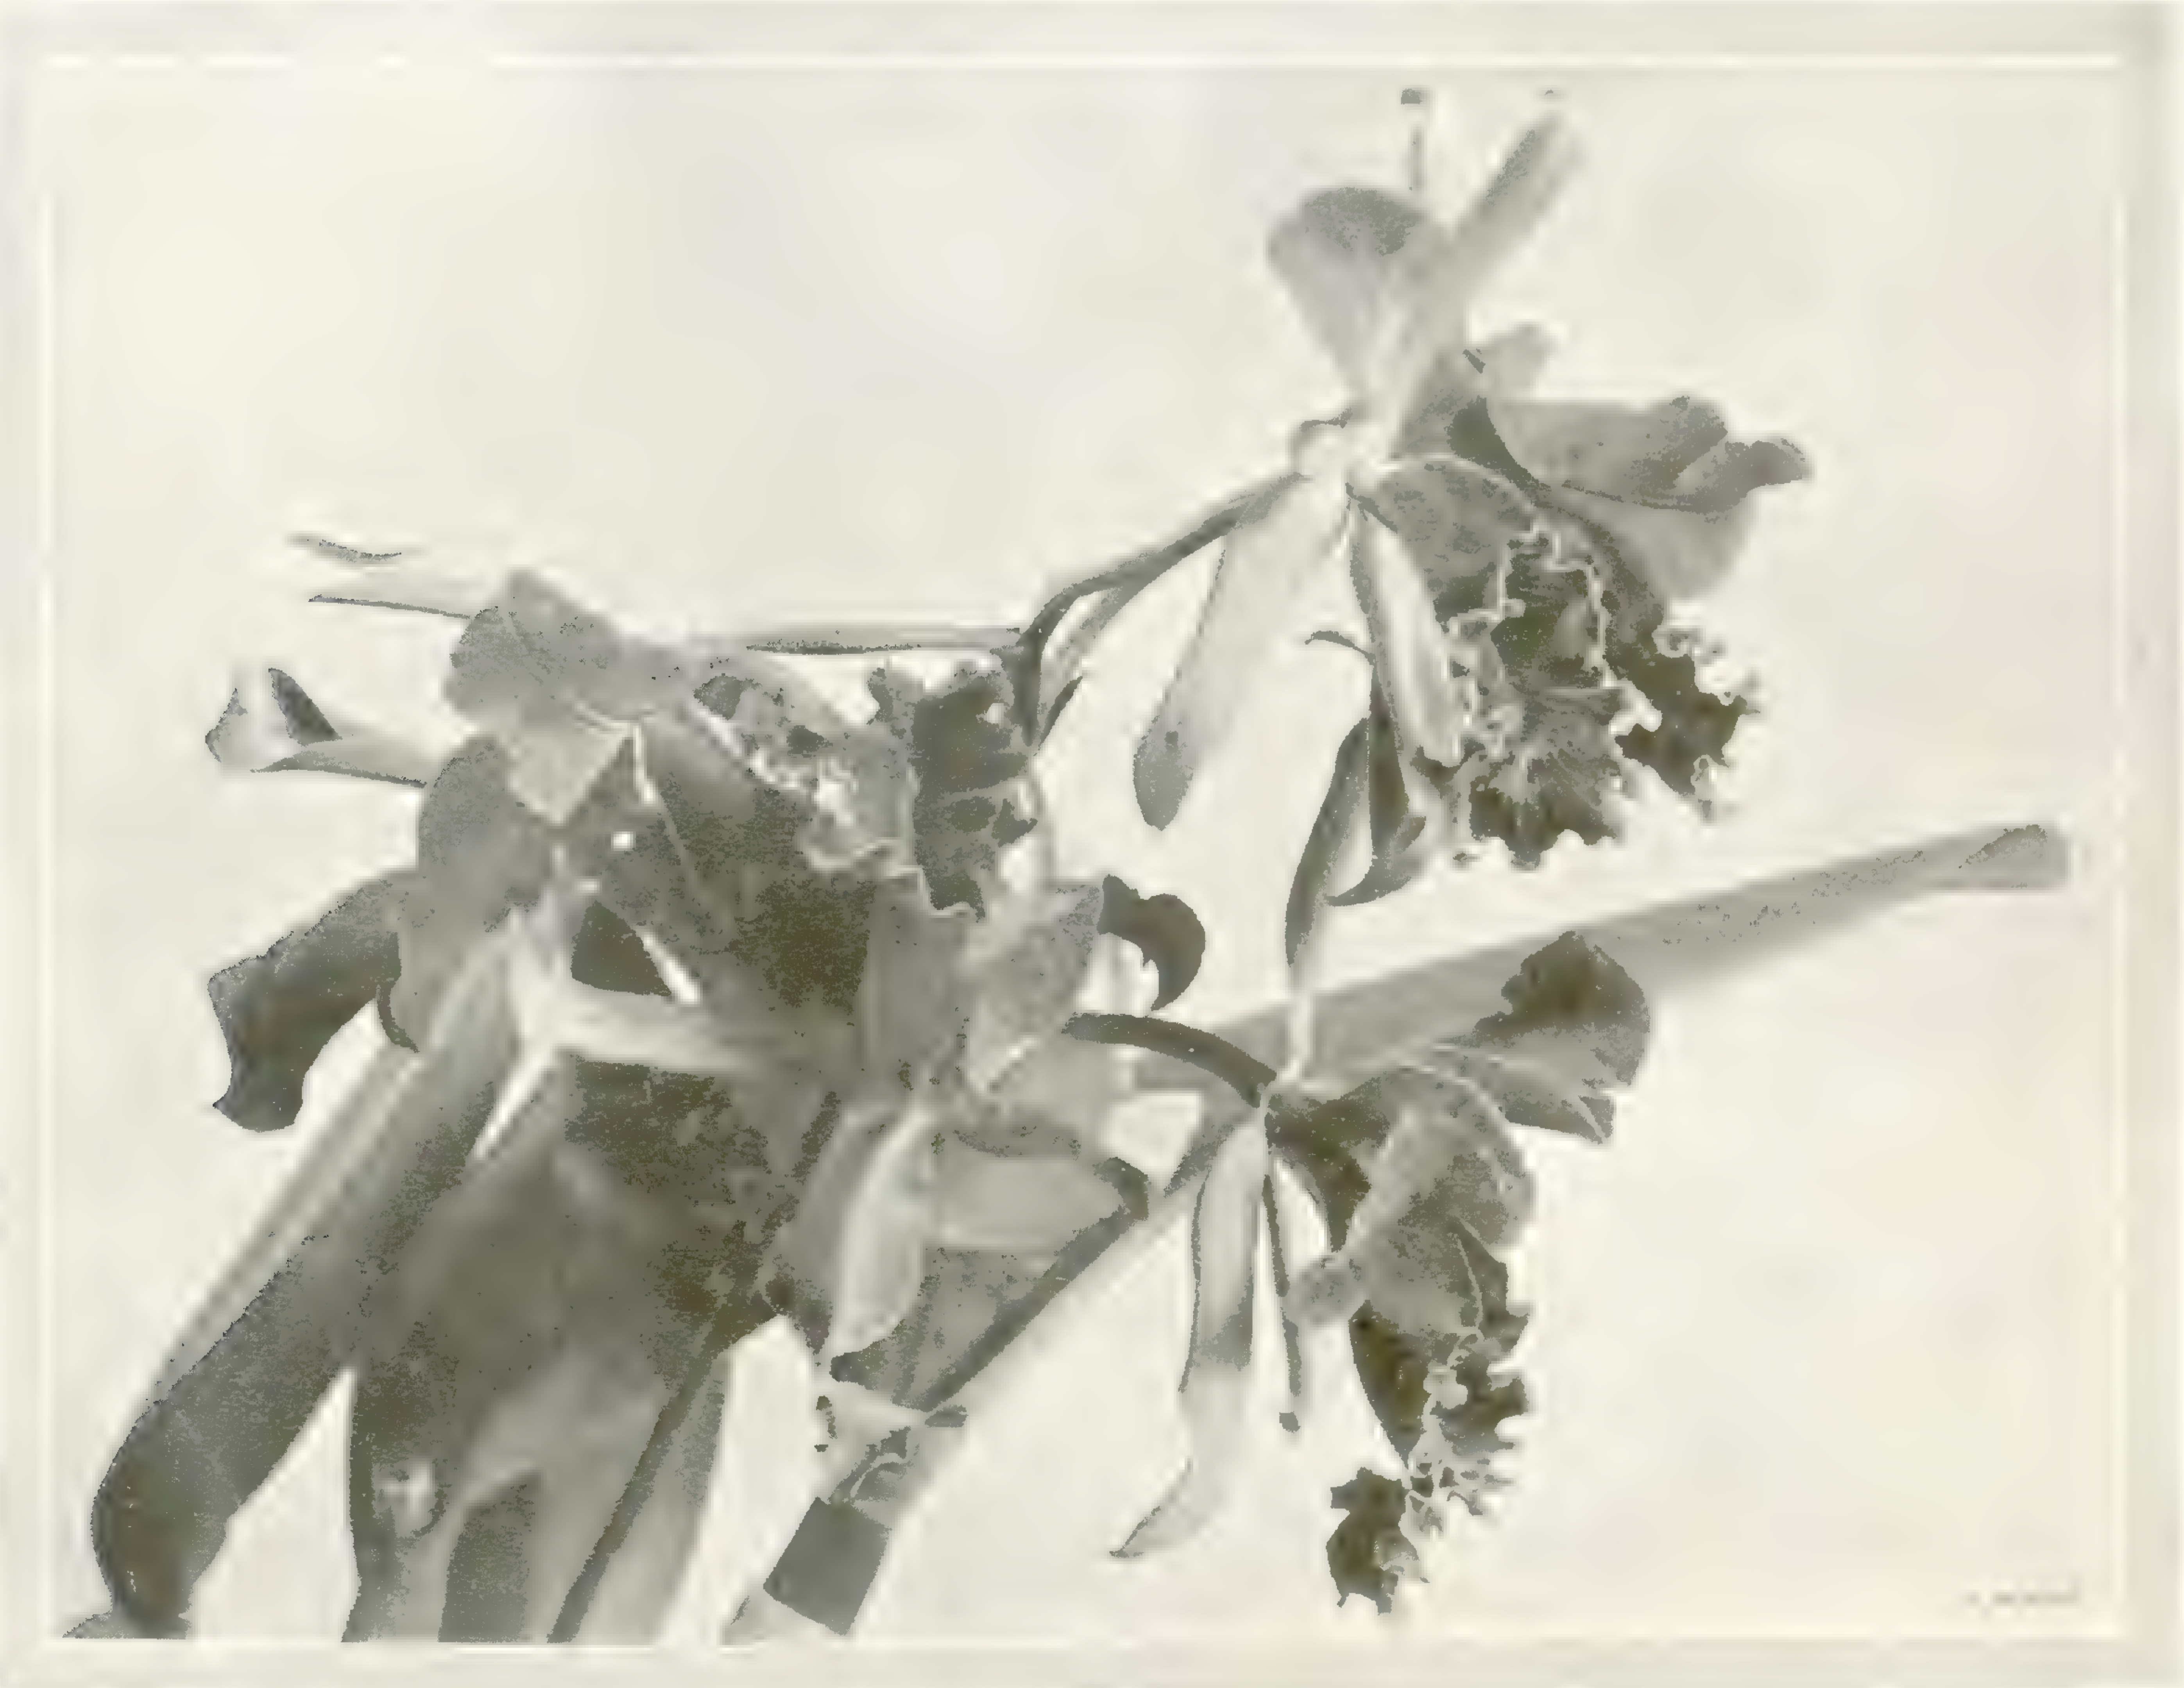
At this show, and also at another more youthful aspirant, running under the title of the Floricultural and Sweet Pea Society, children have hyacinth and daffodil, sweet peas, as well as wild flower contests, in all of which the Rev. Harry Sanders, a local gentleman, is the principal moving spirit, and has been from its inception. Mr. Sanders personally undertakes exploring expeditions in the adjacent countryside during the spring and summer, as do the teachers of the several town schools. Many of these gentlemen, being more or less expert in botanical knowledge, add to their store by these often extended excursions among field crops, the hedges, lanes, and commons. It is, of course, common knowledge that the rarer species are found only in certain localities, and long journeys must be undertaken in order to secure even solitary specimens. It is found that among teachers and scholars there is a grasp and keen intellect markedly evident, as applied to the individual, and there is no doubt a considerable value in botanical tuition, as affecting the youthful community. With even a limited knowledge, a person during a quiet stroll in the country can make almost every step taken a personal pleasure, whereas those not so endowed or enlightened find boredom in taking a walk. It matters not where the location of the individual may be, there is botanical research to be found if the mind is bent thereon. It has been said that among the residue of demolished buildings in the famous "Kingsway," in the heart of London, wild flowers of certain species, common they may be, have taken possession, and the commonest have an interest to the cultured mind.

It cannot be denied that included in the British flora there are many, very many, really beautiful flowers, as, for instance, the fragrant honeysuckle and wild rose, the rarer bee orchis, and the nodding harebell. In the neighbourhood of Mells, a village in rural Somerset, there are both numerous and rare species abounding. This village, rich in iron and limestone formations, woodland, field, and lane, offer attractive hunting ground to the botanist, and at the late summer show the interest centred in botanical studies was plainly reflected in the children's wild flower classes—in bunches, and individual specimens separately grouped. It is not necessary to recount the names; indeed, it would be no easy task to do so, for quite experienced botanists required their handbooks to ascertain them, so unfamiliar were some of the specimens on view.

To us, it seems a phase of floriculture deserving even more encouraging enterprise than is actually given, but as Nature study now becomes a prominent subject in schools, no doubt in the near future field and hedgerow flowers will be as well known as the asters and stocks of the garden. We do not know what is the attitude of school authorities in other counties, but in Wilts and Somerset there is an extending interest in the local flora, examples that might well be emulated by every British county. County Educational Committees would seem to be awakening to the inspiring influence of the simple wild flower as applied to child life in town and country.

W. Strugnell.

Rood Ashton Gardens.



LÆLIO-CATTLEYA GOLDEN ORIEL TIGRINA.

Rich orange red with crimson lip. A.M., R.H.S., August 30; Sir George L. Holford.

FERTILITY OF THE SOIL.

The President of the Agricultural Sub-Section of the British Association, which has this year held its meeting at Sheffield, was Mr. A. D. Hall, director of the Rothamsted Experimental Station, who devoted his presidential address to an account of the causes of the fertility of the soil.

In the course of his address, which was immensely interesting, and remarkable for lucidity of statement, Mr. Hall directed attention to the fact that Professor Daubeny, who for a considerable period occupied the Chair of Botany and Rural Economy at Oxford, was the first to point out the enormous difference between the amount of plant food in the soil and that taken out by the crop. Daubeny obtained by his experiments the results with which we are now familiar, that any normal soil contained the material for from 50 to 100 field crops. If, then, the growth of the plant depended upon the amount of this material it could get from the soil, why was that growth so limited, and why should it be increased by the supply of manure, which only added a trifle to the vast stores of plant food already in the soil? For example, a turnip crop would only take away about 30lb. per acre of phosphoric acid from a soil which might contain about 3,000lb. an acre; yet unless to the soil about 50lb. of phosphoric acid in the shape of manure was added, hardly any turnips at all would be grown. Daubeny then arrived at the idea of a distinction between the active and dormant plant food in the soil. The chief stock of these materials, he concluded, was combined in the soil in some form that kept it from the plant, and only a small proportion from time to time became soluble and available for food. He took a further step and attempted to determine the proportion of the plant food which could be regarded as active. He argued that since plants only took in materials in a dissolved form, and as the great natural solvent was water percolating through the soil more or less charged with carbon dioxide, therefore in water charged with carbon dioxide he would find a solvent which would extract out of a soil just that material which could be regarded as active and available for the plant.

Bacteria and Nitrates.

When the systematic study of plant-nutrition began, it was demonstrated that plants could only obtain their supply of the indispensable element nitrogen when it was presented in the form of a nitrate, but it was not until within the last thirty years that they obtained an idea as to how the nitre came to be found. The oxidation of ammonia and other organic compounds of nitrogen to the state of nitrate was one of the first actions in the soil which was proved to be brought about by bacteria, and by the work of Schloesing and Müntz, Warington and Winogradsky they learnt that in all cultivated soils two groups of bacteria existed which successively oxidized ammonia to nitrites and nitrates, in which latter state the nitrogen was available for the plant. These same investigators showed that the rate at which nitrification took place was largely dependent upon operations under the control of the cultivator: the more thorough the cultivation the better the drainage and aeration, and the higher the temperature of the soil the more rapidly would the nitrates be produced. As it was then considered that the plant could only assimilate nitrogen in the form of nitrates, and as nitrogen was the prime element necessary to nutrition, it was then an easy step to regard the fertility of the soil as determined by the rate at which it would give rise to nitrates. Thus the bacteria of nitrification became regarded as a factor, and a very large factor, in fertility. This new view of the importance of the living organisms contained in the soil further explained the value of the surface soil, and demolished the fallacy which led people instinctively to regard the good soil as lying deep and requiring to be brought to the surface by the labour of the cultivator.

The discovery of nitrification was only the first step in the elucidation of many actions in the soil depending upon bacteria—for example, the fixation of nitrogen itself. As the world must have started with all its nitrogen in the form of gas, it was difficult to see how the initial stock of combined nitrogen could have arisen: for that reason many of the earlier investigators laboured to demonstrate that plants themselves were capable of fixing and bringing into combination the free gas in the atmosphere. In this demonstration they failed, though they brought to light a number of facts which were impossible to explain and only became cleared up when, in 1886, Hellreigel and Wilfarth showed that certain bacteria, which existed upon the roots of leguminous plants, like clover and beans, were capable of drawing nitrogen from the atmosphere. Thus they not only fed the plant on which they lived, but they actually enriched the soil for future crops by the nitrogen they left behind in the roots and stubble of the leguminous crop. Long before this discovery experience had taught farmers the very special value of these leguminous crops; the Roman farmer was well aware of their enriching action, which was enshrined in the well-known words in the Georgics beginning, "Aut ibi flava seres," where Virgil said that the wheat grows best where before the bean, the slender vetch, or the bitter lupin had been most luxuriant. Since the discovery of the nitrogen-fixing organisms associated with leguminous plants other species had been found resident in the soil which were capable of gathering combined nitrogen without the assistance of any host plant, provided only they were supplied with carbonaceous material as a source of energy whereby to effect the combination of the nitrogen.

Heating Soils.

Though numerous attempts had been made to correlate the fertility of the soil with the numbers of this or that bacterium existing therein, no general success had been attained, because probably they measured a factor which was only on occasion the determining factor in the production of the crop. Ever since the existence of bacteria had been recognised attempts had been made to obtain soils in a sterile condition, and observations had been from time to time recorded to the effect that soil which had been heated to the temperature of boiling water, in order to destroy any bacteria it might contain, had thereby gained greatly in fertility, as though some large addition of fertiliser had been made to it. Though these observations had been repeated in various times and places they were generally ignored, because of the difficulty of forming any explanation; a fact was not a fact until it fitted into a theory. But within the last five years the subject had received some considerable attention until the facts became established beyond question. Approximately the crop became doubled if the soil had first been heated to a temperature of 70deg. to 100deg. for two hours, while treatment for 48 hours with the vapour of toluene, chloroform, etc., followed by a complete volatilisation of the antiseptic, brought about an increase of 30 per cent. or so. Moreover, when the material so grown was analysed, the plants were found to have taken very much larger quantities of nitrogen and other plant foods from the treated soil; hence the increase of growth must be due to larger nutriment and not to mere stimulus.

Rothamsted Experiments.

The explanation, however, remained in doubt until it had been recently cleared up by Drs. Russell and Hutchinson, working in the Rothamsted laboratory. In the first place, they found that the soil which had been put through the treatment was chemically characterised by an exceptional accumulation of ammonia, to an extent that would account for the increased fertility. At the same time, it was found that the treatment did not effect complete sterilisation of the soil, though it caused at the outset a great reduction in the numbers of bacteria present. This reduction was only temporary, for as soon as the soil was watered and left to itself the bacteria increased to a degree that was never attained under normal conditions. For example, one of the Rothamsted soils employed contained normally about seven million bacteria per gram—a number which remained comparatively constant under ordinary conditions. Heating reduced the numbers to 400 per gram, but four days later they had risen to six million, after which they increased to over 40 million per gram. The accumulation of ammonia in the treated soils was accounted for by this increase in the number of bacteria, because the two processes went on at about the same rate. The question now remaining was, What had given this tremendous stimulus to the multiplication of the ammonia-making bacteria? and by various steps the two investigators reached the conclusion that the cause was not to be sought in any stimulus supplied by the heating process, but that the normal soil contained some negative factor which limited the multiplication of the bacteria therein.

Interacting Forces.

Examination along these lines then showed that all soils contained unsuspected groups of large organisms of the protozoa class, which fed upon living bacteria. These were killed off by heating or treatment by antiseptics, and on their removal the bacteria, which partially escaped the treatment, and were now relieved from attack, increased to the enormous degree that he had specified. According to this theory the fertility of a soil containing a given store of nitrogen compounds was limited by the rate at which these nitrogen compounds could be converted into ammonia, which, in its turn, depended upon the number of bacteria present effecting the change, and these numbers were kept down by the larger organisms preying upon the bacteria. The larger organisms could be removed by suitable treatment, whereupon a new level of ammonia-production, and therefore of fertility, was rapidly attained. Curiously enough one of the most striking of the larger organisms was an amœba akin to the white corpuscles of the blood—the phagocytes, which, according to Metchnikoff's theory, preserved us from fever and inflammation by devouring such intrusive bacteria as find entrance in the blood. The two cases were, however, reversed; in the blood the bacteria were deadly, and the amœba therefore beneficial, whereas in the soil the bacteria were indispensable and the amœba became noxious beasts of prey.

Since the publication of these views of the functions of protozoa in the soil confirmatory evidence had been derived from various sources. For example, men who grew cucumbers, tomatoes, and other plants under glass were accustomed to make up extremely rich soils for the intensive culture they practised, but, despite the enormous amount of manure they employed, they found it impossible to use the same soil for more than two years. Then they were compelled to introduce soil newly taken from a field and enriched with fresh manure. Several of these growers here had observed that a good baking of this used soil restored its value again: in fact, it became too rich and began to supply the plant with an excessive amount of nitrogen.

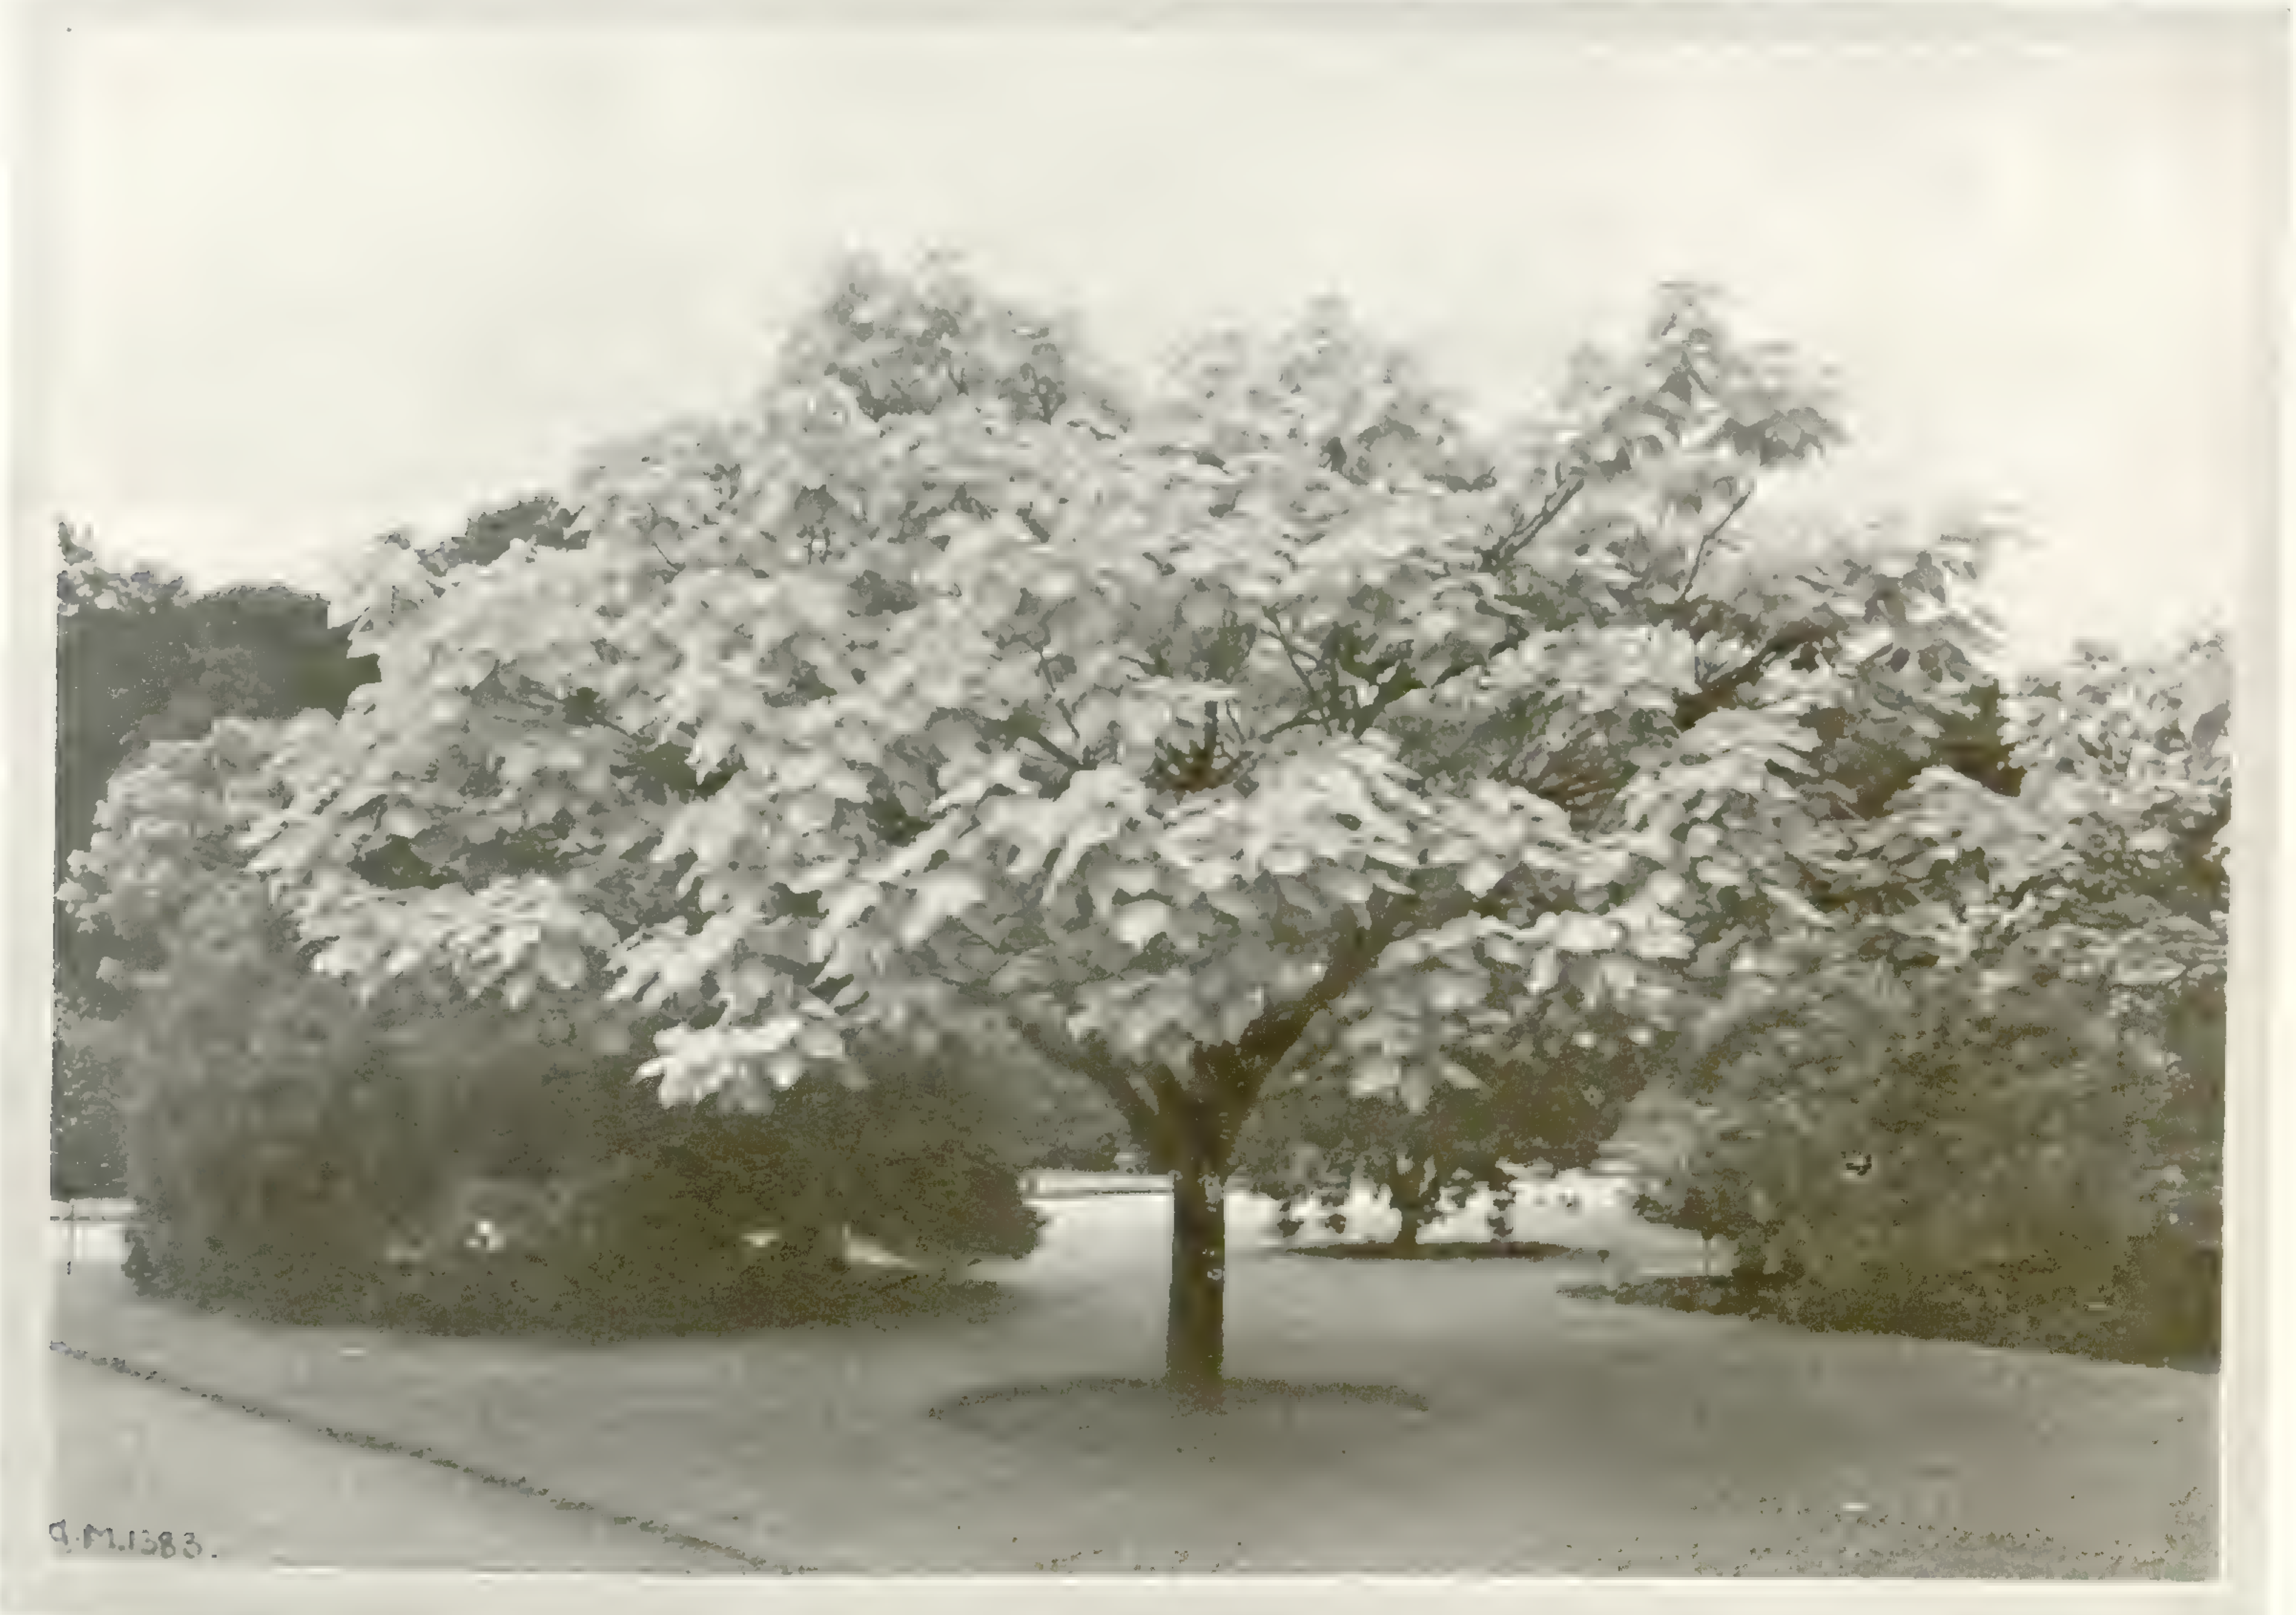
Evidently there was no simple solution to the question—What was the cause of the fertility of the soil? There was no single factor to which they could point as the cause; instead they had indicated a number of factors any one of which might at a given time become a limiting factor and determine the growth of the plant. All that science could do as yet was to ascertain the existence of these factors one by one and bring them successively under control; but, though they had been able to increase production in various directions, they were still far from being able to disentangle all the interacting forces whose resultant was represented by the crop.

DAHLIAS TO PERFECTION.—A thorough guide to the successful culture of these popular flowers is "Dahlias and Their Cultivation," by J. B. Wroe, price 1s. net, by post 1s. 2d., bound in cloth 1s. 6d., by post, 1s. 8d., from W. H. and L. Collingridge, 148, Aldersgate Street, London

THE GOLDEN-LEAVED CATALPA.

This is one of the few golden-leaved trees which may be depended on to maintain a good colour throughout summer, whereas the majority of the golden-foliaged trees and shrubs are very bright for a few weeks when the leaves first appear, but lose much of their freshness after the middle of June. The golden catalpa is a variety of the well-known Indian Bean Tree, Catalpa bignonioides, and is known under the distinctive name of aurea. It presents much of the appearance of the type, having the short trunk and widespreading head of that tree, with similar-sized heart-shaped leaves. The spikes and flowers show no distinctive characters, whilst the fruits are of the usual cylindrical, bean-like appearance. Several well-developed specimens may be seen at Kew, the one represented by the accompanying illustration being near the north end of the Temperate House. The tree is peculiarly adapted for planting amongst other coloured foliaged shrubs as a standard or dot plant, its large handsome foliage being very effective. An example put to such a use may be seen in the bed of coloured foliaged trees and shrubs which is to be found in the vicinity of the Sun Temple at Kew. The tree may be expected to grow in any ordinary garden soil, and may be increased either by means of cuttings in summer or by grafting pieces of dormant wood on to pieces of root in spring. In both cases propagation should be carried on under glass. Several other varieties of catalpa are known which are distinguished by variegated or purplish leaves, but no other is of anything like the value of C. bignonioides aurea for garden decoration, whilst for general effect they are inferior to the typical green-leaved tree, a fact which applies to many variegated leaved trees.

W. D.



A FINE SPECIMEN OF THE GOLDEN-LEAVED CATALPA (C. BIGNONIOIDES AUREA) AT KEW.

ROSE DOROTHY PERKINS.

I have never before seen the flowers of the above-named rose as rich in colour as they have been this year. For several years I have noticed the same plants, some growing near walls with south aspects, others on pillars, pergolas, and arches, and those plants trained on the warm walls bore very pale-coloured blossoms. This year, however, all seem to be excellent, not in one county only, but in many. I attribute the satisfactory condition of the flowers to the fact that the weather generally has been much cooler and not very bright. For a number of years that grand variety Crimson Rambler, was a failure on hot walls, but always a success on arches and pillars in the same garden.

Of course, we like to grow the various sorts of roses in certain positions, but I am quite sure that, generally, climbing varieties are not as satisfactory when trained on hot walls as in more open quarters. I daresay many readers of the GARDENERS' MAGAZINE have noted this fact also, and it would be well if inexperienced persons who intend to plant roses during the coming autumn made a note of it, too.

G. B.

Bowkeria Gerardiana (triphylla).—This uncommon South African shrub, which your correspondent, Mr. Wyndham Fitzherbert, says is not in commerce, was first distributed by the late Mr. William Bull, of Chelsea, and was, to my knowledge, kept in stock for some years after that. I have frequently seen it flowering there in the shape of small bushy plants. There being really such a limited demand for subjects of this class, its culture there has now, I believe, been discontinued. The species strikes very readily from cuttings of the young growing shoots put in a close case, and given the same treatment as a fuchsia.—W. T.

CORYLOPSIS PAUCIFLORA.

The genus Corylopsis is closely allied to Hamamelis, which is fairly well known in gardens by the several early-flowering species called witch hazels. A few species only of corylopsis are in cultivation, the best known being C. spicata. That particular shrub has been in cultivation for many years, but C. pauciflora is of comparatively modern introduction. The name of pauciflora is inaptly applied, for it blossoms very freely when growing under suitable conditions. Unfortunately, it is rather tender, and, except in the mildest parts of the country, it requires protection during winter and spring if the best results are to be obtained. The damage to the shrub cannot, however, be attributed so much to cold during the dormant period as to late spring frosts during the time that the flowers are open and growth buds starting into life.

It is a Japanese shrub, growing 3 to 4 feet or more high, with numerous slender, more or less pendant branchlets, which during early spring, the end of March and beginning of April, are clothed with dainty catkins of primrose-yellow flowers which have a decided fragrance. A further period of beauty is apparent when the foliage commences to expand, for the leaves are delicately marked with green and bronze. In Cornwall, Devonshire, and other kind climates, it may be expected to thrive as a border shrub, but in less favoured localities it should either be planted in a frame or cold greenhouse, where it can remain the whole year; or it should be grown in pots and stood out of doors for the summer. As a forced shrub it has much to commend it, and it can be had in flower early in January without very severe forcing. It thrives well in light loamy soil to which a little peat has been added.

W. DALLIMORE.

AUSTRALIAN GRAPES.

The Acting Agent-General for Western Australia (Mr. R. C. Hare) has received from Mr. R. L. Gilbert, Officer-in-Charge of the Western Australian Government Agency in Melbourne, Victoria, particulars of an interesting and important experiment in connection with the cool storage of table grapes for export to London and other British markets. Several shipments of Western Australian grapes arrived in London a few months ago, and so brisk was the demand that they sold in some cases up to 1s. 4d. per lb. wholesale.

Mr. Gilbert informs the Agent-General that early this year he received a consignment of Western Australian grapes through the Department of Agriculture for exhibition at the Melbourne Government Agency. The grapes were packed in bunches in granulated cork dust in wooden cases containing about 23lb. of fruit in each, precisely similar to the shipments which had been sent from Western Australia to the London Market. The Melbourne consignment had been ten days in the steamer's hold before it reached Mr. Gilbert's hands, and it was placed by him in exactly the same condition in which it was received in the chambers of the Government cool stores, Melbourne.

There the grapes remained untouched for three months, at the end of which period (on July 11 last) the cases were brought out and opened in the presence of a distinguished company, including the Right Hon. Sir John Forrest, G.C.M.G., ex-treasurer of the Commonwealth, the Victorian Minister for Agriculture, the Government Viticultural Expert, and a number of members of the Commonwealth Parliament. The representatives of the three Melbourne daily papers (the "Argus," the "Age," and the "Herald") were also present, and they concur in reporting that the grapes were found, after their ten days' sea journey, and three months' cold storage, in "perfect condition."

The varieties experimented upon were Almeria (known in Spain as Ohanez), Flame Tokay, and Purple Cornichon, and they were grown by Mr. Barrett-Lennard, of Guildford, Western Australia, who was also the grower of a shipment which realised 33s. per case of 23lb. in London a few months ago. Mr. Gilbert writes: "The Ohanez (Almeria) opened up absolutely perfect, and the same can be said of the Flame Tokay. With regard to the Purple Cornichon, although the berries were quite sound, some of them fell away from the stalks when the bunch was lifted. The remarkable freshness and quality of the fruit excited great enthusiasm among those present, and it was unanimously agreed that the experiment had been a great success."

Subsequently several cases were sent to the Federal Parliament which was in Session in Melbourne. "It was generally agreed among the members who inspected and tested the fruit," says Mr. Gilbert, "that it was in a perfect state of preservation, and of excellent quality; the bloom of the fruit had been retained in a wonderful manner, and the berries were as firm and fresh as if the bunches had been cut on that very day."

The grapes which came to England from Western Australia in April and May last were stored only a few weeks between the time they were gathered at the vineyards and the time they were marketed in London, but the Melbourne experiment indicates that even three or four months' storage does not induce deterioration in freshness, firmness, flavour, or appearance. That this was also the view taken by the trade in this country would seem to be indicated by the prices paid for the four shipments of grapes from Australia, totalling over 4,000 cases. One shipment averaged 14s. per case of 23lb.; another, 19s.; a third, 25s.; and the best of all was 33s. for 82 cases, which was also the top market price of the day in London. The cost per case, including all charges, was 1s. 5½d., so that the net return to the growers is considered highly satisfactory.

The Victorian Government Viticultural Expert was so impressed by the success of the storage of grapes at the Melbourne Cool Stores that he is obtaining several thousand cuttings of Flame Tokay from Western Australia for propagating at the Viticultural College in the State of Victoria, and an immense impetus has been given to the grape-growing industry in Western Australia by the results of last season's London shipments. It is calculated by Viticulturists that there are 20,000,000 (twenty million) acres in Western Australia suitable for grape-growing, and it is felt that if only a small proportion of that vast area is laid down in vines the amount of production within a few years should be sufficient to ensure a cheap and ample supply of high quality table grapes in British and European markets at a time of the year when the European supply is out of season.

FLOWERS IN REGENT'S PARK.

Regent's Park has long been famous for its summer bedding, particularly for the extensive use made of large, bold specimens, the condition of which serves to show that there must be ample and effective glass accommodation for them during the winter. The long borders of herbaceous plants that, as it were, serve to form a background to the flower beds, combine to form a glorious floral picture, which it must be remembered is within a couple of miles of Charing Cross.

Fuchsias.

Of the different subjects the innumerable fuchsias, ranging as they do from small plants to large specimens 6ft. to 8ft. high, are in many cases as near perfection as possible. A group of the light-coloured variety Mrs. Marshall, is made up of a number of grand specimens, 6ft. high, or thereabouts, almost perfect in shape, and absolutely laden with blossoms. An extensive bed is planted with such old and well-tried varieties as Abd-el-Kader, single, red; Display, single, mauve lavender corolla; Empress Eugenie, double, white corolla; Mrs. Marshall, white tube and sepals, red corolla; Mrs. Rundle, a single salmon-tinted flower; Beauty of Exeter, semi-double, carmine corolla; and Madame Cornellison, single, white corolla, and for outdoor purposes still one of the very best. On the margin of this bed are numerous plants of the variety Alice Hoffmann, about a couple of feet high. This has coral-tinted sepals, and a pure white corolla. It is at present not much known, but may be kept quite dwarf, and for edging purposes it is very desirable. A large bed is devoted to the bright-red variety, Scarcity, and in this large specimens are interspersed with comparatively small plants, the effect being remarkably good.

Fuchsias are, as a rule, grown for the sake of their flowers, but one bed of them depends for its attractive features upon foliage alone. It is dotted over with the well-known variegated-leaved variety, Sunray, and the yellow-tinted Golden Treasure. Beneath these is an undergrowth of the slender habited Fuchsia gracilis variegata, and edged with the variety Meta, pegged down. The young leaves of this are of a bright bronzy-crimson, but become greener afterwards. One variety especially deserving mention is The Doctor, which bears a considerable resemblance to Mrs. Rundle. It is, however, a good deal superior to that well-known variety, as may be seen by comparison, for there is a bed of each planted side by side. The Doctor differs from the older form in being more floriferous, while the blooms are stouter and more highly coloured. For summer bedding, at least, if not for other purposes, it should supersede Mrs. Rundle.

Cuphea and Lantana.

Cuphea platycentra, which, by the way, is in the "Dictionary of Gardening," and the Kew Hand List, referred to Cuphea ignea, has been long grown for bedding. It is, however, particularly fine at Regent's Park, where a number of specimens, about four feet in height, and springing from a groundwork of the ageratum, form a delightful feature. The plants, fairly upright in growth, are quite smothered with their pretty scarlet and black tubular-shaped flowers. This cuphea, which was introduced from Mexico in 1845, has been used as a bedding plant as long as I can remember, but it is only within recent years that it has been grown as large specimens. Beside this, it is very pretty in the greenhouse, where its continuous flowering qualities stand it in good stead.

Lantana delicatissima of parks and gardens, but which is at Kew grown as Lantana salviæfolia, is at Regent's Park, as almost everywhere else this season, particularly fine. One bed has a number of pyramidal-shaped plants of this lantana springing from a groundwork of verbenas. The effect of the lantanas is heightened by the plants being alternated with good specimens of the pretty silvery-leaved Leucopyhytum Browni.

Pelargoniums.

Of pelargoniums, the variety Paul Crampel holds its own as the most desirable of the scarlet forms, while a good salmon-coloured kind that I have not met with elsewhere is Maurice Bernardin. Though the trusses are not large, they hold themselves erect, while what is more, this variety is exceedingly floriferous, and for bedding purposes can be recommended. A good pink-flowered kind is Sybil. The ivy-leaved varieties are principally used for vases, which are strongly represented at Regent's Park.

Succulents.

Succulent plants form a striking feature in a large undulating bed, the highest peaks being each crowned with a large, well-furnished specimen of the American Aloe. The sides of the mounds are in some cases at least carpeted with the Canary Island Lotus peliorhynchus, whose long shoots, freely clothed with much divided hoary leaves, form a dense mass of a peculiar greyish tint. Though the flowers are very showy, this is well worth growing for its foliage alone.

Heliotropiums and Hydrangeas.

Heliotropium President Garfield still holds its own as one of the best of all for large specimens. It is particularly well represented in this way, one bed being filled with a number of tall examples, all in full bloom, and bordered with the dwarfer dark-coloured variety, Lord Roberts. An edging of white centaurea completes an attractive bed, the perfume from which is most grateful.

The grand specimens of the common hydrangea are now past their best, but, as a set-off H. paniculata grandiflora makes a goodly show. The massive heads of creamy-white flowers are very conspicuous. In some cases they have assumed the ruddy tinge, which comes after a time.

Mixed Beds.

When large palms, quite 15ft. high, are employed for furnishing flower beds, it is quite evident their associates must be on a corresponding scale. Large specimens of such things as Solanum jasminoides, Streptosolen Jamesoni, Lantana delicatissima, Calceolaria Burbidgei, heliotropes, Plumbago capensis, crotons, and others are used with pleasing effect in these large beds. Leucophytum Browni is freely represented, and as specimens from two to three feet in height.

Vases.

These play an important part in the summer bedding scheme. Some of them are very large; indeed, they greatly excel in size the vases to be generally met with in gardens. A couple of the largest, for they are in many cases disposed in pairs, are filled in the following manner. Centre, Eucalyptus globulus, around this variegated abutilons, next fuchsias, lower down scarlet pelargoniums with an edging of ivy-leaved pelargonium Galilée and Tropæolum Lobbianum. With minor changes, this arrangement is pretty closely followed in the larger vases, while in the smaller ones, of course, a less variety of plants is to be found. Two in particular, filled simply with that popular ivy-leaved pelargonium Galilée, are exceedingly effective, forming as they do dense masses of bloom. This variety, which is one of the best of all for vases, as, indeed, it is for pot culture, was distributed in the Jubilee Year, 1887. W. T.

ABERDEEN BOTANIC GARDENS.

Considerable pleasure is being evinced in local circles in consequence of these most useful gardens being placed on a permanent basis as regards occupancy. Meantime, a considerable stretch of the gardens is held upon lease by the Cruickshank Trustees—the representatives of the family which bequeathed the gardens to Aberdeen—and as the proprietor of the leased part is not inclined to sell outright, the trustees have been fortunate in acquiring an adjacent property, which belonged to the late Mr. Charles J. Burnett. In his lifetime, Mr. Burnett preferred to retain his grounds and beautiful old-world house, which he had occupied for so many years, and hence was unwilling to enter upon the sale of them to the Cruickshank Trustees. Mr. Burnett's demise, however, has completely altered the situation, and his executors have now agreed to the sale of the ground and house to the Cruickshank Trustees.

The newly-acquired ground lies contiguous to that actually owned by the Cruickshank Trustees, and is separated from it by a brick wall, upon which many climbing plants have been trained. This wall is to be retained, but two roomy gaps are to be made in it for the purpose of giving access to the ground now obtained. The new ground is of a rising character, with a fine southern exposure, and when laid out—probably in terraces—it should prove very suitable for most of the plants transferred to it. Meantime, the land is under green crop for the purpose of cleaning it.

Another interesting matter connected with the new acquisition is the suggestion—which in all probability will be acted upon—to have plots laid out for the benefit of teachers undergoing a course of nature study, now so much appreciated in our schools' curriculum. Given such facilities, it is felt that not only would the teachers benefit, but the children who might be gathered from all quarters to inspect the plots would also find the new departure advantageous.

The writer paid a visit to the gardens the other day, and was exceedingly pleased to find, under the careful and intelligent supervision of Mr. James Strachan, the head gardener, how well everything was looking. Of course, these gardens are not arranged for ornamental purposes, but for practical, educative work; but even with these retarding and restrictive influences, it was astonishing to find so much beauty and wealth of colour. The large rockery, near the Chanonry entrance, is not exactly looking so well as it did in the months of May and June, when a number of the Alpine plants were in bloom. This beautiful rockery, it is hoped, will be retained, although, occasionally, it suffers from north-westerly winds. Entering further into the gardens, the visitor is struck with the fine beds of carnations, antirrhinums, calceolarias, and other autumn-flowering plants—all in capital condition. Of course, there is no arrangement for spectacular effect, as is the case in our public parks, but to the botanical student these are interesting in the extreme. W. K.

Everyone interested in a garden should obtain a copy of the Alphabet of Gardening, by T. W. Sanders. Thoroughly practical information is given as to soils, manures, seed sowing, planting, potting, budding, pruning, grafting, forcing, hybridising, etc., with explanatory diagrams. Price, bound in cloth, 1s. 6d. net, post 1s. 9d., from W. H. and L. Collingridge, 148 and 149, Aldersgate Street, London.

WORK FOR THE WEEK.

◆

THE ORCHID HOUSES.

SEEDLING CALANTHES.—It is desirable for the storing of young calanthes that they should be removed from their seed beds and transplanted into well-drained small pots, using a compost of equal portions of finely broken turfy loam, peat, finely chopped sphagnum, and broken leaves, with sufficient sand added to render the compost porous. The seedlings will be found in an active rooting state at this season, and they quickly become re-established in the fresh compost. I find by this method the young plants are less liable to injury by being kept so damp as it is usually necessary to retain the old plants for so late in the year, owing to their late flowering. The young plants should be given a position within a short distance of the roof-glass, which will not only prevent their becoming drawn and weakly, but will also assist them to mature. Keep the young plants in a moderately moist state as long as they are active, but as soon as the foliage shows signs of decay gradually reduce the moisture, and if the plants are wintered on a shelf in a house where the atmospheric conditions are in a more or less humid state, the moisture thus procurable should suffice to retain the miniature pseudo-bulbs in a plump state. It is surprising how early in the year seedling calanthes commence growing, and considerable advantage is derived from potting them at this season. The same remarks apply to seedling phaius and phaiocalanthes, with the exception that the phaius being evergreen and practically in a more or less active state of growth throughout the whole year, they will require root moisture, and to be kept growing until they reach the flowering state.

SEEDLING DENDROBIUMS.—The seeds of the deciduous dendrobiums are frequently

GOLD MEDAL COLLECTION OF HERBACEOUS PHLOXES
Exhibited by Messrs. E. F. Fairbairn and Sons, Edentown Nurseries, Carlisle, at the Carlisle Flower Show.

sown on the material about plants of their own species. This is done frequently late in the season, say in the latter part of June and July. The germination is perhaps more rapid at that time of the year than any other, and the seedlings make good headway by the middle of September; but the difficulty is that the majority are at this season reaching maturity, and the reduced amount of moisture and the more airy conditions afforded are soon evident in the young seedlings. It is desirable therefore the young plants should be removed and placed under conditions that are likely to be more favourable to them. If they are transferred to store pots (several may be pricked out together) they are more easily treated than can possibly be the case when they winter on the plant on which the seed has been sown. We find finely chopped sphagnum moss, a little peat, and plenty of silver sand a suitable compost in which to fill the store pots. This compost is easily removed and may be transferred about the roots of the young plants when they require separate potting early in the spring.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

BOUVARDIAS. — These, although not fully recognised as stove plants, will do well with a fair amount of heat during the winter months, especially if they are required for supplying flowers for cutting over a fairly long period, and it is as well to give them a little artificial heat before the wood becomes too hard. Plants established in pots may be brought in from the frames or pits at once, and if well rooted a little help should be given them in the way of weak liquid manure or a dressing of artificial fertiliser. During dry periods of weather syringing may be given them once a day, but this will need to be gradually decreased and finally left off as the autumn advances and the plants begin to show flower. Many cultivators make a practice of planting bouvardias out in frames or in a sheltered position in the garden, and I am inclined to think, if treated properly after lifting, this is the best method of growing them. At all events much larger trusses of flowers are obtained, and the wood being somewhat softer, soon breaks into growth again. A good batch of plants should give a succession of bloom well into the spring season. If not already lifted from the frames or ground they should be taken in hand at once. Cut around the roots with a sharp spade or asparagus knife a day or so before lifting, giving them a good soaking of water immediately afterwards. This should prevent flagging. Lift the plants carefully, and transfer bodily into suitable sized pots without damaging the ball, and if placed in a house and kept fairly close and syringed for a few days, they will soon recover from the check received. Care must, of course, be taken to prevent their suffering from dryness at the roots. As soon as they are nicely rooted a little less overhead moisture will suffice, also during the day a little air may be given; but as the nights become cooler aim at giving a night temperature ranging from 55 to 60 degrees, which will start them nicely into fresh growth.

GLOXINIAS.—All of these will by now be out of bloom, and many of the earlier batches will be quite dried off by now. These should be stored away in a shed or house that is not likely to become too cold during the winter months, the late plants being placed in a frame where they may be gradually dried off. Caladiums also are gradually losing their foliage, and if extra room is required for other plants they may be put quite close together in one portion of the stove, or may be transferred to a slightly cooler house or pit, but I find they start better in the spring if dried off and kept during the winter in quite a warm structure.

POINSETTIAS.—As the nights are now becoming cooler, the batches of these that may have been growing in frames or pits should if possible be removed to a warmer structure, a good light house being the best for them after this date; apart from the cold nights, they are apt to become drawn very quickly in pits as the days get shorter. After transferring to the houses it will be found they will dry up much quicker, so keep a sharp eye on them for a few days, and give them a light spray over with the syringe both morning and afternoon if the weather keeps bright. No shading should be necessary from now if air is judiciously applied.—T. Stevenson, Woburn Place Gardens.

FRUITS UNDER GLASS.

ORCHARD HOUSE TREES.—In a recent calendar reference was made to the potting of early forced peach and fig trees, and at an early date it will, in many cases, be necessary to attend in a like manner to pot trees of other kinds of fruits, such as apples, pears, apricots, and plums. The latter particularly are very free-rooting subjects, requiring usually to be annually repotted, and the compost recently recommended for peaches answers also well for them as well as for apricots, but apples and pears do not require so much lime rubble. In repotting fully-established trees, after turning them out of the pots and removing the crocks, sufficiently reduce the ball of soil by the help of a pointed stick to admit of their being returned to pots of the same size and have a liberal quantity of new soil, which should be made quite firm by a rammer. In the case of young trees that need larger pots, use those which are one size larger than those they have occupied, and in all cases see that the pots are clean and well drained, and use moderately dry compost. Subsequently treat the trees as was advised for peaches. Trees that are not repotted should have their surface soil removed, and when doing this work down a few inches by the sides of the pots, and replace the soil removed by fresh compost.

LATE PEACH HOUSE.—With a view to afford next year's bearing wood all the possible benefit from the sun and air, relieve the trees as soon as their fruit is gathered of all useless wood, which will chiefly consist of that which has carried this year's crop of fruit. Provided the young wood is becoming satisfactorily matured, leave the ventilators of the house fully opened, both by night and day, otherwise keep the atmosphere of the house warm and tolerably dry for the necessary length of time. Give both inside and outside borders, if they require it, enough water to moisten them through, and should the trees indicate, by the weak state of their wood and leaves, that they have not been adequately nourished, there is yet time in which to render them some assistance by making careful use of diluted liquid manures. Keep the leaves clean, and free from red-spider by daily syringing them with water.

LIFTING OF PEACH AND NECTARINE TREES.—Trees in an unsatisfactory condition owing to making gross growths should, as soon as their leaves commence to fall, have their roots attended to. This should be done by taking out a trench in the border at the furthest point from the stems, and carefully uncovering the roots by removing the soil up to near their starting point. This done, carefully coil the roots back, and protect them with damp mats, rectify defects in the drainage, and firmly fill in the open space with fresh compost. As the filling proceeds, shorten any roots that require it, remove damaged portions and suckers by a clean cut, and relay the roots in layers through the upper part of the border, keeping some of the smallest of them quite near the surface. Complete the operation by mulching the border with partially decayed stable litter, and by giving it enough water to moisten it through. A suitable compost consists of good loam, mixed in agreement with its texture with more or less broken mortar rubble, wood ashes, and soot. Bonemeal, or some suitable artificial manure might be added, but we prefer to use stimulants of this nature as top-dressings, or in a liquid form at intervals during the year. Trees treated as advised will be benefited by being protected from bright sunshine and draughts, and by being daily sprayed overhead for a few weeks. — T. Coomber, The Hendre Gardens.

THE KITCHEN GARDEN.

CAULIFLOWERS.—To obtain a good crop both in quantity and quality during the latter part of the spring and early in summer of next year, a sowing must be made now, and a second one about the 20th of the present month. The first sowing can be made on any open ground that has been well worked for the previous crop. Commence by well dressing the ground with burnt garden refuse, then, if it is fairly dry on the surface, well work it with a fork, and tread it, making it quite firm. Rake over and sow the seed broadcast. The following varieties are all suitable: Early London, Magnum Bonum, and Walcheren. The later sowing should be made in a frame, and the seed bed should be three inches in depth and rest on a hard ash bottom. Sow the seeds evenly and thinly, and only place the lights on the frame when rains are heavy, or frosts occur. Always aim at a slow, strong growth. The plants from the early sowing should be pricked out into cold frames. Freely expose the plants except in wet and frosty weather to ensure a hard, stocky growth. With an occasional dusting of soot, and decayed leaves picked off, nothing further will be required of them till January, when a few strongest of the earlier kinds should be brought forward both in pots and in warm frames planted out for a quick return.

CABBAGE.—The plants of this useful vegetable intended for the main spring supply, should be planted forthwith. The best results are obtained here on ground which has borne the onion crop. Providing the soil is friable, all that is necessary is to well hoe the plot and apply a good dressing of wood ashes or burnt garden refuse, with some soot. The distances at which the plants should be apart will vary from fifteen inches to two feet each, according to the variety. If slugs are troublesome place a ring of fine cinder ashes around each plant. This will save much needless work and worry if attended to at an early period. If dry overhead well water the plants at the time of planting. For the earliest supply nothing appears to supersede a good strain of Ellam's Early and Sutton's April, of which a portion of each should be planted twelve inches apart on a warm south border.

MUSHROOMS.—Beds should now be made regularly in the mushroom house, according to the supply of fermenting material, which must be collected over as short a period as possible to gain the best results. After the fermentation of the material is complete and just on the decline, make up the beds firmly and evenly, not less than fifteen inches deep. Insert the spawn in pieces of two inches square and nine or ten inches apart. When the temperature of the bed is about 78 degrees, and there is no further risk of the bed rising in temperature, cover with soil.

POTATOES.—The main crop varieties are yielding heavy supplies of tubers, but the wet weather has resulted in a serious attack of the fungus causing disease, particularly on heavy retentive soils. No better course can be taken than to cut off the haulm and burn up every affected part, whether top or tuber. Lift the crops as early as possible in favourable weather, exposing them for a few hours to well dry off before storing. Potatoes that are in the least diseased should be destroyed. If enormous quantities have to be stored, clamps will be found the most satisfactory. Shed room that is available may be utilised for storage. In either case plenty of air must be provided, excepting in frosty weather. A sprinkling of slaked lime thrown amongst the potatoes as the storing proceeds will help to ward off disease. Seed potatoes should be separated from the ware, and have sufficient exposure to green up and ripen before storing them. They should be stored where they will not be subjected to a very dry atmosphere.—George Ellwood, Swanmore Park Gardens.

ROYAL CALEDONIAN HORTICULTURAL SOCIETY.

(Continued from page 702.)

for twelve vases of carnations; Mr. T. M. Whitehead, Selkirk, being second.

VEGETABLES.

There was a big display of vegetables, and the collections of eighteen varieties contained some exceptionally fine produce, the first prize collection, staged by Mr. J. Gibson, Welbeck, being really wonderful. The Ailsa Craig onions, the New Red Intermediate carrot, Sutton's Autumn Mammoth cauliflower, and the leeks, celery, parsnips, peas, potatoes, tomatoes, cucumbers, and beet were all models of perfection. Second prize was secured by Mr. J. E. Davis, gardener to Col. E. R. Stewart Richardson, Ballathie, Stanley. Another collection of twelve dishes was provided for Scottish-grown produce only, and here Mr. William Galloway, gardener to the Earl of Wemyss, Gosford, proved that Scottish soil, in the hands of a good cultivator, can produce vegetables of really first-rate quality. Every dish was fine, and the staging was well done. Mr. F. M. Urquhart, gardener to H. Mungall, Esq., Melrose, was a good second, his cauliflowers being just a trifle coarse, third prize going to Mr. W. P. Bell, gardener to the Earl of Home, K.T., Bothwell Castle.

PENTSTEMONS AND PHLOXES AT EDINBURGH.
Part of the fine exhibit staged by Messrs. John Forbes, Lim., Hawick.

TRADE DISPLAYS.

Trade exhibits occupied more space than ever. They were of varied character, and constituted a great feature of the show. A large and very fine exhibit of hardy flowers, carnations, and aquatics was well arranged by Messrs. W. Cutbush and Son, Highgate Nurseries, N. Among the perennials were several fine kniphofias, phloxes, and pentstemons, while the nymphæas, spiræas, and other bog plants were shown in a very natural manner. The carnations made a grand exhibit in themselves. A beautiful group of orchids came from Messrs. Stuart Low and Co., Bush Hill Park, Middlesex, who also staged the new Nephrolepis Smithi, and some choice carnations.

Messrs. Sutton and Sons, Reading, had a most attractive stand of vegetables and flowers, which was built up in quite an original manner. On a circular stand, with a base 20 feet in diameter, the potatoes, onions, and other vegetables were arranged between groups of choice asters, and a tall silver epergne filled with melons made a good centrepiece. The whole stand was surrounded with arches effectively decorated with asters of high quality. Messrs. Dobbie and Co., Edinburgh, were large exhibitors, one big stand being occupied by fuchsias, sweet peas, violas, and other cut flowers, and another was occupied by pompon cactus dahlias in pots, early chrysanthemums, and a set of the new miniature single dahlias.

Messrs. Cunningham, Fraser, and Co., Comely Bank Nurseries, Edinburgh, had an extensive and interesting exhibit of choice herbaceous flowers, which included many somewhat rare things, such as Artemesia lactiflora, Senecio tanguticus, Aconitum napellus albus, etc. Phloxes were also well shown by this firm. Mr. John Proctor, Portobello, arranged a group of early chrysanthemums and foliage plants, and Mr. C. Engelmann, Saffron Walden, had a fine lot of perpetual carnations, representative of the newest and most useful varieties. Messrs. J. Cocker and Sons, Aberdeen, were exhibitors of herbaceous flowers, including several liliums, spiræas, and verbascums. Messrs. Tillie, Whyte, and Co., Edinburgh, put up a big exhibit of vegetables.

A grand collection of phloxes and pentstemons came from Messrs. John Forbes, Lim., Hawick. The varieties included the best in cultivation, and the quality of the flowers was all that could be wished. Carnations and violas were also shown. Messrs. Young and Co., Hatherley, Cheltenham, brought perpetual carnations, which they put up in artistic style. A bold exhibit of dahlias came from Messrs. G. Fairbairn and Sons, Carlisle, capital blooms being shown both on boards and in tall stands. Messrs. R. B. Laird and Sons, South Frederick Street, Edinburgh, built up some tall displays of Hydrangea paniculata, liliums, and foliage plants, with Humea elegans worked in with taste. Messrs. John Downie, Edinburgh, put up a well-arranged group of greenhouse plants, mainly of ornamental foliage, but also including choice begonias and liliums. A big group, arranged by Messrs. Thomas Methven and Sons, Edinburgh, was chiefly composed of liliums and choice foliage plants. Mr. A. Thomson, Dean Gardens, Edinburgh, showed single chrysanthemums in considerable variety.

A charming exhibit of phloxes and pentstemons were staged by Mr. D. McOmish, Crieff. An exhibit of cut begonias, both double and single, was brought up from Kent by Mr. A. Ll. Gwillim, Cambria Nursery, New Eltham. Mr. L. R. Russell, Richmond, showed a remarkable collection of choice ivies, and some good clematis. Three big tables of fruit trees in pots were the main feature of Messrs. Storrie and Storrie's exhibit, who also had their cockscombs, Excelsior Iceland poppies, and other flowers. Messrs. W. Wells and Co., Lim., Merstham, Surrey, showed some excellent chrysanthemums and capital phloxes, the arrangement of the stand being very tasteful.

One of the nicest exhibits of sweet peas we have seen this season was artistically staged by Mr. Robert Bolton, Carnforth. The quality of the flowers was first-rate, and the varieties were of the best. Messrs. Webb and Brand, Saffron Walden, were exhibitors of choice hollyhocks, Salmon Queen, Exultum, and Walden Primrose being among the best. Messrs. A. Young and Co., Elgin, had sweet peas arranged in stacks of tubes and glass vases, some good varieties being included in the collection. The phloxes shown by Messers. Gunn and Sons, Olton, Warwickshire, were a capital lot of handsome trusses, put up in a very pleasing manner. Lady Peel, Le Mahdi, Fairy, and Ellen Willmott were conspicuous among a host of the best sorts in commerce.

King's Acre Nurseries, Lim., Hereford, showed a magnificent collection of fruit trees in pots, the apples being of great size and good colour, while the plums carried very heavy crops. Another fine exhibit of fruit came from Messrs. G. Bunyard and Co., Lim., Maidstone; apples and pears of superb quality were staged to the number of sixty dishes, and a fine sample of Monarch plum was on view. The table was backed with pot vines, peaches, plums, etc., one splendid vine of Appley Towers carrying seven big bunches. Particularly choice varieties of ferns were nicely arranged by Mr. H. N. Ellison, West Bromwich, davallias, gymnogrammas, and nephrolepis being well represented. Much interest centred round the begonias extensively shown by Messrs. T. S. Ware, Lim., Feltham, Middlesex. Enormous doubles and some exceedingly good singles were shown in pots among a bed of maidenhair ferns, the very chaste variety Lady Cromer being prominently staged in the centre of the group.

Messrs. E. Webb and Sons, Wordsley, Stourbridge, made a big display of melons and vegetables of their usual high quality. The stand was lavishly decorated with sweet peas and other flowers, the effect being very striking. Probably as fine a lot of the newer montbretias as has yet been staged anywhere was put up by Messrs. R. Wallace and Co., Colchester. Prometheus, King Edmund, Hereward, and all the varieties of note were shown in big masses. Choice gladioli and liliums also came from this firm. An exhibit of much interest came from Messrs. W. Thomson and Sons, Lim., Clovenfords, Galashiels. Some very fine bunches of grapes of the variety Duke of Buccleuch were shown in baskets, the berries and colour being very fine. This is by no means a commonly-grown grape, although of excellent appearance and flavour. The vines from which the bunches shown were cut are close on forty years of age. Cooper's Black was another remarkably good sample, and the handsome appearance of this large-berried grape should appeal strongly to growers.

The Royal Horticultural Society sent up from Wisley an extensive collection of grapes, which had all been grown in one house. About thirty varieties were shown, including many rarely seen, such as Ascot Citronelle, Diamant Traube, Black Monukka, and White Tokay. Messrs. M. Campbell and Son, High Blantyre, were exhibitors of dahlias and carnations. The cactus dahlias were put up on tall stands, and some big doubles were shown on boards. The carnations included some of the best of the borders, both selfs and fancies. Dr. McWatt, Morelands, Duns, the enthusiastic amateur, brought a beautiful exhibit of extra choice primulas, including large-flowered P. obconica, and such things as P. Forbesi, P. Kewensis, and P. malacoides. Delphiniums and other border flowers of the choicest quality were also staged by the Doctor. Mr. Michael Cuthbertson, Rothesay, put up some lovely montbretias, which he arranged in pyramidal form on a round table. All the best and newest varieties appeared to be included in this collection. A nicely arranged group of roses was put up by Mr. R. Ferguson, Brucefield, Dunfermline.

Tritonia Prince of Orange.—This is a new variety of Tritonia crocata, and a delightful little bulb for the greenhouse. It grows to a height of a foot or more, and bears branching racemes of comparatively large flowers of a rich glowing orange-scarlet colour. The beauty of this tritonia reminds one that we do not sufficiently recognise the merit of this and some of its allies, such as the babianas, ixias, and sparaxis.

Clematis flammula rosea purpurea.—This is a very distinct and uncommon variety of the old and well-known Clematis flammula, from which it differs in the petals being deeply edged with rosy purple. In freedom of flowering, and in other particulars, it is the equal of the type, while its distinct colour at once arrests attention. It is also sometimes met with under the varietal name of rubro-marginata.—W. T.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

◆

Carlisle.

In what is undoubtedly one of the finest market halls in the kingdom, and an ideal place for a flower show at this season of the year, the Carlisle Horticultural Society held their third annual exhibition on August 31 and September 1. Once more we heard many complaints about the weather that has played havoc with garden products, and caused the absence of a good many entries, but, notwithstanding, the show was a good one in every sense of the word.

CUT FLOWERS.

There was but one entry in the class for thirty-six roses, this coming from Mr. Hugh Dickson, Royal Nurseries, Belfast. This was a good stand, some of the best blooms being Mdme. Joseph Combet, Hugh Dickson, Mdme. Journaville, and Mrs. Stewart Clark. In a class for twelve blooms, for which Messrs. E. A. White, Lim., Paddock Wood, provided a special prize, there were nine entries, some really good blooms being staged. The place of honour was given to Mr. Thos. Pride, School House, Canonbie, who put up Chas. J. Grahame, Mons. Jos. Hill, Farbenkonigin, Frau Karl Druschki, Horace Vernet, Pharisaer, Victor Hugo, Mrs. John Laing, Countess Annesley, Lady Ashtown, and Countess of Scoby, a nice even lot of first-rate varieties. Mr. G. Brown, 2, Pategill Villas, Penrith, came in second, the third prize going to Mr. J. W. Carruthers, The Gardens, Stanwix House, Stanwix.

Some grand border carnations were shown, and in the first prize exhibit of a dozen vases put up by Messrs. M. Campbell and Son, High Blantyre, Leading Lady, Liberté, Dr. Crawford, and Sovereign were particularly pleasing. Mr. W. Sanders, Garbridge, Appleby, came a good second, his vase of Cecilia being about as good as could be wished. Mr. Geo. Bowness, Riverside Nursery, Busby, N.B., was first for a dozen vases of early chrysanthemums, showing some fine flowers. The same exhibitor secured the first prize for twenty-four cactus dahlias, beating Messrs. Campbell and Sons; a silver cup went with this award. In the amateur's class for twelve cactus dahlias six good stands were staged, the first prize winner being Mr. Alex. Welsh, Hollandbushby, Bankwell; Mr. Peter Skellon, 19, Monty Street, Eagleshan; and Mr. T. W. James, Morville, Carlisle, were awarded the second and third prizes. In another twelve-bloom class, for which prizes were offered by Messrs. Muncaster Bros., Carlisle, eight stands competed, Mr. Peter Skellon leading, followed by Mr. Edwd. Keith, Wallington, Cambo, Morpeth, and Mr. T. Clark, Stanwix. Six vases pompons made a nice class, the highest award going once more to Mr. Peter Skellon; Mr. Wm. Orr took second; Mr. T. Clark third.

Sweet peas were shown in considerable numbers, and it was surprising to see the creditable manner in which they were staged after the unkind weather experienced in the district. Mr. Robert Bolton offered prizes for twelve vases, and the winner was Mr. John Fletcher, Auchenheath, Lanarkshire, who had Mrs. Chas. Foster, Purity, Queen of Norway, and Tom Bolton among other favourites. Mr. Edwd. Keith, Morpeth, received second, showing Nancy Perkins, John Ingman, Elsie Herbert, etc.; third went to Mr. A. Appleton, Farlan Hall, Brampton Junction. Messrs. Robert Sydenham, Lim., Birmingham, provided a challenge vase and cash prizes for twelve distinct varieties, the entries filling a great length of tabling. Mr. Jos. Graham, Rosemont, Morville, Carlisle, scored with a beautiful exhibit, Clara Curtis, America Spencer, Helen Pierce, and Mrs. C. Foster being among the dozen. Mr. Edward Keith came close behind, using pretty well the same assortment; third place was allotted Mr. Jas. Hay, The Gardens, Houghton Hall, Carlisle; and fourth went to Mr. J. Robertson, Knells, Carlisle. A good show was made of nine vases, in which the winners were Mr. J. Fletcher, Mr. Edwd. Keith, and Mr. J. Robertson, in this order. Single vases of sweet peas had eight or nine classes devoted to them, and entries were numerous, the exhibitors already named in the larger classes obtained most of the prizes. Again, in the amateur classes for six varieties we were pleased to see a fine lot of flowers, the allotment holders also putting up very creditable exhibits.

The contributors to the class for twelve kinds of hardy perennials made an effective display, some good flowers being staged. Mr. Jas. Hay, Carlisle, came out top with a nice stand, including montbretia, helenium, eryngium, etc. Mr. J. Robertson, Knells, Carlisle, was a good second; and Mr. T. Fixter, Brackenburgh Tower, Colthwaite, third. Mr. Jos. Turner, New Rent, Hutton-in-the Forest, was awarded first for six phloxes, and in the allotment holders' section Mr. A. Urwin, Corbridge-on-Tyne, scored for twelve phloxes among five good entries. Gladioli, dahlias, enormous African marigolds, pentstemons, etc., were shown by the allotment holders in a most creditable manner.

TABLE DECORATIONS.

Nine beautiful table decorations gave the judges some amount of work in selecting the winners, the premier award going to Mr. Adam Knight, Brayton, who used francoas, Spiræa Peach Blossom, and Burnett carnations, with suitable foliage. Messrs. M. Campbell and Sons, High Blantyre, were given second for an arrangement in which yellow-ground picotees predominated; Mr. A. Hodgson, Reservoir Gardens, Carlisle, was third, sweet peas and Asparagus plumosus being his material.

FRUIT.

Some excellent fruit was exhibited, the black grapes being worthy of special mention. Mr. Wm. Scott, Edenhall, Penrith, won for two bunches black with Madresfield Court; Mr. Edwd. Keith took second with weighty bunches of Alicante; Mr. Jas. Hay following with the same variety. Mr. H. Smith, Castlerigg Manor, Keswick, had the best bunch of Black Hamburgh, Mr. A. Appleton, Farlam Hall, Brampton Junction, being the second, and Mr. J. Robertson, Knells, Carlisle, third. Mr. T. Fixter scored for whites, his followers being Mr. Jas. Hay and Mr. A. Appleton. The winner for six dishes of fruit was Mr. Edwd. Keith; and for six dishes of cooking apples Mr. J. Millican, Scotby Lane, Carlisle, scored with some fine fruit. Single dishes were shown in large numbers, and the quality spoke well for the skill of the Cumberland growers.

VEGETABLES.

These made a big display in themselves, many of the exhibits in both open and local classes coming well up to the average of our best shows. A silver cup and cash prizes were offered for a collection of twelve kinds, the champion exhibitor, Mr. E. Beckett, Aldenham House Gardens, Elstree, leading here with an exhibit of high quality. Needless to say, the onions, celery, peas, and other vegetables in this collection were staged in a most attractive manner. Mr. Thos. Anderson, 9, Hairlings Place, Darvel, Ayrshire, took second, and Mr. Chas. Rowland, Mickleton, Gloucestershire, third. In Messrs. Sutton and Sons' special class, Mr. E. Beckett again surpassed all comers, showing Satisfaction tomato, Windsor Castle potato, A1 celery, etc., in a splendid style. Mr. Jonathan Smith, Herbert Street, Carlisle, took the lead in Messrs. Little and Ballantyne's class, and Mr. J. Lacy, Upperby, secured the cup offered by Messrs. Geo. Fairbairn and Sons, Carlisle, for six varieties. Mr. E. Beckett's twelve onions, which took first prize, were big shapely bulbs of Sutton's selected Ailsa Craig. The single dishes of carrots, parsnips, peas, and other vegetables filled several long tables, and the local allotment holders gathered round in numbers, closely examining and comparing exhibits with keen interest.

NON-COMPETITIVE.

The trade have once more demonstrated that they are pleased to support a well-organised flower show, wherever it may be held, and here were numerous non-competitive exhibits which would have made a good exhibition in themselves. Mr. Hugh Dickson brought over from Belfast a fine lot of decorative and exhibition roses, which included a large number of the best varieties in commerce.

Messrs. Sutton and Sons, Reading, had a specially good exhibit, staged in the form of an oblong group, but with circular ends, and towering up to a good height in the centre. On the straight side stages were arranged capital vegetables, and the circular ends were built up with beautiful gloxinias, stocks, asters, and begonias; liliums and palms, finished off the centre.

Messrs. George Fairbairn and Sons, English Street, Carlisle, were very large exhibitors, having several stands devoted to separate subjects. On a beautifully arranged table of perpetual carnations we noticed a new variety named Unique, which Messrs. Fairbairn are introducing. It is a well-built flower of similar shade to Mikado, but with a splash of red. It has a fimbriated edge, but the petals stand out well. Some massive and cleverly constructed floral designs occupied another stand. Sweet peas filled a third table, the flowers being good, and arrangement excellent. Still another table was monopolised by the firm for a display of begonias, and an equally interesting show of dahlias completed a series of highly commendable exhibits.

Messrs. E. F. Fairbairn and Sons, Edenside Nurseries, Carlisle, put up a big bank of phloxes, such varieties as Coquelicot, Iris, General Von Heutz, and other of the newer sorts, being represented. Sir Benjaman Scott, Carlisle, sent an interesting exhibit of orchids, Vanda cærulea, odontoglossums, and choice cypripediums being features. A miscellaneous table of flowering and foliage plants came from Messrs. Clark Bros. and Co., Carlisle, palms, crotons, and other ornamental foliage plants predominating. Messrs. John Forbes, Lim., Hawick, N.B., brought a bold display of phloxes, and a nice collection of pentstemons. In the front of the stage were good carnations and beautifully coloured antirrhinums.

Messrs. J. Stormonth and Son, Kirkbride, Carlisle, arranged a small bog garden with spiræas, senecios, bamboos, etc., in the background, and a number of choice alpine and kindred plants in front. A bed of phloxes and an improvised rockery on the staging were other exhibits from the Kirkbride Nursery. A big exhibit of vegetables, some fruit trees in pots, and roses.

Sweet peas, etc., were staged by Messrs. Little and Ballantyne, Carlisle, but their most valuable contribution was an exceedingly attractive group of ornamental shrubs and climbing plants arranged in an open space near the centre of the hall. Beautifully coloured vitis of various species, choice ivies, euonymus, and small conifers were grouped in the form of small beds, with ample space between to admit of close inspection.

On a stand of miscellaneous subjects, exhibited by Messrs. Herd Bros., Penrith, a few of the more noteworthy subjects were zonal pelargoniums, double begonias, early chrysanthemums, and a nice group of Nephrolepis Amerpohli. At the back of the stand were fuchsias, Campanula pyramidalis, some cut perennials, and a few choice foliage plants, the whole making an attractive display.

A very instructive exhibit was brought by Mr. W. B. Little, Horticultural Instructor to Armstrong College, from the Cumberland County Council's experimental fruit farms. Apples were shown, and the varieties specially recommended for northern districts were marked. These included such well-known sorts as Worcester Pearmain, Bramley's Seedling, Bismarck, Newton Wonder, and others. Examples of fruit bottling were included in the exhibit, and there were samples of basic slag, kainit, and other chemicals, as well as illustrations of insect and fungoid pests. Such an exhibit was of great educational value, and we should like to see the like at many another show.

The following awards for non-competitive exhibits were made: Large gold medal—Messrs. Sutton and Sons, Reading, and Messrs. George Fairbairn and Sons, English Street, for their exhibit as a whole. Gold medal—Mr. John Forbes, Lim., Hawick, for pentstemons; Mr. John Millican, Scotby, for apples; and Messrs. E. F. Fairbairn and Sons, Edentown, for phloxes. Silver-gilt medal—Messrs. Little and Ballantyne, Carlisle, for exhibits of shrubs, vegetables, and cut flowers as a whole. Silver medal—Messrs. Herd Bros., Penrith, for miscellaneous plants; Messrs. John Stormonth and Son, Kirkbride, for bog garden; Messrs. Clark Bros. and Co., Carlisle, for flowering and fine-foliage plants; Sir Benjamin Scott, and Mr. Alex. McLauchlan, Stranraer, for greenhouse suitable for amateurs. Highly commended—the Chadwick Memorial School.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, AUGUST 16.

Present: Mr. E. A. Bowles, M.A., F.L.S., F.E.S. (in the chair); Messrs. J. Fraser, G. Gordon, J. Douglas, A. Rolfe, and F. J. Chittenden (hon. secretary).

DIMOROUS IRIS. — Mr. W. Fawcett, B.A., F.L.S., sent a flower of Iris xiphium having all its parts in twos instead of threes. This type of variation from the normal in iris is fairly common, but is often confined to one or two whorls instead of all four. The stem also bore a bud, but in that the parts were in threes as usual.

SPORTING IN CARNATIONS.—Mr. J. Douglas, V.M.H., called attention to the variation in colour met with in carnation Rhoda, which, when it was first sent out, was marked with lavender and red on a white ground. It had this year sported in two or three places to a lavender-ground flower. He remarked upon the frequency with which sudden colour sports appeared in more than one locality in the same plant at the same time. Several other instances were remarked upon by other members of the committee.

SALICES. — Mr. J. Fraser showed specimens of Salix alba (the Bat Willow), and called attention to the form of the serrations of the leaves; though the latter vary in size, the serrations are always of similar form. He showed also S. fragilis britannica, which has irregular serrations to the leaves, and the hybrid S. viridis, in which the foliage is intermediate between the other two. In the hybrid the leaves are dark-green above, and whiter than those of fragilis beneath, the serrations are intermediate in form, and more regular than in fragilis.

SPOTTING IN CALANTHE FOLIAGE.—Plants of calanthe vars. were shown badly attacked by this disease. So far as has yet been definitely ascertained, the spotting is not caused by a fungus or other organism, and appears not to be infectious. It appears rather to be due to some cultural defect, especially probably to spraying with cold water, possibly with a falling temperature.

AUGUST 30.

Present. Mr. E. A. Bowles (in the chair), with Messrs. A. W. Hill, J. Fraser, J. W. Odell, Wm. Hales, G. Gordon, W. Fawcett, A. Worsley, and A. W. Sutton.

GARDEN WARBLERS ATTACKING PLUMS.—Mr. Worsley said that garden warblers were this year attacking the ripening plums on the trees, contrary to their usual habit. Mr. Gordon suggested that this may be due to lack of insects—their usual food—this season, and instanced an experiment with hawks whose tastes he had trained to prefer fruit as a food.

ABERRANT BRANCHING IN MENTHA.—Mr. Fraser showed a plant of Mentha gentilis variegata bearing one pair of leaves united by their petioles and half the edges of the lamina. The axillary branches were also lateral, following the leaves. The main axis was at right angles to its base, flattened above and convex beneath like a petiole. Then it bore one leaf with an axillary shoot, and then the axis resumed its upright position with opposite, decussate leaves. Three nodes below also had a single or twin-leaf on one side, and one lateral branch behaved in the same way.

PETALOID CALYX IN ROSE.—A specimen of Rose Eugenie Lamesch was also submitted by Mr. Fraser, to show phylloid sepals and median proliferation of the flower. The axis in the centre of the flower was prolonged, bearing another flower-bud.

ONCIDIODA × CHARLESWORTHI.—The first cross of an oncidium with cochlioda (O. incurvum × C. Noezliana) was shown by Messrs. Charlesworth, of Haywards Heath. The specimen submitted was one of several of the same raising, all of which showed the same characteristics and colouring. A Certificate of Appreciation to Messrs. Charlesworth was recommended.

RHODODENDRON PONTICUM. — Mr. Bowles showed a terminal bud of Rhododendron ponticum, the leaves having petaloid colouration.

ADVENTITIOUS ROOT TO PLANE TREE.—Mr. Wilks sent an adventitious root of a plane tree which he had found penetrating a straw stake-band six feet from the ground. It was thought that the moisture which had been held by the band had induced the formation of the root.

GRAPES.—A sample of Muscat grapes was submitted from Colonel Turnor, of Pinkney Park, which showed cracking and decay at the point of union of berry and stalk, and the leaves were badly spotted. It was agreed that the defects were due to too low a temperature in the house, with insufficient ventilation.

DECAYED MONTBRETIA FOLIAGE.—Some montbretias, irises, and gladioli having decaying foliage were sent by Mr. Edward Hall, of Leamington Spa. The bulbs and corms were apparently in good health, without traces of disease. Many similar specimens had been lately received, but up to the present no explanation of the trouble was forthcoming.

Chester, AUGUST 31.

The floral section of the Cheshire Agricultural Society fully maintained its position as regards quality, and was freely patronised, the tents being crowded throughout the afternoon.

Groups were well staged, and the four set up were of more than average merit, Mr. W. H. Shaw, gardener to A. Ashworth, Esq., Gresford, securing the leading award with highly-coloured crotons, caladiums, good palms, and small ixoras, etc.; Mr. E. Stubbs, gardener to Major MacGillycuddy, Bache Hall, and Mr. John R. Samuel, Shotwick, were placed as named. For six stove or greenhouse plants, not less than three in bloom, Mr. A. Ellams, gardener to Alfred Tyrer, Esq., Plas Newton, led with medium-sized fresh plants, and the remaining prizes went to Mr. J. R. Samuel and Mr. W. Reeves, gardener to E. P. Jones, Esq., Chester. For four ferns the prizemen were Mr. J. R. Samuel, Mr. E. Palin, gardener to Mrs. Butt; and Mr. J. Williams, gardener to A. E. Hall, Esq., Chester. For four geraniums the prizes went to Messrs. A. Ellams, E. Palin, and W. Reeves; while for a single specimen plant Mr. C. H. Creasey won with a small dipladenia, Messrs. J. A. Samuel and A. Ellams being second and third.

Cut flowers were bright and fresh throughout. For twelve cactus dahlias, Mr. H. Coatcup led with beautiful blooms of William Marshall, Killarney, etc.; Mr. E. Jones, gardener to G. F. H. Robertson, Esq., Gresford, had the best six, and Mr. J. Brien won for asters. Mr. G. Aitkens, gardener to P. S. Yorke, Esq., Erddig Park, had the best annuals. For twelve bunches of herbaceous cut flowers Mr. F. England, gardener to Countess

Grosvenor, led with a fine lot. Mr. E. Jones had the best twelve vases of sweet peas, but these were not named. Mr. G. Faulkner, Rowton, had a fine six bunches, including Sunproof Crimson, Asta Ohn, St. George, and Evelyn Hemus. For twelve roses, Mr. G. Rolt, Christleton, won with a bright box, in which Frau Karl Druschki, Killarney, and Hugh Dickson were noteworthy. Mr. E. Jones had the leading gladiolus.

Fruit was of fair quality throughout. For nine dishes, Mr. H. Bateman, gardener to Egerton Leigh, Esq., Holmes' Chapel, was the only competitor, staging Black Hamburgh and Muscat of Alexandria grapes, Sea Eagle, and Bellegarde peaches, Pineapple nectarine, Royal Sovereign melon, etc. For two bunches of black grapes, Mr. W. Pilgrim, gardener to Sir George Meyrick, Bart., Bodagan, won with highly-coloured Madresfield Court. For two bunches of white grapes Mr. J. Clack, gardener to J. G. Frost, Esq., Chester, led with well-coloured Muscat of Alexandria. The best six peaches came from Mr. A. Crisp, gardener to Mrs. M. Clover, and six nectarines. Mr. E. Jones scored for nectarines with well-coloured fruits of Pineapple.

In the class for a collection of hardy fruits Mr. G. Aitkens staged good figs, apples, pears, etc.

Vegetables, as usual, were good, and the entries numerous. There were four classes for collections of six kinds, and the first prizes went to Mr. E. Stubbs, Mr. J. Edwards, Mr. J. Tomlinson, and Mr. R. Walker.

The following staged cut flowers, not for competition: Messrs. Dicksons, Caldwell and Sons; Dickson and Robinson, and Clibrans, fruits and vegetables.

National Chrysanthemum Society.

There was a largely attended meeting of the Floral Committee of this society at Essex Hall on Monday, September 5, and Mr. D. B. Crane was elected chairman of the committee for the tenth successive year. Sir Albert Rollit, who was present, urged that the society should take advantage of the opening of the newly-erected British section of the Brussels Exhibition (re-constituted since the great fire) on September 15, to make an imposing display of chrysanthemums. The difficulties of doing justice to the occasion at such short notice, and at such an early date were discussed, but ways and means were duly considered, and Sir Albert promised that the Royal Commission appointed from the Board of Trade would meet expenses up to £120. Sir Albert Rollit, together with Mr. T. Bevan, Mr. D. B. Crane, and Mr. D. Ingamells, were appointed a sub-committee to deal with the matter, secure the necessary plants and flowers, and their transportation to Brussels; and Messrs. Bevan and Ingamells agreed to go to the exhibition and arrange the plants and flowers—chrysanthemums of British growth — in the newly-arranged British section, ready for the reopening. It was agreed that the N.C.S. should not, as a society, be called upon to pay any of the expenses.

Messrs. Crane, Curtis, Hawes, and Ingamells were appointed to judge the non-competitive displays at the forthcoming exhibitions. Arrangements were made for the inspection of the trials of chrysanthemums at Merstham on Saturday, September 10, and Mr. Wells promised to entertain those who visited his establishment for that purpose.

Messrs. W. Wells and Co., Merstham, showed a dozen and a-half bunches of handsome flowers of early chrysanthemums, the pick of the varieties being Touraine, Orion, Francis, Miss Balfour Melville, Normandie, Mignon, and the vivid yellow Leslie. Mr. J. H. Witty, Swain's Lane, Highgate, N., showed about thirty vases of early varieties, representing several sections. Some of the best varieties shown were Horace Martin, Mdme. Lefort, Flora, Mons. G. Grunerwald, Roi des Belges, Nina Blick, Ralph Curtis, and Polly.

AWARDS TO NEW CHRYSANTHEMUMS.

Francis. — A useful early variety with shapely and elegant flowers borne on stiff stems of moderate length. The colour is soft bronze with short golden tips to the florets and golden reverse. A good decorative variety. Commendation, N.C.S., September 5; Messrs. W. Wells and Co., Merstham.

Orion.—A bright and attractive early decorative variety, and fine for the border. It has shapely flowers of a very brilliant golden hue with a light suffusion of chestnut at the bases of the central florets. Commendation, N.C.S., September 5; Messrs. W. Wells and Co., Merstham.

Touraine. — This is a large-flowered rich blush pink variety that makes an excellent bush plant for early flowering in the garden. The blooms are substantial, the broad florets curving in very slightly at the tips. Commendation, N.C.S., September 5; Messrs. W. Wells and Co., Merstham.

Miss Balfour Melville. — A showy, early flowered variety of large size, and with a very full centre. The colour is bright rosy bronze, and the blooms are carried in goodly sprays. F.C.C., N.C.S., September 5; Messrs. W. Wells and Co., Merstham.

Bristol Gardeners' Association.

A well-attended meeting of this association was held at St. John's Parish Rooms, presided over by Mr. Hayball. A paper upon "Melons," which was full of useful hints, was read by Mr. Wilkinson, gardener to Colonel G. A. Gibbs, M.P. The lecturer said, to be successful in growing melons, the cultivator must have command of plenty of heat, and a night temperature of from 65 deg. to 70 deg. must be maintained. A good stiff loam was the best soil for melons, and it should be made up in a ridge the length of the house or pit, and this ridge should be 10in. in depth and 14in. in width. The plants should be set out 20in. apart, and grown as cordons; in other words, with a single stem. Two fruits should be allowed to each plant, and if the right treatment was given, the fruit would weigh up to 9¼lb. each. The lecturer advised opening the ventilators early in the morning, thus freeing the house from stagnant moisture, which was detrimental to the young fruit. To be appreciated, the fruit must be eaten as soon as ripe. Mr. Wilkinson was accorded a hearty vote of thanks for his paper. Mr. Morse (gardener to Mr. S. Humphries) was awarded first prize for two pots of begonias.

Dundee Horticultural Association.

The members of this association had a pleasant outing on the afternoon of August 20, when, through the kindness of the Right Hon. the Earl of Camperdown, the party had access to the grounds and gardens at Camperdown House, Lochee. Mr. Murry, his Lordship's resident factor, met the party at the South East Lodge, and, after conducting them through his own gardens, accompanied them to the Lodge Gardens, where Mr. David Low, the veteran head gardener, took charge, and showed them round the kitchen garden, where huge quantities of healthy and well-grown produce was commented upon as an excellent source of supply for the demands of a large establishment. In the glass department, plentiful supplies of well-grown grapes, peaches, figs, etc., were found. The conservatory and a small back range were the only places where pot plants were found. Begonias were the leading feature in the former, and plants suitable for table decoration in the latter. Going round by Mr. Low's cottage, some one spoke about its charm, beauty, comfort, and seclusion, and the party was not surprised to hear from Mr. Low that during forty years he had only been three nights absent from it.

Emerging from the grounds under the charge of Mr. Low, he relinquished his post to Mr. Smith, the head forester, who is an active member of the association, and a competent authority on the various branches of forestry, so that, under his leadership, a good time was spent in surveying the grounds and policies in the immediate vicinity of the mansion.

After this, the party was escorted to the front entrance and the dining-room, where a sumptuous tea was in readiness, thoughtfully provided by Lady Abercrombie, who personally welcomed the guests. After tea a downpour of rain prevented further exploration of the beautiful demesne, but this in no way prevented the company's enjoyment, for Lady Abercrombie conducted them over the public rooms, showing the historical art treasures, furniture, and valuable family effects. Those having connection with the famous Admiral Duncan, and the Battle of Camperdown, her Ladyship explained in detail to the thorough enjoyment of every member of the party.

Before taking leave, Mr. Wm. Christeson voiced the thanks of the members present to her Ladyship for the many kindnesses she had shown, and to this her Ladyship appropriately and gracefully replied. At an earlier stage in the proceedings the Earl of Camperdown was accorded a vote of thanks, and Messrs. Low and Smith for their attention, interest, and information during the afternoon. On emerging from the house, the company felt overwhelmed by the further kindness of Lady Abercrombie, who had provided her own carriages to drive the party to the car terminus at Lochee, where, thanks to this act of kindness and forethought, the party arrived dry, when they might otherwise have been drenched.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

BRITISH GARDENERS' ASSOCIATION. —The secretary of the B.G.A. is Mr. J. Weathers, and his address is Talbot Villa, Isleworth, W.

MANURES FOR CHRYSANTHEMUMS. —W. J. K., Kimberley: As we are not conversant with the conditions under which you work, it is difficult for us to advise you, especially as you have practical experience to guide you, and a knowledge of the local and general conditions. We would point out that chrysanthemums, more than any other flower that is highly cultivated, need a variety of food material, hence any combination of fertilisers would not prove successful if used over the whole period during which the plants are fed. We need hardly point out to you the importance of having the roots of chrysanthemums moderately moist before the fertilisers are applied. Further, feeding should not be begun until the plants have taken possession of the soil used for the final potting. At this time feeding should be with a view to build up the plant and secure stout flower buds. Liquid manure made from the droppings of animals, particularly cows and bullocks, prove serviceable at this period, and should be applied in weak form at first, and once or twice a week. Clear soot water should be given occasionally, and if the weather is hot and dry, and growth consequently slow, one or two applications of guano, in weak liquid form, will be beneficial, or even nitrate of soda, though the latter must be used sparingly, as it has a tendency to produce rank growth. At a later period, when the flower buds have well developed, sulphate of ammonia will somewhat hasten development, and also add brilliance and clearness to the colours. Clear soot water is also of great value at this period for the same purpose. We do not advise you to use the mixture suggested for syringing; clear water will suffice, though quite clear and weak soot water is useful, as it acts as a preventive against insect attacks. We are much obliged to you for your kind letter, and shall be glad at all times to receive items of horticultural news or notes on any horticultural matter of interest. It occurs to us that, as you have to grow your chrysanthemums in tins, the latter should be plunged to the rim, or a board should be stood, edgeways, against the rows of tins, so as to guard against damage to the roots from the action of strong sunshine through the tin.

CHRYSANTHEMUMS FOR THE GARDEN.—W. M. S., Leicester: A suitable book for your purpose is "Chrysanthemums for Garden and Greenhouse," by Mr. D. B. Crane, to be obtained from the GARDENERS' MAGAZINE Office, 148, 149, Aldersgate Street, E.C., post free for 2s. 10d.

PLANTING DAFFODILS.—W. B., Sussex: The best time for planting bulbs of daffodils is the second half of August, and those who grow the more expensive varieties for exhibition, or, indeed, for any other purpose, are careful to complete the planting of them before the end of that month. Happily, daffodil bulbs deteriorate less rapidly than do the bulbs of many other plants, when kept out of the ground after the proper time, and they can be planted as late as November with the full assurance of their blooming satisfactorily, and making a strong growth subsequently. We have planted daffodils for experimental purposes as late as the middle of December, and have found them to flower satisfactorily, but the bulbs produced the following summer have not been equal to those from earlier plantings. We advise you to endeavour to complete the planting of the bulbs by the end of October at the latest. If there are insurmountable difficulties in the way plant the Barri and Poeticus varieties first, as they deteriorate more rapidly than do those of the Emperor and Empress and similar varieties, and bloom indifferently if planted late.

BLOTCHED SYCAMORE LEAVES. —J. B., Derby: The black blotches on the sycamore leaves are evidence of the presence of a fungus named Rhytisma punctatum. Unless steps are taken to prevent a recurrence of the attack the tree will become so enfeebled in a few years that it will fall a prey to other diseases and die. The fallen leaves are a source of infection if allowed to remain beneath the trees all the winter and spring, as spores are freely produced in the latter period from the fungus in the decaying leaves, and as these are light as air they float about in the atmosphere and settle on the newly opening leaves, and so a new attack is produced. Every fallen leaf should be gathered up and burned, and the tree should receive a good manurial dressing during the winter or spring.

NAMES OF FRUITS.

When sending fruits for naming, will our readers be good enough to send good specimens, as without these it is not possible to accurately determine the varieties. Pack firmly, using light tin or wood boxes, and send not more than six varieties at once. Label each specimen and enclose letter with the fruit, whether a separate notification is sent or not. Address the packages to the Editor, GARDENERS' MAGAZINE, as advised in the notice at the head of "Answers to Correspondents."

S. E. C., Farnham.—1, Louise Bonne of Jersey; 2, Victoria; 3, Worcester Pearmain.

A. C. R., Newark.—1, Early Julyan; 2, not recognised, not in character; 3, Washington; 4, McLaughlin Gage.

W. H. L., Saxmundham.—1, Lord Suffield; 2, Ecklinville Seedling; 3, Windsor; 4, Pond's Seedling; 5, Warner's King.

T. H., Kingston.—1, Prince of Wales; 2, Coe's Golden Drop; 3, not recognised; 4, McLaughlin Gage; 5, Victoria; 6, Jefferson.

NAMES OF PLANTS.

Under this heading we can only undertake to name species and well marked varieties of plants, and not florists' flowers. Specimens should be packed in stout boxes with damp (not wet) moss, or some leaves, as packing material, to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that numbers be firmly attached to the specimens so that they can be seen without any untying. We cannot promise to name more than six specimens at one time from any one correspondent.

G. B., Dublin.—Carex pseudo-cyperus.

J. L. W., Faversham.—Colutea arborea.

H. B., Southminster.—Ceanothus rigidus.

Mrs. H.—1, Phænocoma prolifera Barnesi; 2, Pentapterygium serpens.

H. W. P., North Wales.—1, Tamarix gallica; 2, Ceanothus azureus; 3, Leycesteria formosa; 4, Spiræa Douglasi; 5, Spiræa Bumalda; 6, Escallonia macrantha.

H. E. T., Stone.—1, Spiræa aruncus; 2, Lychnis chalcedonica; 3 and 4, poor specimens, not recognised; 5, Centaurea sp.; 6, Monarda didyma; 7, Galega officinalis.

J. M., Southampton.—1, a form of Cupressus Lawsonianus; 2, Ligustrum japonicum variegatum; 3, Eleagnus pungens aureopicta; 4, a Cratægus, species not recognised.
